(SECOND EDITION.)

AMARANTHUS.

AMARANTHUS, αμαραντος, formed from α, μαραινω and ανθος, or from α and μαραινω, and denoting *incorruptible*, becauſe the flower being cropped does not ſoon wither, in *Botany*, a genus of the *monoecia pentandria* claſs and order, of the *triandria trigynia* of Gmelin's Linnæus, of the *miſcellaneæ* of Linn. and *amaranthi* of Juſſ.; its characters are, that thoſe ſpecies which have male flowers on the ſame plants with the females have a *calyx*, which is a five or three leaved perianthium, upright, coloured, and permanent, the leaflets lanceolate and acute; no *corolla*; the *ſtamina* have five or three capillary filaments, from upright patulous, of the length of the calyx, the anthers oblong and verſatile: of thoſe which have female flowers in the ſame raceme with the males, the *calyx* is a perianthium the ſame with the former; no *corolla*; the *piſtillum* has an ovate germ, ſtyles three, ſhort and ſubulate; ſtigmas ſimple and permanent; the *pericarpium* is an ovate capſule, ſomewhat compreſſed, as is alſo the calyx on which it is placed, coloured, and of the ſame ſize, three-beaked, one-celled, cut open tranſverſely; the *ſeed* is ſingle, globular, compreſſed, and large. Martyn reckons 29, and Gmelin 22 ſpecies. Thoſe with *three ſtamens* comprehend, 1. A. *gracizans*, pellitory-leaved amaranth, "with glomerules axillary, and leaves lanceolate, repand and obtuſe." The ſtem is a ſpan high, ſmooth, grooved, and whitiſh, except at the baſe, where it is purpliſh; leaves ſmooth, green, and marked with lines; petiole very ſhort; the glomerules in pairs, green, four or five-flowered; and the calyx both of the male and female flowers is compoſed of three ſubulate, mucronate leaflets: a native of North America; cultivated in Chelſea-garden in 1723; flowers from July to September. 2. A. *albus*, white A. "with glomerules axillary, leaves roundiſh ovate, emarginate, and ſtem four-cornered and ſimple." The ſtem is a ſpan high, greeniſh white, decumbent and ſmooth; the leaves petioled, green, ſmooth, marked with lines, ending in an herbaceous, reflex, minute, whitiſh point; the petioles winged and channelled, and almoſt the length of the leaves; glomerules in pairs, ſeſſile, and few-flowered; leaflets of the calyx oblong-lanceolate and whitiſh, with a green nerve, and at the end a ſubulate, herbaceous point; nearly related to the firſt ſpecies; a native of Pennſylvania, whence it was brought to Italy, introduced here in 1778 by M. Thouin; flowers in July and Auguſt. 3. A. *deflexus*, "with ſpike very ſhort with few flowers, leaves rhomb-lanceolate, and capſules not gaping;" the ſtem weak, filiform, decumbent, divided at the baſe into a few branches, green, except at bottom, where it is browniſh, round, ſlightly ſtreaked and ſmooth; leaves green and ſmooth; petioles channelled and green; ſpike ſolitary, compoſed of only five or ſix flowers; no lateral glomerules, but a flower or two ſcattered in the axils of the leaves; the calyx five-leaved; leaflets diaphanous, white, oblong, and edged with green; diſtinguiſhed from the reſt by the capſules not opening tranſverſely, but being entire. Its native place is unknown. 4. A. *polygonoides*, ſpotted-leaved A. blitum of Brown, Jamaic. and chenopodium of Burm. Zeyl. "with three-leaved glomerules, female flowers funnel-ſhaped, and leaves rhomb-ovate, emarginate." The ſtem is red and ſmooth; the leaves ſmooth and green; the petioles green and channelled; the glomerules axillary, with from ſix to eight flowers in each; the calyx of the female flower one-leafed and ventricoſe; the five ſegments ſpreading much, and tranſparent white; the capſules falling with the calyx when the ſeed is ripe; the calyx of the male-flower three-leaved, membranaceous and tranſparent; the leaflets oblong and obtuſe, with a green nerve. This ſpecies varies in different ſituations, it reſembles the ſecond, but differs from it in having the ſtem round, and the calyx of the female flowers one-leafed and funnel-ſhaped: it is found wild by wayſides and among rubbiſh in the tropical countries of Aſia, Africa, and America, as in Jamaica, Guiana, Senegal, Gui-

Strahan and Preſton,
New-ſtreet Square, London.

nea, Ceylon, &c. introduced here in 1778 by M. Thouin; and flowers in Auguſt. 5. A. *polygamus*, hermaphrodite A. "with glomerules two-ſtamened, ſubſpiked and ovate, flowers hermaphrodite and female; leaves lanceolate;" the ſtem 1½ foot high, green, ſtreaked and ſmooth, leaves petioled and naked; from the axils proceed a branch and a head, conſiſting of a many-flowered pedunele, with a branch on each ſide at the baſe converging into a green head; ſpike ſhort, ovate, and ſmall; the hermaphrodite flowers with two ſtamens and two ſtyles, the female with three ſtyles; a native of Guiana, China, Cochin, and Amboina: the leaves and ſtalks boiled are eaten with oil and pepper by the inhabitants, and much liked; it was introduced here by Sir Joſeph Banks in 1780; and flowers in July and Auguſt. 6. A. *mangoſtanus*, "with glomerules ſubſpiked, axillary and ſolitary, and leaves rhomb-roundiſh;" the ſtem is above a foot high, ſtreaked, green, ſmooth, and decumbent; the leaves ſmooth and green, with a ſmall briſtle, almoſt as broad as long; petioles as long as the leaves, ſmooth and channelled; the flowers in large, roundiſh glomerules, from the axils, on ſhort peduncles, and forming at the top a cloſe, nodding ſpike; the calyces five-leaved, the leaflets white-membranaceous, tranſparent, oblong, with a green nerve, terminating in a briſtle of the ſame colour: a native of the Eaſt Indies. 7. A. *inamœnus*, "with glomerules ſubſpiked, three-leaved, axillary, geminate, and leaves rhomb-lanceolate." This ſpecies very much reſembles the laſt, but differs in having a three-leaved calyx, the glomerules axillary and in pairs, the ſpike terminating, erect, and more ſlender, the leaves rhomb-lanceolate, and the petioles ſhorter than the leaves: ſuppoſed to be a native of Japan. 8. A. *melancholicus*, two-coloured A. "with glomerules axillary, peduncled, roundiſh, and leaves ovate-lanceolate and coloured." This ſpecies varies in the colour of the leaves; being in the open air of a dingy purple on their upper ſurface, and the younger ones green; in a ſtove the whole plant is purple-coloured; but it is eaſily diſtinguiſhed in all ſtates by its colour, leaves, and the lateneſs of its flowering after all the others are paſt: it is joined by La Marck with A. tricolor; a native of Guiana and the Eaſt Indies, and cultivated in 1731 by Miller. The obſcure purple and bright crimſon of the leaves are ſo blended as to ſet off each other, and, in the vigorous ſtate of the plants, to make a fine appearance. 9. A. *gangeticus*, oval-ſpiked A. "with glomerules in very ſhort ſpikes, ovate, and leaves ovate-lanceolate, emarginate." Mr. Martyn ſuggeſts, that this may be a variety of the preceding ſpecies, but differs from it in having a terminating ſpike, axillary, ſeſſile glomerules, leaves leſs waved or wrinkled, and alſo in its colour: its ſtem being dark red, leaves green above and red below, petioles red, and glomerules of a reddiſh green colour; it is a native of Bengal and the Society iſles; was introduced here in 1778 by M. Thouin, and flowers from July to September. 10. A. *oleraceus*, eatable A. "with glomerules axillary, branching, and leaves wrinkled, oblong, very obtuſe and emarginate." It reſembles the next ſpecies, but differs from it in the great bluntneſs of the leaves, deeply emarginate, in the edge of the leaf being neither red nor waved, in the glomerules being branched and ſolitary, and in the peduncles and pedicels not being flexuoſe: a native of Guiana, the Eaſt Indies, and Egypt. This, which deſerves no place in a garden on account of its beauty, and the next ſpecies, are in ſome parts of India uſed as eſculent herbs; they are gathered young, and dreſſed like ſpinach, but much inferior to it: cultivated in 1768, by Mr. Miller; flowers in July. 11. A. *viridis*, green A. "with glomerules axillary, germinate trifid male flowers, ovate, emarginate leaves, and erect ſtem." This ſort is diſtinct from all the reſt in having the bractes not ſurrounding the flowers, but ſcattered along the rachis of the glomerule: a native of Jamaica and Braſil; confounded by European botaniſts with a variety of A. blitum; cultivated in 1768 by Miller; flowers in Auguſt and September. 12. A. *tricolor*, three-coloured A. "with glomerules ſeſſile, roundiſh, ſtem-claſping, and leaves lanceolate-ovate, coloured." This has been long cultivated, being in the garden of Gerard in 1596, for the beauty of its variegated leaves, in which the colours are elegantly mixed; theſe, when the plants are vigorous, are large and cloſely ſet from the bottom to the top of the ſtalks, and the branches form a kind of pyramid, and therefore there is not a more handſome plant when in full luſtre; a native of Guiana, Perſia, Ceylon, China, Japan, the Society Iſles, &c. 13. A. *lividus*, livid A. "with glomerules ſubſpiked, rounded, leaves elliptic, retuſe, and upright ſtem." This ſpecies is a native of Virginia and Guiana; was cultivated in 1768 by Miller, and flowers from July to September. 14. A. *triſtis*, round-headed A. "with glomerules in looſe ſpikes, leaves ſubcordate-ovate, emarginate, ſhorter than the petioles." This ſpecies is nearly related to the laſt, but may be eaſily diſtinguiſhed by its upright ſtalk, more looſe and ſlender ſpike, rhomboidal leaves, and five-leaved calyx: it is a native of China, Cochin, Amboina and Braſil, and uſed as we do ſpinach; cultivated in 1759 by Miller, and flowers from June to Auguſt. 15. A. *Blitum*, leaſt A. or blite, "with glomerules ſubſpiked, three-leaved flowers, leaves ovate-retuſe, and diffuſed ſtem." There are three varieties, *viz.* blitum album majus, bl. majus rubrum, and bl. rubrum minus. This is a native of all Europe, except the very cold parts, Japan, &c. in cultivated grounds, on dunghills, banks, among rubbiſh, &c. 16. A. *ſcandens*, climbing A. "with ſpikes interrupted, compound, ſpikelets, bent in, leaves ovate, and ſtem weak." It reſembles the foregoing ſpecies, and is a native of America.

The ſpecies with *five ſtamens* are, 17. A. *hecticus*, "with flowers in ſimple ſpikes, axillary, and glomerate, and leaves ovate, acute." It is doubtful whether this be a diſtinct ſpecies, or merely hybridous; it connects, in point of outward form, the three-ſtamened and five-ſtamened amaranths, varies much, and its native place is not known. 18. A. *hybridus*, cluſtered A. "with racemes decompound, heaped, erect, and leaves ovate-lanceolate." Willdenow enumerates four varieties: 1. wholly green; 2. with a red ſtalk; 3. with the racemes reddiſh, the reſt green; 4. with red racemes. Theſe differ in appearance, but are produced by the ſame ſeed. This ſpecies is found wild in Virginia and Arabia Felix; was cultivated in 1656 by Mr. J. Tradeſcant, jun. and flowers from June to September. 19. A. *ſtrictus*, "with racemes compound, erect, ſtrict, and leaves ovate, concave." This differs from the five-ſtamened ſpecies in its upright racemes preſſed cloſe to the ſtalk, and the ſtiffneſs of the whole habit. Its native place is not known. 20. A. *lætus*, "with racemes compound, erect, and leaves ovate, obtuſe, and mucronate." It much reſembles A. hybridus, but is diſtinguiſhed from it by having the leaves blunt at the end, and being much ſmaller in ſtature, the ſtem never riſing more than a foot high. 21. A. *cruentus*, various-leaved A. "with racemes decompound, naked, patulous, and leaves lanceolate-ovate." This ſpecies varies, of a ſhining red colour, with a red ſtalk, with pale leaves, with a green ſtalk, with variegated leaves, &c. When firſt cultivated in England in 1728, the ſtem was wholly red and ſmooth, the petioles, ribs, and nerves of the leaves underneath purple; the ſpikes purple, much ſpreading, and a little nodding. They were very beautiful for the firſt two years, but the ſeeds degenerated, and the plants had little beauty. It is a native of the Eaſt Indies and of China, and flowers from June to Auguſt. 22. A. *hypochondriacus*,

driacus, prince's feather A. "with racemes compound, crowded, erect, and leaves oblong-lanceolate, and mucronate." This approaches very nearly in ſtructure and variableneſs of colour to A. hybridus, and is diſtinguiſhed from it, but not without difficulty, by the greater redneſs of the racemes, and ſharpneſs of the leaves at the end, and by the baſe of the leaves running far down along the petiole; upon the whole, ſays Mr. Martyn, it ſeems to be only a variety of that. It is a native of Virginia, and flowers from July to September; was cultivated by Miller in 1739, but is now become a common weed, frequently growing upon dunghills, and abundantly ſcattering its ſeeds. 23. A. *ſanguineus*, ſpreading or bloody A. "with racemes compound, erect, branches ſpreading and ſmooth, and leaves oblong and acute." The ſeeds were ſent to Mr. Miller from the Bahama iſland before 1755, as an eſculent plant, bearing fine flowers; and he deſcribes it as growing three feet high, with purple ſtalks and leaves, the ſpikes ſhort and ſwelling out in the middle, and at the extremity of the ſtalk ariſes a large cluſter of ſpikes tranſverſely, with one upright ſtalk in the middle; and theſe are of a bright purple colour at firſt, but become darker as the ſeeds ripen; it flowers from the middle of June to September. 24. A. *paniculatus*, "with racemes compound, branches ſpreading, pubeſcent, and leaves ovate-lanceolate." This differs from A. ſanguineus in its pubeſcent branches, pointed calyxes, cloſer glomerules, and the whole habit: it is a native of America. 25. A. *retroflexus*, hairy A. "with racemes ſuper-decompound, erect, branches pubeſcent, and leaves ovate, waved." It approaches to the laſt ſpecies in the pubeſcence of the racemes, but differs in having green ſpikes, ſetaceous-ſubulate bractes, and leaves waved about the edge: it is a native of Pennſylvania, flowers from July to September, was cultivated by Miller in 1759, and is now become a common weed in many gardens near London. 26. A. *chloroſtachys*, "with racemes compound, nodding, and lanceolate leaves." It reſembles A. retroflexus, but differs from it in its ſmooth ſtalk, lanceolate, flat leaves, glomerules in more diſtant racemes, and in being much more ſlender: its native place is not known. 27. A. *flavus*, pale A. "with racemes compound, nodding, and leaves ovate-lanceolate." It differs from the laſt in the form and waving of the leaves, in the red lines on the ſtalk, in the red rachis of the flowers, and in the greater cloſeneſs of the racemes; and from A. retroflexus, in having the leaves leſs waved, ovate-lanceolate, and much leſs obtuſe, the ſtem at bottom and the petioles ſmooth, and the colour in the ſtem, rachis, and veins of the leaves red. The flowers, notwithſtanding the epithet *flavus*, are always green, and only turn yellow as the ſeed ripens: it is a native of the Eaſt Indies, and cultivated by Miller in 1768. 28. A. *caudatus*, pendulous A. or love-lies-bleeding; there is a variety, which is A. *maximus*, or tree A. the blitum maximum of many authors. This laſt is made by Mr. Miller a diſtinct ſpecies; it riſes to the height of ſeven or eight feet; the ſpikes are ſeldom half as long as the other, which are $2\frac{1}{2}$ feet, but much thicker. This degenerates gradually into the ſmaller; and the ſeeds, which are at firſt white, become red. It flowers in Auguſt and September, and was cultivated in 1683 by Mr. James Sutherland: it is a native of Perſia, Ceylon, Guiana, Peru, &c. 29. A. *ſpinoſus*, prickly A. "with racemes terminating, compound, and axils thorny." This varies, with the ſpikes and ſtem reddiſh: a native of the Eaſt and Weſt Indies, Guiana, Guinea, &c.; in the former it is eaten as a green boiled with baſella cordifolia; it was cultivated in 1683 by Mr. J. Sutherland, and flowers from July to September.

The amaranths are annual, herbaceous plants, and moſt of the ſpecies are uſed as culinary plants in hot countries.

Culture of Amaranths. Thoſe moſt worthy of a place in the pleaſure-garden are the 8th and 14th; but they are tender and require attention. They are uſually diſpoſed in pots, with cocks-combs and other ſhowy plants for adorning court-yards, and the environs of the houſe. Next to theſe are the 23d and 28th ſorts, for the ornaments of the principal borders in the pleaſure garden or parterres. The ſeeds of theſe ſhould be ſown in a moderate hot-bed, about the end of March; and when the plants come up, they ſhould have much air in mild weather. When they are fit for tranſplanting, they ſhould be removed to another moderate hot-bed, and placed at ſix inches diſtance, watering and ſhading them till they have taken new root; afterwards they ſhould have free air, and frequent but gentle waterings. In the beginning of June they ſhould be taken up with large balls of earth to their roots, and planted either in pots or the borders of the pleaſure-garden, ſhaded till they have taken root, and afterwards frequently watered in dry weather. The tree Amaranth muſt be planted in a rich light ſoil, and if it be allowed room, and well watered in dry weather, it will grow to a large ſize, and make a fine appearance. The 21ſt is a tender plant, and ſhould be treated like the 23d and 28th. The other ſorts are ſufficiently hardy to bear the open air, and may be ſown on a bed of light earth, in the Spring, and when the plants are fit to remove, tranſplanted into any part of the garden, where they will thrive and produce plenty of ſeeds. The 23d and 28th ſorts muſt be ſown on a good hot-bed in February, or at the furtheſt in the beginning of March; and they will riſe in about a fortnight; ſoon after which another hot bed muſt be covered with good, rich, light earth, about four inches deep; and the plants carefully raiſed and pricked out into this bed, at the diſtance of four inches every way, and gently watered. In the middle of the day let them be ſecured with mats from the heat of the ſun, and raiſe the glaſſes to give them air; the glaſſes ſhould be kept dry, for the moiſture exhaled by the fermenting dung and perſpiring plants is very injurious. When the plants are firmly rooted give them air every day, more or leſs, as the weather is cold or hot. In about three weeks or a month theſe plants will have grown ſo as to meet, and muſt be removed into another hot-bed, with the ſame rich earth, about ſix inches thick; obſerving to take as much earth about their roots as poſſible, and to plant them at the diſtance of ſix or ſeven inches every way, watering them, ſo as to ſettle the earth about their roots. In the heat of the day let them be ſhaded; refreſh them often with gentle watering; and give them air according to the heat of the weather, and cover the glaſſes every night with mats. In three weeks more, the plants will have acquired a conſiderable ſize and ſtrength, and ſhould be expoſed more and more to the open air, when the weather will permit, and thus they will become ſufficiently hardened to bear being removed into the places where they are to continue the whole ſeaſon; but they ſhould not be placed in the open air till after the firſt week in July, and this ſhould be done, when the air is perfectly ſoft, and, if poſſible, in a gentle ſhower of rain. Theſe plants, when grown to a good ſtature, perſpire very freely, and ſhould, therefore, be every day refreſhed with water, if the weather be hot and dry. By this management fine amaranths may be obtained; and theſe plants, when properly reared, are the greateſt ornament to a good garden, for upwards of two months in the latter part of the ſummer.

Amaranths are very prolific. Willdenow ſays, that he ſaved eight ounces of ſeed from one plant of A. *caudatus*. The ſeeds retain their germinating quality for ſeveral years, but continue longer in the ground than freſh ſeeds, which

germinate in eight days. Gmelin's Linn. Martyn's Miller. Willdenow.

AMARANTHUS. See ACHYRANTHES, CELOSIA. ILLECEBRUM, IRESINE, and RIVINA.

AMARANTHUS *luteus*. See GNAPHALIUM.

AMARANTHUS *marinus*, *Valent. ind.* 3. *t.* 52. *f. C. C.* This is alſo the fungus lapideus undulatus of Sloane, Catal. p. 2. Jam. i. p. 59: the myceedium cavatum undulatum of Hill. plant. p. 3, and cerebrites of Knorr. delic. tom. A. xi. f. 1. 2.—Linnæus deſcribes it under the ſpecific name of arcola, as a madrepore. See AREOLA.

AMARDUS, in *Ancient Geography*, a river of Media, which diſcharged itſelf into the Caſpian ſea.

AMARELLA, in *Botany*. See GENTIANA.

AMARGURA, in *Geography*, an iſland in the Southern Pacific Ocean, lying in S. lat. 17° 57'. W. long. 175° 16' 54". This was the firſt iſland diſcovered by Maurelle, in approaching the Friendly iſlands in 1781; he called it Amargura, *i. e.* bitterneſs, on account of his ſevere diſappointment of obtaining refreſhments from it; no landing place being found even for boats, and the iſland itſelf having a ſingular appearance of barrenneſs. In 1791, Captain Edwards coaſted the north-weſt ſide of this iſland, obſerved much ſmoke upon it, and called it Gardner's iſland.

AMARIACÆ, in *Ancient Geography*, a people of Aſia, in the interior part of Media, near the Mardi, according to Ptolemy.

AMARISCOGGIN River, in *Geography*. See ANDROSCOGGIN.

AMARISPII, in *Ancient Geography*, a people of Aſia, in Bactriana, according to Ptolemy.

AMARNA, or AMARUSA, a town placed by Ptolemy in Hyrcania.

AMARULA, in *Conchology*, a ſpecies of HELIX, that inhabits the rivers and freſh waters in India: ſhell imperforate, or without *umbilicus*, oblong; whorls beſet with ſpinous teeth. Linnæus adds to this conciſe deſcription, that the ſhell is black, without ſpots, the ſpiral ſtriæ ſub-convex, and the number of whorls either five or ſix, each armed along the upper edge with ten ſharp ſpines: the aperture or mouth widely gaping and white, the exterior lip acute, the interior one thick. This ſhell is likewiſe defined by another author, buccinum teſta ſubovata nigra; anfractibus ſurſum muricatis; Mull. Hiſt. Verm. ii. p. 137, n. 330, and is ſuppoſed to be the voluta fluviatilis of Rumpf. Muſ. tom. xxxiii. f. F. F.—Length from nine to 19 lines.

AMARUMAYE, in *Geography*, a river of America, which riſes in the Cordelier mountains, and after a courſe of 400 leagues, joins the river of the Amazons, in S. lat. 5°.

AMARUS, in *Ichthyology*, a ſpecies of the CYPRINUS, that inhabits the clear ſtreams of Germany. Its ſpecific character is taken from the number of bony rays in the pectoral and ventral fins, of which there are ſeven in each: as a ſecondary character the dorſal fin is ſaid to contain ten rays, the anal eleven, and the caudal twenty rays. The head is ſmall and cuneate or wedge-ſhaped, the eyes minute, with the iris red and yellow; the jaws equal, gill covers yellow. The body is pellucid, ſilvery and finely ſpeckled with black; above the lateral line yellow, back greeniſh, chalybeate-black near the tail. Upper fins reddiſh, lower fins greeniſh.

AMARYLLIS, derived either from the name of a ſhepherdeſs, mentioned by Theocritus and Virgil, or from αμαρυγμα or αμαρυγη, *ſplendor*, *lilio-narciſſus* of Tournefort, in *Botany*, a genus of the *hexandria monogynia* claſs and order, of the natural order of *lilia* or *liliaceæ*, the *ſpathaceæ* of Linn. and *narciſſi* of Juſſ.; its characters are, that the *calyx* is a ſpathe, oblong, obtuſe, compreſſed, emarginate, gaping on the flat ſide and withering; the *corolla* has ſix petals, lanceolate, the nectary has ſix very ſhort ſcales without the baſe of the filaments; the *ſtamina* have ſix awl-ſhaped filaments, with oblong, incumbent, riſing anthers; the *piſtillum* has a roundiſh, furrowed inferior germ, the ſtyle filiform, almoſt of the length and in the ſituation of the ſtamens, the ſtigma trifid and ſlender; the *pericarpium* is a ſubovate, three-celled, three-valved capſule; and the *ſeeds* are ſeveral. The inflection of the petals, ſtamens, and piſtil is very various in the different ſpecies of this genus; and the corolla in moſt of the ſpecies is rather hexapetaloid than ſix-petalled. Gmelin reckons 27, Mr. Martyn 29, and Willdenow 38 ſpecies.

Thoſe with a *one-flowered ſpathe* are as follow: 1. A. *lutea*, yellow A. or autumnal narciſſus, colchicum luteum-majus of Bauhin, "with an undivided obtuſe ſpathe, ſeſſile flower, bell-ſhaped corolla erect, ſhortly tubular at the baſe, and erect ſtamens, alternately ſhorter;" the flowers ſeldom riſe above three or four inches high; the green leaves come up at the ſame time, and when the flowers are paſt, the leaves increaſe through the winter. This ſpecies recedes a little from the genus. It is a native of the ſouth of France, Spain, Italy, and Thrace, was cultivated by Gerard in 1596, and flowers in September. 2. A. *Pumilio*, dwarf A. "with two-leaved, one-flowered ſpathe, corolla funnel-ſhaped, equal, ſegments revolute, and ſtamens bent in and alternately ſhorter." This is a native of the Cape of Good Hope, was introduced here in 1774, and flowers in November. 3. A. *Atamaſco*, atamaſco lily, "with ſpathe biſid, acute, flower pedicelled, corolla bell-ſhaped, nearly equal, erect, ſhortly tubular at the baſe, ſtamens bent down and equal." The flowers are at firſt of a fine carnation colour on the outſide, but fade till they are almoſt white; they appear at the end of May or beginning of June, and ſometimes in Auguſt. This is a native of Virginia and Carolina, where it grows plentifully in the fields and woods, and was cultivated here by Mr. Charles Hatton in 1680. 4. A. *formoſiſſima*, jacobea lily, ſo called, becauſe ſome imagined that they diſcovered in it a likeneſs to the badge of the order of the knights of the order of St. James, in Spain, the lilio-narciſſus and narciſſus of others, "with a ſpathe undivided, flower pedicelled, corolla two lipped, nodding, deeply ſix-parted, ſtamens and piſtil bent down." The flowers are produced from the ſides of the bulbs, are large, of a deep red, and make a beautiful appearance; it is a native of America, firſt known in Europe in 1593, ſome roots of it having been found on board a ſhip, which had returned from South America, by Simon de Tovar, a phyſician at Seville; he ſent a deſcription of the flowers to Cluſius, who publiſhed a drawing of it in 1601, called by Parkinſon, by whom it was figured in 1629, the Indian daffodil, with a red flower; cultivated in the Oxford garden in 1658. 5. A. *tubiſpatha*, "with ſpathe one-leaved, tubular, biſid and one-flowered, and peduncle twice as long as the ſpathe;" found at Buenos Ayres, by Commerſon. 6. A. *tubiflora*, "with ſpathe one-flowered, two-leaved, corolla funnel-ſhaped, with a very long tube;" found in the ſandy lands of Lima. 7. A. *maculata*, "with ſpathe one-flowered, two-leaved, linear, flower peduncled, ſtamens and ſtyle bent down;" found in Chili by Dombey. 8. A. *chilenſis*, "with ſpathe one or two-flowered, one or two-leaved, lanceolate, flowers peduncled, and leaves linear." The flowers, which are thoſe of A. belladonna or reginæ, are of a purple colour; found in Chili by Dombey. 9 A. *clavata*, "with ſpathe one-flowered, two-leaved, ſubulate, and corolla club-ſhaped:" native of the ſouthern part of Africa.

The ſpecies with a *two-flowered ſpathe* are, 10. A. *reginæ*, Mexican lily, "with ſpathe, having about two flowers, pedicels divaricating, corollas bell-ſhaped, ſhortly tubular, nodding, throat of the tube hirſute, and leaves lanceolate, patulous;"

patulous;" the bulb is green, corolla ſcarlet, and at the bottom whitiſh green, the ſtyle red, the flowers large, of a bright copper colour, inclining to red: it flowered in Fairchild's garden, at Hoxton, in 1728; and Dr. Douglas wrote a folio pamphlet upon it, giving it the title of *lilium reginæ*, becauſe it was in full beauty on the 1ſt of March, the queen's birth-day: the roots were brought from Mexico, and therefore Mr. Fairchild called it Mexican lily, the name which it has retained: it flowers in the ſpring in a very warm ſtove; is in beauty in February, and in a moderate temperature of air, will flower in March or April. 11. A. *purpurea*, purple flowered A crinum ſpecioſum of Linn. Suppl. "with ſpathe, having about two flowers, corollas ſomewhat erect, tubular at the baſe, throat of the tube ſmooth, and leaves linear-lanceolate:" nearly allied to the laſt: the corolla large, and of a blood-red purple colour; a native of the Cape of Good Hope, and introduced here in 1774. 12. A. *linearis*, crinum lineare of Linn. Suppl. "with linear leaves, bell-ſhaped corollas, two and narrower ſegments;" the flowers are large and white; found at the Cape of Good Hope. 13. A. *equeſtris*, Barbadoes lily, A. dubia of Linn. Amœn. Acad. "with ſpathe having about two flowers, pedicels erect, ſhorter than the ſpathe, tube filiform and horizontal, border ſpreading, open obliquely and curved upwards, and throat hairy;" a native of the Weſt Indies; introduced by Dr. W. Pitcairn in 1778. 14. A. *reticulata*, flat-ſtalked A. "with ſpathe having about two flowers, corollas tubular at the baſe, and nodding, throat of the tube ſmooth, ſcape compreſſed, leaves oblong and attenuated at the baſe;" diſtinguiſhed by the tranſverſe veins of the petals and ſmoothneſs of the throat; a native of Braſil; and introduced by Dr. E. W. Gray in 1777. 15. A. *tatarica*, "with ſpathe having about two flowers, corolla ſub-campanulated, and deeply ſix-parted, ſegments ſuperior, very narrow, inferior obovate acuminate, and leaves linear, longer than the ſcape." found in Siberia.

The ſpecies with a *many flowered ſpathe* are, 16. A. *Belladonna*, Belladonna lily, "with corollas ſomewhat erect, ſix-petalled, petals flat, ſcape compreſſed, leaves ſharply channelled, bluntly keeled, and very ſmooth." This ſpecies differs from the A. *reginæ*, by having the the edges of the petals waved, and not reverſed at the tip: was firſt brought to England about 1712, from Portugal, abounds about Florence, and ſold under the name of Narciſſus Belladonna; uſually flowers in England about the end of September or beginning of October, and the ſtem riſes upwards of two feet in height; in a favourable ſeaſon, and, when ſcreened from froſts, high winds, and heavy rains, will continue in beauty a month or longer, and is an ornamental plant, when other flowers are ſcarce; a native of the Weſt Indies, on ſhady hills, by the ſide of ſtreams. 17. A. *vittata*, ſuperb or ribband A. "with flowers pedicelled, corollas wedge-funnel ſhaped, the rachis of the outer faſtened to the edge of the inner petals, ſcape round, and ſtigmas grooved." It is ſtriped with red on a white ground, whence its name vittata or ribband A.; in perfect bloſſom, it deſerves the name of ſuperb, given to it by Aiton, its ſtem riſing to the height of three or more feet, and producing from two to five beautiful flowers; uſually bloſſoms in April or May; is probably a native of the Cape: and introduced into England by Mr. W. Malcolm, in 1769. 18. A. *falcata*, ſickle-leaved A. or crinum, "with corollas peduncled, erect, ſix-petalled, ſcape compreſſed, of the length of the umbel, leaves flat, preſſed to the ground, about the edge ſickle-ſhaped, white, cartilaginous and crenate." It is a native of the Cape, and introduced here in 1774, by Mr. F. Maſſon. 19. A. *ornata*, cape coaſt lily or A. "with flowers ſeſſile, corollas tubular at the baſe, tubes longer than the ſpathes, and border, curved, ſegments of the border oblong, awned, loweſt ſegment divaricate and concave." It is a native of Guinea, probably cultivated by Lord Petre, in 1740, and flowers with us in June and July. 20. A. *longifolia*, long-leaved A. "with flowers pedicelled, 12—20 in a ſpathe, corollas tubular at the baſe, tube curved, ſhort, ſegments of the borders lanceolate, obtuſe, leaves broad ſubulate, channelled, and flaccid at the tip." It is a native of the Cape of Good Hope, introduced in 1773, by Mr. F. Maſſon, and flowers in July. 21. A. *montana*, "with many-flowered ſpathe, leaves linear-ſubulate, petals alternate, mucronate, ſtamens and ſtyle erect;" or, according to Willdenow, "with bell-ſhaped equal corollas, ſegments alternate, awned, ſtamens and ſtyle ſtraight, and twice ſhorter than the corolla, ſolioſe ſcape and linear leaves." This is a native of the higher parts of Mount Lebanon. 22. A. *zeylanica*, Ceylon lily, Javan tulip of Rumphius, "with many-flowered ſpathe, corollas reclining, tube filiform, very long, and ſegment uncinate." This is a native of the Eaſt Indies. 23. A. *revoluta*, revolute A. "with flowers pedicelled, corollas tubular, at the baſe, tube filiform, ſhort, curved, leaves linear, narrow, channelled, long, flaccid from their origin." It is a native of the Cape of Good Hope, introduced here in 1774, and flowers in September. 24. A. *latifolia*, crinum latifolium of Linn. Miller, and Rheed, "with many-flowered ſpathe, flowers pedicelled, ſomewhat reclining, tubular at the baſe; and leaves oblong-lanceolate." It is found in the ſandy ſoil of the Eaſt Indies. 25. A. *aurea*, golden A. "with flowers pedicelled, ſomewhat erect, corollas funnel-form club-ſhaped, almoſt ſix-petalled, ſegments linear, lanceolate, ſtamens and ſtyle ſtraight, leaves linear, erect, channelled, with a reflex, ſmooth margin." It is a native of China, introduced in 1777, by Dr. Fothergill, and flowers in Auguſt and September. 26. A. *orientalis*, broad-leaved African A. "with many-flowered ſpathe, flowers pedicelled, ſix-parted, conſiderably ſhorter than the peduncles, irregular, germs wedge-ſhaped and angular." It is a native of the Cape of Good Hope, whence Mr. Miller received the roots which ſucceeded in the Chelſea garden; in the Kew catalogue, ſaid to be introduced in 1767, by Mr. W. Malcolm. 27. A. *farnienſis*, lilium farnienſe of Douglas, who publiſhed a deſcription of it in 1725, Narciſſus of others, Guernſey lily, ſo called by Mr. Ray in 1665, "with petals linear, flat, ſtamens and piſtil ſtraightiſh, longer than the corolla, ſtigmas parted and revolute." The bulb is an oblong ſpheroid; the leaves are dark willow green; the number of flowers is commonly from eight to twelve, and circumference of each about ſeven inches; the corolla, in its prime, has the colour of a fine gold tiſſue wrought on a roſe-coloured ground, and when it begins to fade, it is a pink; in full ſunſhine, it ſeems to be ſtudded with diamonds, but by candle-light the ſpecks or ſpangles appear more like fine gold duſt; when the petals begin to wither, they aſſume a deep crimſon colour. The flowers begin to come out at the end of Auguſt, and the head is uſually three weeks in gradually expanding. This beautiful plant is a native of Japan, and has been long naturalized in Guernſey. It is ſaid to have been brought from Japan to Paris, and cultivated in Morin's garden before 1634. It was cultivated at Wimbledon, in England, by general Lambert, in 1659, and in 1664 became more common: it does not ſeem to have been in Holland before 1695. The plants are reputed to owe their origin in Guernſey to the ſhipwreck of a veſſel returning from Japan, probably before the middle of the 17th century. The bulbs, it is ſaid, being caſt on ſhore, took root in that ſandy ſoil, and produced beautiful flowers, which engaged the attention of Mr. Hatton, the governor's ſon, who ſent roots to ſeveral of his friends. A variety of this

found at the Cape of Good Hope is described by Jacquin, "with a many-flowered spathe, corollas very patent, and reflex at the apex, stamens and pistil somewhat straight, longer than the corolla, and leaves ensiform-linear." 28. A. *marginata*, "with oblong revolute petals, stamens and pistil somewhat straight, longer than the corolla, lingulated leaves pressed to the ground, cartilaginous-marginate;" or, according to Jacquin's description, "with a many-flowered spathe, corollas very broad, and reflex at the apex, erect pedicles, sublinguæform and prostrate leaves, terminated with a margin coloured, and undulated towards the apex." This is a native of the Cape of Good Hope. 29. A. *curvifolia*, "with oblong, waved, revolute petals, stamens and pistil somewhat straight, and longer than the corolla, with leaves stiff, linear-ensiform and canaliculated;" or, according to Jacquin, "with many-flowered spathe, revolute, undulated corollas, erect pedicles, and leaves sublinear, widely channelled, and subfoliated." This is a native of the Cape of Good Hope. 30. A. *undulata*, waved flower African A. "with linear channelled, waved petals, stamens and pistil bent down, shorter than the corolla, and obsolete stigma." The flowers have no scent, and expand from November to the beginning of January: a native of the Cape of Good Hope, introduced about 1767, by John Blackburne, esq. and flowers here from April to June. 31. A. *radiata*, snow-drop leaved A. "with lanceolate, waved petals, stamens and pistil bent down, diverging, twice as long as the corolla, and obsolete stigma." The native place of this species is unknown, cultivated by Miller in 1758, and flowers in June. 32. A. *humilis*, "with three or four-flowered spathe, lanceolate, subringent-patent petals, waved-reflex at the apex, with the lowest divaricated, the stamens and pistil ascending, shorter than the petals, and leaves linear, obtuse, smooth, naked and flat;" or, according to Jacquin, "with few-flowered scapes, patent petals, the lowest divaricated, and leaves linear, obtuse, and flat." It much resembles the next species, but the scape and leaves are twice less; a native of the Cape of Good Hope. 33. A. *flexuosa*, "with many-flowered spathe, petals lanceolate, subringent-patent, waved-reflex at the apex, the lowest divaricated, the stamens and pistil ascending, shorter than the petals, and leaves linear, somewhat obtuse, concave, and pustulate dotted:" or, according to Jacquin, "with many-flowered spathe, patent petals, the lowest divaricated, and linear, pointed leaves." The younger leaves are marked with white pustules; the more adult pointed, and when dry the points vanish; a native of the Cape of Good Hope. 34. A. *radula*, "with many-flowered spathe, petals lanceolated, subringent-patent, flat, the lowest divaricated, the stamens and pistil ascending, of the length of the petals, with leaves elliptic, pressed to the ground, and roughly pustuled:" a native of the Cape of Good Hope. 35. A. *striata*, "with many-flowered spathe, corollas bell-shaped, shortly tubulous, segments flat, reflex at the apex, stamens and pistil ascending, and the leaves elliptic-ovate, erect, and marginated;" or, according to Jacquin, "with many-flowered spathe, corollas bell-shaped, equal, and reflex at the apex, sub ovated leaves, and striated on the back:" a native of the Cape of Good Hope. 36. A. *crispa*, "with few-flowered spathe, petals very patent, oblong, obtuse, and waved, stamens divaricated and shorter than the corolla, straight style, and leaves linear-filiform, and lax;" or, according to Jacquin, "with few-flowered spathe, petals very patent and crisp, and leaves linear and very narrow." The flowers are very small: a native of the Cape of Good hope. 37. A. *stellaris*, with many-flowered spathe, corollas patent and flat, a very short tube, stamens unequal, divaricated, shorter than the corolla, straight style, and leaves linear and erect;" or, according to Jacquin, "with many-flowered spathe, very patent petals three, alternate, and barbated below the middle;" a native of the Cape of Good Hope. 38. A. *caspia*, crinum caspium of Pallas, "with many-flowered spathe, bell-shaped corollas, very short tube, filaments erect, longer than the corolla, and leaves lanceolated and waved;" found near the Caspian Sea, in the beginning of Spring. 39. A. *spiralis*, "with spathe two-leaved, few-flowered, peduncles filiform, very long, and leaves subulate." L'Heritier. This species was discovered by Bruguiere in sandy grounds near the Cape of Good Hope. 40. A. *cinnamomea*, "with many-flowered spathe, corollas sub-hexapetalous, lanceolate, waved, stamens and pistil erect, shorter than the corolla." L'Heritier. This species is allied to Hæmanthus: was found by Bruguiere at the Cape of Good Hope. 41. A. *alba*, "with flowers declining, and leaves linear-lanceolated." Forsk. Fl. Æg. Arab. p. 209. Martyn. Gmelin's Linnæus. Willdenow.

Culture and Propagation. Most of these species have very beautiful flowers, and merit the attention of the botanist and florist. The first, or yellow autumnal A. is very hardy, and increases by offsets. The season for transplanting these roots is from May to the end of July, when the leaves are decayed. They will grow in any soil or situation; but they will thrive best in a fresh, light, dry soil, and open situation, and will keep flowering from the beginning of September to the middle of November, provided that they escape severe frosts; and a succession of flowers will spring from the same root. The third, or Atamasco lily, may be propagated by offsets from the bulbs, and will thrive in the open air on a dry soil, and in a warm situation. The 4th, or Jacobæa lily, is propagated by offsets, which are taken off every year; and the best time for shifting and parting the roots is August. They should be planted in middle-sized pots, and they will produce flowers two or three times in a year, and from March to September, when the roots are vigorous. The 10th, or Mexican lily, is less hardy, and must be placed in a warm stove, or the pots should be plunged into a hot-bed of tanner's bark, and may be increased by offsets. It flowers usually in the beginning of Spring and makes a fine appearance in the stove. The 16th, or Belladonna lily, is cultivated by preparing a border near a wall, with a south-west aspect, about six feet wide; and for this purpose the earth should be removed to the depth of three feet, six inches of rotten dung laid at the bottom, and covered to the depth of about twenty inches, with light garden mould: the roots should then be placed at the distance of six inches every way, and covered over with light sandy earth, so as to bury the upper part of the roots about five or six inches; and in the Winter the border is to be covered with rotten tanners' bark to the depth of three inches, in order to guard against the frosts: and in severe frosts mats or straw should be laid over the leaves, to prevent their being killed. Thus managed, the roots will greatly increase, and produce flowers every year, which make a fine appearance during the month of October. The green leaves will abide till June, and then decay, after which the roots should be transplanted. The 17th species may be easily propagated by seeds. The 20th may be treated in the same manner as the Jacobæa lily; will increase by offsets; and usually flowers in Winter, when the pots are placed in a moderate stove; and as there are few flowers in Winter in the open air, it is on this account the more valued. The 26th must be placed during Winter in a stove of moderate warmth, and less watered than the Jacobæa lily. The 27th, or Guernsey lily, has been cultivated for many years in the gardens of Guernsey and Jersey, whence the roots are sent to most parts of Europe. The bulbs are commonly brought over in June and July, and they should then be planted in pots filled with fresh, light, sandy earth, mixed with a small quantity of very rotten dung, placed in a warm

a warm ſituation, and occaſionally refreſhed with water. About the middle of September the ſtronger roots will ſhew their red-coloured flower-ſtem; and then the pots ſhould be removed into a ſituation where they may have the full benefit of the ſun, and be ſheltered from ſtrong winds; but not placed under glaſſes, or too near a wall, which would draw them up, and render them leſs beautiful. When the flowers begin to open, the pots ſhould be put under ſhelter, ſo as to be ſecure from too much wet, but not kept too cloſe or too warm. The flowers will continue in beauty for a month; and though without ſcent, their rich colour entitles them to the firſt rank in the flowery tribe. After the flowers are decayed, the leaves will grow through the Winter, and they will be beſt ſheltered in a common hot-bed frame. The roots ſhould be tranſplanted every fourth or fifth year, toward the latter end of June, and planted into freſh earth. The offſets, planted in ſeparate pots, will in three years time produce flowers; theſe roots will furniſh a ſtock, which will ſupply blowing roots without the trouble and expence of obtaining them from Guernſey; and the roots preſerved here will flower more ſtrongly than thoſe that are uſually brought from thence. In order to preſerve a large number of theſe roots without pots, a bed may be prepared in a well-ſheltered part of the garden, by mixing a third part of freſh virgin-earth from a paſture ground with equal parts of ſand, of rotten dung, and ſifted lime rubbiſh. Of this, when it has been well incorporated, there ſhould be made a bed about two feet thick, raiſed in dry ground four or five inches above the ſurface, and if the ground be moiſt eight or nine inches higher. In this bed the roots ſhould be planted, about the beginning of July, about ſix or eight inches aſunder each way; and in the Winter, when the froſt ſets in, covered with mats and ſtraw; but in the Spring the covering may be removed, and during the Summer kept clear from weeds, and the earth occaſionally ſtirred; and every year, when the leaves are decayed, a little freſh earth ſhould be ſifted over the beds, in order to encourage the roots. Here the roots may remain till they are ſtrong enough to produce flowers, and then removed to pots, or ſuffered to remain in the ſame bed to flower. The roots of theſe plants often flower twice in the compaſs of three years; after which the ſame root will not flower again in ſeveral years, but only the offſets from it. The 22d, or Ceylon lily, is tender, and muſt be treated like the Mexican lily. It flowers uſually in June and July, and ſometimes the ſame root will flower again in Autumn; and if the pots are plunged into a bed of tanners' bark, the roots generally flower twice every year; but the flowers are not of long duration. The 24th may be increaſed by offſets from the roots, or by the bulbs which ſucceed the flowers; and it muſt be treated like the *Crinums*. The beſt time for tranſplanting the roots is about the beginning of Auguſt, when the leaves are quite decayed. Martyn's Miller.

AMARYLLIS *Capenſis*. See HYPOXIS *Stellata*.

AMARYLLIS *Ciliaris*. See HÆMANTHUS *Ciliaris*.

AMARYLLIS *diſticha*. See HÆMANTHUS *toxicarius*.

AMARYLLIS *umbrella*. See CYRTANTHUS *obliquus*.

AMARYNTHUS, in *Ancient Geography*, a ſmall iſland of Eubœa, according to Steph. Byz.; but, according to Strabo and Pauſanias, a ſmall place in the iſland, famous for a temple of Diana, where ſhe was worſhipped, and hence called *Amarynthia*.

AMAS, a mountain of Peloponneſus in Laconia, according to Pauſanias, near Las and Gythium.

AMASENUS, *la Toppia*, a river of Italy. Alſo another river of Italy, which ran into the Liris.

AMASIUS, ROMULUS, in *Biography*, a profeſſor of Greek and Latin at Bologna, and ſecretary to the ſenate, was born at Udine, in Friuli, in 1489. Paul III. invited him to Rome, made him preceptor to his grandſon Alexander Farneſe, and employed him on ſeveral embaſſies to the emperor, the princes of the empire, and the king of Poland. He taught rhetoric at Bologna with an annual ſalary of 300 crowns, and at Rome, where he was much eſteemed for his learning, and had a penſion of 600 crowns a year. He tranſlated Pauſanias, which tranſlation was corrected by Sylburgius, and Xenophon's Expedition of Cyrus the Younger. He alſo wrote a volume of "Orations," and "Scholas duas de Ratione Inſtituendi." Two books, in which he ſhews that the Latin tongue is preferable to the Italian, were never printed. Huetius, "de claris Interpret." repreſents him as a great admirer of perſpicuity and politeneſs of ſtyle, and ſays of him that he enlarged what was too conciſe, abridged what was too prolix, and elucidated obſcure paſſages. He died about the year 1552, and left one ſon, named Pompilius, who taught Greek at Bologna, and tranſlated two fragments of the 6th book of Polybius. Gen. Dict.

AMASIA, in *Entomology*, a ſpecies of PAPILIO in the *nymphales* ſection. Wings indented, of a green colour, with a row of black ſpots along the margin of the poſterior pair: underſide marked with ocellated ſpots. Found in Surinam. Fabricius.

AMASIA, a ſpecies of PHALÆNA, of the *noctua* family. Wings varied with cinereous, and whitiſh, with a fulvous ſtreak: lower-ones yellow, with two black bands, the outer one interrupted. Abbot Inſ. Georgia, by *Dr. Smith*.

AMASIA, in *Ancient Geography*, a diſtrict or diviſion of Anatolia Natolia, or Aſia Minor, in Aſiatic Turkey, bounded on the north by the Euxine Sea, on the eaſt by Armenia, on the weſt by Anatolia Proper, and on the ſouth by Caramania and Aladulia. The capital of this country is Amaſia, called by the Turks Amnoſan and Amaſieh, which is an ancient town, ſituate among mountains, three miles diſtant from the river Iris, or Caſſalmack, and the reſidence of the governor of Cagherbag. It has been cuſtomary for the eldeſt ſon of the Grand Signior to reſide here till he is called to the throne. The city was formerly the ſeat of the kings of Cappadocia, and ſome remains of its ancient magnificence are ſtill exiſting. It gave birth to the famous geographer Strabo, and in Chriſtian times it has been the ſee of an archbiſhop. Its wine and fruits are excellent. It is 12 leagues ſouth of the Euxine Sea, and 200 miles eaſt of Conſtantinople. N. lat. 40° 31'. E. long. 36°.

AMASIA, or AMISIA, in *Ancient Geography*, a town of Germany, ſuppoſed by ſome to be the preſent Embden, and by others Marpurg. It was near this town that Druſus vanquiſhed the Bructeri.

AMASIS, in *Biography* and *Hiſtory*, king of Egypt, was of plebeian extraction, and by his meritorious ſervices obtained the confidence of Apries, his ſovereign, whom he ſucceeded in the throne, B. C. 569, and ſoon after put to death. Upon his acceſſion he was aſſiduous in the exerciſe of his pubic duties, devoting his mornings to buſineſs, and his evenings to ſocial amuſement. Under his reign Egypt was ſingularly proſperous and happy, and is ſaid to have contained 20,000 populous cities. For the preſervation of order and the encouragement of induſtry, he enacted a law which required every perſon to inform the governor of the province once a year how he earned his living, and thoſe who were not able to give a ſatisfactory account of themſelves were puniſhed with death. To the Greeks he was a great friend, inviting them into Egypt, and granting them places where they might erect altars and temples to their

own

own deities; and it is ſaid that he was viſited by Solon; he alſo married a Greek woman. Such was the liberality of his diſpoſition, that he contributed a thouſand talents of alum to the Delphians for their relief when their temple was burnt, and he granted to the Greeks ſeveral valuable donations. In his own country he erected ſeveral magnificent buildings, and at a very great expence enriched the principal temples with gifts and ornaments. Amaſis was the firſt perſon who ſubdued Cyprus, and extorted tribute from its inhabitants. The cloſe of his reign, however, was very different from its commencement and progreſs. Having by ſome means or other, probably by refuſing to pay the ſame homage and tribute to Cambyſes which he had been accuſtomed to render to Cyrus, incurred the diſpleaſure of the Perſian ſovereign, Cambyſes prepared to invade Egypt, and derived effectual aſſiſtance from Phanes of Halicarnaſſus, who commanded the Greek auxiliaries in the pay of Amaſis, and who, leaving Egypt in diſguſt, embarked for Perſia. Amaſis was alſo deſerted by Polycrates of Samos, who, after having been his ally and friend, joined Cambyſes againſt him. Thus deſerted by a prudent and valiant general, and by a powerful ally, and apprehending the formidable invaſion of Cambyſes, Amaſis was reſcued from the evils that threatened him, and that beclouded the cloſing ſcenes of his life, by death, B. C. 525, after a reign of 44 years. His dead body was embalmed, and depoſited in a ſepulchre which he had built for himſelf in the temple at Sais. The reign of his ſon and ſucceſſor, Pſammenitus, was ſhort and calamitous; and the victorious Perſians, after his defeat, capture, and death, took the body of his father Amaſis from the tomb, mangled it in a ſhocking manner, and then burnt it. Thus terminated the ancient ſplendour and liberty of Egypt. Herodotus. Diodorus Siculus. Un. Hiſt. vol. i. p. 314—323. Rollin's Anc. Hiſt. vol. i. p. 99—101.

Amasis, in *Entomology*, a ſpecies of Phalæna, of the *Bombyx* family. Wings deflected; anterior pair whitiſh, ſtreaked with black, poſterior pair yellow, with black ſpots. Abdomen black, belted with red. It is further deſcribed as having the head and thorax whitiſh, with black ſpots. The red or ſanguineous marks that encircle the abdomen are five in number, and the three black ſtreaks on the anterior wings are angulated. A native of Surinam. Fabr. Ent. Syſt.

AMASIUS, in *Ancient Geography*, a river of Germany, the preſent *Ems*.

AMASONIA, ſo called from *Amaſon*, a traveller into America, in *Botany*, a genus of the *didynamia angioſpermia* claſs and order. Its characters are, that the *calyx* is a perianthium, one-leafed, bell-ſhaped, ſemi-quinquefid, acute, equal, and permanent: the *corolla* is one-petalled, tubulous, longer than the calyx; border quinquefid, ſub-equal, ſpreading, and ſmall; the *ſtamina* have four filaments at the upper ſide of the corolla, and longer than it, bending in at the end, two of them ſhorter, the anthers oval and incumbent: the *piſtillum* has an ovate germ, ſtyle in the ſituation and form of the ſtamens, ſtigmas two and ſharp, no *pericarpium*. The *ſeeds* are an ovate, one-celled nut, of the ſame length with the calyx. This agrees with the *Taligalea* of Aublet in every thing except the fruit, which, according to him, is a drupe, longer than the calyx, one-celled, and containing two ſmall hemiſpherical one-celled nuts. There is one ſpecies, *viz.* A. *erecta*. It is a native of Surinam, with an herbaceous ſtem, three feet high, round and ſimple: the leaves are alternate, petiolate, remote, elliptic-lanceolate, ſubſerrate, and ſcabrous; the flowers in a ſimple terminal raceme, a foot long, with about three flowers on a pedicle: the bractes ovate, ſeſſile, a little longer than the flowers, which are yellow, nodding, and grow all on one ſide of the ſtalk. Martyn.

AMASSEA, in *Ancient Geography*, a town of Peloponneſus, in Achaia.

AMASSI, a people of the Aſiatic Sarmatia.

AMASTRA, a town of Sicily, the ſame with Ameſtratus.

AMASTRIS, now *Amaſtro*, a town of Aſia Minor, in Paphlagonia, upon a ſmall iſthmus which joined the peninſula Seſamus to the continent. It was built by Amaſtris, the wife of Lyſimachus, who gave it to his wife Arſinoe, and by her the government of it was entruſted with Hercules. Soon after it became very conſiderable, and put itſelf under the protection of Ariobarzanus, the ſon of Mithridates. When the Romans carried their arms into Aſia, Amaſtris was taken by Triarius, the lieutenant of Cotta. From the Romans it paſſed to the Greek emperors; it was afterwards taken by the Venetians: from them it became the poſſeſſion of the Turks; and, having loſt its commerce, it is now almoſt annihilated.

AMATA, in *Entomology*, a ſpecies of Papilio, in the ſection *Danai Candidi*, with rotund fulvous coloured wings, bordered with black on the upper ſide; beneath greeniſh; is found in India. Linn. Syſt. Nat.

AMATARIA, a ſpecies of the Phalæna, of the *Geometra* family, that inhabits Europe. The wings are angulated, of a pale brown, ſlightly ſpeckled, with an obſolete darker-waved ſtreak, and a ſtraight purple line acroſs the middle. It is produced from a green larva, with yellow rings, that feeds on the leaves of oaks. Linnæus. Don. Brit. Inſects, tab. 33. fig. 2.

AMATEUR, in the *Arts*, is a foreign term introduced and now paſſing current amongſt us, to denote a perſon underſtanding, and loving, or practiſing, the polite arts of painting, ſculpture, or architecture, without any regard to pecuniary advantage. Such have been found in the revivals of painting, &c. in moſt countries. Amateurs who practiſe were never perhaps in greater number or of ſuperior excellence than at preſent, and thoſe who delight in and encourage the arts have been the means of raiſing them in this country to that eminence to which they are arrived. It is to be regretted, however, that the great works of former ages, collected by amateurs in this kingdom, are not ſo acceſſible to our profeſſors as they are in foreign countries, which would tend to accelerate the progreſs of the arts, and that the encouragement given by theſe amateurs is in general upon too limited a ſcale.

It may occaſion ſome ſurpriſe to the next generation, that *Royal Patronage* has not roufed to emulation in this particular more of the noble amateurs who ſurround the throne, and induced them to encourage the greater works, as they do ſuch as are of an inferior nature; for thus our reputation in hiſtoric art would be elevated ſo as to be equal, if not ſuperior, to that of any of the neighbouring nations, and even to rival the juſtly celebrated pictures produced in the 14th and 15th centuries, and our ſculptors might be equally eſteemed with thoſe of ancient Greece or Rome.

Amateur, in *Muſic*, is equal, in French, to the term *Dilettante*, Ital. implying a lover and cultivator of muſic, not profeſſionally, but for his amuſement—a gentleman performer. In the *Encyclopedie Methodique* we have a long article on the ſubject, by M. Guinguerié, in which he divides *les Amateurs* into three claſſes, which he deſcribes in the following candid and fair manner. "The firſt is compoſed of ſuch as are born with delicate organs and much ſenſibility to the beau-

ties

ties of muſic, and who, not having had leiſure, inclination, or the means of cultivating their natural propenſity, continue through life to cheriſh their paſſion for the art; eagerly attending all concerts and muſical dramas; and, finally, by frequent and impartial parallels, dictated by nice and accurate diſcrimination, becoming, ſometimes, better judges of compoſition and performance than trained profeſſors, poſſeſſed neither of taſte nor impartiality.

"The ſecond claſs comprehends thoſe who have had the means of developing, and confirming by ſtudy, the gifts of nature, and who have ſublimed their diſpoſitions into talents. Of theſe the number is at preſent conſiderable. Muſic is become ſo intereſting a part of a good education, and vocal and inſtrumental muſic have made ſo great a progreſs, and are ſo generally cultivated, that there are few private concerts in which more talents are not diſplayed by amateurs of both ſexes than the moſt celebrated profeſſors poſſeſſed in France 20 years ago. Concerts entirely compoſed of gentlemen and lady performers are not uncommon; but perſons at all difficult are much diſſatisfied if the principal parts at leaſt are not guided by able profeſſors.

"The third claſs is the moſt numerous and the moſt diſtinguiſhed, though they are leſs ambitious of ſhining than the ſecond: it is compoſed of *amateurs*, who, not content with learning to read and execute muſic, have tried to penetrate into the ſecrets of the art, and enable themſelves to account for the pleaſure they receive, by analyſing their ſenſations and ſtudying the theory of muſic, to enable themſelves to judge more accurately of the practice, and to unite intellectual pleaſure with that of ſenſe and the heart. Maſters are fortunate who have ſuch for judges, where their knowledge is incorporated with natural ſenſibility and candour; and ſtill more happy, a thouſand times, the true *amateur*, who has neither the rage of deciſion, of diſputation, nor the arrogant pretenſions of ſettling ranks; who, knowing the arcana and refinements of the art, diſcovers and taſtes beauties unknown to vulgar hearers; who, preſerving his primitive ſenſibility, enlightens it by meditation and ſtudy: and who finds himſelf impelled, both by judgment and feeling, to treat with regard the artiſt to whom he owes his pleaſure, without diſtinction of nation or party.

AMATH, in *Ancient Geography*, a town of Syria, called by the Greeks *Emeſa*.—Alſo, a borough of Paleſtine, near Gadara, the ſame with *Amatha*.—Alſo, a town of Cœloſyria, called by the Greeks *Epiphania*.

AMATHA, a country of Arabia.—Alſo, a town of Phœnicia, probably the ſame that was founded by the 11th ſon of Canaan, called *Chamati* in the Book of Geneſis, and by the Septuagint *Amathi*. According to Joſephus, it was the capital of the Amathæans, and ſome have ſuppoſed it to be the ſame with *Emeſa*.—Alſo, a place of Judea, in that part of it that was allotted to the half-tribe of Manaſſeh, on the eaſt of Jordan.

AMATHÆI, a people of Arabia Felix, according to Pliny.—Alſo, a people who inhabited the Land of Promiſe before the Iſraelites, and who occupied part of the tribe of Nephtali, towards Mount Libanus. Theſe people were vanquiſhed by the Iſraelites, and retired into Phœnicia, where they built Amath, or Emath, on the banks of the river Orontes. According to Joſephus, they ſent forth a colony, who built the town of Amath, near the Lake of Genneſareth.

AMATHEA, in *Entomology*, a ſpecies of Papilio, in the *Nymphales* ſection, that inhabits South America. The wings are angulated, brown, with white ſpots; a red band, and undulated black line. Linn. Syſt. Nat.

AMATHO. See Amato.

AMATHUS, or Amathonte, in *Ancient Geography*, a town of the ſouthern part of the iſland of Cyprus, near Lycus, between Curtum to the weſt and Citium to the eaſt. It was founded by the Phœnicians, and owed its celebrity partly to the fertility of the adjacent country, and partly to the temple and worſhip of Venus in this place. Strangers, it is ſaid, were ſacrificed on her altars. The goddeſs was diſpleaſed, and puniſhed the inhabitants by changing the men into bulls, and by deſpoiling the women of their modeſty, ſo that they proſtituted themſelves without ſhame. Agreeably to this opinion, Ovid reports that the firſt courteſans appeared in this town. The ſtatue of Venus in this place was that of an hermaphrodite. The ſtatue was allegorical; and probably the men ſacrificed to her in female habits, and the women in thoſe of males. There was another temple in this place, as we are informed by Pauſanias, conſecrated to Venus and Adonis. Amathus was afterwards called Limaſſol; but it is now utterly deſtroyed.

Amathus was alſo a town of Peloponneſus, in Laconia, according to Strabo.—Alſo, a river of Peloponneſus, in Meſſenia, called *Pamiſus*.—Alſo, a town of Paleſtine, beyond Jordan, north-eaſt of Mount Abarim, ruined by Alexander Jannæus.

AMATHUSA, one of the epithets of the iſle of Cyprus, and the inhabitants were called *Amathuſii*, from Amathus above mentioned.

AMATI, Anton and Hieronimo, in *Biography*, two brothers, celebrated inſtrument makers in Cremona, flouriſhed in 1662. Nicolo Amati, the ſon of Geronimo, was living in 1682. All theſe were ſuch admirable fabricators of violins, as to render valuable every inſtrument that was ſuppoſed to come from Cremona. See Straduarius and Steiner.

AMATILLAN, in *Geography*, a town of Mexico, in the province of Guatimala; 10 miles S. E. of Guatimala. N. lat. 14° 20′. W. long. 92° 26′.

AMATIQUES, a ſea-port town, at the mouth of Guanacos river, which diſcharges itſelf into the Amatique gulf, or gulf of Honduras, in the province of Vera Paz, in Mexico. The inhabitants are chiefly logwood-cutters, and on the ſouth of the gulf is a tract of land, called Amatique land. The gulf is formed by the peninſula of Cape Three Points, and that which lies between it and Dolce gulf, and between theſe it runs far into the land. N. lat. 15° 23′. W. long. 89°.

AMATISSA, Amesse, in *Ancient Geography*, a ſmall river of Gaul, which runs from the S. E. to the N. E. eaſtward of Ambacia, and diſcharges itſelf into the Loire.

AMATITUE, in *Geography*, a river of North America, in New Spain, which diſcharges itſelf into the Pacific Ocean, upon the confines of the province of Guaxaca.

AMATKINAK Island is, with Ulak, the largeſt of the third group of iſlands between Aſia and America.

AMATO, a town of Naples, in the province of Calabria Citra, on a river of the ſame name, 7 miles S. E. of Nicaſtro.

Amato, or Amatho, anciently Lametus, a river of Naples, which ſpreads itſelf over a large flat, in 50 different channels, and would overflow a great extent of country if its devaſtations were not reſtrained by high cliffs on each ſide of its bed. Its waters are of a muddy white colour. It diſcharges itſelf into the ſea, three miles ſouth of St. Eufemia, on the weſt coaſt of Calabria Ultra.

AMATORII, Musculi, in *Anatomy*, an appellation given to thoſe muſcles of the eye, which give them a caſt ſideways, and aſſiſt in that particular look, by ſome called ogling. When the abductor and humilis act together, they give to the eye this oblique motion.

AMATORIUS, in *Ornithology*, a ſpecies of the Parus genus, of a deep blue ſlate colour, with a longitudinal ſpot in the

the middle of the wings, half rufous, half yellow.—It is the *meſange amoureuſe* of Buffon, and *amorous titmouſe* (parus amorofus) of Latham. The length is five inches and a quarter, bill two thirds of an inch, black at the baſe, tip orange.

This bird inhabits the northern parts of Aſia, and is remarkable for the affection each ſex ſhews the other. When paired in cages its careſſes are ſcarcely interrupted; a circumſtance that has impoſed the emphatic names of *amatorius*, *amaroſus*, and *amorous* upon this ſpecies, to diſtinguiſh it from others of the parus genus.

AMATRICE, in *Geography*, a ſmall town of Naples, in Abruzzo, with the title of a principality.

AMATTA DO BRASIL, a town of South America, in the country of Braſil, and government of Fernambuco.

AMATTA FOA, or TOOFOA-AMA, or KAMA, ISLAND, an iſland in the Southern Pacific Ocean, diſcovered by Captain Cook, in 1774, about 11 or 12 leagues diſtant from ANAMOOKA, N.N.W. ½ weſt. It is about five leagues in circuit, conſiderably elevated, and probably has a volcano; it is inhabited, but not very fertile. Betwixt this and another iſland, called Oghao, is a ſafe channel, about two miles broad, without any ſoundings.

AMAUROSIS, in *Surgery*, a privation or obſcurity of ſight, from αμαυροω, more commonly named GUTTA SERENA. This diſorder is either complete, when total blindneſs exiſts, or incomplete, when viſion is not perfectly deſtroyed. It is diſtinguiſhed from the GLAUCOMA or CATARACT, in as much as the latter is a diſeaſe of the cryſtalline lens, whereas the former is generally ſeated in the optic nerve. *Amauroſis* may be produced by various cauſes, and admits of different modes of treatment; but the conſideration of theſe particulars is referred to the article gutta ſerena. See AMBLYOPIA and DYSOPIA.

AMAXIA, in *Ancient Geography*, a town of Aſia Minor, in Cilicia Trachæa or Cilicia Montana.

AMAXITUS, a borough of Aſia Minor, in the Troas, and territory of the Alexandrians. In this place there was a temple of Apollo, in which the prieſt Chryſes, mentioned by Homer, is ſuppoſed to have ſacrificed.

AMAXOBII, a people who, according to Ptolemy, inhabited the interior parts of Scythia, in Europe. Their name, derived from Αμαξα, a chariot, refers to the practice which prevailed amongſt theſe people and other Tartarian nations, of placing their tents on carriages for their more eaſy removal from one place to another. See HAMAXOBII.

AMAYA, in *Geography*, a town of Spain, at the foot of a rocky mountain, in the county of Leon, four leagues from Aquilar del Campo.

AMAZIAH, in *Scripture Hiſtory*, the eighth king of Judah, was the ſon of Joaſh, and ſucceeded his father in his 25th year, A.M. 3165, B.C. 839. He adhered to the worſhip of the true God, but not without a mixture of idolatry; and therefore, he is ſaid (2 Chron. xxv. 2.) to have done "that which was right in the ſight of the Lord, but not with a perfect heart." We are further informed (Ch. xxv. 3, 4.) that, after his acceſſion to the throne, he put to death the murderers of his father, and in conformity to the humane reſtriction of the Moſaic law, (Deut. xxiv. 16.) he preſerved their children alive. With a large army, formed of his own ſubjects, and other hired troops from Iſrael, he marched againſt the Edomites, who had revolted from Judah, in the reign of Joram, about 54 years before; but having diſmiſſed the Iſraelite auxiliaries, he led forth his own people to battle, and defeated the enemy in the valley of Salt, with great ſlaughter. The auxiliaries on their return ravaged the country, killed 3000 men, and carried off a great booty, as a compenſation for the advantage which they expected to have derived from their expedition againſt Edom. Amaziah, after his victory, took home the gods of the children of Seir, and paid them divine honours. Preſuming on his ſucceſs, and imagining himſelf to be invincible, he ſent a hoſtile challenge to Joaſh, king of Iſrael, expreſſed by the words (2 Chron. xxv. 17.) "come, let us look one another in the face." Joaſh, by the fable of the cedar and thiſtle, endeavoured to diſſuade him from his hoſtile purpoſe; but he perſiſted, and the adverſe armies met at Bethſhemeſh, where that of Amaziah was routed, and he himſelf taken priſoner. Joaſh led the captive king with him to Jeruſalem; and having made a breach in the wall, he entered the city, plundered the temple and royal palace, and then returned to Samaria. After this diſaſtrous event, the reign of Amaziah was prolonged 15 or 16 years; but a conſpiracy having been formed againſt him at Jeruſalem, he fled to Lachiſh, where his enemies overtook and aſſaſſinated him, A.M. 3194. B.C. 810. 2 Kings, ch. xiv. 2 Chron. ch. xxv.

AMAZON, in a *General Senſe*, denotes a bold, courageous woman, capable of daring and hardy achievements. See AMAZONS *infra*.

AMAZON, or the river of the AMAZONS, called alſo *Maragnon*, in *Geography*, a river of South America, is one of the largeſt rivers in the world. Its ſource is in Peru, in a lake near Guanuco, about 30 leagues from Lima, where the Maragnon riſes, and at the head of the river Napo, near Quito; its firſt direction in Peru is from ſouth to north; it afterwards runs a courſe from weſt to eaſt, of about 3000 miles, acroſs South America, and receives near 200 other rivers, many of which have a courſe of 5 or 600 leagues, and ſome of them not inferior to the Danube or the Nile. Theſe rivers ruſh down with amazing impetuoſity from the eaſtern declivity of the Andes, and uniting in a ſpacious plain, form this immenſe river. The chief of theſe, from the ſouth and ſouth-weſt, proceeding from the mouth weſtward, are Araguaya, Paratinaa, Madeira, Eurus, Yulay, Yulacina and Ucagai rivers. From the north and north-weſt, advancing from its mouth, are Parma, Negro, Yupura, Iſſa and Napo, which laſt riſes near the town of Archidano, about 150 miles eaſtward of Quito. The Amazon is interſperſed with a great number of iſlands, which are too often overflowed to admit of culture. It falls into the Atlantic Ocean, almoſt under the equator, by ſeveral channels, and its breadth at its mouth is 150 miles, and at the diſtance of 1500 miles from hence it is 30 or 40 fathoms deep. In the rainy ſeaſon it overflows its banks, watering and fertilizing the adjacent country. M. de la Condamine, who made a voyage down this river in 1743, found its deſcent in a ſtraight courſe of about 1860 miles, to be about 1020 Engliſh feet, or 6½ inches in a mile. The tides are perceptible at 600 miles from its mouth, but at an elevation only of 90 feet. Phil. Tranſ. vol. lxxi. p. 93. 109.

Beſides Orellana, who made this voyage from motives of ambition, and de la Condamine, who was prompted to it from a love of ſcience, Madame Godin des Odonais, undertook it in 1769, from conjugal affection. The narrative of the hardſhips which ſhe ſuffered, of the dangers to which ſhe was expoſed, and of the diſaſters which befel her, is one of the moſt ſingular and affecting ſtories in any language, and exhibits in her conduct a ſtriking picture of the fortitude which diſtinguiſhes the one ſex, blended with the ſenſibility and tenderneſs peculiar to the other. Lettre de M. Godin à M. de la Condamine.

AMAZONA, in *Ornithology*, a ſpecies of ALCEDO, firſt deſcribed by Dr. Latham, in his Syn. Av. Sup. p. 116, under the name of AMAZONIAN KINGSFISHER. It inhabits Cayenne, and is about thirteen inches in length. The colour above is gloſſy green, beneath white, paſſing backwards in a ring

a ring to the nape; the ſides are variegated with green: the wings and tail ſpotted with white. Theſe particulars conſtitute the ſpecific character: it may be further added, that the bill is three inches long, narrow, ſtraight, and black; the under mandible yellow at the baſe; the thighs mottled with green, and the breaſt clouded with the ſame; tail feathers green, ſpotted on each ſide of the web with white, except the two middle feathers which are paler than the reſt; legs black.

AMAZONA, a ſpecies of EMBERIZA, deſcribed by Linnæus and Gmelin. The general colour is brown, crown of the head fulvous, vent whitiſh. It inhabits Surinam, and is about the ſize of the titmouſe. The underſide of the wings white at the baſe.—Buffon calls this L'Amazone, tom. iv. p. 364, and Latham gives it the Engliſh name of AMAZON'S BUNTING.

AMAZONE, in *Sculpture*, a very fine antique ſtatue, in Parian marble. It was about two hundred years at the *Villa Mattei*, upon Mount Coelius, at Rome; from whence it was removed to the muſeum of the Vatican, by pope Clement XIV.; and is now in the gallery of antiques at Paris. There is alſo a beautiful ſtatue of a queen of the Amazons at Wilton; repreſented in a warlike action; being on one knee; as under a horſe, defending herſelf in battle. Her ſhield is in the form of a half moon; behind the lower part of which, the ſculptor has executed a horſe's foot; in order to illuſtrate the attitude. This ſtatue was executed by the celebrated Cleomenes.

AMAZONIA, in *Geography*, a large country of South America, 1400 miles long, and 900 miles broad, is ſituated between the equator and 20° S. lat., and bounded on the north by Terra Firma and Guiana, on the eaſt by the Atlantic Ocean and Braſil, on the ſouth by Paraguay, and on the weſt by Peru. This country was firſt diſcovered by Franciſco Orellana, about the year 1541, who, in a bark, manned with 50 ſoldiers, was borne down by the ſtream of the river Napo into the channel of the Maragnon; and who, after making frequent deſcents on both ſides of the river, ſometimes ſeizing by force of arms the proviſions of the fierce ſavages, ſeated on its banks, and ſometimes procuring a ſupply of food by a friendly intercourſe with more gentle tribes, reached the ocean. This bold and magnanimous adventurer pretended to have diſcovered along the banks of this river, nations ſo rich, that the roofs of their temples were covered with plates of gold; and he deſcribed a republic of women ſo warlike and powerful, as to have extended their dominions over a conſiderable tract of the fertile plains which he had viſited. From this community of warlike women, who, with arms in their hands, oppoſed his paſſage, he called the country Amazonia, or the land of the Amazons, and he gave the name of Amazon to the river, which had formerly been denominated Maragnon.

The Spaniards have made ſeveral attempts to plant this country, but always met with ſo many difficulties and diſaſters, as to render their deſigns abortive. The Portugueſe have ſome ſmall ſettlements on that part of the coaſt which lies betwixt Cape North and the mouth of the river Amazon; but theſe excepted, the natives are in the ſole poſſeſſion of the whole country. The air in this country is cooler than might be expected, conſidering its ſituation in the middle of the torrid zone; which is owing partly to the heavy rains, which cauſe the inundations of the rivers for one half of the year, and partly to the cloudineſs of the weather, ſo that the ſun is obſcured, during the greateſt part of his ſtay above the horizon. The fair ſeaſon is about the time of the ſolſtices, and the wet or rainy ſeaſon is about the equinoxes. The ſoil of Amazonia is very fertile, and produces corn, grain, and all kinds of tropical fruits; beſides a variety of timber, as cedar, braſil-wood, oak, ebony, iron-wood, log-wood, and other dying woods; and alſo cocoa, tobacco, ſugar canes, cotton, caſſava root, potatoes, yams, ſarſaparilla, gums, raiſins, balſams of various ſorts, pine apples, guavas, bananas, &c. The foreſts abound with wild honey, and alſo with tigers, wild boars, buffaloes, deer, parrots, and game of various kinds. The rivers and lakes afford an ample ſupply of fiſh, ſea-cows, and turtles; but the alligators and water-ſerpents render fiſhing a dangerous employment. The trees, fields, and plants, are verdant throughout the year. The natives are of good ſtature, with agreeable features, long black hair and a copper-coloured complexion, and are very different from the natives of Africa, in the ſame latitude, on the oppoſite ſide of the Atlantic. Condamine ſays, that they have a taſte for the imitative arts, eſpecially ſculpture and painting, and that they frequently excel in mechanical profeſſions. They ſpin and weave cotton cloth. Their houſes are built with wood and clay, and thatched with reeds. Their arms, in general, are darts and javelins, bows and arrows, with targets of cane or fiſh ſkins. The ſeveral nations, on both ſides of the river Amazon, which are very numerous, are governed by chiefs or caziques; for it is obſervable, that the monarchical form of government has prevailed almoſt univerſally, in both ancient and modern times, in a rude and unrefined ſtate of ſociety. The regalia, by which the chiefs are diſtinguiſhed, are a crown of parrot's feathers, a chain of tiger's teeth or claws, which hang round the waiſt, and a wooden ſword. They are all idolaters, and worſhip the images of their ancient heroes; and in their various expeditions they carry their gods along with them.

As to the Amazonian race, if it ever exiſted otherwiſe than in the imagination of the original adventurer Orellana, or in the exaggerated reports of travellers and voyagers, it is now wholly extinct; and probably the notion was at firſt ſuggeſted by the activity and courage which the females of this country exerted, in the defence of their privileges, againſt the encroachment of foreigners.

AMAZONS, in *Geography* and *Hiſtory*, denote an ancient nation of warlike women, who founded an empire in Aſia Minor, upon the river Thermodon, along the coaſts of the Black Sea; and who are ſaid to have formed a ſtate out of which men were excluded. What commerce they had with that ſex, was only with ſtrangers, whom, after occaſional intercourſe at ſtated times, they put to death; hence, as Herodotus informs us, they have been called Æorpata, or murderers of their huſbands. They alſo killed all their male children, or, as ſome authors ſay, broke their legs, or diſjointed their knees, and thus rendered them incurably lame, by luxations, as Diodorus Siculus, Hippocrates, and Galen aſſert, that they might be the more eaſily reduced to a ſtate of dependence and ſlavery. Moreover, they nurſed their females, and trained them up to war; and that they might uſe their arms more readily, and be more fit for the combat, they cut off, or ſeared with a plate of hot braſs, their right breaſts, apprehending that there would be otherwiſe ſome impediment in the uſe of the bow. Hippocrates and Galen allow that this fact was reported; but they allege, that this operation was performed, not on account of any impediment in the uſe of the bow, but to render the right arms ſtronger by an addition of aliment, as that which would have gone to the breaſt would be thus reſtricted to the arm. In reference to the exciſion of their breaſts, Penthefilea, one

of their queens, is repreſented by Virgil, Æn. lib. i. v. 492.

"Aurea ſubnectens exſertæ cingula mammæ."

From this laſt circumſtance it is, that they are ſuppoſed to take their name, *viz.* from the privative α and μαζὸς, *mamma, breaſt.*

Others have ſuggeſted, that the amputation performed on the breaſts of the females was invented by the Greek etymologiſts, in order to explain the name of the nation. Others again have conjectured, that the name was derived from the Circaſſian word *mazai*, the *moon*, which is ſaid to have been a favourite deity among the mountaineers of Caucaſus, in the vicinity of which the Amazons were ſettled. Dr. Bryant (*ubi infra*) traces the etymology of the appellation to *zon*, the *ſun*, which was the national object of worſhip. Some have maintained, that the deſcription of the Amazons, given by the ancient writers, is purely allegorical; the amputation of one of the breaſts ſignifying, that the female only was nouriſhed by the mothers; and the killing of the boys denoting, that they were committed to the care of ſtrangers.

It is, however, a point that has been controverted, even among the ancient writers, as well as the moderns, whether ſuch a nation as the Amazons are deſcribed to be, have ever exiſted. Strabo, Palæphatus, and others, abſolutely deny it; whilſt, on the contrary, Herodotus, Pauſanias, Diodorus Siculus, Trogus Pompeius, Juſtin, Pliny, Mela, Plutarch, &c. expreſsly aſſert it.

Herodotus, in his hiſtory of the Scythians (lib. iv. c. 110. p. 330—332. ed. Weſſeling.), informs us, that the Greeks, who had obtained a ſignal victory over the Amazons, near the river Thermodon, were carrying off the reſidue that had eſcaped the ſlaughter in ſhips into their own country. While they were at ſea the Amazons conſpired againſt them, and killed all the men whom they had on board; but being unacquainted with the art of navigation, even with the uſe of the rudder, ſails, and oars, they were driven by the wind and tide to the precipices of the Palus Mæotis, in the territories of the free Scythians. Here they went aſhore, and marching up into the country, they ſeized the firſt horſes they found, and began to plunder the inhabitants. The Scythians unacquainted with their language, ſex, and dreſs, took them at firſt to be youths; but after a ſkirmiſh or two, in which ſome of them were taken priſoners, they found that they were women. Accordingly all hoſtilities ceaſed, and they formed connections with them as their wives. But when the Scythians invited theſe women to accompany them to their own country, they declined accepting the invitation; alleging, that they had been always uſed to draw the bow, dart a javelin, mount a horſe, and ſuch warlike exerciſes, to which they ſuppoſed the Scythian women were altogether unaccuſtomed, and that they could not conſent to exchange their military mode of living for a life of eaſe and indolence. They therefore exhorted their huſbands, if they ſtill retained the ſame conjugal affection for them, to viſit their parents and friends, and to return with the ſeveral portions aſſigned them. They complied with the advice; and upon their return, were informed by their wives, that ſince they had deprived them of their parents, and committed ſeveral depredations in that country, they thought it much ſafer to fix their habitation on the other ſide of the Tanais. This ſcheme was approved and executed. After three days march to the eaſt of that river, and three more northward from the lake Mæotis, they arrived and ſettled in the country of Sarmatia, where they continued, ſays Herodotus, to his time. Hence, continues the hiſtorian, the wives of the Sarmatians purſue their ancient mode of life, hunting on horſeback either alone, or in the company of their huſbands, marching with their armies, and wearing the ſame dreſs with the men. The Sarmatians uſed the Scythian language, corrupted by the Amazons, who had never learned to ſpeak it correctly. Their marriages were attended with this peculiar circumſtance, that no virgin was allowed to marry till ſhe had killed an enemy in the field, and therefore ſome of them were old before they married, according to the requiſition of the law.

From Diodorus Siculus (lib. ii. c. 45. p. 156—158. ed. Weſſeling.), we learn, that there was formerly a nation who dwelt near the river Thermodon, in which women governed and conducted all their military expeditions. Among theſe, one excelled all the reſt in ſtrength and valour. By her an army was aſſembled, and trained up in military diſcipline, ſo as to ſubdue ſome of the neighbouring nations. Her fame increaſing with her ſucceſs, ſhe ſtyled herſelf the daughter of Mars, and ordered the men to ſpin wool, and to perform the domeſtic ſervices of the women. She promulgated laws, which required the women to engage in warlike exerciſes, and the men to remain at home in an abject condition, and to be employed in the moſt ſervile offices. The male children that were born were debilitated in their legs and arms, ſo as to be unfit for war; and the females had their right breaſts ſeared, ſo that they might be no impediment to them in fighting; and hence, ſays the hiſtorian, this nation obtained the name of Amazons. The queen, diſtinguiſhed by her military ſkill, built at the mouth of the Thermodon a large city, called Themiſcyra, and adorned it with a famous palace. In her warlike expeditions ſhe maintained ſtrict diſcipline and order; and thus reduced to ſubjection all the neighbouring nations, as far as the river Tanais. Having finiſhed theſe exploits, ſhe cloſed her life in the field like a hero, and fell in a battle, in which ſhe had diſplayed ſingular courage. She was ſucceeded by her daughter, who emulated the valour of her mother, and in ſome reſpects ſurpaſſed her. She cauſed the young women to be inured to hunting in early life, and alſo to military exerciſes. She inſtituted feaſts and ſacrifices to Mars and Diana, which were denominated Tauropoli, carried her arms beyond the Tanais, and ſubdued the people of all thoſe countries as far as Thrace. Upon her return with rich ſpoils, ſhe cauſed temples to be erected to the above-mentioned deities, and gained the love of her ſubjects by her mild and gentle government. She afterwards reduced a great part of Aſia, and extended her conqueſts as far as Syria. The ſucceeding queens of the ſame race acquired renown by their government, and greatly enlarged the dominion of the Amazonian nation. The fame of the Amazons continued for ſeveral ages, till at length Hippolyta was vanquiſhed and captured by Hercules, the ſon of Jupiter and Alcmena; and by degrees the Amazonian name became totally extinct. The laſt queen of the Amazons was Penthefilea, who aſſiſted the Trojans, after the death of Hector, and was ſlain by Achilles. So ſignal and extraordinary were the character and exploits of this queen, and others of the Amazonians, that Diodorus acknowledges, that in later ages, the relations of them have been regarded as fabulous.

Diodorus elſewhere (*viz.* lib. iii. p. 220.) mentions another race of Amazons, much more ancient than thoſe of Pontus, in the vicinity of Thermodon. Theſe inhabited the weſtern parts of Libya; they were under the government of women; and as long as they continued ſingle, they performed the duty of ſoldiers in the field; and after a ſtipulated period they aſſociated with the men, and bore children;

but the magiſtracy and all public offices were retained by the females, and the men were employed in domeſtic offices, and were altogether ſubject to their wives, who would not allow them any participation of authority in the ſtate, or any concern in military affairs. Their females had their breaſts ſeared, that they might not be any hindrance to them as they grew up, and engaged in martial exerciſes. One of the principal queens of this nation was Myrina, who is ſuppoſed to have lived in the time of Orus, the ſon of Iſis, and to have conquered Africa and the greater part of Aſia, but was at laſt ſlain in Thrace.

Juſtin (ex Trog. lib. ii. cap. 4.) traces the origin of the Amazonian republic in Scythia. About the time of the firſt irruptions of the Scythians into Aſia, in the reign of Seſoſtris, king of Egypt, two princes of the royal blood, named Hylinos and Scolopytus, were compelled by an adverſe faction to retire into Cappadocia with their wives and families. By the aſſiſtance of the youths they brought with them, they obtained poſſeſſion of Thermoſciria, on the river Thermodon, whence they made incurſions into the adjacent nations for ſeveral years, till at laſt they were all treacherouſly murdered. Their wives, partly from revenge and partly from a dread of ſlavery, put themſelves under the conduct of ſome of their chief heroines, and prepared for a bloody war with the murderers. In order to give full ſcope to their fury, they renounced all future marriages, and deſtroyed thoſe of their huſbands, who had eſcaped the ſlaughter; and then proceeded with ſuch vigour and ſuch ſucceſs againſt their enemies, as totally to overthrow them, and to compel them to ſue for peace. One of their ſtipulations was, that they ſhould yearly have a month's intercourſe with each other, for the propagation of their ſpecies; after which they brought up all their girls in their own way, deprived them of their right breaſts, that they might be no obſtruction to them in drawing their bow; and as for the boys, they either killed them, as Juſtin ſays, or diſabled them for martial exerciſe, or ſent them to their fathers, according to Herodotus and others. Theſe ſurprizing exploits were achieved under the government and conduct of two queens, Lampeto and Marpheſia, who pretended to be the daughters of Mars; and who, having extended their conqueſts into Aſia, built cities there. The former of theſe females was left behind, with an army to ſecure their conqueſt, and the latter, on her return home, with her ſpoils, was ſurpriſed and cut off, with the reſt of her female warriors, by ſome bands of barbarians. After a ſucceſſion of female queens, Penthesilea is ſaid to have come to Troy for the aſſiſtance of Priamus, as we have already mentioned. This queen, it is added, was the inventreſs of the battle-axe, and was killed by Pyrrhus, the ſon of Achilles. Another of their queens, named Tomyris, had a bloody encounter with Cyrus, king of Perſia; and the famous queen Thaleſtris had an amorous intercourſe with Alexander the Great. Under this laſt queen it is ſaid, that the Amazonian kingdom and race were ultimately deſtroyed.

Quintus Curtius (De Rebus Geſtis, A. M. lib. vi. c. 5. tom. i. p. 400. ed. Snakenburg.) has given a particular account of this intercourſe between Thaleſtris and Alexander. He ſays, that the nation of the Amazons were ſituated upon the borders of Hyrcania, and that they inhabited the plains of Themiſcyra, near the river Thermodon. Thaleſtris, their queen, who governed the whole country between Mount Caucaſus and the river Phaſis, being deſirous of ſeeing Alexander, ſent meſſengers to requeſt an interview with him. Having obtained permiſſion to viſit him, ſhe advanced with 300 of her female warriors; and when ſhe approached his preſence, ſhe leaped from her horſe, with two javelins in her right hand. The apparel of the Amazons, ſays Curtius, does not cover the whole body; but the left ſide is naked to the breaſt, and the ſkirts of their garments, which are tied up in a knot, reach below the knees. Their left breaſt is preſerved, that they may ſuckle their female offſpring; but the right breaſt is ſeared, that they may the more eaſily bend the bow, and ſhoot their arrows. Thaleſtris, after obſerving Alexander for ſome time with an undaunted countenance, was diſappointed, as his perſonal appearance did not correſpond to the ideas ſhe had previouſly formed of him, from the report of his ſignal exploits. When the king aſked her, whether ſhe had any thing to deſire of him, Thaleſtris without heſitation replied, that ſhe wiſhed to have children by him, and that ſhe was worthy of the honour of giving heirs to his dominions. The female ſhe would reſerve for herſelf, and the male ſhould be delivered to him. When Alexander interrogated her, whether ſhe would accompany him in his wars, ſhe declined, alleging, that ſhe had left her kingdom without a guardian. Alexander, after renewed ſolicitations on her part, and a delay of 13 days, complied with her wiſhes; and Thaleſtris returned to her kingdom.

Plutarch, in his life of Pompey, (Oper. tom. i. p. 638.) ſays, that the Amazons inhabit thoſe parts of Mount Caucaſus, that lie towards the Hyrcanian ſea, that they are ſeparated from the Albanians by the Getulæ and Leges, and that they annually, for two months, accompany theſe people, and cohabit with them near the river Thermodon. They then retire to their own habitations, and live apart for the reſt of the year. In his life of Theſeus, (Oper. tom. i. p. 13.) Plutarch, after reciting ſome particulars relating to the hiſtory of the Amazons, acknowledges, that the accounts of them which had been preſerved were partly fabulous and partly true. The arms of the Amazons were bows and arrows, javelins, and a kind of battle-axes, denominated the axe of the Amazons, the invention of which is aſcribed by the elder Pliny to their queen, Penthesilea. On medals, the buſt of the Amazons is uſually armed with a ſmall two-edged axe, called *bipennis* or *ſecuris*, borne on the ſhoulder, and a buckler, in the form of a half moon, by the Latins called *pelta*, on the left arm. Hence Ovid's deſcription Ex Pont.

> "Non tibia Amazonia eſt pro me ſumenda ſecuris,
> Aut exciſa lævi pelta gerenda manu."

And Virgil, ſpeaking of the queen Penthesilea in Æneid. lib. i. v. 490, ſays,

> "Ducit Amazonidum lunatis agmina peltis."

Beſide the Amazons of Africa, which formed the moſt conſiderable body of theſe female warriors, and thoſe of Mount Caucaſus, near Colchis and Albania, and likewiſe near the Palus Mæotis, of whom we have already given an account, Polyænus ſpeaks of Amazons in India, who are alſo mentioned by Nonnus. They likewiſe occur in Æthiopia. They at one time, ſays Dr. Bryant, poſſeſſed all Ionia; and there were traditions of their being at Samos, and in Italy, where they had a town in Meſſapia, towards the lower part of the country, called Amazonia. Even the Athenians and Bœotians were of the ſame family; hence it is ſaid, that Cadmus had an Amazonian wife, when he went to Thebes, and that her name was Sphinx. The Colchians and Iberians, as well as the Cimmerians and Mæotæ, according to this learned writer, were Amazonians; and ſo were all the Ionians, and the Atlantians of Mauritania. Philoſtratus, in

in his Heroicis, mentions Amazonians on the Danube, and in Lucius Florus we read of German Amazons.

Among the ancient writers, who conſider the peculiar hiſtory of the Amazons as fabulous, we have already mentioned Palæphatus, who was complimented for his diſtinguiſhed underſtanding, by the appellation "ὁ ἀπιστότατος," and who gave it no credit. Strabo alſo, although born at Amaſtris, in Cappadocia, an Amazonian region, could obtain no evidence to countenance the hiſtory. He ſays, (lib. ii. tom. ii. p. 772.) that many legendary ſtories have a mixture of truth, and moſt accounts admit of ſome variation. But the hiſtory of the Amazons has been uniformly the ſame; the whole a monſtrous and abſurd detail, without the leaſt appearance of probability. For who can be perſuaded, that a community of women, either as an army, or a city, or a ſtate, could ſubſiſt without men? and not only ſubſiſt, but make expeditions into other countries, and gain the ſovereignty over kingdoms; not merely over the Ionians and thoſe who were in their neighbourhood, but paſs the ſeas and carry their arms into Europe; to accede to this were to ſuppoſe, that nature varied from her fixed principles; and that in thoſe days women were men, and men women. It may be added, that if ſuch a people really exiſted, ſome traces of them would have been found, either in Iberia and Albania; or in the country upon the Thermodon, where they are ſuppoſed chiefly to have reſided. But Procopius (De Bell. Gothic. lib. iv. c. 3. p. 570.) ſays, that there was no mark, no tradition to be obſerved concerning them.

Amongſt the moderns, who have maintained the exiſtence of Amazons in ancient times, we may mention M. Petit, a French phyſician, who publiſhed a Latin diſſertation, in 1685, in order to eſtabliſh the fact. This diſſertation contains abundance of curious inquiries, relating to their habit, their arms, the cities built by them, &c. Dr. Bryant (Analyſis of Ancient Mythology, vol. iii. p. 457, &c.) explodes the account of the exiſtence of ſuch a nation as fabulous; and he ſays, that the whole of this ſtrange hiſtory has been owing to a wrong etymology of the appellation Amazon. The Greeks, who were fond of deducing every thing from their own language, imagined, that by the term Amazon was ſignified a perſon without a breaſt. This perſon they inferred to be a female; and, in conſequence of it, as the Amazons were a powerful people, they formed a notion, that they were a community of women, who ſubſiſted by themſelves; and every abſurdity, with which this hiſtory is attended, took its riſe from the above-ſtated miſconception. They did not conſider, that there were many nations of the Amazons widely ſeparated from each other; nor did they know, that they themſelves were of Amazonian race. Dr. Bryant is of opinion, that the Amazons were in general Cuthite colonies from Egypt and Syria; and as they worſhipped the ſun, they were called Azones, Amazones, and Alazones, which are names of the ſame import and bear reference to the national object of worſhip. To this purpoſe Pauſanias (lib. iii. p. 274.) mentions Apollo Amazonius, who was worſhipped in Laconia. The moſt noted of them inhabited the region of Pontus, near the river Thermodon; and they were alſo called Chalybes, and Alybes, and occupied part both of Cappadocia and Armenia, being ſituated near Sinope, and extending towards Colchis. They are mentioned by Homer (Iliad. lib. v. v. 856.) among the allies of the Trojans. One of the principal cities of theſe Chalybes, beſides Sinope, was Amiſon, or as Pliny expreſſes it more juſtly (lib. vi. p. 303.) Amazon, and he mentions a mountain near it of the ſame name. Theſe people had different titles in the countries where they ſettled, and often in the ſame region; and therefore their hiſtory has been confuſed. They were called not only Amazonians, but Syri, Aſſyrii, Chaldæi, Mauri and Chalybes, and were ſtill further diverſified. They were the ſame as the Ionim, and in conſequence of it, they are ſaid to have founded the chief and moſt ancient cities in Ionia, and its neighbourhood. Accordingly the coin of the cities in Aſia Minor, and particularly of thoſe in Phrygia, Ionia, and Myſia, has often an Amazon for its device. The Amazons, according to the learned writer now cited, were Arkites, and one of their chief cities was called Archæopolis, who came from Egypt, and worſhipped the ſun, and Selene, the chief deities of the country, from whence they came. They are ſtiled by Herodotus Æorpata, not as he conceives from killing their huſbands, becauſe, according to their hiſtory, they had not any, but from their worſhip; and this name was given to their prieſts. It ſignifies a prieſt of אור or Orus; and theſe prieſts uſed to ſacrifice ſtrangers, who accidentally came upon their coaſt, and hence they were ſtyled, "Ανδροκτονοι," murderers. The Egyptians, it is alleged, admitted the ſiſtrum among their military inſtruments of muſic, and made uſe of it when they went to war. The ſame practice prevailed among the Amazonians, who worſhipped the Iſis of Egypt, and made uſe of her ſiſtrum, when they engaged in battle. The Amazonians of Colchis and Armenia were not far removed from the Minyæ, near Mount Ararat, and were of the ſame family. They were Arkites, as we may learn from the people of Pontic Theba, and followed the rites of the ark, under the name of Meen, Baris, and Iona. Hence it is, that they have been repreſented with lunar ſhields; not that they were of a lunar ſhape, but the lunette was a device taken from their worſhip. It was the national enſign, which was painted upon their ſhields; whence it is ſaid of them, "pictis bellantur Amazones armis." The Amazonian ſhield approached nearly to the ſhape of a leaf, as did alſo the ſhields of the Gothic nations; and upon theſe ſhields they had more lunettes than one; and from them the cuſtom was tranſmitted to the Turks and other Tartar nations. One of the moſt extraordinary circumſtances in the hiſtory of the Amazons is their invaſion of Attica. They are repreſented as women, who came from the river Thermodon, in revenge for the inſult offered them by Hercules, who had plundered their country. Their attack is deſcribed as violent; and the conflict for a long time doubtful. At laſt, having loſt many of their companions, they were obliged to retreat and entirely to leave the country. Of this invaſion the Athenians pretended to have had many evidences; they exhibited the tombs of the Amazons, who fell in the conteſt; the place of engagement was called Amazoneum; and near it was an ancient pillar, ſaid to be erected by this people But the hiſtory abounds with inconſiſtencies, though Plutarch (*ubi ſupra*) ſeems to credit it, and adduces ſeveral circumſtances, with a view of eſtabliſhing its certainty. Such a people, however, as the Amazonians, had certainly been in Attica; the Athenians, as well as the Bœotians, were in a great meaſure deſcended from them. The rites to which Plutarch refers, in proof of hoſtility between the Amazonians and Athenians, afford no concluſive argument to this purpoſe; becauſe they conſiſted originally in offerings made to the deity, from whom the Amazons derived their name. He was called Azon, and Amazon, and was the ſame as Ares, the ſun. They worſhipped both Ares and Harmon, changed by the Greeks to a feminine Harmonia; and in conſequence of this worſhip, the Amazons were ſaid to be the offſpring of thoſe deities. Hence it is, that the wife of Cadmus was ſaid to be Harmonia; for the Cadmians were

undoubtedly Amazonians. What became of theſe female warriors after their repulſe from Attica, the Grecians have not hiſtorically aſcertained. Some ſay that they retreated into Magna Græcia, and founded the city Cleite. Iſocrates (in Panegyr. p. 93.) acknowledges, that none of them returned into their own country; and Lyſias (Funeb. Orat.) ſays, that their nation was wholly ruined by this expedition, that they loſt their territories, and that they were no more heard of. Upon which Plutarch (*ubi ſupra*) obſerves, that we muſt not wonder, when tranſactions are of ſuch antiquity, if hiſtory ſhould prove contradictory and obſcure.

The Amazons are ſaid to have always fought on horſeback, (Ariſtoph. Lyſiſtrata, v. 680.); and yet the uſe of cavalry was not known in Greece, till long after this æra; for, according to Homer, the Aſiatic nations at the ſiege of Troy were equally unacquainted with this advantage. As for the tombs, which have been adduced as evidence of this invaſion, they were probably high altars, raiſed in ancient days. The whole of this hiſtory relates to old rites and cuſtoms; and not to any warlike expedition. The pillar, called Amazonium, indicates, that the Amazons might have been once in this country, and that they probably erected it; but this was the object to which they paid their adoration, as they lived in an age, when ſtatues were not known. Such a one the Argonauts are ſaid to have found in the temple of Arez, when they landed upon the coaſt of Pontus, and made their offerings to the deity, thus deſcribed by Apollonius, (Argonaut. lib. ii. v. 1174.) according to the Engliſh tranſlation of the original——

> "Now to the grove of Arez they repair,
> And while the victims bleed, they take their ſtand
> Around the glowing altar, full in front
> Of a fair temple. Here of ebon hue
> Riſes in air a lofty antique ſtone.
> Before it all of Amazonian name
> Bow low, and make their vows."

That theſe ſuppoſed tombs were altars, is alſo inferred from their ſituation in the middle of the city, and in many different places. Every circumſtance of this invaſion is attended, ſays our author, with ſome abſurdity. It is owing, we are told, to the injuſtice of Hercules, who ſtole the girdle of Hippolyte, and attacked the nation, of which ſhe was queen, ſo as quite to ruin it. The Amazons, thus defeated and weakened, and not able to withſtand their next neighbours (ſee Diod. Sic. lib. iv. p. 229. tom. i. p. 262.) determined to wage war with the Greeks, and particularly with Theſeus of Athens. They began their march, but inſtead of proceeding directly to Greece, they purſued a contrary route, paſſing north-eaſt in order to arrive at the ſouth-weſt, and ranging round the whole Euxine ſea, by Mount Caucaſus and Colchis, to the Cimmerian Boſphorus, and traverſing many hills and rivers, they at laſt arrived at Athens, pitched their camp in the precincts of the city, cloſe to the Acropolis, fought a ſevere battle, retired, and not being able to return home, were diſperſed and annihilated. And yet ſo far is this female hiſtory from terminating, the Amazons are introduced again by the poets, Homer, Virgil, &c. at the ſiege of Troy, and are to be met with in the wars of Cyrus. Some ages after, in the time of Alexander, an interview is ſaid to have paſſed, as we have already related, in which the queen of the Amazons makes propoſals to that monarch about ſharing, for a night or two, his bed. And even in the time of Pompey the Great, during the Mithridatic war, they are ſuppoſed to exiſt; for after a victory gained by that general, the Roman ſoldiers are ſaid to have found many boots and buſkins, which Dion Caſſius (in Bell. Mithrid.) thinks were undoubtedly Amazonian. Such, ſays Bryant, after a long and learned detail of various particulars, of which the above is merely a conciſe abſtract, was the credulity of the ancients about one of the moſt improbable ſtories that was ever feigned: and this learned writer concludes upon the whole, "that the Amazonians were a manifold people, and denominated from their worſhip. They were ſome of the Titanic race, who ſettled in Colchis, Ionia, Hellas, and upon the Atlantic in Mauritania; they were alſo to be found in other parts, and their family characteriſtic may in all places be ſeen. They were the ſame as the Cadmians; and the ſtructures which bore their names were not erected to them, but were the work of their own hands." Eumolpus, ſays Plato (Menexenus, vol. ii. p. 239.), led the Amazons, when they invaded Attica; and he is ſuppoſed to have been the principal perſon who introduced the rites and myſteries, which were obſerved by the Athenians. His ſons were the prieſts, who officiated at the temple of Ceres in Eleuſis. From all circumſtances it is concluded, "that what has been repreſented as a warlike expedition, was merely the ſettling of a colony, and thoſe who had the conduct of it were Amazonians, who had been repreſented as women. And ſo far is probable, that there were women among them, who officiated at the religious ceremonies which were inſtituted." —Among barbarous nations women have often combated by the ſide of their huſbands; but it is almoſt impoſſible, ſays Mr. Gibbon, (Hiſt. vol. xi. p. 46.) that a ſociety of Amazons ſhould ever have ſubſiſted either in the old or new world.

Later geographers and travellers ſpeak of Mingrelian and Georgian Amazons; Amazons in America, in Monomotapa, in the Philippine iſlands, in Denmark, &c. John de los Sanctos, a Portugueſe capuchin, in his deſcription of Ethiopia, mentions a race of Amazons in Africa; and Æneas Sylvius gives us a very preciſe account of a republic of real Amazons in Bohemia, which laſted nine years, founded by the valour of a young woman, named Valaſca. That there have been females of ſingular talents and very extraordinary firmneſs and reſolution, in all ages and in all nations, no one can diſpute; and if we compare the warlike genius of the Scythian women in general, and more particularly that of the Sarmatians, in whoſe neighbourhood the Amazons are ſaid to have lived, with the occaſion which is reported to have given birth to their ſtrange kind of government, namely, the treacherous murder of their huſbands, and their being in danger of becoming a prey to their murderers, and in a ſtrange country; we may incline to give ſome credit to the brave and maſculine method which they took to ſave themſelves from ſlavery, and to revenge the ſlaughter of their huſbands. The Scythian, as well as the Celtic women, were anciently held in great eſteem and veneration, for their ſkill in divination above the men, inſomuch that the latter are upbraided by ancient authors for ſuffering women to aſſiſt at and direct their councils and to have even preſided in their courts of judicature, and other aſſemblies; in which their judgment was reckoned deciſive, becauſe they were ſuppoſed to be divinely inſpired. Being, therefore, inured to council, execution, and warlike exploits, exaſperated by the barbarous brutality of their huſbands, and rendered, as it were, deſperate by the proſpect of impending ſlavery, we need not wonder, that they ſhould adopt effectual means of inflicting vengeance, and of defending themſelves; and, with this view, that they

ſhould

ſhould ſelect one or two of the ſtrongeſt and moſt valiant to lead them in an offenſive war againſt their enemies, and that they ſhould carry it on with courage and conſtancy, and of courſe with ſuch aſtoniſhing ſucceſs. And if their warlike temper, their government, cuſtoms, valour, conduct, and achievements, have been exaggerated beyond credibility, it may be alleged, that this has been done with reſpect to other nations, governments, and conquerors, which have attracted unuſual attention, and which it would be abſurd to reject as altogether fabulous on that account. The ſame allowance ſhould be made in both caſes: and this is much more reaſonable than to ſuppoſe that the various hiſtorians who have given an account of them, have been guilty of forgery or of too great credulity.

The true hiſtory of the ancient, and even of the modern Amazons, has, without doubt, been blended with much fable, with many marvellous and improbable, not to ſay altogether incredible relations; but the teſtimony upon which it is tranſmitted to us deſerves regard, and it would manifeſt a degree of ſcepticiſm, which, applied to other caſes, would be not only unwarrantable, but dangerous and pernicious, altogether to diſcard it. The empire of the Amazons was certainly of a different kind from that which properly belongs to the female ſex. "The empire of the woman," ſays Rouſſeau, "is an empire of ſoftneſs, of addreſs, of complacency. Her commands are careſſes; her menaces are tears." "The character of the ancient Amazons," ſays Dr. Johnſon, "was rather terrible than lovely. The hand could not be very delicate that was only employed in drawing the bow, and brandiſhing the battle-ax. Their power was maintained by cruelty; their courage was deformed by ferocity; and their example only ſhews, that men and women live beſt together."

AMAZON is applied, in a figurative ſenſe, to bees, becauſe among theſe inſects the females alone are commonly ſuppoſed to bear ſway.

Ariſtotle, treating of the breeding of bees, profeſſes himſelf ignorant of their ſex; and therefore, willing to keep up the prerogative of the males, calls their governor βασιλευς, *rex*, in which he has been followed by the generality of authors.

An ingenious writer of our own country, takes the liberty to ſtrain the ordinary ſignification of the word *rex*, and in ſuch places tranſlates it *queen*, this being an *Amazonian*, or female kingdom.

Mr. Warder has publiſhed a work under the title of the True Amazons, or the Commonwealth of BEES.

AMAZONIAN, ſomething relating to, or reſembling AMAZONS.

AMAZONIAN *kingdom*, is particularly uſed for a feminine one, or that wherein the females alone bear rule.

AMAZONIAN *habit*, in *Antiquity*, denotes a dreſs formed in imitation of the Amazons.

Marcia, the famous concubine of the emperor Commodus, had the appellation Amazonian, becauſe ſhe charmed him moſt in a habit of this kind.—Hence alſo that prince himſelf engaged in combat, or at leaſt intended to engage, in the amphitheatre, in an Amazonian habit; and of all titles the Amazonius was one of thoſe he moſt delighted in. In honour either of the gallant, or his miſtreſs, the month of January was alſo denominated Amazonius. Some alſo apply Amazonian habit to the hunting dreſs worn by many ladies among us.

AMAZONIUS is an appellation given to a kind of paſtil, or *troche*, anciently uſed againſt riſings of the ſtomach, and vomitings.—The ingredients of which it is compoſed, are ſmallage, aniſe-ſeed, wormwood, myrrh, pepper, *caſtoreum*, *opium*, and cinnamon.

AMAZONUS, in *Entomology*, a ſmall ſpecies of SCARABÆUS, found in Surinam. It is teſtaceous, with two black marks on the thorax, and a brown callus on the exterior margin of the wing-caſes. Linn. Syſt. Nat.

AMBA, in *Botany*, a name by which ſome authors have called the *magna Indica*, or MANGO-*tree*, called alſo *ambalam*, and *ambe*.

AMBACHT, in *Topography*, denotes a kind of juriſdiction, or territory, the poſſeſſor whereof has the adminiſtration of juſtice, both in *alto* and *baſſo*; or of what is called in the Scots law a power of pit and gallows, *i. e.* a power of drowning and hanging.

In ſome ancient writers ambacht is particularly uſed for the juriſdiction, government, or chief magiſtracy of a city. The word is very ancient, though uſed originally in a ſenſe ſomewhat different. Ennius calls a mercenary, or ſlave hired for money, *ambactus*; and Cæſar (De Bell. Gallic. vi. 14.) gives the ſame appellation to a kind of dependents among the Gauls, who, without being ſlaves, were attached to the ſervice of great lords.

AMBAGES, in *Rhetoric*. See CIRCUMLOCUTION.

AMBAIBA, the name of a tree in Braſil, called by the Indians, *tipioca*. Ray's Hiſt. Plant. See CECROPIA.

AMBAITINGA, the name of a tree, whoſe leaves are ſo rough that they may be uſed to poliſh hard wood. Ray's Hiſt. Plant.

AMBAPAYA. See CARICA.

AMBAR *ſeed*, in the *Materia Medica*, a name by which ſome have called muſk ſeed.

AMBARES, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton, in the diſtrict of Bourdeaux, five miles north-eaſt of Bourdeaux.

AMBARVALIA, in *Antiquity*, a feaſt, or ceremony, among the Romans, celebrated annually, in honour of the goddeſs Ceres, in order to procure a happy harveſt.

At theſe feaſts, they ſacrificed a bull, a ſow, and a ſheep; which, before the ſacrifice, were led in proceſſion thrice around the fields; whence the feaſt is ſuppoſed to have taken its name: from the Greek αμφι, *about*: or the Latin *ambio*, *I go round*; and *arvum*, *field*.—Though others write it *ambarbalia*, and *ambarbia*, and deduce it from *ambire urbem*, *to go round the city*.

From the beaſts offered in ſacrifice, the ceremony was alſo called SUOVETAURILIA.

Some will have the *ambarvalia* to have been held twice a year: the firſt time towards the end of January, or, as others think, in April; and the ſecond time in July, or as Roſinus imagines, in Auguſt; at the time when the harveſt was ripe, *maturis frugibus*. Which opinion is the more probable, in that Ovid, who, in his Faſti, deſcribes the feaſts of the firſt ſix months of the year, from January to June incluſive, ſays nothing of the *ambarvalia*.

The ſacrifice offered on this occaſion was hence called *ambarvale ſacrum*, and *hoſtia ambarvalis*.

The *ambarvalia* were of two kinds, *public* and *private*.

The *private* were thoſe ſolemnized by the maſters of families, accompanied with their children and ſervants, in the villages and farms out of Rome.—They walked three times round the grounds, every one being crowned with leaves of oak, and ſinging hymns in honour of Ceres. After the proceſſion, they went to ſacrifice.

The,

The *ambervale carmen* was a prayer preferred on this occaſion; whereof we have the *formula* preſerved in Cato. "De re ruſtica." c. 142.

The *public* ambervalia were thoſe celebrated in the boundaries of the city; and in which the twelve *fratres arvales* officiated pontifically, walking at the head of a proceſſion of the citizens, who had lands and vineyards at Rome.

The prayer, or *formula*, here uſed, as it is given by Feſtus, in voc. "peſtilas," was *avertas morbum, mortem, tabem, nebulam, impetiginem, peſtilatum.* Virgil has deſcribed the ambervalia in the firſt book of his Georgics, v. 343, &c.

Some make a quinquennial as well as an annual ambervalia, the one performed once every *luſtrum*, the other once a year.

The prieſts who chiefly officiated at this ſolemnity, were called *fratres* ARVALES.

AMBERVALIS *flos*, in *Botany*, a name given, by ſome authors, to the *polygala*, or milkwort.

AMBASSADOR. See EMBASSADOR.

AMBAZAC, in *Geography*, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diſtrict of Limoges, 10 miles north-eaſt of Limoges. The place contains 2783, and the canton 7342, inhabitants; the territory includes 202½ kiliometres, and 7 communes.

AMBE, in *Anatomy*, a ſuperficial jetting out of a bone.

AMBE, or AMBI, in *Surgery*, an inſtrument employed for the reduction of a diſlocated ſhoulder, eſpecially when the head of the os brachii reſts in the axilla. Various improvements have been made in the conſtruction of the ambi ſince Hippocrates's time; but its uſe is rarely wanted, as a dexterous ſurgeon can generally replace the ſhoulder bone by more ſimple means. See DISLOCATIONS.

AMBEEZES, AMBOISES, or AMBOZES, in *Geography*, an iſland of Africa, in the Atlantic Ocean, near the coaſt of Benin. N. lat. 4° 15′. E. long. 10° 50′.

AMBEL, in *Botany*. See NYMPHÆA.

AMBELANIA. See WILLUGHBEIA.

AMBER, Ηλεκτρον, Gr.—*Electrum*, *ſuccinum*, Lat.—*Succin*, *carabé*, *ambre jaune*, Fr.—*Bernſtein*, *agtſtein*, *glas Firnſtein*, *waſch-amber*, Ger.—*Gleſſum*, ancient German, according to Pliny.—*Bärnſten*, *raf*, *glys*, Sweed.—*Bernſteen*, Dan.—*Succino*, *ambra gialla*, Ital.—*Enyokö*, Hung.—*Juntar*, Ruſſ.—*Sacal*, Egypt.—*Bitumen ſuccinum*, Werner.

The colour of amber is generally ſome ſhade of yellow, as wine yellow, wax yellow, honey yellow, hyacinth red, yellowiſh white; it is alſo found occaſionally green or brown. It occurs amorphous, and in detached pieces. Is ſhining, or little ſhining, with a waxen luſtre. Its fracture is conchoidal, and when broken it flies into indeterminate not particularly ſharp fragments. It is commonly tranſparent, more rarely ſemitranſparent or tranſlucid. Is brittle, and its ſp. grav. varies from 1.065 to 1.1.

By rubbing, it readily becomes electric. When applied to a lighted candle it takes fire, ſwells conſiderably, but does not run into drops, and exhales a white ſmoke of a pungent penetrating odour.

It is ſometimes confounded with COPAL and HONEY-STONE, but may be diſtinguiſhed from each without much difficulty. Copal is ſofter than amber, and when inflamed melts into drops. Honey-ſtone is much weaker in its electrical properties, and when laid on a hot coal becomes white.

The only proper mines of this ſubſtance that are as yet known, are in ducal Pruſſia, near the ſea coaſt. They are worked in the uſual way by ſhafts and galleries to the depth of about a hundred feet. The amber is imbedded in a ſtratum of foſſil or carbonated wood, and occurs in nodules from a few grains in weight, to three or even five pounds: ſpecimens alſo are occaſionally met with conſiſting of the wood penetrated by veins of amber. The upper and under ſtrata are ſand and ſandſtone. Amber is alſo found along the whole ſhore of the German ſea, and on the ſouth coaſt of the Baltic. The projecting eaſtern ſhore of England too, and the coaſt at the entrance of the channel from the north affords many ſpecimens. Rounded nodules have been occaſionally met with in the beds of gravel near London. It is not, however, excluſively, though principally a northern product: the coaſt of the Adriatic ſea and the Sicilian ſhores furniſh a ſmall quantity, and occaſionally pieces have been dug up near Siſteron in Provence.

The property of amber, when rubbed, to attract hair, ſtraws, and other light ſubſtances, was firſt obſerved by Thales one of the Greek philoſophers, who on this account attributed a certain kind of life to it; and from the Greek name of amber, electron, is derived the modern term electricity, being the ſcience of an important claſs of facts, the firſt known of which was the attracting power of amber. On this account, and alſo from the real beauty of the ſubſtance, it was held in high eſtimation among the Romans, who made it into bracelets, necklaces, and other articles of female ornament. Thoſe pieces that contained inſects, &c. then as at preſent were the moſt valued, and we meet with many alluſions in the Roman poets to this circumſtance: thus Martial ſays,

"Cum Phætonteâ formica vagatur in umbrâ,
Implicuit tenuem ſuccina gutta feram."

They alſo held the idle opinion, which till lately was generally received among us, that a collar of amber tied round an infant's neck, would enable it to cut its teeth with ſafety.

When amber was more in requeſt than it is now, as an ornament, and an article of Materia Medica, great attention was paid to it by the Pruſſian miners, and many experiments were made by the artiſts to remove its defects, and improve its beauty. The coarſer and ſmalleſt pieces were called ſtandſtein or ſchlug, thoſe that were a little larger and cleaner had the name of firniſs or varniſh amber, and the larger and better pieces were called, from the particular works to which they were applicable. Of the tranſparent ambers the moſt valuable was the bright golden yellow, of the opaque varieties the moſt eſteemed were the flaky, or ſcaly. Methods were diſcovered, eſpecially by Gottlieb Samuelſon of Breſlau, of making opaque amber tranſparent, and of tinging it red, blue, violet, green, and white. Moſt of theſe ſecrets have periſhed with the inventors, but the two following were the uſual methods of rendering amber tranſparent. Firſt, by ſurrounding it with ſand in an iron pot, and cementing it with a gentle heat for forty hours, ſome ſmall pieces being occaſionally taken out to judge of the progreſs of the operation. Secondly, which was the moſt uſual method, by digeſting and boiling the amber about twenty hours with rapeſeed oil, when it became harder and clearer; linſeed oil has not the deſired effect. Amber, however, thus clarified, is always harder and leſs electric than in its natural ſtate. The value of amber depending on its ſize, numerous attempts, but conſtantly without ſucceſs, were made to ſolder together or melt down ſeveral ſmall pieces, ſo as to convert them into one large piece.

The origin of amber has exerciſed the imagination of poets and chemiſts from the days of ancient Greece to the preſent, nor is it worth while to enter into an examination of any of theſe opinions, except thoſe which are held by modern inquirers. Amber is by ſome conſidered as a proper mineral bitumen analogous to petroleum, perhaps originating

A M B

nating from this, and ſlightly altered by the action of the air or an acid. By others it is reckoned as a vegetable reſin, which, by being buried in the earth in contact with carbonaceous and pyritical matters, has become hard, and experienced other modifications of its original properties. That whenever it is found in real mines, it is always accompanied with ſtrata of foſſil wood and peat, is a ſtrong preſumption of its vegetable origin; and the ants and other inſects which it is ſo frequently found to contain, ſhew that amber muſt formerly have been fluid, and when in that ſtate have been in places acceſſible to theſe animals, and therefore upon, or at leaſt very near the ſurface of the earth. It might alſo be mentioned upon the authority of Girtanner, if the uncorroborated authority of this chemiſt was of any value, that pieces of turpentine have been found in the large ants' neſts, that abound in pine foreſts, penetrated by the acid of ants, and thus partly converted into amber, but ſtill of a ductile conſiſtence like wax.

The chemical properties of amber have been as yet but little examined. Few menſtrua will diſſolve without in ſome degree altering it. According to Hoffman, one part of powdered amber, and two of oil of almonds, are capable of combining with each other into a clear gelatinous maſs, by being moderately heated for about an hour in a Papin's digeſter. It is alſo, according to the ſame author, totally ſoluble in cauſtic potaſh. Alcohol extracts the colouring part with ſome reſin, but is not a complete ſolvent. It is ſaid alſo, that ſulphuric acid is a menſtruum for amber, but probably not without conſiderably changing its properties. When expoſed to dry diſtillation in a glaſs retort, it melts and ſwells greatly, and gives out firſt a watery acid liquor ſmelling ſtrongly of amber, then a concrete acid ſalt which cryſtallizes in yellowiſh needles in the neck of the retort, and is the SUCCINIC *acid;* after which there paſſes a light coloured odorant oil, which, as the diſtillation goes on, becomes of a darker colour and thicker conſiſtence, a ſmall quantity of the acid alſo riſes at the ſame time. When all the volatile parts are thus ſeparated, there remains in the retort a ſpungy intenſely black ſhining coal, the baſis of the fine black VARNISH. The oil is afterwards rectified by diſtillation with water, when only the light fragrant colourleſs part comes over. The relative proportions of oil and acid vary according to the purity of the amber uſed and the care of the operator. From ſixteen ounces of the common dark brown amber of the ſhops Neumann obtained eleven ounces, ſix drams of oil, four drams and a half of acid, an ounce and a half of acidulous water, and about an ounce of carbonaceous reſidue. From thirty-two ounces of the ſmall granular kind, or ſandſtein, he obtained nine drams of acid, and twenty-four ounces of oil.

The uſe of amber as a fumigatory is nearly laid aſide, as is alſo the medical employment of its acid. The oil is uſed as an antiſpaſmodic, both externally and internally, and when combined with ammonia forms EAU DE LUCE.

By the change of faſhion, amber is little uſed as an ornament in Europe. Trinkets of this ſubſtance are, however, ſtill valued in Turkey, and the Eaſt. The fineſt ſpecimens are in the cabinet of the king of Pruſſia: as to the column ten feet high in the Florentine muſeum, an account of which authors have copied from each other for a century paſt, it is probably artificial.

Fourcroy Syſt. des Connaiſſ. Chim. vol. viii. Bomare, Dict. d'Hiſt, Nat. vol. i. 250. Neumann's Chemiſtry, vol. i. p. 362. Macquer's Chemiſches Worterbuch, vol. i. p. 463. Hauy, Traite de Mineralog. vol. iii. 327. Weidenmann, handbuch der Mineralog. p. 637. Lenz, Verſuch, &c. p. 511.

AMBER, *black, gagates.* See JET.

AMBER, *liquid,* and *balſam of.* See BALSAM.

AMBER, in *Geography,* a river of Germany, in Bavaria, which riſes two leagues from Faxſen, and joins the Iſer, near Landſhut.

AMBER *Bay,* is ſituated on the peninſula of Yucaten, in the bay of Honduras, and lies north of ASCENSION *Bay.*

AMBER-SEED, or *muſk ſeed,* is a ſeed that is ſomewhat like the millet, of a bitteriſh taſte, and brought dry to us from Martinico and Egypt. The Egyptians uſe it internally, as a cordial, to fortify the heart, ſtomach, and head, and provoke luſt.—It gives a grateful ſcent to the breath, after eating; but it is not proper for thoſe who are inclinable to vapours.

AMBER-TREE, in *Botany.* See ANTHOSPERMUM.

AMBERBOI. See CENTAUREA.

AMBERG, in *Geography,* a city of Germany, in the circle of Bavaria, and Upper Palatinate, 32 miles north of Ratiſbon, and 32 eaſt of Nuremberg. It is the capital of the duchy and reſidence of the elector's governor; it is ſeated on the river Vils, which runs through it, is well fortified, and is the largeſt place in the Upper Palatinate. It has an electoral palace, a cathedral, and a college of Jeſuits. It is ſaid to have been raiſed from a village to a town in 1297; and was taken by the Imperialiſts in 1703. On a mountain near it ſtands the pilgrimage-church, called *Mary's-help,* and in its vicinity is an iron-mine, which furniſhes it with a conſiderable trade. N. lat. 49° 25'. E. long. 11° 55'.

AMBERG, a mountain of Sweden, in Eaſt-Gothland, about two Swediſh miles from Wadſtena. Its height is ſo conſiderable, that from the ſummit of it a perſon may ſee 50 churches. Upon this mountain is a flat ſtone, under which one of the ancient kings is ſaid to be interred. Antimony is found in this mountain near the Wetter-lake.

AMBERGER, CHRISTOPHER, in *Biography,* an eminent painter of portrait and hiſtory, was born at Nuremberg, and reſided at Augſburg, where he died in 1550. He was a diſciple of Hans Holbein, whom he imitated ſo exactly, that his pictures were ſometimes taken for thoſe of his maſter. He principally excelled in portraits, and acquired great reputation by his hiſtory of Joſeph, in 12 pictures, and by the portrait of Charles V., for which the emperor paid him three times as much as he expected, beſides a preſent of a rich chain of gold and a medal. Amberger was alſo an engraver, though his works are not ſpecified. Pilkington and Strutt.

AMBERGREESE KEY, in *Geography,* an iſland in Hanover Bay, on the eaſt ſide of the peninſula of Yucaten, in the bay of Honduras. It runs along the mouth of the bay, and is ſeventy miles in length, but very narrow.

AMBERGRIS, from *amber* and *gris,* AMBERGREASE, AMBRAGRISEA, *ſuccinum griſeum,* in *Natural Hiſtory,* a light, inflammable, greyiſh, variegated ſubſtance, fuſible and fragrant with a gentle heat, and uſed as a perfume and a cordial. Its colour is grey, brown, or yellowiſh brown, ſpotted with black; its hardneſs and conſiſtence are thoſe of wax; its ſpecific gravity from .780 to .926, ſo that it ſwims both in water and rectified ſpirit; its fracture is earthy and rugged, and exhibits bones of fiſh or beaks of birds; it has ſcarcely any particular taſte, and unleſs heated, or much handled, very little ſmell; but in ſuch circumſtances its odour is very fragrant, reſembling that of burning amber, and to moſt perſons agreeable. It ſoftens between the fingers, melts in a ſmall degree of heat like wax; in a ſtronger inflames, and if pure, leaves no reſiduum; cold water has no effect upon it, but to boiling water it communicates its ſmell, and being partially melted, falls to pieces. It is ſcarcely affected by ſpirit of wine, which diſſolves it ſparingly with the aſſiſtance

aſſiſtance of a boiling heat, or fat oils: but by the eſſential, as that of turpentine, it is diſſolved almoſt entirely, and by ether moſt perfectly. It has been found ſoluble in cauſtic fixed alkalis, ſtill more ſo in oil of vitriol, and precipitable by water. Diſtilled it yields an aqueous phlegm, a brown-coloured acidulous ſpirit, a deeper coloured oil, at length, a thick balſam, and as ſome ſay, a volatile ſalt, leaving a black ſhining reſiduum. The ſpirit, oil, balſam, and ſalt, are ſimilar to thoſe obtained from amber; but the oil is of a more grateful ſmell. Its chemical products reſemble thoſe of bitumens, among which ſome have ranked it.

It is found on the ſea-coaſts, floating on the ſurface of the ſea, adhering to rocks, or thrown out upon the ſhores, in ſeveral countries; as along the ſouthern and eaſtern parts of Africa, Madagaſcar, the Maldives, ſome parts of the Mediterranean, and in the Weſt Indies, about the iſlands of Bermudas and Jamaica, and the Bahama iſlands, alſo on the coaſts of Carolina, and the weſtern coaſts of Ireland. It is likewiſe ſaid to be found on the coaſts of Norfolk, and in the iſlands of Orkney. It has alſo been found in the ſtomachs of whales, of various ſizes and ſhapes. We have ſeveral inſtances in authors of large pieces of this matter: one of the largeſt that has been known in Europe was bought by the Dutch Eaſt India Company, of the king of Tidore, for 11000 dollars, in 1693, and ſent to Amſterdam in 1694, and kept in their houſe for ſome years. It was almoſt round; meaſured two feet in diameter, and weighed a hundred and eighty-two pounds. The great duke of Tuſcany offered fifty thouſand crowns for it. We are told, however, that one was taken up, near the Cape of Good Hope, which weighed three hundred pounds; and another, if we may credit the relation, fifteen thouſand pounds. Phil. Tranſ. N° 263. N° 232.

There has been a great variety of opinions among naturaliſts with regard to the origin and production of this ſubſtance: to rehearſe them all, would make a volume. Klobius recites eighteen, to which we could add half as many more. The principal may be reduced to theſe which follow.

1. Some take it for the excrement of a bird, called in the Madagaſcar language *aſchibobuch*, and by the Maldives *Anacangriſpaſqui*; which being melted by the heat of the ſun, and waſhed off the ſhore by the waves, they ſay, is ſwallowed up by whales, who return it back in the condition we find it.

2. Others, and particularly many of the orientals, imagine it ſprings out of the bottom of the ſea, as *naphtha* does out of ſome fountains.—They add that the only ſprings of it are in the ſea of Ormus, between the Arabian and Perſian Gulfs. Edriſſi, who is of this opinion, in the firſt climate of his Geography, mentions pieces of ambergris on thoſe coaſts, weighing a full quintal. Paludanus and Linſchotten alſo ſpeak of it as a ſort of bitumen, gradually working up from the bottom of the ſea and hardening in the ſun.

3. Others take it for a ſea-muſhroom, torn up from the bottom by the violence of tempeſts; it being obſerved, that ambergris is never found but during the ſouth-weſt monſoons, after ſtorms.

4. Others aſſert, that it is a vegetable production, iſſuing out of the root of a tree, whoſe roots always ſhoot toward the ſea, and diſcharge themſelves into the ſame. This account we have in the Philoſophical Tranſactions, from one of the Dutch factors at Batavia; and the ſame is confirmed by Mr. Boyle. Others take it for a kind of wax or gum, which diſtils from trees, and drops into the ſea, when it congeals, and becomes ambergris. Mr. Magellan mentions an undoubtedly vegetable ambergris, gathered from the tree by M. Aublet, and examined by Rouelle. Cronſtett's Mineralogy, p. 458.

5. Others ſuppoſe it a ſpongious kind of earth, which the working of the ſea waſhes off the rocks, where, being lighter than water, it floats.

6. Others maintain, that ambergris is made from the honey-combs which fall into the ſea from the rocks, where the bees have formed their neſts. This opinion ſeems to have ſomething of experience on its ſide; ſeveral perſons having ſeen pieces that were half ambergris, and half plain honey-comb; and others, again, having found large pieces of ambergris, in the middle of which, when broken, they diſcovered both honey-comb and honey. But the error of this hypotheſis may be detected by chemical experiments; as honey likewiſe admits of a ſolution in aqueous *menſtrua*, but reſiſts the moſt highly rectified ſpirit of wine.

7. Others are of opinion, that it is a bituminous matter; that it is at firſt liquid, and runs into the ſea: and that it is there condenſed, and reduced into a maſs. To this purpoſe Mr. Neumann, chemiſt to the king of Pruſſia, after an ample recital of all the different opinions advanced by others, gives us his own; which is, that ambergris is a bitumen, iſſuing out of the earth into the ſea; at firſt of a viſcous conſiſtence, but hardening, by its mixture with ſome liquid *naphtha*, into the form wherein we find it. Phil. Tranſ. N° 433, N° 434. N° 435. Mr. Cartheuſer is of the ſame opinion.

This opinion has been conſidered as the beſt founded, and ſtrengthened by this circumſtance, that ambergris is found in the greateſt quantities in the ſea, about the iſland of Madagaſcar, where the ſubterranean parts are ſuppoſed to be impregnated with bituminous matter.

The pieces are frequently ſeen compoſed of divers ſtrata, laid one over another, with ſtones and other bodies incloſed therein, and the ſtrata are ſometimes full of little ſhells, which ſeem a ſpecies of *concha anatifera*; whence it may be conjectured, that the ambergris has originally been in a fluid ſtate, or, at leaſt, that it has been diſſolved and in that ſtate has formed itſelf afreſh, and inveloped ſuch bodies as happened to be in its way.

Neumann gives the chemical characters of this bitumen, and its analyſis, by diſtillation. He diſtinguiſhes the ſophiſtications of ambergris, and obſerves, that it is totally ſoluble in oils and vinous ſpirits, and that it yields the ſame product, as AMBER. See the particulars and the proofs of this in Neumann's Works, p. 239. & ſeq.

8. Dr. Boylſton, and Mr. Dudley, in the Philoſophical Tranſactions, aſſert, that the ambergris is a true, animal concrete, formed in balls, in the body of the male ſpermaceti whale, and lodged in a large oval bag, over the teſticles, at the root of the penis. Phil. Tranſ. N° 385. and 387. vol. xxiii.

It is certain the whale-catchers have divers times found ambergris in their ſpermaceti whales, and that chiefly in the large and older ſort; and it is from the information of Mr. Atkins, and other whale catchers, that Mr. Dudley chiefly drew his account. But it is added, that it is not one ſpermaceti whale in an hundred that is found to have ambergris, and that it is found only in the male. To this account it has been objected, that ambergris is frequently found in females as well as in males; and that the beaks of the ſepia, which are ſo conſtantly found in ambergris taken out of the whale, could not have been abſorbed from the inteſtines by the lacteals or lymphatics, and collected with the ambergris in the above mentioned bag.

9. Others have approached nearer to the truth, who repreſent ambergris as the excrement of a cetaceous fiſh; becauſe it has been ſometimes found in the inteſtines, and

ſometimes in the fæces themſelves of ſuch animals. Notwithſtanding this ſuggeſtion, it was long thought, that ambergris, after having been ſwallowed, and in ſome mode or other changed in the ſtomach and bowels of the whales, from which it was obtained, was afterwards found among its excrements. But the real animal origin of ambergris has been ſatisfactorily aſcertained by Dr. Swediar, in the Philoſophical Tranſactions, vol. lxxiii. art. 15.

In the accounts given of ambergris by various writers we have been told, that claws and beaks of birds, feathers of birds, parts of vegetables, ſhells, fiſh, and bones of fiſh, have been found blended with it. But Dr. Swediar, after examining many fragments of this ſubſtance, found no ſuch materials mixed with it; and though he allows that ſuch may occaſionally occur, yet the black ſpots which he diſcovered in the various pieces, found in the ſea or in the whale, that were examined by him, appeared upon accurate ſcrutiny, to be the beaks of the *ſepia octopodia*; and he apprehends, that theſe beaks were miſtaken for claws or beaks of birds, or for ſhells. From the exiſtence of theſe beaks in ambergris he infers, that this ſubſtance in its origin muſt have been of a very ſoft or liquid nature. In order to inveſtigate the true nature of this ſubſtance, he premiſes, that ambergris has been found upon the ſea and ſea-coaſt, and alſo in the bowels of whales; but he obſerves, that it has never been determined, whether the ambergris found in theſe different ſituations be of the ſame kind, and poſſeſſed of the ſame or ſimilar properties. He alſo ſuggeſts as a ſubject of previous inquiry, whether ambergris is found in all ſorts of whales, or only in a particular ſpecies; whether it is conſtantly to be met with in thoſe animals; and if this be the caſe, in what part of their body it is to be found. In diſcuſſing theſe ſubjects of examination, Dr. Swediar conſulted the moſt intelligent perſons concerned in the ſpermaceti whale fiſhery, or in procuring and ſelling ambergris; and from their information it appeared, that this ſubſtance is ſometimes found in the belly of the whale, but only in that ſpecies which is called the ſpermaceti whale, and which ſeems from its deſcription and delineation to be the *phyſeter macrocephalus* of Linnæus. The New England fiſhermen, having been long apprized that ambergris is to be found in the ſpermaceti whale, conclude, that whales of this ſpecies frequent thoſe ſeas where ambergris is found. They naturally expect to find ambergris in the ſpermaceti whales which they catch; but they are generally diſappointed. Whenever they took a ſpermaceti whale, they obſerved, that it conſtantly not only vomits whatever it has on its ſtomach, but alſo generally diſcharges its fæces at the ſame time; and if this circumſtance occurs, they ſeldom find ambergris in its belly. But whenever they diſcover a ſpermaceti whale, male or female, which ſeems torpid and ſickly, they commonly find ambergris, as the whale in this ſtate ſeldom voids its fæces upon being hooked. They likewiſe generally find it in the dead ſpermaceti whales, which they find floating upon the ſea. Beſides, thoſe whales which yield ambergris have a morbid protuberance, or a kind of gathering, in the lower part of the belly, in which, when it is opened, they find ambergris. The whales, that yield this ſubſtance, are not only torpid and ſick, but always leaner than others; and hence it is inferred, that a larger collection of ambergris in the belly of the whale is a ſource of diſeaſe, and probably ſometimes the cauſe of its death. As ſoon as a whale, that is torpid, ſick, or emaciated, or one that does not dung on being hooked, is caught, they immediately cut the protuberance already mentioned, if there be any, or rip open its bowels from the orifice of the anus, and find the ambergris, ſometimes in one lump, ſometimes in different lumps, generally from three to 12 and more inches in diameter, and from one to 20 or 30 lbs. in weight, at the diſtance of two, but moſt frequently of about ſix or ſeven feet from the anus, and never higher up in the inteſtinal canal; which, according to their deſcription, is probably the inteſtinum cœcum, hitherto miſtaken for a peculiar bag formed by nature for the ſecretion and collection of this ſingular ſubſtance. That this is the inteſtinal canal is certain, becauſe they conſtantly begin their inciſion at the anus, and find the cavity every where filled with the fæces of the whale, which, from their colour and ſmell, it is impoſſible for them to miſtake. The ambergris found in the inteſtinal canal is not ſo hard as that which is found on the ſea or ſea-coaſt, but ſoon hardens in the air. When firſt taken out, it has nearly the ſame colour, and the ſame unpleaſant ſmell, though not ſo ſtrong, as that of the mere liquid dung of the whale; but, on expoſing it to the air, it gradually not only becomes greyiſh, and its ſurface covered with a greyiſh duſt like old chocolate, but it alſo loſes its diſagreeable ſmell, and when kept for any long time, acquires the peculiar odour which is ſo agreeable to moſt people. In conſidering whether there be any material difference between ambergris found on the ſea or ſea-coaſt, and that found in the bowels or among the dung of the whale, Dr. Swediar refutes the opinion, that ambergris found in whales is of an inferior quality, and therefore of much leſs value in price. Ambergris, he obſerves, is valued on account of its purity, lightneſs, compactneſs, colour and ſmell. On the different coaſts pieces of ambergris are found of a very inferior quality; and thoſe found in whales are of a ſuperior quality; and different pieces in the ſame whale, are, according to the above ſpecified teſt, of greater or leſs value. When ambergris is firſt taken out of the inteſtines of the whale, it has nearly the ſame ſmell with that of the liquid excrements, and alſo the ſame blackiſh colour; and it is found of different degrees of compactneſs, but never ſo liquid as the natural fæces of that animal. After being taken out and kept in the air, all ambergris becomes harder and whiter, and gradually loſes its ſmell, and aſſumes ſuch an agreeable one, as that in general has which is found ſwimming on the ſea, and therefore the goodneſs of ambergris ſeems rather to depend on its age. By being accumulated after a certain length of time in the inteſtinal canal, it ſeems even then to become of a white colour, and leſs heavy, and to acquire its agreeable ſmell. The only reaſon why ambergris floating on the ſea generally poſſeſſes the above mentioned qualities in a ſuperior degree is, becauſe it is commonly older, and has been longer expoſed to the air.

It is more frequently found in males than in females; thoſe pieces that are found in females are generally ſmaller, and thoſe in males ſeem conſtantly to be larger and of a better quality; and therefore the high price in proportion to the ſize is not merely imaginary on account of its rarity, but in ſome reſpect well-founded, becauſe ſuch large pieces appear to be of greater age, and poſſeſs the above-mentioned qualities in a higher degree of perfection than ſmaller pieces.

It is known, continues our author, that the ſepia octopodia, a little fiſh, is the conſtant and natural food of the ſpermaceti whale, or phyſeter macrocephalus. Of this the fiſhermen are ſo well convinced, that whenever they diſcover any recent relics of it ſwimming on the ſea, they conclude that a whale of this kind is or has been in that part. Beſides, the ſpermaceti whale, on being hooked, generally vomits up ſome remains of the ſepia. Hence it is eaſy to account for the many beaks, or pieces of beak, of the ſepia that

that are found in ambergris. The beak of the ſepia is a black horny ſubſtance, and therefore paſſes undigeſted through the ſtomach into the inteſtinal canal, where it is mixed with the fæces; after which it is either evacuated with them, or, if theſe latter be preternaturally retained, form concretions with them, which render the animal ſick and torpid, and produce an obſtipation, that terminates either in an abſceſs of the abdomen, or becomes fatal to the animal; whence, in both caſes, on the burſting of its belly, that hardened ſubſtance, called ambergris, is found ſwimming on the ſea, or thrown upon the coaſt.

From the circumſtances above recited, and from having obſerved the above-mentioned pieces of ſepia in all fragments of ambergris of any ſize, Dr. Swediar concludes with great probability, that all ambergris is generated in the bowels of the phyſeter macrocephalus, or ſpermaceti whale, and then mixed with the beaks of the ſepia octopodia, which is the principal food of that whale. He therefore defines ambergris to be the preternaturally hardened dung or fæces of the phyſeter macrocephalus, mixed with ſome indigeſtible relics of its food.

Many of the preceding obſervations, with regard to the production of ambergris, have been confirmed by the examination of Alexander Champion, Eſq. a principal merchant concerned in the Southern whale fiſhery, and of the captain of a ſhip, employed by him, in the ſaid fiſhery. This ſhip brought home about 360 ounces of ambergris, which the captain took out of the body of a female ſpermaceti whale, on the coaſt of Guinea. This was obſerved to proceed from the fundament of this fiſh, and whilſt they were cutting the blubber, a piece of it was ſeen to ſwim on the ſurface of the ſea. Some of this ſubſtance was obſerved in the ſame paſſage, and the reſt was contained in a ſmall bag, a little between the paſſage, and communicating with it. The whale ſeemed ſickly, was lean and very old. The ſpermaceti whale, it was obſerved, feeds almoſt wholly on a fiſh called ſquids; and when the whale is dying, ſhe throws up a quantity of ſquid, ſometimes whole, and ſometimes in pieces. The bills of the ſquid were found, ſome in the inſide, and ſome on the outſide of the ambergris, ſticking to it. The ſpermaceti whale, when ſtruck, voids her excrement; and if ſhe does not, it is conjectured that ſhe has ambergris in her. It was concluded by the intelligent captain, who communicated this information to the council of trade and foreign plantations, that ambergris is moſt likely to be found in a ſickly fiſh; and that it is the cauſe or the effect of ſome diſorder. The whole quantity of ambergris found in the whale, of which the above account was given, was 362 ounces troy, and it was ſold for 19s. 9d. per ounce; half of it having been bought for exportation to Turkey, Germany, and France, and the other half having been purchaſed by the druggiſts in town. Phil. Tranſ. for 1791. vol. lxxxi. art. 2.

Ambergris is of conſiderable uſe among perfumers, who melt it over a gentle fire, and make extracts, eſſences, and tinctures of it. It is one of the moſt agreeable perfumes. the leaſt apt to diſorder weak conſtitutions, or ſuch as are liable to be offended by ſubſtances of that claſs. It would be of more uſe in phyſic too, were not its ſmell apt to occaſion vapours.

There is a preparation, however, recommended by Hoffman, which is ſaid not to be attended with theſe ill conſequences. The preparation is made in the following manner: Let the ſpirit of roſes, perfectly dephlegmated, be, not only once, but twice, at leaſt, drawn off from the ſalt of tartar, which is burnt, or calcined, in a vehement fire. By this means there is produced a ſpirit, which, by its penetrating quality, enters into the inmoſt ſubſtance of the ambergris, and ſo ſeparates and reſolves its oleous contexture. This, we are aſſured, will not excite commotions and agitations in a weak body, as does the common preparation of ambergris, which is made with a mixture of muſk or civet. Hoffman. Obſerv. Phyſ. Chem. lib. i. c. 18.

Ambergris enters into the compoſition of many cordial, ſudorific, and alexiterial waters. But its chief virtue conſiſts in its antiſpaſmodic and ſedative qualities, ſimilar to thoſe of muſk and caſtor, and its power of relieving certain hyſterical, convulſive, and other nervous affections. It may be taken inwardly from half a grain to ten or twelve grains, or more; for as to doſes, there can be no fixed rules about remedies and diſeaſes of theſe kinds. Dr. Lewis ſays, that taken internally, from two or three grains to a ſcruple, it is accounted a high cordial, corroborant and antiſpaſmodic; and with this view it is preſcribed by Riverius, in hypochondriacal affections. Dr. Swediar obſerves, that we cannot expect any medicinal effects from this ſubſtance in doſes of two or three grains, but that it ſhould be adminiſtered in the quantity of as many ſcruples for a doſe; though even then it could not be expected to produce any great effect, as he himſelf took 30 grains of pure unadulterated ambergris in powder at once, without any ſenſible effect. A ſailor once took half an ounce, and found it a good purgative. The faculty of Paris directs a tincture to be drawn by digeſting two ſcruples of ambergris in two ounces of a highly rectified ſpirit, impregnated with roſes. They have alſo a compound tincture made from the ſame quantity of ambergris, with half as much muſk, ten grains of civet, ſix drops of oil of cinnamon, and four drops of oil of rhodium, digeſted together in four and one-half ounces of a ſpirit impregnated with roſes, and orange flowers. This compound tincture is a very high perfume; and a few drops of it will give a fine ſcent to a large proportion of inodorous matter. In preparing theſe tinctures, the ſpirit ſhould be made to boil or ſimmer with it firſt, that this ingredient may be completely diffuſed before the more ſoluble ones are added. The orientals are ſaid to look upon it as an aphrodiſiac, and ſuppoſe that the frequent uſe of it contributes to longevity. In Aſia and part of Africa, ambergris is uſed not only as a perfume and a medicine, but as an article of cookery; in which it is added to diſhes in lieu of allſpice. A great quantity of it is bought by the Mecca pilgrims, probably to uſe it for the purpoſe of fumigation and ſacrifice, as the Catholics uſe frankincenſe. With us it is uſed by the perfumers to ſcent pillars, candles, balls, bottles, gloves, and hair-powder; and it is mixed with pomatums for the face and hands, either alone or compounded with muſk, &c.

Ambergris is very commonly counterfeited and adulterated. The firſt generally conſiſts of muſk, civet, ſtorax, laudanum, and aloes wood, mixed together; the latter of a large quantity of bullock's blood, duly flavoured with muſk and civet. It is one of the moſt agreeable perfumes; but muſt be proportioned ſo ſparingly, as that while it improves the ſmell of what it is added to, its own may not be perceived.

It may be known to be genuine by its fragrant ſcent, when a hot needle or pin is thruſt into it, and its melting like fat, of an uniform conſiſtence. Whereas the counterfeit will not yield ſuch a ſmell nor prove of ſuch a fat texture. One thing, however, is very remarkable, that this drug, which is the moſt ſweet of all the perfumes, ſhould be capable of being reſembled in ſmell, by the preparation of one of the moſt odious of all fœtid ſubſtances. Mr. Homberg found that a veſſel in which he had made a long digeſtion of the human fæces, acquired a very ſtrong and perfect ſmell of ambergris, inſomuch that any one would have thought a great quantity

of eſſence of ambergris had been made in it. The perfume was ſo ſtrong and offenſive, that the veſſel was forced to be removed out of the laboratory. Mem. Acad. Roy. 1700.

AMBERIEUX, in *Geography*, a town of France, in the department of the Ain, and chief place of a canton, in the diſtrict of Belley, 8 leagues north-eaſt of Lyons. The place contains 2850, and the canton 7275 inhabitants. The territory comprehends 105 kiliometres, and 5 communes. N. lat. 45° 58′. E. long. 5° 15′.

AMBERING is uſed, by ſome writers, to denote the giving a ſcent or perfume of *amber* to any thing. This is otherwiſe called *enambering*. Dr. Hooke mentions an extraordinary method of *ambering in infinitum*, i. e. with a ſmall quantity of amber, and other requiſites, *enambering* a hundred or a thouſand pounds of ſugar, or the like, ſo as the firſt matter ſtill remains undecayed, to be uſed again. Hooke's Phil. Collect. N° 4.

AMBERT, in *Geography*, a town of France, in the department of Puy de Dome, and chief place of a diſtrict, ſituate on the rivere Dore, 10½ leagues ſouth-eaſt of Clermont. It has a manufacture of camblets and woollen ſtuffs, and alſo of excellent paper and playing-cards, &c. The place contains 5926, and the canton 16,376 inhabitants. The territory includes 265 kiliometres and 8 communes. N. lat. 45° 33′. E. long. 3° 39′.

AMBETTUWAY, in *Botany*, the local name of a tree, the leaves of which are ſaid, when boiled in wine, to create an appetite, and uſed by the people of Guinea, for that purpoſe.

AMBIA, in *Ancient Geography*, an epiſcopal city of Africa, in Mauritania.

AMBIANI, a people of Gaul, in Belgia Secunda, mentioned by Cæſar, Strabo, Pliny, and Ptolemy. They were ſituated between the Morini to the north, the Atrebatii and Veromandui to the eaſt, the Bellovaci to the ſouth, and the Caleli to the weſt, and had the ſea on the north-weſt. Their principal river was Samara, and their capital Samarobriva, which afterwards took the name of the people. Theſe people were diſtinguiſhed among the ancient Belgians. We learn from Cæſar that they furniſhed 5000 men for the ſiege of Aleſia, and their cavalry are much commended.

AMBIANUM, now *Amiens*, the capital of the Ambiani.

AMBIBARI, a people of Gaul, ſuppoſed to be the Armoricæ of Cæſar; and ſince his time the Abrincatui. M. D'Anville does not know where to place them.

AMBIDRANI, a people placed by Ptolemy in Norica.

AMBIDEXTER, compounded of *ambo*, *both*, and *dexter*, *right hand*; by analogy to the Greek, αμφιδεξιος, which ſignifies the ſame; one who uſes both hands alike, the left as well as right, or in caſes where only the uſe of one is neceſſary.

Women, according to the obſervation of Hippocrates, are never ambidextrous. But this is denied by ſome moderns, who give inſtances of the contrary; though it is owned, they are but few in compariſon of thoſe that are found in the other ſex. It may be imputed to education and habit, that men as well as brutes are not all ambidexters, there being no difference of right and left in the nature of things. Nurſes are even forced to be at ſome pains to enure the infants under their care to forego the uſe of their left hand. How far it may be our advantage to be deprived of half our natural dexterity, may be doubted. It is certain there are infinite occaſions in life, when it would be better to have the equal uſe of both hands. Surgeons and oculiſts are of neceſſity obliged to be ambidexters; bleeding, &c. in the left-arm or left-ankle, and operations on the left-eye, cannot be well performed but with the left-hand. Divers inſtances occur in hiſtory, where the uſe of the left-hand has been cultivated preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exerciſe both hands alike, without partiality either for the right or left; and Plato enjoins *ambidexterity* to be obſerved and encouraged in his republic. In the Grecian armies their more diſtinguiſhed ſoldiers, their pikemen and halberdeers, as thoſe who formed the firſt line of their battalions, were to be able to fight indifferently with the left hand or right. We find it mentioned in Scripture, that, on an extraordinary occaſion, the ſingle tribe of Gad produced 700 brave men, who fought with the left hand as well as the right; and the Roman hiſtorians aſſure us, that they had gladiators who were trained up to the ſame exerciſe. An ingenious French writer is ſurpriſed, that among all the modern refinements in the art of war, none have thought of reſtoring the ancient practice of forming ambidexters, which, it is certain, might be of conſiderable ſervice in the way of ſtratagem. In performing on keyed inſtruments, the harp, the dulcimer, and ſuch as have a ſeparate part for each hand, ambidexterity is neceſſary. On the piano forte, organ, harpſichord, or clarichord, *two right hands* are ſo neceſſary, that a child rigidly prohibited the uſe of the left hand in the common offices of life, can never have a powerful left hand in performing on the inſtruments juſt mentioned; but in rapid diviſions, fugues, and imitations, the clumſineſs with which difficult paſſages are performed with the left hand diſgraces the player and injures the compoſition. In the ſerious ſtudies and practice of the ſtudent on the piano forte intended for the profeſſion, it might be neceſſary for him perhaps to try to execute all kinds of feeble paſſages, ſhakes, beats, and trills with the left hand, till they can be played with ſo much eaſe and brilliancy, that a diſtant hearer, out of ſight of the inſtrument, ſhall not be certain which hand has been employed.

Ambidexter, in *Law*, denotes a perſon who takes money from both of the contending parties to aid them in their cauſe. In this ſenſe the word may be applied to a judge, juror, a ſolicitor, or the like. The penalty on a juror, in ſuch a caſe, is to forfeit decies tantum, ten times as much as he receives.

AMBIEGNA, in *Antiquity*, an appellation given to a victim, which was ſurrounded, or attended at the time of offering it, with other leſſer ones. In this ſenſe the word is alſo written *ambegui*. We read of *ambiegnæ oves*, uſed in ſacrificing to Juno; which were ſheep, having brought forth twins, and offered up with two lambs fattened on either ſide.

ABIENT, formed of *ambire*, *to encompaſs*, a term applied to ſuch things as encompaſs others round about; called alſo *circumambient* bodies. The whole body of air, becauſe it encompaſſes all things on the face of the earth, is often by phyſical writers called, by way of eminence, the *ambient*, or *ambient* air.

AMBIERLE, in *Geography*, a town of France, in the department of the Rhone and Loire, and chief place of a canton, in the diſtrict of Roanne, eight miles north-weſt of Roanne.

AMBIGENAL *hyperbola*, in *Conics*, a name given by Newton in his "Enumeratio Linearum tertii Ordinis," to one of the triple hyperbolas, E G F (*Plate* I. *Conics*, *fig.* 1.) of the ſecond order, having one of its infinite legs, as E G, falling within the angle A C D, formed by the aſymptotes A C, C D, and the other leg G F falling without that angle. See Hyperbola.

AMBIGU denotes a kind of mixed entertainment, where-

in

in both flesh and fruit are served together; so that it seems doubtful whether to denominate it a mere collation, or a meal.

AMBIGUA, in *Conchology*, a species of Bulla. Shell somewhat tapering, slightly compressed, pale flesh colour, with two remote bands, one broad and brown, the other blue. Gmelin. Country unknown. It is uncertain whether this shell belongs to the Linnæan genus, in which Gmelin places it.

Ambigua, in *Entomology*, a species of Cicada, that inhabits China. Its colour is olive. Wing cases clear, anterior margin testaceous. Donov. Inf. China.

Ambigua, a species of Phalæna, of the *noctua* family. Thorax smooth; wings deflexed, greyish, speckled with black; behind the middle a black streak. Inhabits Austria; and is produced from a larva with a brown head and body, variegated with ferruginous and brown. Lower wings whitish, with a black spot in the middle. Fabricius.

AMBIGUOUS, something dubious, obscure, or which may be taken in different senses. See Equivocal.

The word is formed of *ambo*, *both*, and *ago*, *I drive*; q. d. that which keeps the mind wavering, or in suspence, not knowing which side to choose. The answers of the ancient oracles were always ambiguous. An anonymous writer has published a dictionary of ambiguous words. Lexicon Philosophicum de *Ambiguitate* Vocabulorum. Francoff. 1597, 4to.

Ambiguity is occasioned either by a wrong choice of words and the use of equivocal terms, or by an improper arrangement of them. Ambiguities of the last kind are either where the arrangement leads to a wrong sense, or where the sense is left doubtful. Dr. Campbell expresses the former by the term equivocation, and appropriates that of ambiguity to the latter. See Elem. of Criticism, vol. ii. p. 20—54. and Campbell's Philosophy of Rhetoric, vol. ii. p. 28—38. See Perspicuity.

AMBIL, in *Geography*, one of the smaller Philippine islands, with a volcano, near the island of Luban.

AMBILATRI, in *Ancient Geography*, a people of Gaul, supposed by Martin to be the same with the *Ambiliates*, who are called by Orosius *Ambivarites*. Sampson places them in Brittany, towards Lamballe.

AMBILICI, a people of Norica, according to Ptolemy.

AMBISNA, a town of Spain, assigned by Ptolemy to the Murgobi.

AMBISONTII, or Ambissuntes, a people so called by Pliny, and placed by Ptolemy in Norica.

AMBIT *of a figure*, in *Geometry*, denotes the *perimeter*, or the line or sum of all the lines by which it is bounded.

Isaac Vossius has a particular inquiry concerning the ambit, or circumference of ancient Rome. That of the city he makes to be 60¾ miles, or *mille passus*, and that of the city and suburbs together 72 miles; exceeding ancient Babylon, whose ambit was only 60 miles.

Ambit, *ambitus*, called also *angiportus*, was particularly used, in *Antiquity*, to denote a space of ground to be left vacant betwixt one building and another. By the laws of the Twelve Tables, houses were not to be built contiguous, but an ambit or space of 2½ feet was to be left about each for fear of fire. This was usually a thorough-fare, but sometimes not. For when Rome was crowded with houses, these interstices were only left between some houses. Nero, after the dreadful fire which happened in his time, restored the ancient mode of building houses separate from one another. Tacit. Annal. xv. 43.

The *ambitus* of a tomb, or monument, denoted a certain number of feet, in length and breadth, around the same, within which the sanctity assigned to it was limited. The whole ground wherein a tomb was erected was not to be separated from the common uses: for this reason, it was frequent to inscribe the *ambit* on it, that it might be known how far its sanctity extended: thus, *in fronte pedes tot*, *in agrum pedes tot*.

AMBITIANUS *Vicus*, in *Ancient Geography*, the place in which Caligula was born, and in which, according to Pliny, there were altars erected in honour of that prince. Cluvier makes it the village of Capella, near Coblentz. M. d'Anville places it on the Rhine, between Confluentes on the north-west, and Baudobrica to the south.

AMBITION, in *Ethics*, is the passion which prompts men to value or to seek any kind of eminence or distinction, as well as to avoid degradation and reproach. It is a kind of compound of *admiration* and *desire*, and becomes either a virtue or a vice, honourable or disgraceful, useful or pernicious, according to its direction or degree. The opinions of others concerning us, when expressed by words or actions, are principal sources of happiness or misery. The pleasures of this kind are usually referred to the head of honour; the pains to that of shame; but as it is most convenient to have a single word, to which to refer both pleasure and pain of this class, Dr. Hartley selects ambition for this purpose. He classes the several particulars which persons, under the influence of ambition, wish to have known to others, or concealed from them, in order to obtain praise or dispraise, under four heads; *viz.* external advantages or disadvantages, of which the principal are fine clothes, riches, titles, and high birth, with their opposites, rags, poverty, obscurity, and low birth; bodily perfections and imperfections, of which the chief are beauty, strength, and health on the one hand, and on the other, deformity, imbecility unfitting a person for the offices of life, and disease; intellectual accomplishments or defects, such as sagacity, memory, invention, wit, learning, and their opposites, folly, dulness, and ignorance; and moral qualities, *i. e.* virtue or vice. This ingenious writer investigates, in conformity to his proposed theory, the associations by which the pleasures and pains of ambition are produced. Observations on Man, § 2. prop. 95. p. 262, &c. Ed. 1791.

The Romans erected a temple to Ambition; and this was the divinity to which they offered the greatest number, or at least a very considerable number of sacrifices. It was represented with wings on its back, and naked feet, to express the extent of its designs, and the promptitude with which they were executed. "A being of the nature of man," says an elegant historian, at the close of his account of the Byzantine princes, "endowed with the same faculties, but with a longer measure of existence, would cast down a smile of pity and contempt on the crimes and follies of human ambition, so eager, in a narrow span, to grasp at a precarious and short-lived enjoyment. In a composition of some days, in a perusal of some hours, 600 years have rolled away, and the duration of a life or reign is contracted to a fleeting moment; the grave is ever beside the throne; the success of a criminal is almost instantly followed by the loss of his prize; and our immortal reason survives the 60 phantoms of beings who have passed before our eyes, and faintly dwell on our remembrance. The observation, that in every age and climate ambition has prevailed with the same commanding energy, may abate the surprise of a philosopher; but while he condemns the vanity, he may search the motive of this universal desire to obtain and hold the sceptre of dominion." Gibbon's Hist. vol. ix. p. 10.

AMBITNI, in *Ancient Geography*, a people of Galatia.

AMBITUS, among the *Ancient Romans*, the act of soliciting, or making interest, for offices or honours.

The candidates, in this case, went about the city, and into all publick places and assemblies, to beg votes; which

was called *ambitus*: from *am*, in the ancient Latin, ſignifying *circum*, *about*, and *ire*, *to go*.

Among the Romans, it differed from *amlition*, as the former lies in the act, the latter in the mind. *Ambitus* was of two kinds, one lawful, and even laudable; the other infamous. The firſt, called alſo *ambitus popularis*, was when a perſon offered his ſervice to the public frankly, leaving it to every body to judge of his pretenſions as they found reaſonable. This kind was not prohibited by any law, but always approved and practiſed by the beſt and greateſt men.

The means and inſtruments here made uſe of were various: 1. *Amici*, or friends, under divers relations, including *cognati*, *affines*, *neceſſarii*, *familiares*, *vicini*, *tribules*, *clientes*, *municipes*, *ſodales*, *collegæ*. 2. *Nomenclatura*, or the calling and ſaluting every perſon by his name; to which purpoſe the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditiæ*, or obliging perſons by ſerving them, or their friends, patrons, or the like, with their vote and intereſt on any other occaſions. 4. *Prenſatio*, the ſhaking every perſon by the hand, offering him his ſervice, friendſhip, &c. 5. *Aſſiduitas*. 6. The *toga candida*, worn looſe. 7. *Benignitas*, the diſtributing largeſſes, *congiaria*, &c.

The ſecond kind was that wherein force, cajoling, money, or other extraordinary influence was made uſe of. This was held infamous, and ſeverely puniſhed, as a ſource of corruption and other miſchiefs. This kind of *ambitus* was at one time the great trade of Rome, and demanded a conſtant ſupply of great ſums of money. Tully aſſigns this as the cauſe of the high rate of intereſt, and tells us it had raiſed it from 4 to 8 per cent. Bribery was come to the pitch of 80729l. per tribe; and there being no leſs than 35 tribes, it is obvious how expenſive this corruption was grown. It is alſo well known where it ended. Several laws were made againſt it; as the *Lex Acilia*, or *Calpurnia*, A.U. 686, *Aufidia*, A.U. 692, *Bæbia*, A.U. 571, *Æmilia*, A.U. 675, *Cornelia*, A.U. 672, *Cæcilia Didia*, *Fabia*, *Julia Auguſti*, *Julia Cæſaris*, *Licinia*, A.U. 698, *Maria*, *Pætelia*, A.U. 397, *Pompeia*, A.U. 701, *Tullia Vetus*, A.U. 960.

In the year of Rome 321, the uſe of the *toga candida* was prohibited. In the year 397, the candidates were forbid to go to the markets and meetings in the neighbouring towns. In 571, ſevere penalties were laid on the givers of largeſſes. In 594, this was made puniſhable by baniſhment. In 692, by the lex Aufidia, it was enacted, that if a candidate preſented money to a tribe, and did not pay it, he ſhould be exempt, but if he did pay it, he ſhould be obliged to pay to every tribe a yearly fine of 3000 ſeſtertii as long as he lived. In 697, heavy fines were impoſed. By the *Lex Tullia*, made in the conſulſhip of Cicero, the candidates were forbidden to beſtow any combats of gladiators on the people, to make any publick feaſts, or to cauſe themſelves to be followed by a crowd of clients for two years before they offered themſelves for any place. A ſenator, who was guilty of a breach of this law, was puniſhed with ten years baniſhment; others were fined, and rendered incapable of any dignity for ever.

Ambitus was not only practiſed at Rome and in the forum, but in the meetings and aſſemblies of other towns in Italy, where numbers of citizens were uſually found, on account of trade and buſineſs. The practice ceaſed in the city from the time of the emperors, becauſe poſts were not then to be had by courting the people, but by favour from the prince. Perſons who had cauſes depending practiſed the ſame, going about among the judges to implore their favour and mercy. They who practiſed this were called *ambitioſi*. Hence we alſo meet with *ambitioſa decreta*, and *ambitioſa juſſa*; uſed for ſuch ſentences and decrees as were thus procured from the judges, contrary to reaſon and equity, either gratuitouſly or for money.

AMBITUS, in *Muſic*, a name ſometimes appropriated to ſignify the particular extent of each tone, or modification of grave and acute.

AMBIVARETI, in *Ancient Geography*, a people of Belgic Gaul, placed by Cæſar beyond the Meuſe. Martin places them between the Scaldi to the weſt, and Moſa to the eaſt; and to the ſouth of the Menapii, near the ſituation of the preſent Brabant.

AMBIX, in *Ancient Writers*, denotes a veſſel of glaſs or ſhell. Hence the origin of the word *alembic*, which we ſometimes alſo find denoted by the word *ambix*.

AMBLADA, in *Ancient Geography*, a town of Aſia Minor, in Piſidia, according to Stephan. Byz. but in Caria, according to Strabo, who ſays, that the wine of Amblada was uſeful in medicine.

AMBLAU, in *Geography*, one of the Moluccа iſlands, is the ſmalleſt of thoſe that are ſubject to the governor of Amboyna, and diſtant three leagues from Bouro.

AMBLE, AMBLING, in *Horſemanſhip*, a peculiar kind of pace, wherein a horſe's two legs, of the ſame ſide, move at the ſame time.

The ambling horſe changes ſides at each remove; two legs of a ſide being always in the air, and two on the ground at the ſame time: an amble is uſually the firſt natural pace of young colts, which, as ſoon as they have ſtrength enough to trot, they quit. There is no ſuch thing as an amble in the manege; the riding-maſters allowing of no other paces beſide walk, trot, and gallop; their reaſon is, that a horſe may be put from a trot to a gallop, without ſtopping him; but not from an amble to a gallop without ſtopping, which loſes time, and interrupts the juſtneſs and cadence of the manege. This movement, which is very laborious to the horſe, and in which he ought not to be indulged, except on ſmooth ground, is very eaſy to the rider; it has not the hardneſs of a trot, becauſe the hind leg moves along with the fore one, and creates no reſiſtance to the motion. Connoiſſeurs ſay that horſes which naturally amble never trot, and that they are much weaker than thoſe which have no ſuch movement. Colts, indeed, often aſſume this mode of moving, when forced to go quick, and when they have not ſtrength enough to trot or to gallop; and even good horſes, after being fatigued, or when they begin to decay, are apt, when puſhed, to amble ſpontaneouſly. The amble may, therefore, be regarded as a motion occaſioned by weakneſs or defect. But there are two other movements aſſumed ſpontaneouſly by weak or decayed horſes, which are ſtill more defective than that of the amble, and they are known by the name of *broken ambles*. The one is a motion between walking and ambling, and the other between trotting and galloping. Both proceed from great fatigue or weakneſs in the loins, and are conſpicuous in many of our hackney and poſt-horſes.

There are various practices and methods of diſcipline for bringing a young horſe to amble; ſome chooſe to toil him in his foot-pace through new-ploughed lands, which naturally inures him to the ſtroke required in the amble. But its inconveniences are, the weakneſs and lameneſs that ſuch diſorderly toil may bring on a young horſe.

Others attempt it by ſudden ſtopping or checking him in the cheeks when in a gallop, and thus putting him into an amazedneſs, between gallop and trot, ſo that loſing both he neceſſarily ſtumbles upon an amble. But this is apt to ſpoil a good mouth and rein, and expoſes the horſe to the danger of a hoof-reach, or ſinew ſtrain, by over-reaching, &c.

Others

Others prefer ambling by weights as the beſt way; and to this end ſome overload the horſe with exceſſive heavy ſhoes, which is apt to make him interfere or ſtrike ſhort with his hind feet. Others fold leaden weights about the fetlock paſterns, which are not only liable to the miſchiefs of the former, but put the horſe in danger of incurable ſtrains, cruſhing of the coronet, and breeding of ring-bones, &c. Others load the horſe's back with earth, lead, or the like maſſy ſubſtance; but this may occaſion a ſwaying of the back, over-ſtraining the fillets, &c.

Some endeavour to make him amble in hand before they mount his back, by means of ſome wall, ſmooth pail or rail, and by checking him in the mouth with the bridle hand, and correcting him with a rod on the hinder hoofs, and under the belly, when he treads falſe. But this is apt to drive a horſe to a deſperate phrenſy before he can be made to underſtand what they would have of him, and to rear, ſprawl out his legs, and to make other antic poſtures, which are not eaſily quitted again. Others think to effect it by a pair of hind ſhoes, with long ſpurns or plates before the toes; and of ſuch length, that if the horſe offers to trot the hind-foot beats the fore-foot. But this occaſions wounds of the back-ſinews, which often bring on an incurable lameneſs.

Some attempt to procure an amble by folding fine ſoft liſt ſtrait about his gambels, in the place where he is gartered for a ſtiffle-ſtrain, and turn him thus to graſs for two or three weeks, and afterwards take away the liſt. This is a Spaniſh method, but diſapproved; for though a horſe cannot then trot but with pain, yet the members muſt be ſufferers; and though the amble be gained it muſt be ſlow and unſightly, becauſe attended with a cringing in the hind-part. In effect, ambling by the trammel, as practiſed by us, appears the neareſt to nature, and beſt and moſt aſſured way.

There are divers errors, however, uſually practiſed in this method; as, that the trammel is often made too long, and ſo gives no ſtroke, but makes a horſe hackle and ſhuffle his feet confuſedly; or too ſhort, which makes him volt and twitch up his hind feet ſo ſuddenly, that by cuſtom it brings him to a ſtring-halt, from which he will ſcarce ever be recovered. Sometimes the trammel is miſplaced, and, to prevent falling, put about the knee and the hind-hoof. In which caſe the beaſt cannot give any true ſtroke, nor can the fore-leg compel the hind to follow it; or if, to evade this, the trammel be made ſhort and ſtraight it will preſs the main ſinew of the hind-leg and the fleſhy part of the fore-thighs, ſo that the horſe cannot go without halting before and cringing behind.

As to the matter of the trammel ſome make it all of leather, which is inconvenient, in that it will either ſtretch or break, and thus confound the certainty of the operation. In a true trammel the ſide ropes are to be ſo firm as not to yield to a hair's breadth; the hoſe ſoft, and to lie ſo cloſe as not to move from its firſt place; and the backband flat, no matter how light, and to deſcend from the fillet ſo as not to gall.

When the horſe, by being trammelled on one ſide, has attained to amble perfectly in the hand, it is to be changed to the other ſide, and that is to be likewiſe brought to rule.

When by this changing from one ſide to another with a half-trammel, the horſe will run and amble in the hand readily and ſwiftly, without ſnappering and ſtumbling, which is ordinarily done by two or three hours labour; the whole trammel is to be put on, with a broad, flat, backband, and both ſides trammelled alike. See TRAMMEL.

This pace is now generally diſuſed, and not admitted in the regular ſyſtem of the Manege.

AMBLAUW, or BELAUW, in *Geography*, one of the Molucca iſlands, about four leagues in circumference, two leagues ſouth of Bourro.

AMBLESIDE, an old irregular town of Weſtmoreland, near the lake of Windermere or Winandermere. It is 274½ miles from London, and its weekly market is on Wedneſday.

AMBLETEUSE, a ſea port town of France, in the department of the ſtraits of Calais, in the Engliſh channel, eight miles north of Boulogne, and twelve ſouth-weſt from Calais. It is defended with a battery of cannon. King James II. on his departure from England, in 1688, landed in this place. At this port, called *Ambletonienſis portus*, Cæſar embarked his cavalry when he paſſed over into England. N. lat. 50° 48′. E. long. 1° 37′.

AMBLYGON, or AMBLYGONIUM, formed of αμβλυς, *obtuſe*, and γωνια, *angle*, and denoting *obtuſe-angular*; in *Geometry*, denotes a triangle, one of whoſe angles is obtuſe, or conſiſting of more than ninety degrees.

AMBLYOPIA, AMBLYOPY, in *Surgery*, dulneſs of ſight, from αμβλυς *dull*, and ωψ *the eye*: *viſa debilis* of Ætius; *viſa hebitudo* of Boerhave. By this term Paulus and Actuarius denote the GUTTA SERENA, or AMAUROSIS. See DYSOPIA and GUTTA SERENA.

AMBO, or AMBON, a kind of pulpit or deſk in the ancient churches, where the prieſts and deacons ſtood to read or ſing part of the ſervice, and preach to the people; called alſo *analogium*.

The term is derived from αναβαινειν, *to mount*. The *ambo* was mounted upon two ſides, whence ſome alſo derive the application from *ambo*, *both*. The ambo was aſcended by ſteps, which occaſioned that part of the office performed there to be called the gradual. The Goſpel was read at the top of the ambo, the Epiſtle a ſtep lower.

The modern reading deſks and pulpits have been generally ſubſtituted inſtead of the ancient ambos, though, in ſome churches, remains of the ambos are ſtill ſeen. In that of St. John de Lateran, at Rome, there are two moveable ambos. M. Thiers inveighs againſt the diſuſe of the ancient ambo. Thoſe by whom this innovation has been effected he calls by a new word *ambonoclaſtes*. It was in the ambo that publication was made of feaſts, faſts, proceſſions, &c. Here were read the acts of the martyrs, the *ſanctæ ſanctis*, the diptychs, or commemoration of the dead; the letters of peace and communion, which one church ſent to another. Here new converts made their public confeſſion of faith, and biſhops their defence againſt accuſations brought againſt them. Here treaties of peace were ſometimes alſo concluded, and coronations of kings and emperors performed, &c.

Several antiquaries hold that the ambo was anciently the place from whence the biſhops and preſbyters made their ſermons; pulpits for that purpoſe having only been introduced by the mendicants at the beginning of the thirteenth century. A late writer combats this opinion, and ſhews, that the uſual place from whence the ancients preached was the ſteps of the altar; not but St. Chryſoſtom and St. Auguſtine both appear to have preached from the ambo, but this was looked on as a thing ſomewhat extraordinary.

AMBOES, or AMBUS, in *Geography*, a people of Lower Guinea in Africa.

AMBOHITSMENE, or VOHITSANGHOMBE, a province of Madagaſcar, ſituate weſt and north of Antavare, derives its appellation from the red mountains of the ſame name, lying in 20° of ſouth latitude. The high mountains reſemble the Tafelberg of the Cape of Good Hope, and

are ſeen from a great diſtance at ſea. On one ſide of this long and lofty ridge of mountains, which extends fifteen leagues inland, is the ſea, and on the other a flat country, abounding in ponds and marſhes. Here is alſo a lake fifteen leagues long, and of the ſame breadth, that contains ſeveral ſmall iſlands. The people that inhabit theſe mountains are called Ambohitſmenes.

AMBOINENSE, in *Conchology*, a ſpecies of CARDIUM. This ſhell is rather oblong, white, with blackiſh ſpots, and the ribs very convex. It inhabits the ſhores of Amboyna, is an inch and three quarters in length, and the ribs are uſually about twelve in number.

AMBOINENSIS, in *Ornithology*, a ſpecies of CERTHIA that inhabits Amboyna; it is of a cinereous colour above, beneath green, head and neck yellow, breaſt red, and wings black. Gmelin's Linn. This bird is remarkably brilliant and gloſſy, the length is about two inches and three quarters, bill half an inch long, and yellowiſh, and the edges of the wings and quills yellow.

This is the Tſioei, or Kakopit of Seba. Muſ. or Avis Amboinenſis; and Polytmus Amboinenſis of Briſſon. Dr. Latham calls it the Amboina Creeper, obſerving, that "both Edwards and Buffon ſay, that *humming-birds* are peculiar to South America, and that none are found on any part of the old continent. It is moſt probable that the three laſt-mentioned (*viz.* the Macaſſar, Indian, and Amboinan creepers) may belong to the creeper genus on our better acquaintance with them; which is the more to be ſuppoſed, as the whole deſcription has been taken from Seba, who lived in an age not ſufficiently enlightened in theſe matters.

AMBOINENSIS, a ſpecies of PSITTACUS, or parrot. It is of a fine ſcarlet, with a blue back, and a green ſpot in the wing. Gmel. Linn. This is the Pſittaca Amboinenſis coccinea (red Amboyna parrot) of Briſſon, and Lori Perruche tricolor, (three-coloured Lory parrot) of Buffon, as well as the Perruche rouge d'Amboine, Pl. enl. of the latter author.

The length of this bird is fifteen inches and an half, the bill red, with a black tip; the head, throat, neck, and under parts ſcarlet; back, rump, upper tail, leſſer underwing coverts, and the edge of the wings fine blue; under tail coverts violet in the middle, ſurrounded with red; the two middle tail feathers nine inches and an half in length, and of a violet brown; the exterior feathers decreaſe gradually in length, the outer one on each ſide being only four inches and an half long, and is diſtinguiſhed from the reſt by having the interior margin red. The legs and claws are red. It is a native of Amboyna, as its ſpecific names imply.

AMBOINENSIS, a ſpecies of TURDUS, rather bigger than a lark; it inhabits Amboyna, and is remarkable for its fine ſinging, and for flirting up its tail, which reflects on the back in the breeding ſeaſon.—The colour is ferruginous or reddiſh-brown, beneath yellow; the ſecondary quill-feathers from the baſe to the middle yellowiſh, tail cuneiform or wedge-ſhaped, and fulvous beneath. Gmel. Linn. Seba calls this Avicula Amboinenſis cinerea. It is the Merula Amboinenſis of Briſſon, Le Merle d'Amboine of Buffon, and Amboina thruſh of Latham.

AMBOISE, GEORGE D', in *Biography*, a French cardinal and miniſter of ſtate, was born of an ancient and noble family in 1460. As he was a younger ſon he was deſtined for the church, and at the age of 14 obtained the biſhopric of Montauban. He was appointed almoner to Lewis XI. and raiſed by Lewis XII., to whoſe intereſt, whilſt he was duke of Orleans, he attached himſelf, and for whom he ſuffered impriſonment, to the archbiſhopric of Narbonne, which he changed for that of Rouen. In the ſituation of lieutenant-general, under the duke of Orleans, who was governor of Normandy, he was inſtrumental in reſtoring juſtice and order to that province. Upon the acceſſion of Lewis XII. he was made cardinal and prime miniſter, and acquired popularity by diminiſhing the impoſts. After the conqueſt of the Milaneſe in 1499, he recovered the people who had revolted to their allegiance. As the pope's legate in France he attempted the reformation of the eccleſiaſtical orders, and promoted it by his own example; for he held only one benefice at a time, and devoted two-thirds of the revenue of his archbiſhopric to the relief of the poor and the repair of religious edifices. He aſpired to the papacy with a view of more effectually accompliſhing his ſchemes of reform, but he was counteracted and outwitted by the Italian cardinals. As a miniſter of ſtate he contributed ſo much to the welfare of the nation, that he was honoured with the appellation of "the father of the people." For the purpoſe of reforming the courts of judicature, and ſuppreſſing partiality and bribery in the adminiſtration of juſtice, he cauſed to be compiled a new code of regulations, and exerciſed his authority in Normandy, where he was governor, in reducing them to practice. The diſappointment of his views with regard to the papacy, induced him to recommend a war with the Venetians, to whom he conceived it was owing. Conſcious of ſome errors and faults into which his ambition had led him, he expreſſed his concern in the review of his conduct to an infirmary brother, who attended him at the convent of the Cæleſtines, at Lyons, where he was taken ill, in the proſecution of his journey for the Venetian war.—"Brother John! why have not I been all my life-time brother John." He died in this place, A.D. 1510, in the 50th year of his age. During the whole of his adminiſtration he cauſed the ſciences and trade to flouriſh. He was a munificent patron and encourager of literature; and ſuch was his general conduct in the various ſtations which he occupied, and eſpecially as prime miniſter, that he was as much beloved by the people as by his maſter. Gen. Dict.

AMBOISE, FRANCIS D', was the ſon of a ſurgeon to Charles IX. of France, and maintained by his liberality in the college of Navarre, where he ſtudied rhetoric and philoſophy. In 1572 he was made ſolicitor of the French nation, and afterwards applying to the ſtudy of the law, became one of the beſt advocates of the parliament of Paris. From this employment he was advanced to that of counſellor in the parliament of Bretagne, and then to be a maſter of requeſts and counſellor of ſtate. He publiſhed ſeveral pieces chiefly of a poetical kind, and others containing an account of his travels into various countries. He took great pains in collecting the MSS. of Abelard, and he prefixed an apologetical preface to the edition of 1616. His two brothers, Adrian and James, arrived at conſiderable literary and profeſſional eminence; the former as an eccleſiaſtic and the latter as a phyſician. Gen. Dict.

AMBOISE, *Ambaſia*, or *Ambacia*, in *Geography*, a town of France in the department of the Indre and Loire, and chief place of a canton, in the diſtrict of Tours; ſituate at the conflux of the Loire and Amaſſe. The place contains 5100, and the canton 14,415 inhabitants: the territory comprehends 322½ kiliometres and 16 communes. It has two pariſh churches, four convents, and a hoſpital; and near it is a large caſtle ſeated on a high rock, and difficult of acceſs, in which are ſhewn the ſtatues of Charles VIII. and of his conſort Anne. In this place the proteſtants conſpired in 1560, and the civil war commenced in 1561, and here it is ſaid the name of Huguenot had its origin. In the caſtle of this town Lewis XI. inſtituted

ſtituted the order of St. Michael, in 1469; and Charles VIII. was born in 1470, and died in 1498, at Amboiſe. N. lat. 47° 24′ 51″. W. long. 0° 59′ 7″.

AMBOISES, ſee Ambeezes.

AMBON, a town of France, in the department of the Morbihan, three leagues S.E. of Vannes.

AMBONUM, in *Natural Hiſtory*, a term uſed by ſome old writers, to expreſs the prominent tubercles on certain ſtones.

AMBORA, in *Botany*. See Mithridatea.

AMBOTE, in *Geography*, a town of Poland, in Samogitia, on the river Wardana, 28 miles north north-eaſt of Mednink.

AMBOTEN, a town of the duchy of Courland, eight leagues ſouth of Goldingen.

AMBOULE, *valley* of, a province of Madagaſcar, is ſituated ſomewhat more northward than 23° ſouth latitude, at the mouth of the river Manampani, which waters the whole valley. In this valley ſtands a large town of the ſame name. The country produces abundance of plants and fruits, particularly yams, and the ſeſame herb, whoſe ſeeds yield by expreſſion the oil called menachil; the oxen and cows are very fat, and their fleſh excellent. It has alſo iron mines. Near the town of Amboule is a fountain of hot water, within 20 feet of a ſmall river whoſe ſand is almoſt burning. The water of this fountain is ſaid to boil an egg hard in two hours, and to be a ſovereign remedy againſt the gout. The inhabitants of the country are employed in different preparations of iron and ſteel, which they obtain from their own mines, and forge darts and various other inſtruments, with conſiderable ſkill. The voadziri, or chief governor of the country is honoured with the title of great lord, or rabertau; and he is the richeſt and moſt powerful of the chiefs in this country. He exerciſes ſovereign authority, and abſolute power; but in times of public diſtreſs his ſubjects often aſſemble in great numbers, ſeize his perſon, and threaten him with death, unleſs they are relieved; and this he does, by iſſuing orders for diſtributing proviſions among them. The people are repreſented as licentious, diſhoneſt, and indolent. Mod. Un. Hiſt. vol. xi. p. 404.

AMBOURNAY, or Ambronay, a town of France, in the department of the Ain, and chief place of a canton, in the diſtrict of St. Rambert. It is ſituated in the road from Lyons to Geneva; has a pariſh church, a hoſpital, and an abbey of Benedictine monks, founded about the year 800; nine leagues north-eaſt of Lyons, and one mile and an half north-weſt of St. Rambert. N. lat. 46° 1′. E. long. 5° 16′.

AMBOUTNOSSI, a ſmall iſland on the coaſt of Madagaſcar, near the bay of Galemboule; and alſo a river of the ſame name.

AMBOY. See Perth-Amboy.

AMBOYNA, one of the Molucca or ſpice iſlands, in the Eaſtern Indian Ocean, lies in S. lat. 4° 25′, and E. long. 127° 25′. This iſland is about 60 miles in length from north to ſouth, and is divided on the weſt ſide, by a large bay into two parts or peninſulas, one of which, being about 12 leagues long, and two and a half broad, is called Hetou; and the other about five leagues in length, and one and a half broad, is called Leytimor. On the eaſtern ſide is another bay, with a bad harbour, where the Portugueſe erected their chief fortreſs Victoria. The town of Amboyna, which is the capital of the iſland, is neatly built, and ſtands near the ſouth-weſt extremity. As the iſland is ſubject to frequent earthquakes, the houſes generally conſiſt only of one ſtory; but the ſtate-houſe is a more lofty edifice of two ſtories. The face of this iſland is beautiful; as woody mountains and verdant vales are interſperſed with hamlets, and enriched by cultivation. The ſoil is chiefly a reddiſh clay, but in the vales it is blackiſh and ſandy. The chief produce of the iſland, in conſequence of the reſtrictions impoſed by the monopolizing avarice and deſpotiſm of the Dutch, is cloves; and the clove-tree grows to the height of about 40 or 50 feet, with ſpreading branches, and long pointed leaves. Some of theſe trees, that are ſituated in deep ſheltered vales, yield annually thirty pounds weight, and the chief crop is from November to February. The Dutch governor, in order the more effectually to ſecure this monopoly, makes an annual progreſs through the ſpice iſlands, for the purpoſe of enforcing the obſervance of exiſting treaties, and of preventing the culture of cloves beyond the limits to which it is reſtricted. About eleven years ago, indeed, nutmegs were allowed to be cultivated in Amboyna, becauſe Banda did not ſupply a ſufficient quantity. The growth of indigo is prohibited, leſt the natives ſhould become rich and turbulent: but the ſugar and coffee are excellent, and among many delicious fruits, which the iſland produces, is the mangoſteen of Hindoſtan. Cattle, grain, &c. are imported from Java, and they have a variety of curious woods, but theſe are chiefly brought from Ceram. The plants of the iſland have been deſcribed by Rumphius. The principal animals are deer, and wild hogs, and among their birds is the caſſowary. Amboyna, with its dependencies, contained in 1796, when it was taken by the Engliſh, 45,252 inhabitants, of whom 17,813 were proteſtants; the reſt were Mahometans, except a few Chineſe, and ſavages. As this is the next ſettlement to Batavia, with reſpect to wealth and importance, the Dutch are tolerably poliſhed; but the natives are ſtill rude and uncultivated. They reſemble the other Malays, and when intoxicated with opium they will commit any crime. Their dreſs is a looſe ſhirt or frock of cotton cloth; the men wear large whiſkers, and leave a little hair upon the chin; the women tie the hair in knots; wives are bought of their fathers, and if they prove barren, the marriage is diſſolved. Their houſes are made of bamboo canes and ſago-trees; they ſleep on mats; and their weapons are bows and arrows, javelins, ſcymetars, and targets; and their chiefs are called Rajas.

The iſlands that are immediately ſubject to the Dutch governor of Amboyna are ten, comprehending an extent of about five degrees of longitude, that of Amboyna being fartheſt to the ſouth: theſe iſlands are Ceram, Ceram-Lavut, Bouro, Amblau, Manipa between Bouro and Ceram, Kelang, two leagues north-eaſt of Manipa, Bonva farther north, Orna two leagues eaſt of Amboyna, Honimoa, a league eaſt of Orna, and Nouſſa-Laout, a league ſouth-eaſt of Honimoa. The three laſt iſlands are denominated Uliaſſers. The culture of cloves is reſtricted to theſe three iſlands, and Amboyna; but they formerly grew in all the iſlands, more eſpecially in Ceram. Amboyna is the centre of this rich commerce, and the Dutch have taken care to deſtroy all the clove-trees in the adjacent iſlands, and it is ſaid that even in Amboyna, when the harveſt is very large, part of the produce is burnt. Soon after the fruit is gathered from the tree, the cloves are collected and dried on hurdles before the fire; and thus their natural and beautiful red colour is changed into a deep purple or rather black, to which their being ſprinkled with water probably contributes. The reaſon aſſigned for this ſprinkling is to prevent the worm from getting into the fruit; but it has been generally ſuppoſed that the true reaſon is to add weight to

the cloves. The cloves are carefully gathered by the hand; and the produce is very different in different ſeaſons; but at a medium of ſeven years it has been eſtimated at a million of pounds.

Amboyna was firſt diſcovered by the Portugueſe adventurers Diego d'Abreu and Ferdinand Magellan, about the year 1515, and taken poſſeſſion of in 1564; it was conquered by the Dutch about the year 1605; but it was ſome time before they became complete maſters of the whole iſland. The Engliſh were at this time in poſſeſſion of ſeveral factories, that were protected by the Dutch caſtle, but differences having ariſen between the Engliſh and Dutch colonies, they were terminated, or rather ſuſpended, by a treaty concluded in 1619 between Great Britain and the States General of the United Provinces. In conſequence of this treaty, the Engliſh lived in ſecurity at Amboyna, and enjoyed one-third part of its cloves, whilſt the Dutch were in poſſeſſion of the other two-thirds. In the year 1622, freſh occaſions of diſcord aroſe; theſe were referred to the council of defence eſtabliſhed at Jacatra, in the iſle of Java; and the council, not being able to decide to the ſatisfaction of all parties, the ſtate of the caſe was tranſmitted to Europe to be ſettled by the Eaſt India Companies of both nations, or, in the laſt reſort, by the king of England and the States General. During the deliberations in Java and Europe, the diſſenſion at Amboyna increaſed, and the Dutch contrived, by a feigned plot, to get poſſeſſion of the whole iſland. This plot, as it was pretended, was confeſſed by two ſoldiers in the Dutch ſervice, one a Japaneſe, and the other a Portugueſe, who, upon a ground of ſuſpicion, trivial and even imaginary, had been put to the torture; and, by the teſtimony of theſe two unhappy wretches, confirmed by that of an Engliſh priſoner who was alſo ſentenced to the rack, the Engliſh were accuſed of being confederates in a conſpiracy againſt the Dutch ſettlement. Upon this extorted confeſſion, the Engliſh were ſeized; ſome of them were impriſoned, and others loaded with irons and confined on board the ſhips in the harbour: and their books and property were ſeized. By a proceſs of varied torture of the moſt ſavage kind, the governor and fiſcal conſtrained ſome of the wretched ſufferers, after proteſting their own innocence and total ignorance of the pretended conſpiracy, to acknowledge the truth of charges that were altogether unfounded. Some were racked, drenched with water, and ſcorched with fire; others were compelled to ſwallow ſuch quantities of water as cauſed their bodies to be diſtended to more than twice their uſual dimenſions, and then made to diſgorge, by violence, the water which they had ſwallowed; and others were conſumed by burning them gradually from the ſoles of the feet upwards. But humanity ſhudders at the recital of ſuch acts of barbarity. Of thoſe who eſcaped or ſurvived this ſavage treatment, ten Engliſhmen, with one Portugueſe, and eleven Japaneſe were executed, though all of them proteſted their innocence with their expiring breath. The day following that of the execution was ſpent, by order of the governor, in public rejoicings and thankſgivings for ſo ſignal an eſcape and deliverance from a pretended conſpiracy, and for the iniquitous extirpation of their rival traders. That the conſpiracy was a mere pretence on the part of the Dutch for gaining the ſole poſſeſſion of the iſland, is evident from various concurring circumſtances. They had, at this time, a garriſon of 300 men in the fort, and ſeveral other garriſons in the iſland; whilſt the number of the Engliſh did not amount to 20 perſons, who were unprovided with arms and ammunition for effecting the purpoſe with which they were charged. The Engliſh had not one veſſel in the harbour, whereas the Dutch had eight ſhips near the town. When the boxes of the factors were opened, and their papers rifled, no trace of any ſuch conſpiracy could be diſcovered; and, beſides, the ſufferers on this occaſion perſiſted in avowing their innocence. The Engliſh factory was withdrawn from the iſland; and the Dutch governor retained the effects that had been ſeized, amounting, as ſome ſay, to the value of 400,000 pounds. When the Engliſh council at Jacatra demanded juſtice, the conduct of the governor was vindicated, and his proceedings were declared to be juſt and indiſpenſably neceſſary; and from all the ſubſequent proceedings of the Dutch, it ſufficiently appears, that the plot was of their own invention, and that their object was to monopolize the whole trade of the ſpice iſlands; for, after the cataſtrophe at Amboyna, they ſeized all the Engliſh factories in theſe iſlands, and diſpoſſeſſed the Engliſh, to their incredible loſs and damage.

When the news of this tranſaction reached England, and ſufficient proof was adduced of the treachery and cruelty of the Dutch, it was natural to expect that reparation would be demanded and obtained. If, indeed, king James I. had acted with becoming ſpirit, and made proper repreſentations to the States General, juſtice would probably have been done; for ſuch atrocious villanies could not have been abetted by any civil community. But James ſubmitted to the national injury even without requiring ſatisfaction, and contented himſelf with merely telling the Dutch ambaſſador, "That he never heard nor read a more cruel or impious act, than that of Amboyna." But he adds, "I forgive them, and I hope God will, but my ſon's ſon ſhall revenge this blood, and puniſh this horrid maſſacre." Charles I. finding remonſtrances, letters of requeſt, and memorials ineffectual, was preparing to increaſe his ſhipping, and to call the Dutch to an account; but he was prevented from accompliſhing his deſign by the civil war which enſued. Cromwell, in this inſtance, avenged the wrongs of the Britiſh nation; for among the conditions on which he gave peace to the Dutch, in April 1654, it was inſerted, "That they ſhould deliver up the iſland of Polerone in the Eaſt Indies," which they had taken from the Engliſh in the time of king James, and where they had acted a tragedy ſimilar to that at Amboyna, "into the hands of the Engliſh Eaſt India Company; and pay a good ſum of money (300,000*l.*) for the old barbarous violence exerciſed ſo many years ſince at Amboyna, for which the two laſt kings could never obtain ſatisfaction and reparation." The Dutch, however, have long retained unmoleſted poſſeſſion of this iſland.—But both Amboyna and Banda were taken without reſiſtance in February and March, 1796, by the Engliſh admiral Rainier; however they have been reſtored to their Batavian maſters by the treaty with France in the year 1801. Mod. Un. Hiſt. vol. viii. p. 288—301. vol. ix. p. 70. Aſiatic Regiſter for 1800. p. 200.

AMBRA, or Ambro, *Cape*, in *Geography*, ſometimes called Cape Natal, is the north point of Madagaſcar iſland. S. lat. 12° 15′. E. long. 49° 10′.

AMBRACIA, in *Ancient Geography*, was one of the moſt conſiderable cities of Epirus, and ſituated in the territory of Theſprotia, near the mouth of the river Arachthus, or Arethon, and the gulf to which it gave its name. It was built, according to Polybius, (lib. iv.) by Ambrax, ſon of Theſprotus; probably when the territory of his father had been ravaged by the Dryopes, and afterwards by Hercules; and thus the origin of the Ambracians is traced to an æra about 50 years before the laſt war of Troy. Strabo

(lib. vii.) ſays, that Ambracia was the work of Tolgus, the ſon or the brother of Cypſelus, who was tyrant of Corinth, and lived about 620 years before the Chriſtian æra. A colony from Corinth under the conduct of Cypſelus arrived in Epirus, and delivered the Ambracians from the tyranny of Phalæcus, and reduced them into ſubjection to himſelf: and Ariſtotle informs us, that they drove away Periander the ſon of Cypſelus, and recovered their ancient liberty, for it was originally a free city. It was afterwards reduced by the Æacidæ kings of Epirus, who choſe it for the place of their reſidence. In proceſs of time, the Ætolians made themſelves maſters of it, and held it till the year before Chriſt 189, when they were ſubdued by the Romans, who found at Ambracia a great number of pictures and ſtatues belonging to the magnificent palace of Pyrrhus.

At this time it was a place of great ſtrength, defended on one ſide by the river Arachthus, and on the other by ſteep and craggy hills; and it was ſurrounded by a high and thick wall, about three miles in circuit. It was vigorouſly beſieged by the Romans and their allies, the Epirots, under the conduct of the Roman conſul Marcus Fulvius, and as bravely defended by the Ætolian garriſon. It was at length compelled to capitulate; and Fulvius was preſented with a crown of gold, which is ſaid to have weighed 150 pounds. Paulus Æmilius alſo deprived its inhabitants of their privileges and effects. Livy (lib. xxviii. c. 4.) has given a particular deſcription of Ambracia. It is now reduced to a ſmall place of Turkey in Europe, called *Ambrachia*, on the lower part of the gulf of Larta in the ſouthern Albania.

AMBRACIUS SINUS, the gulf of Ambracia, now the gulf of Larta, was ſituated between the country of the Moloſſi in Epirus, to the north, and Acarnania to the ſouth, and communicated with the Ionian Sea, by a ſtrait called that of Actium.

AMBRARIA, in *Botany*. See ANTHOSPERMUM.

AMBRAS, or OMBRAS, in *Geography*, a town of Germany, in the county of Tyrol, four miles eaſt of Innſpruck.

AMBRAVETTY, a river of Hindoſtan, which runs into the Cauvery, eight miles eaſt-north-eaſt of Carroor.

AMBREADA, thus they call the falſe or factitious amber, which the Europeans uſe in their trade with the Negroes on the coaſt of Africa, and particularly on the river Senegal. There are ſome large and red pieces of it, a thouſand of which making twenty ropes of ſtrings weigh three pounds. There are others ſmall, and alſo red, which weigh but two pounds and a half.

AMBRES, in *Geography*, a ſmall town of France, ſituate on an eminence, in the department of Tarn and dioceſe of Caſtres.

AMBRESBURY, or AMESBURY, a town of England, in the county of Wilts, pleaſantly ſituate in a ſmall valley on the banks of the Upper Avon, and conſiſting of two ſtreets. The town is indifferently built, and has all the appearance of decay. Whether it derived its name from Ambres' conſecrated ſtone, as Toland ſuggeſts—from its neighbouring monument, Stonehenge, being erected by Aurelianus Ambroſius, who is ſuppoſed to have been ſlain near this place—or from Ambri, a Britiſh monk, who founded a monaſtery in this place—it is not eaſy to determine. In former times it was a place of importance. Some have ſuppoſed that, when the Britons reſorted to the general *Gorſedd* at Stonehenge, Ambreſbury might have been uſed as a reſting-place, or place of Aſſembly, and that Ambri founded a monaſtery here for the benefit of future devotees. At this town a nunnery was founded by Elfrida, widow of king Edgar, in expiation, as it has been ſaid, of the atrocious and unprovoked murder of her ſon-in-law, Edward the Martyr, at Corfe Caſtle. Queen Eleanor, widow of Henry III. retired to Ambreſbury, took the veil, and died a nun in 1291; and her grand-daughter Mary, the ſixth daughter of Edward I. followed her example, and in company with 13 children of the Engliſh nobility reſorted hither, and took the veil in 1285. The eſtates belonging to this nunnery, after its diſſolution, and in proceſs of time, became the property of the Queenſbury family. To the weſt of the river Avon is a camp, occupying the whole ſummit of a hill, which has been generally attributed to Veſpaſian; but an ingenious tourift ſuggeſts that it is the camp, or town, often mentioned in the old Britiſh writings under the name of Caer Caradoc. It is conſtructed in the ſhape of an oblong ſquare, with a very deep vallum towards the weſt; and to the eaſt it overlooks the town. The road paſſing from Ambreſbury to Warminſter is cut through the rampart of this fortification. The market of this town is on Friday: and it is diſtant from London 78 miles.

AMBRI, in *Ancient Geography*, a name given by Juſtin to a people of India, who lived upon the banks of the river Aceſines. The Ambri are, according to M. d'Anville, the ſame with the Oxydraci.

AMBRIÈRES, in *Geography*, a town of France, in the department of Mayenne, and chief place of a canton in the diſtrict of Mayenne, two leagues north of Mayenne. The place contains 2231, and the canton 14,077, inhabitants; the territory includes 162½ kiliometres, and 10 communes. N. lat. 48° 24'. W. long. 0° 44'.

AMBRIZ, or AMBRISI, a river of Africa, in the kingdom of Congo, which ſprings from a lake in the eaſtern mountains of Tenda, and runs weſtward into the ocean between the mouths of the Lahunda and Loze. It runs by the town of St. Salvador. Its courſe is rapid; its channel deep, and large; and its waters muddy. S. lat. 7° 10'. E. long. 13° 25'.

AMBROCHOS, in *Ancient Geography*, a country of Africa, in Marmarica, according to Ptolemy.

AMBRODAX, a town or borough, placed by Ptolemy in Parthia.

AMBROGI, DOMINICO, in *Biography*, an Italian artiſt, flouriſhed in 1653, and painted hiſtory and landſcape. He was the diſciple of Brizio, and, as an engraver, he is ſaid to have executed ſome prints on wood in Chiaro-Scuro. One of his engravings is "a woman ſeated in a triumphal car, holding two flambeaux and a ſerpent, conducted by Neptune." Strutt.

AMBROMA, in *Botany*. See ABROMA.

AMBRONES, in *Ancient Geography*, a people of Gaul, known in the Cimbric war. They were probably the anceſtors of the Ligurians, and had poſſeſſions to the north and ſouth of the Po. They invaded the Roman territories, as Plutarch (in Marco) informs us, in conjunction with the Cimbri and Teutones, and were defeated with great ſlaughter by Marius, about 102 years before Chriſt. Their wives, who were waiting the iſſue of the engagement, ſeeing their huſbands flying and the Romans purſuing, armed themſelves with axes, and, gnaſhing their teeth, fell furiouſly on the purſuers and the purſued, without diſtinction. Heedleſs of their own defence, they threw themſelves upon the combatants, ſeized their ſwords, and endeavoured to ſnatch away their bucklers; but when their rage was exhauſted, they offered to capitulate on this ſingle condition, that their honour ſhould be preſerved. When this condition was denied, theſe unfortunate women, being reduced to deſpair, firſt killed their children, and afterwards themſelves, not one of ſo great a multitude remaining alive.

AMBROOK.

AMBROOK *Iſland*, in *Geography*, a ſmall iſland of the Baltic, under Œſel, ſeven leagues ſouth-eaſt from Demeſneſs, and eight leagues north-weſt from Round iſland. See Arensburg.

AMBROSA Island, is ſituated on the coaſt of Chili, in South America, on the Pacific Ocean. S. lat. 26° 40'. W. long. 82° 35'.

AMBROSE, of Alexandria, in *Biography*, the friend of Origen, flouriſhed about the beginning of the third century. He was deſcended from a good family, affluent in his circumſtances, and diſtinguiſhed by his intellectual accompliſhments and Chriſtian virtues. According to Jerom he was a Marcionite, but Euſebius calls him a Valentinian; and he was convinced of his errors by Origen, about the year 212, in conſequence of which he became a deacon of the church, either at Alexandria, or at Cæſarea, where Protoctetus was preſbyter. To both theſe perſons Origen inſcribed his book on Martyrdom, and he dedicated to Ambroſe many of his other works, which were publiſhed at his deſire and charge. Origen and Ambroſe lived on terms of the moſt intimate friendſhip; they were alike indefatigable in their application; and Ambroſe aſſiſted Origen by procuring him notaries, and amanuenſes, who copied his works, and to whom he occaſionally dictated. Origen repreſents his friend, as a perſon eminent for his piety and for his diligent ſtudy of the Scriptures. Although Jerom reports that Ambroſe was blamed by many for making no proviſion at his death for Origen, who was not only poor but likewiſe far advanced in years, Tillemont ſuggeſts this apology for him, that he knew his friend's mind, and that Origen choſe to be poor, and to live in a ſtate of dependence upon Providence. Some ſay that Ambroſe died, with his friend Protoctetus, as a martyr, in the perſecution under Maximin, about the year 236; but the dedication of Origen's eight books againſt Celſus ſhews, that though he died before Origen, yet he lived to the year 250, or near it. Ambroſe had a wife named Marcella, by whom he had ſeveral children; and ſhe is commended by Origen as a true Chriſtian and a faithful wife. Lardner's Works, vol. ii. p. 447. Cave's H. L. vol. i. p. 122.

Ambrose, St. biſhop of Milan, deſcended from a noble family of Romans, was born in Gaul, as ſome ſay, in the year 333, but according to others, in 340. His father, at the time of his birth, was prætorian præfect of Gaul, and reſided at Arles, the capital of Gallia Narbonenſis. The ſon, after paſſing through the ſtudies of a liberal education, attained, by the regular gradation of civil honours, the ſtation of Conſular of Liguria, a province which included the imperial reſidence of Milan. In the exerciſe of this government, he manifeſted a degree of wiſdom and equity which obtained general eſteem. At the age of 34, and before he had received the ſacrament of baptiſm, a circumſtance occurred which ſerved ſuddenly to transform him from a civil magiſtrate to an eccleſiaſtical governor. His mother, and his ſiſter Marcellina, both women of diſtinguiſhed piety, had trained him up not only in habits of virtue, but with an early bias towards the religious ſyſtem of the Catholic church. Thus previouſly diſpoſed, he was prepared for availing himſelf of a diſpute concerning the ſucceſſion in the epiſcopal ſee of Milan, that had been produced by the death of Auxentius, who had been the leader of the Arian party in the weſt. In a tumultuous conteſt between the Arians and Catholics for ſupplying the vacancy, Ambroſe preſented himſelf to the aſſembly, and by an eloquent ſpeech recommended a peaceable election. At the cloſe of his addreſs, a child exclaimed—"Ambroſe is biſhop!" The voice of the infant was regarded by the ſuperſtitious multitude as a miraculous ſuggeſtion, though others might more naturally have inferred that it was the reſult of contrivance on the part of Ambroſe or his friends. But the expedient, however, was effectual, and Ambroſe was immediately elected by acclamation. The civil magiſtrate expreſſed great reluctance in complying with the public choice, and recurred to a variety of ſingular expedients to divert the multitude from perſiſting in the appointment. The emperor Valentinian was at length ſolicited to confirm and enforce the election; and as the talents and character of the biſhop elect were well known to him, he very readily interpoſed. Ambroſe ſubmitted to his authoritative injunction, and, after baptiſm, was ordained to the epiſcopal office. The eccleſiaſtical hiſtorians, acquitting the biſhop and his friends of art and intrigue, and conſidering his oppoſition as real, repreſent the choice as "a divine election," and "the peculiar work of God." But the traces of human contrivance were much more diſcernible in the whole conduct of this buſineſs than thoſe of a divine operation; and it will not be eaſy to exculpate the biſhop himſelf from all concern in the plot.

Unprepared as Ambroſe was, by the habits and occupations of his former life, for the new office that was devolved upon him, the active force of his genius ſoon qualified him to exerciſe, with zeal and prudence, the duties of his eccleſiaſtical juriſdiction. With this view, he beſtowed his money upon the poor, ſettled his lands upon the church, with the reſerve of a life-intereſt in favour of his ſiſter, and committed the care of his houſe and family to his brother. Thus diſengaged from ſecular concerns, he commenced a courſe of theological ſtudy with Simplician, preſbyter of Rome, and devoted himſelf to eccleſiaſtical buſineſs. In 377 he was obliged, by the irruption of the Goths and other northern barbarians, to retire to Illyricum; but the invaders were ſoon defeated by the Roman emperor, and Ambroſe and the other exiles were allowed to return home. The prevalence of the Arian doctrine furniſhed ample occaſions for the zealous exertions of Ambroſe. Having written a treatiſe concerning the Trinity, for the eſtabliſhment of the faith of Gratian, he was leſs ſucceſsful in his attempts for converting the younger Valentinian, Gratian's colleague in the empire. The inſtructions of his mother Juſtina, who was an avowed Arian, counteracted the arguments of the orthodox prelate. Ambroſe, by his influence with Gratian, prevented the aſſembling of a general council, which he had agreed to convene; and probably fearing that the ſentiments of the whole body of Chriſtian biſhops would be favourable to Arianiſm, he wiſhed the deciſion of the diſpute to be referred to an aſſembly of the weſtern clergy. Here the two "rotten heretics," as he called the two Arian biſhops, Palladius and Secundianus, might be eaſily ſilenced. Accordingly a ſynod, conſiſting of 32 biſhops, was held at Aquileia in 381, and Ambroſe preſided. Palladius very properly demurred againſt the deciſion of ſuch a partial aſſembly, and it terminated with Ambroſe's ejection of the two obnoxious biſhops from the epiſcopal office. The orthodox prelate was no leſs zealous in his oppoſition to the followers of the ancient pagan religion than in his efforts for ſuppreſſing Arianiſm. The leader of the pagans was Symmachus, a wealthy and eloquent ſenator; and in the year 384 he was employed to prepare and preſent a petition for reſtoring the Altar of Victory to its ancient place in the hall of the ſenate; and the public funds for the ſupport of the ſeven veſtal virgins, and their religious ceremonies. To the talents of Symmachus were oppoſed thoſe of Ambroſe, who addreſſed a letter to Valentinian, in reply to the pleas of this petition; and he concludes with obſerving, that it

was

was a debt which Chriſtian princes owed to their faith, not to give countenance to heathen rites. Ambroſe prevailed, and the petition of Symmachus was rejected.

The Arians were at this time a more formidable body to the intolerant biſhop than the pagans. They were ſupported by the young emperor Valentinian and his mother Juſtina; and they concurred in demanding from the biſhop the uſe of two churches, one in the city and the other in the ſuburbs of Milan. The biſhop peremptorily refuſed; alleging, that though the palaces of the earth might belong to Cæſar, the churches were the houſes of God; and that, within the limits of his dioceſe, he was the lawful ſucceſſor of the apoſtles, and was the only miniſter of God. The privileges of Chriſtianity, temporal as well as ſpiritual, were confined to the true believers; and Ambroſe was ſatisfied in his own mind that his own theological opinions were the ſtandard of truth and orthodoxy. He therefore declared, that it was his firm purpoſe to die a martyr rather than to yield to the imperious ſacrilege, by delivering up the temple of the Lord into the hands of heretics. Juſtina reſented the refuſal as an act of diſloyalty and rebellion; and as ſhe deſired to perform her public devotions on the approaching feſtival of Eaſter (A. D. 385), Ambroſe was ordered to appear before the council. He obeyed, accompanied by a tumultuous crowd of people; and the affrighted miniſters of Valentinian, inſtead of pronouncing a ſentence of exile on the biſhop, humbly requeſted that he would interpoſe his authority to protect the perſon of the emperor, and to reſtore the tranquillity of the capital. Notwithſtanding the tumult and clamours of the people, the biſhop perſiſted in his refuſal, and the court proceeded to the exerciſe of power. Orders were iſſued to the officers of the houſhold to prepare, firſt, the Portian church, and afterwards the Baſilica, for the immediate reception of the emperor and his mother. But it was found neceſſary to defend them by a ſtrong guard from the inſults of the people. The Arian eccleſiaſtics, who ventured to ſhew themſelves in the ſtreets, were expoſed to the moſt imminent danger of their lives; and Ambroſe had enjoyed the merit and reputation of reſcuing his perſonal enemies from the hands of the enraged multitude; but while he laboured to reſtrain the effects of their zeal, the pathetic vehemence of his ſermons continually inflamed the angry and ſeditious temper of the people of Milan. The characters of Eve, of the wife of Job, of Jezabel, of Herodias, were indecently applied to the mother of the emperor; and her deſire to obtain a church for the Arians was compared to the moſt cruel perſecutions which Chriſtianity had endured under the reign of Paganiſm. The prelate was ſupported, not only by the populace, but by the moſt reſpectable citizens; and the court, finding violent meaſures to be ineffectual, had recourſe to the milder method of perſuaſion, and ſolicited Ambroſe to reſtore peace to his country by a timely compliance with the will of his ſovereign. He reſolutely replied: "if you demand my patrimony, which is devoted to the poor, take it; if you demand my perſon, I am ready to ſubmit; carry me to priſon, or to death, I will not reſiſt; but I will never betray the church of Chriſt. I will not call upon the people to ſuccour me; I will die at the foot of the altar rather than deſert it. The tumult of the people I will not encourage; but God alone can appeaſe." In his ſermons he aſſerted the excluſive power of the catholic biſhops over the churches, and expreſsly denied the right of the emperor even to the uſe of a church for himſelf. Valentinian and his court were not diſpoſed to ſubmit to this eccleſiaſtical tyranny. An attempt was made for ſeizing the Baſilica; and a body of Goths, urged by their Arian principles and ferocious ſpirit, advanced towards the church. On the threſhold they were met by the biſhop, who, thundering out a threat of excommunication, aſked them, by what authority they preſumed to invade the houſe of God? Superſtitious terror held the barbarians in ſuſpenſe: and the empreſs was perſuaded to leave the catholics in poſſeſſion of all the churches of Milan, and to diſſemble, till a more convenient ſeaſon, her intentions of revenge. The mother of Valentinian, however, could never forgive the triumph of Ambroſe; and the royal youth uttered a paſſionate exclamation, that his own ſervants were ready to betray him into the hands of an inſolent prieſt. This temporary triumph of Ambroſe was ſucceeded by an edict of general toleration in favour of thoſe who profeſſed Arianiſm, and by a ſentence of eaſy and honourable baniſhment, enjoining the prelate to leave Milan, and to chuſe the place of his exile as well as the number of his aſſociates. This ſentence was reſiſted by the biſhop, and his refuſal to obey it was ſupported by the unanimous conſent of his faithful people, who guarded his perſon and his palace. He deviſed various expedients for ſecuring and increaſing their attachment. By his bounty to the poor he formed a train of indigent perſons; by introducing into Italy from the eaſt the alternate or reſponſory pſalmody, he aided the public devotion; and by alluding to exiſting characters and circumſtances in his diſcourſes and commentaries upon the ſcriptures, he increaſed the popularity which was annexed by the ſuperſtition of the times to his religious and epiſcopal character. Pious frauds and pretended miracles ſerved alſo to augment the eſteem and veneration with which he was regarded by the credulous multitude. The contending prelate was fortunately directed by a dream to the diſcovery of the remains of two martyrs, Gervaſius and Protaſius, which had been under the pavement of the church for 300 years. Two perfect ſkeletons were found, with the heads ſeparated from the bodies, and a plentiful effuſion of blood. Theſe holy relics were preſented with ſolemn pomp, to the admiration of the people; and many miracles were wrought on poſſeſſed and diſeaſed perſons who touched them, and one recovered his ſight by touching the bier on which the bodies were depoſited with his handkerchief. Ambroſe appealed to theſe miracles in his ſermons, and the people believed them to be real. The incredulity of the Arians, and the deciſion of Juſtina and her court, were reproached and condemned; and the miracles were atteſted not only by Ambroſe himſelf, but by Auguſtine, and Paulinus, who were then reſident in Milan. Dr. Cave, relying on theſe teſtimonies, expreſſes his firm belief of their reality, and ſays, "that God ſuffered them to be wrought, at this time, on purpoſe to confront the Arian impieties." Such were the talents of Ambroſe and the general eſtimation in which his character was held, that his aſſiſtance was repeatedly ſolicited in times of public exigence and danger; and it ought to be recorded to his honour, that he ſurrendered his private reſentment to the public good, and ſerved his country with fidelity and ardour. After the aſſaſſination of Gratian in 383, Ambroſe was deputed by Valentinian on an embaſſy to Maximus, and contributed by his authority and eloquence to check the ambition of the tyrant, to diſſuade him from paſſing the Alps, and thus to protect the peace of Italy. In 387 he undertook the ſame office; and if the council of Milan had availed themſelves of the information given them by Ambroſe on his return from an unſucceſsful embaſſy, they might have been guarded againſt the perfidy of Maximus, and Italy might poſſibly have eſcaped the deſolation which ſoon followed. The conqueror, however, entered Milan in triumph; Juſtina and her ſon Valentinian fled precipitately

cipitately from the country, and put themſelves under the protection of Theodoſius, the emperor of the eaſt, in the port of Theſſalonica; but Ambroſe remained reſolutely at his poſt, and during the depredations of a victorious army, humanely ordered the church-plate to be ſold, and the money to be diſtributed among the unfortunate ſufferers. After Theodoſius had reſtored Valentinian to the kingdom in 388, he received information that the monks and populace of Callinicum, an obſcure town on the frontier of Perſia, had tumultuouſly burnt a Jewiſh ſynagogue. The magiſtrate of the province had ordered the biſhop, by whoſe inſtigation the ſynagogue had been burnt, either to rebuild it or to repay the damage; and his order was confirmed by Theodoſius. Ambroſe remonſtrated; repreſenting the toleration of the Jewiſh, as the perſecution of the Chriſtian religion; boldly declaring, that he himſelf, and every true believer, would eagerly diſpute with the biſhop of Callinicum the merit of the deed, and the crown of martyrdom; and lamenting, in the moſt pathetic terms, that the execution of the ſentence would be fatal both to the fame and ſalvation of Theodoſius. Beſides this private admonition, he publicly addreſſed the emperor from his pulpit, nor would he conſent to offer the oblation of the altar, till he had obtained from Theodoſius a ſolemn and poſitive declaration, which ſecured the impunity of the biſhop and monks of Callinicum. After an interval of five years, and at a diſtance from Ambroſe, his ſpiritual guide, Theodoſius, tolerated the Jews, and condemned the deſtruction of their ſynagogue. How different were the feelings and conduct of Theodoſius and Ambroſe on another occaſion! The tolerant emperor, incenſed by the conduct of the populace at Theſſalonica, who had murdered Botheric, and ſeveral of the principal officers of his army, and irritated by the ſuggeſtions of his miniſter Rufinus, iſſued a general order for the maſſacre of the inhabitants. The promiſcuous carnage continued three hours, without diſcrimination of ſtrangers or natives, of age or ſex, of innocence or guilt; the moſt moderate accounts ſtate the number of the ſlain at 7000; and it is affirmed by ſome writers, that more than 15000 victims were ſacrificed to the manes of Botheric. "A foreign merchant, who had probably no concern in his murder, offered his own life, and all his wealth, to ſupply the place of one of his two ſons; but while the father heſitated with equal tenderneſs, while he was doubtful to chuſe, and unwilling to condemn, the ſoldiers determined his ſuſpenſe, by plunging their daggers at the ſame moment into the breaſts of the defenceleſs youths." Ambroſe, on the other hand, though unforbearing and intolerant on occaſion of the ſlighteſt religious differences, heard the relation of the maſſacre with horror and anguiſh; reproached Theodoſius with the enormity of his crime; admoniſhed him not to receive the holy euchariſt with hands that were ſtill polluted with the blood of an innocent people; and ſtopped him in his approach to the church of Milan, declaring to his ſovereign in the tone and language of an ambaſſador from heaven, that private contrition was not ſufficient to atone for a public fault, or to appeaſe the juſtice of the offended deity. When Theodoſius replied, that David, the man after God's own heart, had been guilty both of murder and adultery, the undaunted Ambroſe rejoined, "you have imitated David in his crime; imitate then his repentance." After a delay of eight months, Theodoſius was abſolved and reſtored to the privilege of communion; but in the interval he appeared, ſtripped of the enſigns of royalty, in a mournful and ſuppliant poſture, in the church of Milan, ſoliciting the pardon of his ſins, and he ſigned an edict enjoining a ſpace of 30 days before any ſentence of death or confiſcation, and its execution. After the aſſaſſination of Valentinian, A.D. 392, the empire of the Weſt was uſurped by the ignoble Eugenius; but Ambroſe, with a laudable reſolution, refuſed to enter into alliance with the uſurper, and withdrew from Milan; but when the empire was regained by Theodoſius, he generouſly interceded with the emperor for the pardon of the adherents of Eugenius. Ambroſe did not long ſurvive Theodoſius, whoſe funeral obſequies he performed; but after a ſhort illneſs, in which his mind was perfectly compoſed, and which afforded him an opportunity of declaring to his friends, "that he had not conducted himſelf ſo among them as to be either aſhamed to live or afraid to die," he departed this life in April, A.D. 397.

Many fabulous particulars are related concerning Ambroſe, which are not worth minutely recording, and which the allowable ſcepticiſm of the preſent age will not admit. Such are the ſtories of the ſwarm of bees that ſettled upon his face, when he was an infant in the cradle; of the paralytic woman, who was inſtantaneouſly cured, when he was praying by her bed-ſide; of the two Arians, who having affronted him, were inſtantly thrown from their horſes and killed; of the globe of fire, which covered his head in his laſt illneſs, and inſinuating itſelf into his mouth, left his face white as ſnow; and of the voice, which proclaimed in the hearing of a biſhop, juſt as he was expiring, "ariſe, and haſten to him, for he is departing." Theſe tales are gravely related by Paulinus, Dr. Cave, and others; but they will claim little credit. Of his general character, it will be ſufficient to ſay, that his moſt partial advocates cannot acquit him of diſhoneſt artifice, arrogance, and intolerance; and that his moſt prejudiced enemies cannot deny him the praiſe of firmneſs in avowing his ſentiments, aſſiduity in the performance of his eccleſiaſtical offices, liberality to the poor, generoſity in his conduct towards his enemies, and zeal in the cauſe of humanity. With energy of mind he combined a great degree of tenderneſs and ſympathy, and in his general conduct he was virtuous and amiable, except on occaſions when he was miſled by profeſſional ambition or religious bigotry. As a writer, many of his ſentiments will now be thought abſurd, trivial, or ludicrous; his ſtyle is conciſe and affected, and ſomewhat reſembling that of Seneca. "Ambroſe," ſays Mr. Gibbon, "could act better than he could write; his compoſitions are deſtitute of taſte, or genius; without the ſpirit of Tertullian, the copious elegance of Lactantius, the lively wit of Jerom, or the grave energy of Auguſtin." The writings of Ambroſe are numerous; but many of them are little more than tranſcripts from the Greek fathers, particularly Origen. Their chief object is to maintain and eſtabliſh the faith and diſcipline of the Catholic church; or recommend perpetual celibacy as the ſummit of Chriſtian perfection. One of the moſt valuable is his book "De Officiis," intended to explain the duties of Chriſtian miniſters, formed on the model of Cicero's "Offices." In his "Commentaries on the Scriptures," he chiefly follows the abſurd method of allegorical interpretation; his "Epiſtles" throw much light on the hiſtory of his life and times. The moſt accurate and complete edition of his works is that of the Benedictine Monks, in two volumes, folio, in 1682; reprinted in 1690. Ambroſe appears to have received all the books of the New Teſtament, which we receive, without any other. For in his works he does not pay any particular regard to the writings of Barnabas, Clement, or Ignatius, or to the recognitions, or conſtitutions. Hence we may reaſonably conclude, that theſe writings were not eſteemed of authority by himſelf,

himſelf, or other Chriſtians at that time. Cave's H. L. vol. i. p. 261. Gibbon's Hiſt. vol. v. p. 38—78. Lardner's Works, vol. iv. p. 447.

Ambrose, a monk of Camalduli, was born at Portico, near Florence, ſtudied Greek under Emanuel Chryſoloras, at Venice, and entered into the order of Camalduli at the age of 14 years. He was made general of the order in 1431, after having lived in it 30 years; at the council of Baſil, to which he was deputed by Eugenius IV., he defended the authority of the papal ſee; at the councils of Ferrara and Florence he diſplayed equal ardour againſt the Greeks: and at Florence he was employed to draw up the articles of union between the Latin and Greek churches. The Greek oration, which he addreſſed at Ferrara, in 1437, to John Paleologus, emperor of Conſtantinople, was much applauded. He was much eſteemed by Coſmo de Medicis, who had his letters collected into a volume, that has been kept in the library at Florence; and by Paul Jovius, he is repreſented as a perſon who united piety with good humour, and who was ſo free from envy, and from a ſpirit of contradiction, that when he endeavoured to reconcile Poggius with Laurentius Valla, he declared to them, that they acted neither as true men of letters nor like Chriſtians, ſince they diſgraced the dignity of the ſciences by their ſatirical writings. Ambroſe died, on his return from the council of Florence, in the year 1439, and his remains were depoſited in the oratory of Camalduli, without any epitaph or ornament. He collected a very large library in the convent of St. Mary de Angelis, where he lived; and left behind him ſeveral tranſlations of Greek authors; ſuch as thoſe of Dionyſius Areopagita de Cæleſti Hirerarchia, Manuel Calecas againſt the errors of the Greeks, Palladius's Life of Chryſoſtom, Æneas of Gaza's Theophraſtus, S. Ephrem's Sermons, Diogenes Laertius's Lives, &c. He alſo wrote, "Hodæporicon," or a Journey through Italy, in 1431, to viſit ſeveral monaſteries and nunneries of his order, and to correct their abuſes; publiſhed in 4to. in Florence, in 1681; and "Letters," above-mentioned, which have been inſerted in the third volume of Martenne's and Durand's "Veterum Scriptorum et Monumentorum Collectio," Paris, 1724, fol. ſome of which contain hints concerning the lives and characters of the learned men of his time. Gen. Dict. Cave's H. L. vol. ii. p. 155.

Ambrose, Isaac, an Engliſh Preſbyterian divine, was the ſon of a clergyman, and deſcended from the Ambroſes, of Ambroſe-hall, in Lancaſhire. In 1621, he was admitted into Brazen-noſe college, in Oxford, where he took a degree of bachelor of arts; and he afterwards took holy orders, and officiated in the church of England, but he obtained no preferment. In 1641, he left the eſtabliſhed church, joined the Preſbyterian party, took the covenant, and preached firſt at Garſtang, and afterwards at Preſton, in his native county. His zeal againſt the eſtabliſhed clergy recommended him to the office of aſſiſtant to the commiſſioners for ejecting ſuch as were called ſcandalous and ignorant miniſters and ſchool-maſters. It was his cuſtom to retire for a month every year into a hut in the wood for the advantage of ſolitude and religious meditation. He anticipated his death for ſome time before it occurred, and took leave of all his friends at their own houſes. He then died ſuddenly, as it is ſuppoſed, of an apoplexy, in 1634, at the age of 72. His works, written in the truly puritanical ſtyle and ſpirit, are numerous. They are entitled "Prima, Media, et Ultima; or Regeneration, Sanctification, and Meditations of Man's Miſery and God's Mercy, &c." 1682 and 1689, Lond. "Looking upon Jeſus," 1658, 4to. Lond. "War with devils, miniſtration of and communication with angels," printed with the former. Biog. Brit.

Ambrose, St. *Gulf* or *Haven*, in *Geography*, lies on the weſt coaſt of Africa, ſouth-ſouth eaſt from Cape Negro, S. lat 20° 25′. E. long. 13°.

Ambrose.—*St. Ambroſe in the Wood*, by the Italians called *al nemo*, is an order of religious, confirmed in 1431, under the rule of St. Auguſtine.

The monks of *St. Ambroſe al nemo* wear the image of the ſaint engraven on a little plate, and make uſe of the Ambroſian office.

In the province of Berry, in France, the title of *Fathers of St. Ambroſe* is alſo given to the canons regular of St. Auguſtine, becauſe their abbey at Bourges is dedicated to St. Ambroſe de Cahors.

AMBROSIA, in the *Heathen Theology*, &c. a delicious kind of food, on which the gods were ſuppoſed to feed.

The word is compounded of the primitive particle α, and βροτος, *mortal*; becauſe it rendered thoſe who fed on it immortal, or becauſe it was the food of the immortals.

Lucian, rallying the poetical gods, tells us, that *ambroſia* and *nectar*, of which one is the meat, and the other the drink of the gods, were not ſo excellent as the poets deſcribe them; ſince theſe deities would leave them for blood and fat, which they come to ſuck from the altars like flies.

But though the ambroſia is commonly repreſented as the ſolid food of the gods, by way of contradiſtinction from the fluid, which was called *nectar*; yet the appellations are ſometimes inverted, and the name ambroſia given to the drink of the deities, as that of nectar to the meat.

Wedelius has a diſſertation on ambroſia and nectar, wherein he ſhews, that the term is ſometimes uſed to denote honey, ſometimes wine, ſometimes perfumes, and particularly ambergris; ſometimes the method and ingredients for embalming and preſerving dead bodies from putrefaction, and ſometimes alſo for a ſtate of unchangeableneſs or immortality.

Ambrosia is alſo a ſplendid kind of title given by ſome phyſicians to certain alexipharmic compoſitions of extraordinary virtue. In this ſenſe *ambroſia*, αμβροσια, amounts to much the ſame with αθανασια, *athanaſia*, as being ſuppoſed to conduce to immortality. This name was particularly given to a famous antidote of Philip of Macedon againſt all poiſons, bites, and ſtings of venomous creatures, as well as many internal diſeaſes.

Ambrosia is alſo uſed for a pure ſpirituous kind of medicine, artfully extracted from the groſs elementary parts of a body, and which being adminiſtered in the ſmalleſt doſe is of conſiderable virtue, and may be taken without diſguſt or inconvenience. In this ſenſe *ambroſia* amounts to much the ſame with what we otherwiſe call quintessence. Nic. Abr. Frambeſa has a treatiſe on the preparation of theſe *ambroſiæ*. Ambroſiopœa, Ludg. Bat. 1628, 12mo. Francof. 1629. 4to.

Ambrosia is alſo uſed by ſome of the *Ancient Writers* to expreſs what they judged to be the food of the bees.

This ſubſtance is by ſome taken to be a groſs or ſolid honey, and is contradiſtinguiſhed from the liquid or purer ſort, which is denominated *nectar*.

The ambroſia will not keep, and, if not ſpeedily ſpent, corrupts and turns ſour, making what is ſometimes called *coom*, or *ſlopping*, or, after the Greeks, *ſandarak*; highly offenſive and pernicious to the hive. See Pain *des Abeiles*.

Ambrosia, in *Antiquity*, denotes a feaſt celebrated in Ionia, and in almoſt all the countries of Greece, in honour of Bacchus, at the time of vintage.

The ambroſia were alſo denominated *choa* and *lenæa*.

They were held in the month called Lenæon, conſecrated to Bacchus.

Ambrosia, in *Mythology*, the daughter of Atlas, was one of the Hyades.

Ambrosia, formed of α and βρότος, and denoting *immortal food*, in *Botany*, a genus of the *monœcia pentandria* (*pentandria monogynia*, Gmelin) claſs and order; of the natural order of *compoſitæ nucamentaceæ*, and *corymbiferæ* of Juſſieu: its characters are as follow. Male flowers compound: the *calyx* is a common, one-leafed, flat perianthium, of the ſame length with the floſcules; the *corolla* compound, uniform, tubulous, equal, and hemiſpherical; the proper, one-petalled, tubulous, funnel-ſhaped, erect, quinquefid (trifid, Linn.); the *ſtamina* have very ſmall filaments, anthers erect, parallel, and acuminate; the *piſtillum* has a filiform ſtyle, of the length of the ſtamens, ſtigma orbiculate and membranaceous; the *receptacle* common, ſcarcely any, naked. Female flowers, below the males, doubled; the *calyx* is a one-leafed, acuminate, entire, permanent perianthium, the belly five-toothed, and one-flowered: no *corolla*; the *piſtillum* is a germ ovate, in the bottom of the calyx, ſtyle filiform, of the ſame length with the calyx, ſtigmas two, ſetaceous, long, and divaricate; the *pericarpium* a ſubovate nut, formed from the calyx hardened, one-celled, not opening, crowned with the five acuminate teeth of the calyx; the *ſeed* ſingle and roundiſh. There are five ſpecies, *viz.* 1. A. *trifida*, trifid-leaved A. "with three-lobed, ſerrate leaves." There is a variety, β. A. gigantea inodora, fol. aſperis trifidis. Ray. Hiſt. This ſpecies is a common annual weed in North America, growing often eight or ten feet high, and in a rich moiſt ſoil, ſpreading out into many branches; the flowers are not more conſpicuous than thoſe of hemp: cultivated in 1699 by Mr. C. Bobart. The ſort common in gardens has three-lobed leaves; but the larger variety β. has the lower leaves five-lobed. 2. A. *elatior*, tall A. "with leaves pinnatifid, racemes panicled, terminal, and ſmooth." This is an annual, herbaceous plant, from two to three feet in height, upright, and branched; male flowers more numerous, approximating and nodding; the female flowers fewer, ſeſſile, from three to ſix, aggregate: a native of Jamaica, in barren, ſandy, rocky ſituations, by river ſides, in the ſouthern part of the iſland; flowers there from February to June, with us in July and Auguſt; cultivated in Kew garden by Mr. S. Doody, in 1696. It has the appearance and taſte of wormwood; and the ſeeds have been imported from Virginia and Carolina, as well as from the Weſt India iſlands. 3. A. *artemiſiifolia*, mugwort-leaved A. "with bipinnatifid leaves, the firſt leaves at the origin of the branches quite entire;" differs from the ſecond in having the ſpikes of the flowers axillary; the racemes are lateral, and not terminal as in the preceding ſpecies; the primary ſtem about a foot high, is more diffuſed, and the branches four feet long: a native of North America; cultivated, in 1759, by Mr. Miller. 4. A. *maritima*, ſea A. "with multifid leaves, ſpikes ſolitary, hairy and ſubſeſſile;" riſes about two feet high: the leaves, when handled, emit a ſtrong odour; the ſpikes of the flowers are axillary; the ſpike does not ſit on a long peduncle as in the preceding ſpecies: grows naturally in Cappadocia, Tuſcany, and the county of Nice, on ſandy ſhores; cultivated in Kew garden in 1570. 5. A. *arboreſcens*, tree A. "with pinnatifid, hirſute leaves, racemes ſolitary and terminating, and ſtem ſhrubby:" a native of Peru, grows to the height of 10 or 12 feet; the ſpikes and flowers are produced at the extremities of the branches, and the female flowers grow in ſmall, ſeparate cluſters. The fifth ſpecies of Gmelin's Linnæus is A. *ſimplicifolia*, with ſimple, lanceolated leaves, and axillary, ſubſolitary leaves. Walt. Flor. Carol. p. 231.

Culture.—The ſeeds of the firſt ſpecies, ſown in Spring, will remain till the following Spring; and when the plants come up, they may be tranſplanted into a moiſt, rich ſoil, at the diſtance every way of four or five feet. If the ſeeds ripen, and are ſuffered to ſcatter, they will vegetate the following Spring, provided that the ground be not diſturbed; or if the ſeeds be ſown in Autumn, the plants will come up in the Spring, and may be treated as above. The ſecond ſort will thrive in the open air in England; but in order to obtain the ſeeds every year, they ſhould be ſown on a moderate hot-bed in March; and when the plants are two inches high, they muſt be tranſplanted into another moderate hot-bed, allowing to each plant a ſquare diſtance of three or four inches, watering and ſhading them till they have taken root, and afterwards expoſing them to the air in warm weather, and well watering them: when the plants are pretty ſtrong, they ſhould be taken up with balls of earth to their roots, and planted in large pots filled with light earth: towards the latter end of May they ſhould be placed abroad with other hardy, annual plants; they will flower in July, and their ſeeds will ripen in September. The third ſort may be cultivated in the ſame manner. The ſeeds of the fourth ſort ſhould be ſown in a warm border in Autumn; and when the plants come up in the Spring, they ſhould be tranſplanted into a warm border of poor ground; the beſt method for obtaining good ſeeds, is to plant ſome of them in lime-rubbiſh; the plant has not much beauty, and is admitted into gardens merely for variety. The fifth ſort may be propagated by cuttings or ſeeds; if the former are uſed, they ſhould be planted in a ſhady border in any of the ſummer months, and frequently watered; in four or five weeks they will have good roots, and ſhould be taken up and potted; this ſort is hardy enough to admit of being expoſed to the open air in Summer, and in Winter, if it be ſheltered in a common greenhouſe, it will live ſeveral years; the ſeeds that are ſown in the Spring will ſeldom come up the ſame year, but thoſe which fall, or are ſown in Autumn, will come up the following Spring. Martyn's Miller.

Ambrosia. See Artemisia and Cochlearia.

AMBROSIACA, in *Ornithology*, a ſpecies of Hirundo, or ſwallow, that inhabits Senegal, and ſmells particularly ſtrong of ambergris. It is of a greyiſh brown colour, bill blackiſh, legs brown. Gmel. Linn. Syſt. The length is five inches and an half, bill half an inch, the plumage darkeſt on the head and quills, and the tail very forked. This is the hirundo riparia Senegalenſis of Briſſon. av. ii. p. 508. N° 13. L'Hirondele ambrée of Buffon. Oiſ. vi. p. 612.; and ambergris ſwallow of Lath. Gen. Syn. iv. p. 568.

Amerosiaca β. It is uncertain whether this ſhould be conſidered as a diſtinct variety of the preceding ſpecies, or merely a ſexual difference. Dr. Latham deſcribes it as "cineraſcens ſubtus cinereo-alba, cauda elongata maxime forficata;" (Ind. Orn. tom. ii. 575.) general colour inclining to grey, beneath cinereous white, tail long, and greatly forked; its length is five inches. This was obſerved in the collection of Sir Joſeph Banks, Bart. after the former had been deſcribed, and was publiſhed in the ſupplement of the Gen. Syn. It is ſuppoſed to inhabit China.

AMBROSIAN *rite*, or office, denotes a particular office or formula of worſhip, uſed in the church of Milan, which is ſometimes alſo called the Ambroſian church.

The denomination takes its riſe from St. Ambroſe, archbiſhop of Milan, in the fourth century, who is uſually ſuppoſed to have been the author of this office. Yet ſome are of opinion the church of Milan had an office different from that of the Roman and other churches of Italy before the time

time of that father. In effect, till the time of Charlemagne, each church had its ſeveral office: and when in after-days the pope took on him to impoſe the Roman office on all the other churches of the Weſt, that of Milan ſheltered itſelf from the impoſition, under the name and authority of St. Ambroſe; from which time the phraſe Ambroſian rite has obtained, in contradiſtinction to the Roman rite.

The public library of Milan is alſo called the *Ambroſian Library*.

We alſo meet with the *Ambroſian chant*, or ſong.

AMBROSIAN CHANT. There are few writers on eccleſiaſtical muſic who do not ſpeak of the *Ambroſian chant*, and of its being different from the Gregorian; but no ſatisfactory account has been given of their ſpecific difference; nor was I able (ſays Dr. Burney) in hearing the ſervice performed at the Duomo in Milan, (whereit is ſaid to be preſerved in all its purity), or by a peruſal of the Miſſals, or other books on *canto fermo* publiſhed in that city, to diſcover any conſiderable deviation from the plain ſong uſed in the ſervice of other cathedrals in France or Italy, where the Gregorian chant is ſaid to ſubſiſt. The truth is, that there are no veſtiges of the Ambroſian chant remaining, ſufficient to aſcertain its peculiar character. The fragments of it that Gafurio has inſerted in his Practica Muſica are very ſuſpicious, not only as they have a much more modern appearance than even the ancient Gregorian chants that are come down to us, but on account of the *number* of modes in which he gives them, which amount to eight; whereas all writers on theſe ſubjects agree in ſaying that St. Ambroſe only uſed the four authentic modes, and that the four plagal were added afterwards by St. Gregory. Thoſe who pretend to know the difference between the Ambroſian and the Gregorian canto fermo, tell us, that it is louder, higher, and of greater compaſs—*fortior, durior, et magis extenſa*; but this conveys nothing to the mind of a muſician as to the difference in the melody of the two chants. See GREGORIAN CHANT, CANTO FERMO, and PLAIN SONG.

AMBROSIN, in *Middle Age Writers*, denotes a coin ſtruck by the lords or dukes of Milan, whereon was repreſented St. Ambroſe on horſeback, with a whip in his right-hand. The occaſion of this coinage is ſaid to have been a viſion of that ſaint, who appeared to the Milaneſe general in 1339, during the time of a battle.

AMBROSINIA, ſo named in honour of the two brothers Bartolomeo and Hyacinto Ambroſini, for 52 years profeſſors of botany at Bologna, in *Botany*, a genus of the claſs and order of *gynandria polyandria* of Miller, *monoecia monandria* of Schreber, *polyandria monogynia* of Swartz, and *polyandria polygynia* of Gmelin's Linnæus, of the natural order of *piperitæ*, and *aroideæ* of Juſſieu: its characters are, that the *calyx* of the *males* is a ſpathe, one-leafed, cowled, convolute at the baſe, and converging at the tip, partition membranaceous. (Spadix *Baſs.*), divided into two cells communicating at top; no *corolla*; theſtamin a have no filaments; the anthers are very many, ſolitary, within the hinder cell of the ſpathe, in the upper part of the partition, digeſted in a diſtinct order; the nectaries are two, roundiſh, concave, at the baſe of the anthers. The *calyx* of the *female* is a ſpathe common with the males; no perianthium; the *piſtillum* has a germ in the anterior cell of the ſpathe, and the lower part of the partition, ſolitary and roundiſh; the ſtyle cylindrical, ſhorter than the ſpathe; the ſtigma obtuſe; the *pericarpium* a roundiſh one-celled capſule; the *ſeeds* are very many, ovate and neſtling. There is one ſpecies, *viz.* A. *Baſſii*, ariſarum of Moriſon, Ray, and others, a native of Sicily near Palermo, firſt found, deſcribed and figured by Bocconi, requiring the protection of a green-houſe, and capable of being increaſed from the root.

AMBROSIUS, AURELIANUS, or AURELIUS AMBROSIUS, in *Biography* and *Hiſtory*, a famous general, and afterwards king, of the ancient Britons, was of Roman extraction, and is ſuppoſed to have been the ſon of one of the kings elected by the Britons after the Romans had left the iſland. He was educated at the court of Aldroen, king of Armorica, and ſent over at the requeſt of the Britons with 10,000 men under his command, to aſſiſt them againſt the Saxons, whom Vortigern their king had invited into Britain.

His ſucceſs in this expedition was ſo conſiderable, that, after the death or abdication of Vortigern, Ambroſius, probably king of the Dammonii, in conſequence of the death of his father, was elected to the pendragonſhip or ſovereignty of all England; which ſupreme office he exerciſed with great honour to himſelf and benefit to his ſubjects. During his reign, and under his direction, the famous Arthur obtained ſeveral victories, and was eminently ſucceſsful in reſtraining the progreſs of the Saxons among the Northern Britons. Ambroſius, after diſtinguiſhing himſelf by his valour on ſeveral occaſions, and by his zeal, as it is ſaid, in regulating the affairs of the church, died at Wincheſter, according to the report of Geoffrey of Monmouth, of poiſon, adminiſtered by a Saxon diſguiſed as a phyſician, and hired for the purpoſe by one of the ſons of Vortigern, or, according to the more generally received opinion, was killed in a battle fought in 508, againſt Cerdic, one of the Saxon generals. Geoffrey of Monmouth pretends that Ambroſius built STONE-HENGE, near Saliſbury, in commemoration of 300 Britiſh noblemen, who were maſſacred by the Saxon general, Hengiſt. Polydore Virgil ſays, that this edifice was erected by the Britons as a monument to their general Ambroſius, on the place where he fell in battle, to perpetuate the memory of the illuſtrious ſervices which he performed for his country. But both theſe ſtories are rejected as fabulous by the beſt antiquarians, though they are by no means agreed as to the true origin of this building. Biog. Brit.

AMBRY, the place where arms, plate, veſſels, and every thing belonging to houſe-keeping, were formerly kept.

Hence, probably, the *ambry* at Weſtminſter was ſo called, becauſe formerly ſet apart for that uſe; or rather, from *aumonery*, a houſe adjoining to an abbey; in which the charities were laid up and diſtributed to the poor. The word is ſtill uſed in Scotland, in the ſame ſenſe.

AMBRYM, or AMBRIN, *iſland*, in *Geography*, one of the New Hebrides in the ſouth Pacific Ocean, S. lat. 16° 9′ 30″. E. long. 168° 12′ 30″. It has a volcano, and is about 50 miles in circumference.

AMBRYSUS, or AMBRYSSUS, in *Ancient Geography*, a town of Greece in the Phocide. M. d'Anville places it between two chains of mountains, weſt of Lebadea, and north-weſt of Anticyra. It is called by Pauſanias Amphryſſus. This town was ſeparated from Delphi by Mount Parnaſſus; and it was fortified by the Thebans, in their war with Philip of Macedon. Near it was a temple of Diana Dictynnea, to which the inhabitants paid peculiar homage. Her ſtatue was of black marble. Pauſan. lib. x. c. 36.

AMBUBAJÆ, in *Antiquity*, a kind of wanton minſtrels about Rome, who lived by playing on the flute, dancing in places of reſort, and proſtituting their bodies for hire.

Authors ſpeak as if there had been a regular college, or community of ambubajæ, and that theſe were the ſame with

what were otherwiſe called *tilicinæ*. Thus Horace, ſat. i. ſpeaks of

" Ambubajarum collegia, Pharmacopolæ."

Some ſuggeſt that the ambubajæ were of the male kind, only dreſſed in the habit of women.

Antiquaries have been greatly divided about the ambubajæ; ſome will have them to have come to Rome out of Syria; others ſuppoſe them to have been Roman women, though called by a name of Syriac origin.

Torrentius, Turnebus, and Pulmannus, derive the name from *amba*, or *am*, an old Latin prepoſition, denoting *circum*, *about*, and *Baja*, a delicious place near Naples; and maintain, that the ambubajæ were a kind of courtezans, who frequented the baths of that city. Cruquius is of a different opinion, taking the word ambubajæ to have been uſed for *ambubeja*, and primarily to denote a ſeller of *ambubeja*, an herb mentioned by ancient naturaliſts. Theſe ſellers of ambubeja being a kind of empirics, their name became afterwards applied to all charletans, and quacks.

Others ſay, that ambubaia is a Syrian word, and that in the Syriac language, it denotes a flute, or the ſound of a flute. From Juvenal it appears, that Syria was famous for furniſhing the beſt players and muſicians. Thus he ſays, ſat. iii. 62.

" Jam pridem Syrus in Tiberim defluxit Orontes,
Et linguam, et mores, et cum tibicine chordas
Obliquas, necnon gentilia tympana ſecum
Vexit, et ad Circum juſſas proſtare puellas."

Suetonius exhibits the emperor Nero as attended by theſe Syrian women, and Roman courtezans at table; thus, " Cœnitabat non nunquam—inter ſcortorum totius urbis, et ambubajarumque miniſteria." The followers of the profeſſion of female flute-players became ſo numerous and ſo licentious at Rome, that their occupation was prohibited in the Theodoſian code; but with ſo little ſucceſs, that in the time of Juſtinian, as we are informed by Procopius, the ſiſter of the empreſs Theodora, who was a flute player, or tibicina, appeared on the ſtage without any other dreſs than a ſlight ſcarf thrown looſely over her. Theſe performers even became ſo common in all private entertainments, as well as at public feaſts, where they frequently obtruded themſelves, uninvited, that towards the cloſe of this reign their profeſſion was regarded as infamous, and utterly aboliſhed.

Hoffman has a diſcourſe on the ambubajæ.

AMBUBEIA, in *Botany*, a name given, by ſome authors, to wild ſuccory.

AMBUELLA, or Amboilla, in *Geography*, a country of Africa, in the kingdom of Congo, between the lake of Aquelond and St. Salvador.

AMBULANS, in *Entomology*, an inſect of the Podura genus, deſcribed by Linnæus; it is white, with an extended tail, and lives amongſt moſſes. This is the " Podura terreſtris nivea," of Degeer Inſ. vii. p. 33. n. 6. tom. iii. f. 5.

Ambulans, a ſpecies of Cryptocephalus, one of the new genera, adopted by Gmelin in the Linnæan arrangement, from Geoffroy and Fabricius. This inſect is a native of Germany, is black, ſhining, and has the wing-caſes punctured. Fab. et Gmel. It approaches Cryptocephalus elongatus, very nearly, and the antennæ of both ſpecies are ſerrated, but the thorax of the latter is rufous and downy, which in the former is black.

AMBULANT, or Ambulatory, a name formerly given in France to thoſe commiſſioners or clerks of the king's farms, who had no ſettled office, but viſited all the offices within a certain diſtrict, to ſee that nothing was done in them againſt the king's right, and the intereſt of the farm.

Ambulant is alſo uſed to denote thoſe brokers at Amſterdam, or exchange agents, who have not been ſworn before the magiſtrates. They tranſact brokerage buſineſs, but their teſtimony is not received in the courts of juſtice.

AMBULATION, or walking. See Exercise.

Ambulation, in *Phyſic*, is uſed by ſome for the ſpreading of a gangrene or mortification.

AMBULATOR, in *Entomology*, a ſpecies of Lamia, figured by Petiver, Gazop. tab. 37. fig. 6. and deſcribed by Fabricius. The anterior part of the thorax is armed on each ſide with two ſpines, and the body is clouded with cinereous and cheſnut. It is properly a cerambyx of Linnæus. See Lamia.

AMBULATORIUS, a ſpecies of Ichneumon, with a yelloviſh ſcutellum, and ſpotted thorax, the ſecond joint of the abdomen ferruginous brown, the margins of the others white. This inſect is very rare, it inhabits Great Britain, and was firſt deſcribed by Fabricius in the Species Inſectorum, from a ſpecimen in the cabinet of Sir Joſeph Banks, Bart. The ſpecies was known to Linnæus, and his lateſt editor Gmelin has adopted the above Fabrician ſpecific character. The head of this creature is black, the antennæ yellow beyond the middle, the thorax is black, with a yelloviſh line in the anterior part, and a ſpot of the ſame colour before the baſe of the wings: the abdomen is black, except the ferruginous or ſecond joint, and the white margins of the third, fourth, and fifth.

AMBULATORY, formed from *ambulare*, *to walk*, a term anciently applied to ſuch courts, &c. as were not fixed to any certain place; but held ſometimes in one place, and ſometimes in another.—In oppoſition to ſtationary courts.

The court of parliament was anciently ambulatory; ſo alſo were the courts of king's bench, &c.

We ſometimes alſo ſay, in a legal ſenſe, a man's will is ambulatory to the time of his death; meaning, that he has it always in his power to revoke it.

AMBULIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs and order; the eſſential characters of which are, that the *calyx* is quindentated, the *corolla* tubuloſe, quadrifid, with unequal ſegments; and the *capſule* pentagonous, ſingle-celled, and ſingle-ſeeded. There is one ſpecies, *viz.* A. *monoſperma* of Gmelin, or A. *aromatica* of La Marck, who repreſents the capſule as polyſpermous. This plant, particularly deſcribed by La Marck, (Encycl. tom. i. p. 128.) grows in Malabar, in a ſandy and watery ſoil, and appears to be annual. All its parts have a ſweet and aromatic ſmell, reſembling that of pepper, when it is green. Its taſte is bitteriſh; and it is adminiſtered in a decoction, for allaying fevers, and in four milk in caſes of vertigo. La Marck ſuggeſts that it is the manga-nari of Rheed, and the terebinthiana of Rumphius.

AMBULII, in *Mythology*, a name given at Lacedæmon to Jupiter, Minerva, Caſtor, and Pollux, where they had altars before a large portico, in which the inhabitants were accuſtomed to walk. They are ſaid to have derived their name from αμβολη, delay, becauſe it was thought that thoſe deities had it in their power to retard the inſtant of death.

AMBULON, in *Botany*, a tree which grows in the iſland

iſland of Aruchit, and the fruit of which is white, and reſembles that of ſugar, and about the ſize of the coriander ſeed. La Marck ſuggeſts that it is a ſpecies of GALLIUM, the fruit of which contains a white duſt reſembling that of ſugar, but is a ſort of wax of which are made bougies. It is probably the *Myrtus Brabanticæ ſimilis*, &c. mentioned by Plukenet, in his Almageſt, p. 260. Ray mentions a tree called Ambulong, which, he ſays, is a ſort of palm, the fruit of which grows in large cones, like the NIPA.

AMBURBIUM, or AMBURBIALE *Sacrum*, in *Antiquity*, a religious feaſt or ceremony, practiſed among the Romans, in which they made proceſſions around their city. See a deſcription of an amburbiale in Lucan's Pharſalia. lib. i. v. 392, &c. Hence alſo we have *amburbiales victimæ*, the victims carried along in the proceſſion, and afterwards ſacrificed.

The word is compounded of *ambio*, *I go round*; or of *amb*, or *ambu*, an ancient prepoſition, ſignifying *around*, and *urbs*, *a city*.

Scaliger, in his notes on Feſtus, followed by many others, maintains the amburvia to be the ſame with amburvalia. Servius, however, expreſsly diſtinguiſhes between the amburvia and amburvalia, and ſays, the one was performed in the city, and the other in the country.

AMBUSCADE, AMBUSH, AMBUSHMENT, in *Tactics*, a body of men who lie in a wood, &c. in readineſs to ruſh out upon, or incloſe an enemy unawares.—Or, the place wherein ſuch a corps hide themſelves.

Ambuſcades in battle are certain arrangements or diſpoſitions, in which a general, by drawing back one of his wings, or his centre, or even his whole army, entices the enemy to follow him, and by theſe means draws him into ſome ſnare, which he has prepared for receiving him. No general in ancient times ever manifeſted a greater talent for ſtratagems, or uſed them with better ſucceſs, than Hannibal. He defeated Sempronius on the banks of the river Trebia, by means of an ambuſcade, compoſed of a thouſand horſe and a thouſand foot, placed in ravins and buſhes near this river, by which the two armies were then ſeparated. Minutius, who commanded the Roman army jointly with Fabius, fell into a ſimilar ambuſcade at Gerunium. On another occaſion Hannibal ſurpriſed the conſuls Criſpinus, and C. Marcellus. Livy.

Amongſt the moderns, the eaſtern nations, though little verſed in tactics, are, perhaps, of all people, thoſe who beſt underſtand the art of ſtratagem; thus endeavouring to compenſate for the defects of other parts of their military diſcipline. A ſingular inſtance of a well-contrived and ſucceſsful ambuſcade is furniſhed by the hiſtory of Thamas Kuli Khan, the famous uſurper of the throne of Perſia. Whilſt he was beſieging Gangea, a city on the confines of Armenia, he received intelligence, that the Ottoman army, conſiſting of more than 100,000 men, was advancing to ſuccour the place; upon which he immediately raiſed the ſiege, joined a body of troops commanded by his ſon, and encamped on the plains of Erivan: but ſome mountains, which were on his rear, ſuggeſted to him the idea of inſuring victory by a ſtratagem. This ſtratagem he conducted with ſo much art and aſſiduity, that by a feigned retreat he allured the Turks into a purſuit, and at length into the defiles prepared in the mountains; when they ſuddenly found themſelves attacked by the Perſian artillery in ambuſh, and abyſſes opened under their feet, by the ſpringing of mines, which ſwallowed up whole battalions of them. The Turks, on this occaſion, loſt 50,000 men, their artillery, baggage, and military cheſt; and among the killed were nine baſhaws, with the general in chief, Abdoual Cuperli. Similar inſtances of ſucceſsful ambuſcades frequently occur among the Aſiatics, who have recourſe to them on a greater variety of occaſions than the Europeans.

AMBUSTA, in *Entomology*, a ſpecies of PHALÆNA of the *noctua* family. Thorax creſted; wings incumbent, greyiſh-brown, with three yelloviſh ſtreaks, an annule in the middle, and an undulated ſtreak behind.—This moth is produced from a naked brown larva, with white lines. The antennæ are ferruginous, white at the baſe; head, and thorax reddiſh grey. Poſterior wings white, tips brown. Inhabits Auſtria, on Lichen parietinus. Fabricius.

AMBUSTA, or AMBUSTIO, in *Surgery*, a ſolution of continuity, cauſed by the application of heated ſubſtances. See BURN and SCALD.

AMBUSTUS, in *Ornithology*, a ſpecies of FALCO. The body is pale tawny, front of the head between the eyes and bill naked, cere large, legs bluiſh. Gmel. Linn. This is the tawny vulture of Brown and Latham. The bill is duſky, ſhort and thick, cere large, and beſet with briſtles, the chin bearded with a tuft of long ſlender feathers: head, neck, breaſt, belly, and thighs, pale tawny: coverts of the wings intermixed with brown; tail dirty white, with brown bands: legs ſlender, bluiſh claws, long and ſlightly bent. The length of this bird is two feet four inches; it inhabits Falkland iſlands.

AMBY, in *Geography*, a town of the Auſtrian Netherlands, in the province of Limburg, oppoſite to Maeſtricht, and on the eaſt ſide of the river Maeſe.

AMBUTUA. See PAREIRA *Brava*.

AMCHITCHE, one of the Fox iſlands in the North Pacific Ocean. N. lat. 53° 22′. E. long. 178° 14′.

AME, ſoul, is made a muſical term by the French, for feeling and expreſſion. As to its effect in the *airs tendres* of their old muſic, it degenerated into over-charged tenderneſs, diſpleaſing to all ears but their own.

AMEA, in *Botany*, a name given, by the natives of Guinea, to a plant which they uſe in bleeding at the noſe, drying and powdering the leaves, and ſnuffing up the powder. It ſeems to be of the family of the plant called *pajamirioba*, by Sir Hans Sloane, in his Jamaica Catalogue. Its leaves are large and alated, and of a beautiful green, even when dried. Phil. Tranſ. N° 232.

AMEDABAD, in *Geography*. See AMHEDABAD.

AMEDAN, a town of Perſia in the province of Taberiſtan, 20 leagues S. S.W. of Amol.

AMEDEI, *Amedians*, in *Eccleſiaſtical Hiſtory*, formed of the Latin *amans Deum*, q. d. *lover of God*, or rather of *amatus Deo*, *beloved of God*, a congregation of religious in Italy, inſtituted in 1400.

The Amedei wore a grey habit, and wooden ſhoes, had no breeches, and girt themſelves with a chord. They had twenty-eight convents, and were united by Pope Pius V. partly with the Ciſtercian order, and partly with that of the Soccolanti, or wooden-ſhoe wearers.

AMEDEUS, in *Biography*, a monk; was biſhop of Lauſanne about the middle of the 12th century. His "Sermons in praiſe of the Virgin Mary," printed at Baſil in 1537, and at Antwerp in 1600, are included in the Bibliotheca patrum. Dupin.

AMEDNAGUR, in *Geography*, a country or Soubah of Hindoſtan, bounded on the north by Candeiſh and Malwa,

on the weſt by the Gatte or Balagat mountains, on the ſouth by Bejapour or Viſiapour, and Tellingana, and on the eaſt by the province of Berar.

AMEDNAGUR is alſo a capital of the above Soubah, now called Dowlatabad, ſituate at the foot of the Balagât mountains, 105 miles N.N.W. of Viſiapour, and 65 N.E. of Poonah. This city has been generally placed 30 miles S.E. of its true poſition. N. lat. 17° 6′. E. long. 74° 52′. See AHMEDNAGUR.

AMED. See DIARBEKIR.

AMEENABAD, or AMINABAD, a town of Hindoſtan, in the country of Lahore; 30 miles north of Lahore. N. lat. 31° 30′. E. long. 72° 40′.

AM-EIS, a town of Germany, in Carinthia, on the Drave, five miles W.S.W. of Lavamund.

AMEIVA, in *Zoology*, a ſpecies of LACERTA, having a verticillated long tail, thirty abdominal ſcales, and a kind of collar conſiſting of a double wrinkle beneath. Linn.

The ameiva inhabits America. Dr. Shaw ſays it is principally found in South America, but that it is ſaid to occur in ſome parts of Aſia and Africa. "This creature varies conſiderably in colour, but is commonly blue or bluiſh green above, with ſomewhat irregular variegations of black and white, which are ſometimes diſpoſed in ſtreaks, and ſometimes in ſpots or patches; and commonly in ſuch a manner as to leave ſeveral whitiſh, or pale blue round ſpots ſcattered on different parts of the body and limbs; the under parts are duſky, with more or leſs of a bluſh caſt, and often marked here and there with ſmall whitiſh ſpots."—Dr. Shaw. Zool.

AMELANCHIER, in *Botany*. See CHIONANTHUS and MESPILUS.

AMEL, ſee ENAMEL.

AMELANDT, in *Geography*, an iſland in the German Ocean, about four leagues long, and one wide, ſituated about two leagues north from the main of Friſland. N. lat. 53° 30′. E. long. 6° 12′.

AMELBUREN, a town of Germany, in the circle of Weſtphalia and biſhopric of Munſter, ſix miles ſouth of Munſter.

AMEL CORN, in *Agriculture*, the ſame with SPELT-CORN.

AMELIORATING SUBSTANCES, in *Agriculture*, are ſuch, either of the animal or vegetable kind, as, when applied to land, render it more fertile and productive.

AMELIORATING CROPS, are ſuch as are ſuppoſed to improve the lands on which they are grown. Moſt of thoſe plants which have a large ſtem and ſhady leaf are thought to render the ſoils on which they are produced more fertile. Carrots, turnips, artificial graſſes, and many other green vegetables, are in general conſidered as ameliorating crops; but it is probable, that all ſorts of vegetables, carried off the land, are in ſome degree or other exhauſters of the ſoil; and that green crops, ſuch as have been juſt mentioned, are only leſs ſo, than ſuch crops of grain or other vegetables as contain large proportions of gluten, or vegeto-animal matter in their compoſitions. The improvement of lands, therefore, by what are termed ameliorating crops, in a great meaſure probably depends either upon the culture, which the ground receives while they are growing, and the returns which they make to it in the way of manure, after decaying, or being conſumed by animals, or from their taking up only ſuch ſorts of matters as are not neceſſary to the ſucceeding crop.

AMELI, in *Botany*, *Karetta-Amelpodi* of Rheed, Malab. is a tree about ſeven feet high, with a ſlight ſtem, and white wood, covered with brown bark. The leaves are oppoſite, ovate-lanceolated, pointed at the two ends, thick, entire, ſoft, ſmooth, gloſſy, of a blackiſh green above, and greeniſh below. The flowers are white, and grow at the ſummit of the branches, diſpoſed in ſhort panicles, and corymbiform. Each flower has a corolla with five oval-pointed petals, opening in a ſtar, thick, white above, and ſtriated with red lines below; the ſtamina are five, a little longer than the petals, white, withered anthers, and an ovary with a purpliſh ſtyle, forked at its ſummit. The fruit is a roundiſh capſule, of a brownith green colour, gloſſy, with three cells; but Rheed does not mention its ſeeds. This tree grows on the coaſt of Malabar, in ſandy ſtony ſoil. It is always green; flowers all the year, and produces mature fruit about the month of Auguſt. The decoction of its leaves in water is recommended as a ſovereign remedy in colics. Its leaves and roots, boiled in oil, furniſh a topic which is ſaid to be efficacious in reſolving large tumours. Rheed mentions another ſpecies of Ameli, which he calls *Kattou-belutta amelpodi*, ſomewhat ſmaller than the former, but little differing from it in other reſpects; it grows in the mountainous and uncultivated parts of Malabar. La Marck, Encycl. tom. i. p. 12).

AMELIA, in *Geography*, a county of Virginia, in North America, ſituate between the Blue ridge and the tide waters, having Cumberland county to the north, Prince George county to the eaſt, and Lunenburg county to the ſouth and weſt. Amelia, including Nottaway, a new county, contains 18,097 inhabitants, of whom 11,037 are ſlaves.

AMELIA *iſland*, lies on the coaſt of Eaſt Florida, in America, about ſeven leagues north of St. Auguſtine, and very near Talbot iſland on the ſouth, at the mouth of St. John's river. It is thirteen miles long, and two broad, is very fertile, and has an excellent harbour. Its north end lies oppoſite to Cumberland iſland, between which and Amelia iſland is the entrance into St. Mary's river, in N. lat. 30° 52′. W. long. 67° 23′.

AMELIA, anciently AMERIA, a ſmall town of Italy, ſeated on a mountain in the duchy of Spoleto, and the reſidence of a biſhop, holding immediately of the pope, fourteen miles ſouth of Todi. N. lat. 42° 33′. E. long. 13° 2′.

AMELIUS, GENTILIANUS, in *Biography*, a Platonic philoſopher, was born in Tuſcany, chiefly reſided at Apamea in Syria, and flouriſhed about the year of Chriſt 263. Having been inſtructed in philoſophy by Lyſimachus, he became the diſciple of Plotinus, and continued with him at Rome 24 years, viz. from the year 246 to the beginning of the year 269. His talents and taſte were ſo ſimilar to thoſe of his maſter, that he was ſoon admitted into his friendſhip, and employed by him in reſolving queſtions propoſed by his diſciples, and refuting the objections and calumnies of his enemies. Here he commenced an intimate acquaintance with Porphyry, who, during the laſt ſix years of his reſidence at Rome, was his fellow diſciple and companion, and who repreſents him as the moſt ſtudious and laborious of all the diſciples of Plotinus. He made large collections from the lectures and diſputations of the ſchools: and in a work of his own, conſiſting of 40 books, he refuted Zoſtrianus, a Chriſtian heretic, who confounded the doctrines of the goſpel with thoſe of the philoſophers. He alſo vindicated his maſter from a charge of plagiariſm, in a treatiſe "On the difference between the Doctrine of Numenius and that of Plotinus." His works, amounting,

as

as it has been ſaid, to 100 volumes, are loſt. Longinus ſpeaks of him as a verboſe writer, but ſays, that Amelius and Plotinus were the only philoſophers, who, in his time, publiſhed works that were worth procuring. Euſebius, Cyril, and Theodoret cite a paſſage from his writings, in which he refers to the Evangeliſt John, and quotes the beginning of his goſpel in confirmation of Plato's doctrine concerning the divine nature. His proper name, as we learn from Porphyry, was Gentilian; and he choſe to have his ſurname written with an *r*, *Amerius*, as it is in Eunapius, and not *Amelius*; the laſt in Greek denoting negligence, the former integrity. He ſurvived his maſter Plotinus ſome years, and probably died at Apamea. Porphyr. Vit. Plot. apud Fabr. Bib. Græc. tom. iv. p. 104. Suidas. Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 70. Lardner's Works, vol. viii. p. 160.

AMELLOIDES, in *Botany*. See CINERARIA.

AMELLUS, a genus of the *ſyngeneſia polygamia ſuperflua* claſs and order; of the natural order of *compoſitæ oppoſitifoliæ*, and *corymbiferæ* of Juſſieu: its characters are, that the common *calyx* is imbricate, roundiſh, (ſcales linear, preſſed cloſe) the *compound corolla* is radiate, corollets hermaphrodite, very many in the diſc, females very many in the ray; *proper* of the hermaphrodite tubulous, five-cleft, female ligulate, lax, two or three-toothed; the *ſtamina* in the hermaphrodites, have five capillary, ſhort filaments, anther cylindrical and tubulous; the *piſtillum* in the hermaphrodites has an obovate germ, ſtyle filiform, of the length of the ſtamens, ſtigmas two, and filiform; females very like the hermaphrodites; no *pericarpium*; *calyx* unchanged; *ſeeds* to the hermaphrodites ſolitary, obovate; down capillary, to the females very like the others; the receptacle chaffy. Obſ. The teeth in the corollets of the ray are ſcarcely viſible. Martyn reckons two; Gmelin and La Marck three, ſpecies. 1. A. *Lychnitis*, trailing A. verbeſina aſteroides of Linn. ſpec. edit. 1. chryſanthemum Africanum of Breynius, "with leaves oppoſite, lanceolate, obtuſe, downy, peduncles one-flowered." This ſpecies riſes from two or three feet high, ſending out branches on every ſide, terminated by flower-ſtalks, each ſupporting one violet-coloured flower, with a yellow diſk, ſhaped like thoſe of the aſter, and appearing in July or Auguſt. The down is villoſe with few rays; a native of the Cape of Good Hope; cultivated in Kew Gardens, by Mr. Miller, in 1768. 2. A. *umbellatus*, umbelled A. ſolidago villoſa, &c. of Brown Jam. "with leaves oppoſite, three-nerved, downy underneath, flowers umbelled." This ſpecies has herbaceous, upright, ſimple round hairy ſtems, two or two and a half feet high; the leaves at firſt radical, petioled, wedge-ſhaped at the baſe, ſomewhat decurrent and ſerrate, nerved, ſmooth, dark green, white and ſoft beneath; the ſtem towards the top generally divided into three branches, each of which is ſubdivided into many ſmall flower branches, forming a ſort of umbel; the umbellules have from three to eight flowers, with linear leaflets, the peduncles an inch long, each ſuſtaining one large yellow flower; the ſcales of the calyx lanceolate, membranaceous, and hoary; the ſeeds obconical; the down ſeſſile and hairy; the receptacle hirſute. It has the habit of tuſſilago, and would be of that genus, if the down were ſtipitate, and the receptacle naked. It is connected with the firſt ſpecies by the briſtly chaffs between the florets. It is a native of Jamaica, in the rocks, woods, and mountains, and flowers there in Summer. 3. A. *tenuifolius*, ſlender-leaved A. amellus fruticoſus, "with alternate linear leaves, and one-flowered branches." This ſpecies is about fifteen inches high; its ſtem is woody, and divided at the bottom into cylindric branches, hairy, leafy, and generally ſimple; the leaves one line and a half long, and one line and a half broad, are ſtraight, linear, ſoft, pubeſcent and alternate, the flowers terminating, the branches are ſolitary, and reſemble thoſe of the firſt ſpecies in their form and colour; the ſcales of their calyx are ſtraight, very acute, hairy, and almoſt equal to one another; the receptacle contains ſmall ſeeds. The account of this plant was communicated by M. Sonnerat to La Marck. It was found at the Cape of Good Hope. Its wood is yellow. 4. A. *caroliniamus* of Gmelin, "with oppoſite, ſublanceolate, ſubſerrate leaves, the peduncles double, one-flowered and axillary." Walt. Flor. Carol. p. 213.

The firſt ſpecies is a perennial plant, and may be eaſily propagated by cuttings, planted in the ſhade in the Summer months, and well watered. The plant ſhould be taken up with beds of earth, and put in pots, ſo as to be ſheltered in winter, under a common frame or in a green houſe, with plenty of air in mild weather. The ſecond ſpecies may be propagated by ſeeds ſown on a hot-bed in ſpring; two or three of the plants, when they are fit to be removed, ſhould be planted in pots, and plunged into a hot bed of tan, ſo as to get ripe ſeeds in the autumn, otherwiſe the plants will require a ſtove in winter. Martyn's Miller.

AMELLUS. See CALEA and ERIGERON.

AMELLUS *Virgilii*. See ASTER.

AMELOT DE LA HOUSSAYE, ABRAHAM NICHOLAS, in *Biography*, was born at Orleans in 1634, and formed under the preſident of St. Andrè, ambaſſador at Venice, who employed him as his ſecretary. His manner and his writings were alike auſtere; and as he never roſe much above indigence, he was often indebted to the liberality of his friends. The events of his life are little known; and he died at Paris in 1706, in the 73d year of his age. His writings are numerous, and attracted notice, as he wrote with freedom on political ſubjects. The principal of his works, which were written in French, are the following:—"A Tranſlation of Father Paul's Hiſtory of the Council of Trent," 4to. 1686, well received, and highly commended by the aſſertors of the liberty of the Gallican church, now greatly ſuperſeded by that of Courayer; "A Tranſlation of Machiavel's Prince," 12mo. with notes, vindicating that writer from the charge of having taught aſſaſſination and poiſoning; "A Tranſlation of Gratian's Courtier," 12mo. with moral and political reflections; "A Tranſlation of the Annals of Tacitus," with valuable notes of a political kind; "The Hiſtory of the Government of Venice," in 3 vols. 12mo. printed in 1714, with "An Inquiry into the original Liberty of Venice, tranſlated from the Italian," which gave great offence to the Venetian ſtate; "The Morals of Tacitus, "extracted from his Annals, 12mo. a work that has been much read; "Memoirs, Hiſtorical, Political, Critical, and Literary," a poſthumous work, abounding with ſatirical anecdotes. Amelot was at one period of his life confined in the Baſtile; but the cauſe of his impriſonment is not now known. Probably ſome of his free political writings might incur diſpleaſure. Gen. Dict.

AMELOTTE, DENNIS, a prieſt of the Oratory, and a famous writer among the Roman Catholics, was born at Saintes, in 1606, ordained prieſt in 1632, and maintained a great correſpondence with the fathers of the Oratory. He publiſhed at Paris, in 1643, a life of Charles de Gendron, ſecond ſuperior of that congregation, which contained reflec-

tions

tions on the famous abbot of St. Cyran, the [illegible] the resentment of the gentlemen of Port Royal excited them to write a libel against the author; but [illegible] ample retaliation, fo that he did them greater prejudice than the whole body of Jefuits. The work which principally deferves to be mentioned is, "The French Tranflation of the New Teftament, with Annotations," in 4 vols. 8vo. printed in 1667, 1667, and 1675. His firft object in this tranflation was to find expreffions more proper and elegant than thofe of the former verfions, and with this view he obtained the affiftance of M. Conrart, a proteftant, well fkilled in the French language, but ignorant of Greek and Latin, fo that in turning a period he perverted the true fenfe of the text, or enervated its force, for want of being able to conful the original. In the preface to the firft edition he boafted that he had confulted the manufcripts of the Vatican, and many others, but afterwards he confeffed that he had never feen any of them. He alfo wrote "An Abridgment of Divinity;" "A Catechifm for the Jubilee;" "A kind of Chriftian Manual;" (Journée Chretienne) and "A Harmony of the Gofpels," in 12mo. publifhed in French, in 1669, and in Latin in 1670. Amelotte entered into the congregation of the Oratory in 1650, and continued with them till his death in 1678. Gen. Dict.

AMEN, a fcriptural and eccleſiaſtical term, uſed as the concluſion of all ſolemn prayers, &c. and ſignifying *ſo be it*, or *fiat*.

The Hebrews had four kinds of *amen*. That juſt mentioned they called *amen paſt*, which was accompanied with the greateſt attention and devotion: in this ſenſe the word has paſſed into almoſt all languages, without any alteration.

Some authors are of opinion, that the word amen is formed of the initial letters of theſe words, *Adonai, Melech Neeman, Dominus Rex Fidelis;* an uſual expreſſion among the Jews when they would give weight or ſanction to any thing they ſaid. In effect it is known that to expreſs the words אדני מלך נאמן *Adonai Melech Neeman*, in the ordinary way of abbreviatures; the rabbins only take the initial letters, which, joined together, are really the letters of the word אמן, *amen*.

On the other hand, there are ſome of their Cabbaliſts, who according to their uſual manner of finding a hidden meaning in words, which they call *notaricon*, out of the letters of the word amen form the whole phraſe *Adonai Melech Neeman*.

Yet it is certain alſo that the word amen was in the Hebrew tongue before ever there were any ſuch things as cabbala or cabbaliſts in the world, as appears from Deuteronomy, chap. xxvii. ver. 15.

The primitive of the word *amen* is the verb *aman*, which, in the paſſive voice, ſignifies to be true, faithful, conſtant, &c. Hence came the noun אמן *amen*, which ſignifies *truth*. And, laſtly, of this noun *amen* they made a kind of affirmative adverb, which, when placed at the end of any phraſe, or propoſition, ſignifies, *ſo be it, be it true, I acquieſce in it*, &c. Thus in the paſſage above cited from Deuteronomy, Moſes ordered the Levites to cry aloud to the people, *Curſed is he that makes any graven or molten image, &c. and all the people ſhall ſay amen*, i. e. yes, may he be curſed, we deſire, we agree to it.—But at the beginning of a phraſe, as in ſeveral paſſages of the New Teſtament, it ſignifies, truly, verily.—When it is redoubled, or repeated twice together, as is always done by St. John, it has the effect of a ſuperlative; agreeably to the genius of the Hebrew tongue, and her two daughters, the Chaldee, and Syriac.—In this ſenſe we are to underſtand *amen, amen, dico vobis*. The Evangeliſts uſually preſerve the Hebrew word *amen*, in their Greek αμην, though St. Luke ſometimes renders it by αληθως, *truly*, or ναι, *certainly*.

AMENABLE, or AMAINABLE, from the Fr. *amener*, or *main, hand*, is applied in our *law-books* to a woman, who is ſuppoſed to be governable by her huſband.

It is likewiſe uſed to ſignify a right or power of bringing perſons before a particular juriſdiction: thus, we ſay, a perſon is *amenable* before ſuch a court, or magiſtrate.

AMENANUS, in *Ancient Geography*, a river which paſſed by Catana.

AMEND, or AMENDE, in the French *Cuſtoms*, a mulct, or pecuniary puniſhment, impoſed by a ſentence of the judge; for any crime, falſe proſecution, or groundleſs appeal.

AMENDE HONORABLE, denotes an infamous kind of puniſhment, uſed in France, &c. on traitors, parricides, ſacrilegious perſons, and other heinous criminals.

It conſiſts in this, that the offender is delivered up to the common hangman; who, having ſtript him to his ſhirt, and put a rope about his neck, and a wax taper in his hand, leads him to the court, where he is to beg pardon of God, the king, the court, and his country.

Sometimes the puniſhment ends here; and ſometimes death, or the galleys, are added.

The phraſe *amende honorable* is alſo uſed by way of alluſion, where a perſon is condemned to come into court, or into the preſence of ſome perſon injured, and make an open recantation, aſk pardon, &c.

AMENDMENT, in a general ſenſe, a change made in a thing for the better.

Amendment amounts to much the ſame with melioration, reformation, correction, &c.

AMENDMENT, in *Agriculture*, is more particularly uſed for a MANURE laid on the ground, to fatten or enrich it.

AMENDMENT, in a *literary ſenſe*, is uſed to denote the corrections and other alterations made in the poſterior editions of books. In this ſenſe, amendments are alſo denominated emendations.

AMENDMENT, in *Law*, the correction of an error committed in a proceſs, and diſcovered after judgment.

If the error be committed in giving judgment, *viz.* if a wrong judgment be given, there they cannot amend it; but the party aggrieved muſt bring his writ of error.—However, where the fault appears to be in the clerk who writ the record it may be amended. Terms de Ley. 39.

At common law there was little room for amendments; for, ſays Britton in a treatiſe, publiſhed in the name and by the authority of the king, probably about the 13 Edw. I., becauſe the laſt ſtatutes therein referred to are thoſe of Winchester and Weſtminſter the ſecond, the judges are to record the parols or pleas, deduced before them in judgment; and king Edw. I. granted to the juſtices to make record of pleas pleaded before them, but prohibited their making their own record a warranty for their own wrong, and raiſing their rolls, amending them, and recording them contrary to their original enrolment. So rigidly was this ſtatute obſerved, that when juſtice Hengham, in the ſame reign, was induced from motives of mere compaſſion for a poor man, who was fined 13s. 4d. to eraſe the record and to make it 6s. 8d., he was fined 800 marks. With this fine, it has been ſaid, a clock-houſe was built at Weſtminſter, and furniſhed with a clock; but the true æra of the invention and uſe of clocks in this country, which did not take place till about 100 years afterwards, or about the cloſe of the 14th century,

falſifies

falſifies this ſtory. There were, however, ſome caſes, that were amendable at common law. Original writs were not amendable at common law; for if the writ be not good, the party may have another: judicial writs may and often have been amended. 8 Rep. 157. Whatever at common law might be amended in civil caſes, was at common law amendable in criminal caſes, and ſo it is at this day: reſolved by Holt, Ch. J. Powell, and Powis J. 1 Salk. 51.

Formerly the ſuitors were much perplexed by writs of error brought upon very ſlight and trivial grounds, as miſpellings and other miſtakes of the clerks, all which might be amended at the common law, while all the proceedings were in *paper;* for they were then conſidered as only *in fieri*, and therefore ſubject to the controul of the courts. But when once the record was made up, it was formerly held, that by the common law no amendment could be permitted, unleſs within the very term in which the judicial act ſo recorded was done; for during the term the record is in the breaſt of the court; but afterwards it admitted of no alteration. But now the courts are more liberal; and, when juſtice requires it, it will allow of amendments at any time while the ſuit is depending, notwithſtanding the record be made up, and the term be paſt. For they at preſent conſider the proceedings as *in fieri*, till judgment is given; and therefore, that, till then, they have power to admit amendments by the common law; but when judgment is once given and enrolled, no amendment is permitted in any ſubſequent term. Stat. 11 Henry IV. c. 3. Miſtakes are alſo effectually helped by the ſtatutes of amendment and *jeofails*, ſo called, becauſe when a pleader perceives any ſlip in the form of his proceedings, and acknowledges ſuch error (*jeo faille* or *j'ai faillè*), he is at liberty by thoſe ſtatutes to amend it; which amendment is ſeldom actually made, but the benefit of the acts is attained by the court's overlooking the exception. Stra. 1011. Theſe ſtatutes are 12 in number; and by theſe all trifling exceptions are ſo thoroughly guarded againſt, that writs of error cannot now be maintained, but for ſome material miſtake aſſigned. See Com. Dig. tit. *Amendment.*

By ſtat. 14 Edw. III. c. 6. no proceſs ſhall be annulled or diſcontinued by the miſpriſion of the clerk in writing one ſyllable or one letter too much or too little; but it ſhall be amended; and by ſtat. 9 Henry V. c. 4. it is declared, that the judges ſhall have power to make theſe amendments, as well *after* as *before* judgment, as long as the record in proceſs is before them. This ſtatute is confirmed by ſtat. 4 Hen. VI. c. 3. For further enlarging the authority of the courts the ſtatute 8 Hen. VI. c. 12. gives power to amend what they ſhall think in their diſcretion to be the miſpriſion of their clerks in any record, proceſs, and plea, warrant of attorney, writ, pannel, or return. There are only two ſtatutes of amendments, *viz.* 14 Ed. III. ſtat. 1. c. 6. and 8 Hen. VI. c. 12. and 15.; the reſt are reckoned to be ſtatutes of jeofails, and not of amendments. As theſe ſtatutes only extended to what the juſtices ſhould interpret the miſpriſion of their clerks, and other officers, it was found by experience, that many juſt caſes were overthrown *for want of form*, and other failings, not aided by ſtat. 8 Hen. VI. c. 15. though they were good in ſubſtance; and therefore the ſtatutes of jeofail were made. By ſtat. 32 Hen. VIII. c. 30. it is enacted, that if the jury have once paſſed upon the iſſue, though afterwards there be found a *jeofail* in the proceedings, yet judgment ſhall be given according to the verdict. The ſtat. 18 Eliz. c. 14. ordains, that after verdict given in any court of record, there ſhall be no ſtay of judgment, or reverſal, for want of form in a writ, count, plaint, &c. or for want of any writ original or judicial; or by reaſon of inſufficient returns of ſheriffs, &c. By ſtat. 21 Jac. I. c. 13. if a verdict ſhall be given in any court of record, the judgment ſhall not be ſtayed or reverſed for variance in form between the original writ or bill and the declaration, or for want of averment of the party's being living, ſo as the perſon is proved to be in life; or for that the *venire facias* is in part miſ-awarded; for miſnomers of jurors, if proved to be the perſons returned; want of returns of writs, ſo that a pannel of jurors be returned, and annexed to the writs; and for that the return-officer's name is not ſet to the return, if proof can be made that the writ was returned by ſuch officer, &c.

The ſtat. 16 and 17 Car. II. c. 8. called in 1 Ventr. 100. an omnipotent act, and made perpetual by ſtat. 22 and 23 Car. II. c. 4. enacts, that judgment ſhall not be ſtayed or reverſed after verdict in the courts of record at Weſtminſter, &c. *for default in form;* or becauſe there are not pledges to proſecute upon the return of the original writ, or becauſe the name of the ſheriff is not returned upon it, for default of alleging and bringing into court of any bond, bill, or deed, or of alleging or bringing in letters teſtamentary or of adminiſtrations; or for the omiſſion of *vi* and *armis*, or *contra pacem*, miſtaking the Chriſtian name or ſurname of either party, or the ſum of money, day, month, or year, &c. in any declaration or pleading, being rightly named in any record, &c. preceding; nor for want of the averment of *hoc paratus eſt verificare*, or for not alleging *prout patet per recordum*, for that there is no right *venire*, if the cauſe was tried by a jury of the proper county or place; nor ſhall any judgment after verdict, by confeſſion, *cognovit actionem*, &c. be reverſed for want of *miſericordia* or *capiatur*, or by reaſon that either of them be entered, the one for the other, &c.; but all ſuch defects, *not being againſt the right of the matter of the ſuit*, or *whereby the iſſue or trial is altered*, ſhall be *amended* by the judges:—though not in ſuits of *appeal*, of *felony*, *indictments*, and *informations*, on *penal ſtatutes*, which are excepted out of the act.

By ſtat. 4 and 5 Ann. c. 16. all the ſtatutes of *jeofails* ſhall extend to judgments entered by confeſſion, *nil dicit*, or *non ſum informatus* in any court of record, and no ſuch judgment ſhall be reverſed, nor any judgment or writ of inquiry of damages thereon ſhall be ſtayed for any defect which would have been aided by thoſe ſtatutes, if a verdict had been given, ſo as there be an original writ filed, &c.—By ſtat. 9 Ann. c. 20. § 7. this act and all other ſtatutes of *jeofail* are extended to writs of *mandamus* and *informations*, in the nature of a *quo warranto:* the ſtatutes of amendment and jeofails not being conſtrued to extend to criminal proceedings, or on penal ſtatutes in general. Bull. N. P. 325. 2 Mod. 144. But a *mandamus* may not be amended after return. 4 Term. Rep. 689. The ſtat. 5 Geo. I. c. 13. ordains, that, after verdict given, judgment ſhall not be ſtayed or reverſed for defect in form or ſubſtance in any bill or writ, or for variance therein from the declaration, or any other proceedings.

By the foregoing ſtatutes, from 14 Edw. III. c. 6. to 8 Hen. VI. c. 15. the faults and miſtakes of clerks are in many caſes amendable; the miſpriſion of a clerk in matter of *fact* is amendable, though not in matter of *law*. Palm. 258. If there be a miſtake in the legal form of the writ, it is not amendable; the negligence of the clerk ſhall be amended, but his ignorance in the legal courſe of original writs is not amendable. 8 Rep. 159. A party's name was miſtaken in an original writ; and it appearing to the court

that the curſitor's inſtructions were right, the writ was amended in court; and they amended all the proceedings after. 2 Vent. 152. Cro Car. 74. If a thing which the plaintiff ought to have entered himſelf, being a matter of ſubſtance, be totally omitted, this ſhall not be amended; but otherwiſe it is, if omitted only in part and miſentered. Danv. Abr. 346. By the common law a writ of error, returned and filed, could not be amended; becauſe it would alter the record; but now by ſtat. 5 Geo. I. the writs of error, wherein there ſhall be any variance from the original record, or other defect, may be amended by the court where returnable.

When the award of a writ of inquiry on the roll is good, the writ ſhall be amended by the roll. The court cannot amend to make a new writ, or to alter a good writ and adapt it to another purpoſe, &c. only when the writ is *prima facie* bad. Mod. Caſ. 263. 316. Annaly 367. A declaration grounded on an original writ may not be amended, if the writ be erroneous; though if it be on a bill of Middleſex or a latitat, it is amendable. 1 Lill. Abr. 67. A plaintiff may amend his declaration in matter of form, after a general iſſue pleaded, before entry thereof, without payment of coſts; if he amend in ſubſtance, he is to pay coſts, or to give imparlance; and if he amend after a ſpecial plea, though he would give imparlance, he muſt pay coſts. 1 Lill. 58. A declaration in ejectment laid the demiſe before the time; this was not amendable, becauſe it would alter the iſſue and make a new title in the plaintiff. 1 Salk. 48. A demurrer may be amended after the parties have joined in demurrer, if it is only on paper. Style. 48. For the amendment of a plea, in paper or on record, &c. ſee ſtat. 4 Geo. II. c. 26.

As to the amendments of records, &c. an iſſue entered upon record, with leave of the court may be amended; but not in any thing material, or that ſhall deface the record. 1 Lill. Abr. 61. A record may be amended by the court in a ſmall matter, after iſſue joined, ſo as the plea be not altered. Danv. Abr. 338. If on a writ of error a record is amended in another court in affirmance of the judgment, it muſt be amended in the court where judgment was given. Hard. 505. Where the record of *niſi prius* does not agree with the original record, it may be amended after verdict, provided it do not change the iſſue; but a record ſhall not be amended to attaint the jury, or prejudice the authority of the judge. A general or ſpecial verdict may be amended by the notes of the clerk of aſſize in civil cauſes; but not in criminal actions. 1 Salk. 47. The iſſue roll ſhall be amended by the imparlance roll, which is precedent; but a roll may not be amended after verdict, where there is nothing to amend it by; though ſurpluſage may be rejected, and ſo make it good. Cro. Car. 92. 1 Sid. 135.

A miſtake of the clerk in entering a judgment was ordered to be amended. Cro. Jac. 351. Hutt. 41. A judgment may be amended by the paper-book, ſigned by the maſter. 1 Salk. 50. At common law, the judges may amend their judgment of the ſame term, and by ſtatute of another term. 8 Rep. 156. 14 Edw. III. If judgments are not well entered, on payment of coſts, they will be ordered to be done ſo. When judgments are entered, it is ſaid that the defects therein being the act of the court, and not the miſpriſion of the clerk, are not amendable. Golſb. 104. Miſtakes in returns of writs, fines, and recoveries, by mutual aſſent of parties may be amended. Judgment ſhall not be ſtayed after verdict, becauſe an original wants form, or varies from the record in point of form, which are amendable. 5 Rep. 45. After verdict given in any court of record, there ſhall be no ſtay of judgment for want of form in any writ, or inſufficient returns of ſheriffs, variance in form between the original writ and declaration, &c. Stat. 32 Hen. VIII. 18 Eliz. 5 Geo. I. c. 13. The *poſtea* may be amended by the judge's notes. 1 Wilſ. 33. 2 Stra. 1797. For amendments in informations by the attorney general, ſee 4 Term. Rep. 457, 8. Amendments are uſually made in affirmance of judgments, and ſeldom or never to deſtroy them; and where amendments were at common law, the party was to pay a fine for leave to amend. 3 Salk. 29. Jacob's Law Dict. by Tomlins, art *Amendment*. Blackſt. Com. vol. iii. p. 407.

AMENDMENT *of Bills in Parliament*, means ſome alteration made in the original draught; and we read of *amendments* of *amendments*, *amendments* of returns of repreſentatives, &c.

In caſes of wrong returns, ſo reported by the committee of privileges and elections, and voted by the houſe of commons, it is uſually ordered, that the returns be *amended* by the returning officer, according to the directions of the houſe, without iſſuing a new writ.

Amendments ought always to be in that houſe from whence the thing to be amended originally proceeded, though the directions for the amendments came from the other houſe. Hakew. Mann. of Paſſing Bills, p. 167.

AMENDOLARE, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Citra; fourteen miles north-eaſt of Caſſano.

AMENDUS, in *Ancient Geography*, a town of Caria, ſuppoſed, by Martiniere, to be Myndus.

AMENEBURG, in *Geography*, a town of Germany, in the circle of the Lower Rhine, five miles eaſt-ſouth-eaſt of Marpurg, 48 north-north-eaſt of Mentz.

AMENIA, a town of Aſia Minor, belonging to the Chalybes, who inhabited the eaſtern part of Pontus.

AMENIA, in *Geography*, a thriving townſhip of Ducheſs County, New York, in America, ſix miles from Sharon, in Connecticut; containing 3078 inhabitants, of whom 383 are electors.

AMENORRHOEA, formed of *α priv.* μὴνες, the *menſes*, and ῥέω, to *flow*, in *Medicine*, is an abſence or deficiency of the *menſtrual* excretion in women, between the age of thirteen and forty-ſeven. See MENSES, OBSTRUCTION, and CHLOROSIS.

AMENTACEOUS, in *Botany*, a term applied to the flowers of certain trees and plants, which are compoſed of a vaſt number of *apices*, or *antheræ*, hanging down in form of a rope, ſuch as the hazel, &c. See CATKIN.

AMENTACEÆ denote one of the claſſes of plants in Linnæus's natural method of claſſification; and they are ſuch as bear catkins.

AMENTIA, in *Medicine*, is that deficiency of memory or reaſoning which conſtitutes an IDIOT. This lamentable malady is placed, by Dr. Cullen, under *nervous* diſeaſes affecting the *mind*; becauſe the mental deficiency is generally the moſt prominent ſymptom. In many inſtances, however, the bodily defects are equally conſpicuous, and we may conclude that the *cauſe* of the diſeaſe is always to be traced to ſome imperfect organization of the body, particularly the brain and head.

A degree of mental imbecility is ſometimes obſerved to follow violent *fevers* and *apoplectic* attacks; and this is the only kind from which we expect a patient to recover.

In theſe caſes the return of mental power is obſerved to be proportionable to that of the corporeal functions; and therefore

therefore to be promoted by the means employed in the treatment of theſe diſeaſes.

AMENTUM, in *Antiquity*, a leathern thong faſtened about the middle of a dart, or javelin, whereby, after caſting it at the enemy, it might be drawn back again to the owner. The amentum ſerved alſo to increaſe the force of the ſtroke; for which reaſon, ſome of their great men refuſed to uſe it, as confiding wholly in the natural ſtrength of their own arms. *Amentum* denoted alſo a leathern ſtring or latchet that bound their ſandals.

AMENTUM, in *Botany*, ſee CATKIN.

AMENY, in *Geography*, one of the Laccadive iſlands, ſituate in the Indian Sea. N. lat. 11° 37′. E. long. 72° 30′.

AMER, a river of Germany, which runs into the Neckar, one and one-half mile eaſt of Tubingen.

AMERADE, a kind of officers among the Saracens, anſwering to the governors of provinces among the Europeans.

The name is originally the ſame with that of *emir*.

AMERBACH, JOHN, in *Biography*, a learned printer, was born at Reutling, in Swabia, and acquired great reputation in the practice of his art at Baſil. The works of Auguſtin were very correctly printed, for the firſt time, at his preſs, in 1506. He begun an edition of Jerom, but died, in 1515, before it was finiſhed. We are indebted to Amerbach for the introduction of the beautiful and uſeful Roman type inſtead of the Gothic and Italian.

AMERCEMENT, or AMERCIAMENT, from Fr. *Merci*, in *Law*, a pecuniary puniſhment impoſed upon the offenders, at the diſcretion of the court; frequently alſo called *miſericordia*.

In the new Terms of the Law, *amercement* is ſaid to be properly a penalty aſſeſſed by the peers or equals of the party *amerced*, for an offence done; for which he puts himſelf upon the mercy of the lord.

There is this ſtated difference between fines and amercements; that fines are puniſhments certain, and determined by ſome ſtatutes; but amercements are arbitrary impoſitions, proportioned to the fault, and wholly at the mercy of the court.—Manwood, in his *Foreſt Law*, makes another difference; as if an amercement were a more eaſy and merciful penalty, and a fine a more ſharp and grievous one. If amercements were too grievous, releaſe might be ſued by an ancient writ called *moderata miſericordia*.

Fines alſo are impoſed and aſſeſſed by the court; amercements by the country: and no court can impoſe a fine, but a court of record; other courts can only amerce. 8 Rep. 39. 41. A town ſhall be amerced for the eſcape of a murderer in the day-time: and if the town be walled, it is ſaid it ſhall be ſubject to amercement, whether by day or night. 3 Inſt. 53.

By the ſtatute of *Magna Charta*, c. 14. a freeman is not to be amerced for a ſmall fault, but proportionable to the offence, and that by his peers. 9 Hen. III. c. 4.

Before this period amercements were often exceſſive, and they were impoſed on a thouſand different occaſions, not only for real crimes, but for trivial or imaginary offences, and on the moſt frivolous pretences; of courſe they were the ſources of infinite vexations to the ſubjects, as well as of great riches to the ſovereigns of England. They fell heavy not only on the common people, but upon the greateſt prelates, and moſt powerful barons of the kingdom. This gave occaſion to the above-mentioned article of the great charter, and to the rules founded upon it, which enacted, that no man ſhould have a larger amercement impoſed upon him than his circumſtances or perſonal eſtate would bear; ſaving to the landholder his contenement or land, to the trader his merchandize, and to the countryman his wainage, or team and inſtruments of huſbandry. In order to aſcertain which, the great charter alſo directs, that the amercement, which is always inflicted in general terms (*"ſit in miſericordia,"*) ſhall be ſet, *ponetur*, or reduced to a certainty, by the oath of good and lawful men of the neighbourhood, which method of liquidating the amercement to a preciſe ſum was uſually performed in the ſuperior courts by the aſſeſſment or aſſeerment of the coroner, a ſworn officer choſen by the neighbourhood, under the equity of the ſtatute Weſtm. 1. c. 18. and then the judges eſtreated them into the exchequer. But in the court leet and court baron it is ſtill performed by aſſeerors, or ſuitors ſworn to aſſeere, that is, tax and moderate the general amercement, according to the particular circumſtances of the offence and the offender. Amercements impoſed by the ſuperior courts on their own officers and miniſters were aſſeered by the judges themſelves; but when a pecuniary mulct was inflicted by them on a ſtranger, (not being party to any ſuit), it was then denominated a FINE; and the ancient practice was, when any ſuch fine was impoſed, to inquire by a jury, *quantum inde regi dare valeat per annum, ſalva ſuſtentatione ſua, et uxoris, et liberorum ſuorum*. And ſince the diſuſe of ſuch inqueſt, it is never uſual to aſſeſs a larger fine than a man is able to pay, without touching the implements of his livelihood; but to inflict corporal puniſhment, or a limited impriſonment, inſtead of ſuch fine as might amount to impriſonment for life. Hence it happens that fines in the king's court are frequently denominated ranſoms, becauſe the penalty otherwiſe falls upon a man's perſon, unleſs it be redeemed or ranſomed by a pecuniary fine; according to an ancient maxim, *qui non habet in crumena luat in corpore*. Yet, where any ſtatute ſpeaks both of fine and ranſom, it is holden, that the ranſom ſhould be treble to the fine at leaſt. Blackſt. Com. vol. iv. p. 380.

A court leet can amerce for public nuiſances only. 1 Saund. 135. For a fine and all amerciaments in a court leet, a diſtreſs is incident of common right: but for amerciament in a court baron, diſtreſs may not be taken but by preſcription. 11 Rep. 45. When amerciament is agreed on, the lord may have an action of debt, or diſtrain for it, and impound the diſtreſs, or ſell it at his pleaſure; but he cannot impriſon for it. 8 Rep. 41. 45.

There is alſo amercement in pleas in the courts of record, when a defendant delays to tender the thing demanded by the king's writs, on the firſt day. Co. Litt. 116. And in all perſonal actions without force, as in debt, detinue, &c. if the plaintiff be non-ſuited, barred, or his writ abate for matter of form, he ſhall be amerced; but if on judicial proceſs, founded on a judgment and record, the plaintiff be non-ſuited, barred, &c. he ſhall not be amerced. 1 Nelſ. Abr. 206. And an infant, if non-ſuited, is not to be amerced. Jenk. Cent. 258.

Amerciament royal, is uſed by ſome to denote a pecuniary puniſhment laid upon a ſheriff, coroner, or ſuch-like officer of the king, by juſtices, for ſome offence or abuſe in his office.

AMERI, in *Botany*. See INDIGOFERA.

AMERIA, in *Ancient Geography*, a diſtrict of Armenia, mentioned by Strabo (tom. ii. p. 835.) ſituate in the vicinity of Cabira, in which was a temple of the month Pharnacus, a number of prieſts or Hieroduli, and a ſacred territory, the fruits of which were appropriate to the pontifex. The

mouth Pharnacus, which was the deity denominated Lunus among the ancients, was held in ſuch veneration, that the oath by the fortune of the king and of the mount Pharnacus, was called the *royal oath*.

AMERIA, now AMELIA, a town of Italy, ſouth-weſt of Spoleto, founded, according to Cato, 964 years before the Perſian war, or 1135 years B. C. Auguſtus eſtabliſhed a colony in it. The celebrated Roſcius is ſaid to have been a native of this city. The whole of its territory was aſſigned by Auguſtus to the veteran ſoldiers.

AMERIA, in *Geography*, a town of Aſiatic Turkey, in Natolia, 72 miles eaſt of Kutaja. N. lat. 39° 25'. E. long. 32° 14'.

AMERICA, *General Hiſtory of*. Throughout the hiſtory of the world no event more curious, in the eye of the philoſopher, has happened than the diſcovery of the new continent, which, with its ſurrounding ſeas, forms a complete hemiſphere of our planet, whereof the ancients knew no more than a hundred and eighty degrees of longitude, which might even, by a ſtrict diſcuſſion, be reduced to a hundred and thirty; for, ſuch is the error of Ptolemy, that he ſhoves back a hundred and forty-eight degrees and more the eaſtern mouth of the Ganges, which, according to aſtronomical obſervations, taken by the moderns, is ſettled at about a hundred and eight: thus manifeſtly giving an overplus of forty degrees of longitude in the ſtatement of Ptolemy, who ſeems to have had no notion of any of the parts beyond what we denominate Cochinchina, which conſequently forms the eaſtern boundary of the world, as known to the ancients, as our firſt meridian is the boundary of the world to the weſt.

To pretend that the Phœnicians and the Carthaginians made the voyage to America is an opinion truly ridiculous, and no better ſupported on authentic documents than the ſtories related in our times of the pretended navigations of the Chineſe towards the ſhores of Mexico. It is well known, from inquiries made at Pekin, that the work wherein ſome traces of theſe navigations to the latitudes of Mexico were ſuppoſed to be found, is a romance to the full as groſs as the fictions related by Ælian, (Hiſt. Diverſ. lib. iii.) in regard to an imaginary country, entirely full of gold, and which has ſeemed to have a complete conformity with Peru, in the eyes of ſeveral of the learned, whoſe judgment was extremely confined. Notwithſtanding what Voſſius is pleaſed to ſay, in his commentaries on Pomponius Mela, and M. Huet, in his diſſertation on the commerce of the ancients, where he cites the *Annals of Ormus*, which nobody knows, it is certain that the Chineſe never took long voyages; and that in 1430 they had not any notion whatever of the iſland Formoſa, which is at no greater diſtance than eighteen leagues from their coaſt. If they had been in the practice of making long voyages, their ignorance in geography would not be ſo prodigious as it actually is at preſent, to ſuch a degree that they have never been able to lay down the map of China: accordingly, whenever they wanted a map of China, they have been obliged to employ Europeans, whoſe performances we are well acquainted with, and know them to fall very far ſhort of what poſitive geography has a right to demand concerning ſo vaſt a region as Aſia.

If any people in Europe in reality did frequent ſome parts of the coaſt of North America prior to the æra of the navigations of Columbus and Veſpucius, it muſt have been the Icelanders and Norwegians; ſince it cannot be diſputed that both the one and the other of theſe people had before the fifteenth century formed ſettlements in Greenland, which ſhould at preſent be reckoned as a part of the new continent. But here, we cannot avoid obſerving, that we ſhould never have been able to diſcover the centre of America, if no other way had been found for penetrating thither, than that of Greenland, by reaſon of the huge bodies of ice which at once prevent any great progreſs within land, and from making any conſiderable advances towards the pole. Beſides, the danger to be encountered in theſe high latitudes, the exceſſive ſeverity of the climate, the want of every ſpecies of ſuſtenance, and the little hope of meeting with any treaſures to counterbalance the arduous enterpriſe, would have been enough to diſhearten the moſt intrepid navigators. Chriſtopher Columbus, however, in 1492, diſcovered an eaſy paſſage; and, when we perceive him puſhing up as far as the 25th degree of north latitude, to fetch that eaſt wind which commonly prevails between the tropics, and afterwards proceeding in nearly a ſtraight line to the iſland of St. Domingo, we are almoſt tempted to believe that he had a previous intimation of that track; and therefore, the Spaniards, with a degree of ingratitude altogether monſtrous, endeavoured to deprive that great man, becauſe he was not born in Spain, of the credit of his diſcovery, by publiſhing on this occaſion the moſt puerile and contradictory fables. The truth of the matter is, that Columbus ſubmitted to be guided by one of his brothers, named Bartholomew, who was a geographer by profeſſion; and in drawing his maps of the world, ſuch as they were able to make them at that time, he was perpetually aſtoniſhed, that of three hundred and ſixty degrees of longitude, only a hundred and eighty at moſt were known; and, of courſe, there remained as much of the world to be diſcovered as had already been found out: and as it ſeemed by no means probable that the ocean could extend, without any interruption, over one entire hemiſphere, he maintained, that by keeping conſtantly to the weſt from the Canaries, they muſt infallibly come either to iſlands or to a continent. And in fact ſo it turned out. They firſt came to iſlands, and then to a continent, where every thing wore the face of ſuch extreme deſolation, that one cannot reflect upon it without amazement. It is by no means our intention here to follow the ancient ſtories, in which, to the credulity of childhood has been added the dreams of dotage. In theſe accounts whatever we meet with ſavours of the marvellous; nothing is examined into: it ſhall be our buſineſs, therefore, to endeavour at communicating to the reader clearer notions and juſter ideas.

Among the various populations diſperſed throughout the foreſts and deſerts of this newly diſcovered world, it is not poſſible to point out above two that had formed any ſort of political ſociety, the Mexicans and the Peruvians, and even their hiſtory is ſtuffed with fables. Beſides, their population muſt have been much lower than has been ſtated, ſince they had no iron inſtruments for felling the trees, nor for tilling the ground; they had no animal fit for drawing the plough, and the conſtruction of the plough itſelf was even unknown to them. It is eaſily conceived, that when the labour of the field muſt altogether be done with a wooden ſhovel, and by the hand, it is impoſſible to lay out much ground in agriculture: and without a regular agriculture, wherein the labour of animals concurs with that of mankind, no people can become numerous in any part of the world. It is, however, very ſurpriſing, that at the time of its diſcovery America poſſeſſed ſcarcely any animal fitted for tillage: the ox and the horſe were unknown, as well as the aſs, which was anciently employed in culture by ſeveral nations of our continent, as in Bœtica and Lybia, where the lightneſs of the

the ſoil, ſays Columella, (De Re Ruſt. lib. vii.) enabled this animal to ſupply the place of horſes and oxen. It is commonly thought that the American biſon might have been ſerviceable in tillage; but the biſon being of a rude untractable nature, it would have required a long ſeries of generations to tame him gradually for the purpoſes of huſbandry. Now this is what no one ever even thought of in America, where the people are both leſs induſtrious and leſs inventive than the inhabitants of our hemiſphere: their lazineſs and indolence particularly ſtruck the more attentive and ſagacious obſervers. In ſhort, the ſtupidity they evince on certain occaſions is ſuch, that they ſeem, according to the expreſſion of M. de la Condamine, to live in eternal infancy. (Voyage ſur le fleuve des Amazones.)

At the ſame time no irregularity has been noticed in their outward organs, unleſs we chuſe to except the abſolute defect of a beard, and of that down which perſons of both ſexes ſhould have on the chin, after arriving at the age of puberty. It is in vain to affirm that the germ of this ſoft down is deſtroyed or eradicated, ſince at a very advanced age, here and there ſome ſcattered hairs of it grow, which they commonly pluck up with nippers made of ſhells. Their ſtature differs not from that of others of our ſpecies in the temperate zones: for beyond the arctic circle, the tribe of Eſquimaux or Innuits, though of American deſcent, is compoſed of only ſhort people; becauſe the action of the extreme cold is hoſtile to the complete expanſion of the members; and the caſe is nearly the ſame with the inhabitants of Greenland, which is known to have been originally peopled by hordes of American race, of which the perfect agreement between the language of the Greenlanders and that of the Eſquimaux leaves no room to doubt.

Nothing but a blind fondneſs for the marvellous could have occaſioned the propagation of ſuch abſurd figments as thoſe relating to a gigantic race, found on the Magellanic ſhores, now cuſtomarily denominated Patagonia. The moſt ſenſible navigators, as Narbrough, (Voyage to the South Seas,) who have had communication with the Patagonians, deſcribe them to be of the ordinary ſtature of mankind, living by ſmall troops in thoſe immenſe regions, where the Engliſh, who traverſed them from one extremity to the other, from Cape Blanco to Buenos Ayres, ſaw not an inch of ground cultivated, nor the leaſt trace of tillage; inſomuch that the difficulty of finding the means of ſubſiſtence muſt have been exceedingly great, prior to the time of the diſcovery, and while there was not a horſe in exiſtence, ſince the fleſh of that animal is at preſent almoſt the ſole nouriſhment of the Patagonians who occupied the midland countries between the river de la Plata, and the 45th degree of ſouth latitude. Such is the extreme indolence of theſe ſavages, that they devour the very animals by means of which they might clear their deſerts, and at length put an end to that miſerable mode of exiſtence in which they are not a jot above the level of the beaſts under the guidance of inſtinct alone.

We ſhall not, as has been hitherto done, reckon among the particular and diſtinct races, thoſe Blaſards that are found in numbers by no means conſiderable at Coſta Rica, and the iſthmus of Darien, (Wafer's Deſcription of the Iſthmus of Darien, and Coreal Voyages, tom. i.) this being only a diſeaſe, or an accidental alteration in the temperament of the parents who produced theſe diſcoloured individuals, who are known to bear a great analogy with the white negroes, or the Dondos of Africa, and with the Kakerlakes of Aſia. The diſtemper in which theſe ſymptoms originate attacks more or leſs all the black or extremely ſwarthy people in the hotteſt climates of the globe. The pygmies, ſpoken of in an account tranſlated by M. Gomberville of the French academy, the himantopodes, or ſavages having the inflection of the knee turned backwards, and others that have but one leg, may be ranked in the ſame claſs with the Amazons, and the inhabitants of El Dorado, among the abſurdities which ſome travellers have been weak enough to believe, and vain enough to publiſh. All the monſtrous people that have been ſeen in the New World, were rendered ſo by artifice; ſuch as thoſe that have the head completely round, and are called bowl-heads, thoſe who have it flatted, and are denominated plagiocephali; in ſhort, ſuch as have it conical, or lengthened out, and are ſtyled macrocephali. Among a naked people, where the garments cannot be affected by faſhions, they influence the body itſelf, and produce thoſe various deformities which have been noticed among the ſavages, ſome ſhortening their neck, others piercing the cartilage of the noſe, the lips, the balls of the cheeks, others lengthening their ears, or cauſing their legs to ſwell by means of a ligature above the ankle.

It is not known, and it will ever be a matter of difficulty to trace the true ſource of the venereal diſeaſe with which the Americans were afflicted in the Weſt India iſlands, the Caribbees, at Florida, in Peru, and throughout a great part of Mexico: on this ſubject ſeveral curious conjectures have been thrown out, ſome of them ſufficiently ridiculous. It has been pretended, that the fleſh of the fiſh intoxicated with the cururu-ape, and the fleſh of the game killed with arrows poiſoned with a ſpecies of woodbine, called woorara, produced this contagion among them. But the ancient wild people of our continent poiſoned in the ſame manner their hunting weapons, without any conſequences in the leaſt degree prejudicial to their health; and it is a well-known fact, that the fiſhes killed in the ponds with the coccula orientalis officinarum, and that the fowls ſlain in ſome diſtricts of the Alps with knives rubbed over with ſuc de napel, afford a very wholeſome nutriment. Beſides, in the iſland of St. Domingo, where the venereal diſeaſe was extremely rife, the uſe of poiſoned darts was not in practice as among the Caribs and ſeveral tribes on the Terra Firma. Neither is it true, that the ſting of a ſerpent or lizard of the iguan tribe, or that the human fleſh eaten by theſe anthropophagi, engendered the venereal virus in the blood of the inhabitants of the New World. The hypotheſis of M. Aſtruc, as ſtated in the laſt edition of his great work "De Morbis Venereis," borders far more on probability than the fanciful opinions juſt mentioned; though this hypotheſis of that famous phyſician is by no means generally adopted. We ſhall content ourſelves with obſerving, that the venereal diſeaſe may have been a morbific affection in the temperament of the Americans, like the ſcurvy in the countries of the north: for, after all, we are not to imagine that this diſtemper made the ſame ravages in America as it did in Europe ſome time after its tranſplantation.

The almoſt total want of culture, the vaſt extent of the foreſts, the immenſe tract of country, the waters of the rivers exundated from their beds, the infinite number of ſwamps and lakes, together with the hoſt of inſects which are a natural conſequence from all theſe, rendered the climate of America inſalubrious in certain parts, and much colder than it might otherwiſe be expected, conſidering the relative latitude of its territory. The difference of temperature in the two hemiſpheres, under the ſame parallels, has been eſtimated at twelve degrees, and by a cloſer calculation, it might

might even be fixed at ſome degrees more. Now, theſe ſeveral cauſes operating conjointly muſt have had an influence on the conſtitution of the indigenous people, ſo as to produce ſome alteration in their faculties: accordingly, it is only to a want of penetration that we can aſcribe the little progreſs they had made in metallurgy, the firſt of all arts, as that without which the others fall, as it were, into a lethargy. It is well known that nature has not denied iron mines to America; and yet no nation of America, neither the Peruvians nor the Mexicans, poſſeſſed the ſecret of forging that metal; whereby they were deprived of many conveniences, by rendering it impoſſible for them to make regular falls of timber in their forefts, and to reſtrain the rivers within their beds. Their hatchets of ſtone could not enter the trunks of trees, except by the application at the ſame time of fire to them; ſo that they were forced to convey away all the parts reduced to coal, in order to prevent the flame from coming at the reſt. Their proceſs was nearly the ſame whenever they wanted to make barks of a ſingle piece, or cauldrons of wood for boiling their victuals, by afterwards caſting in red hot ſtones; for comparatively but few of the ſavages had the art of making veſſels of clay. The farther theſe methods were from perfection, the more time they required in the practice: therefore, in South America it was often obſerved, that men were employed for two whole months in felling three trees. To conclude, it will be eaſily imagined, that the more ſtationary populations, as the Mexicans and the Peruvians, notwithſtanding the want of iron, had acquired a degree of induſtry greatly ſuperior to the mechanical ſkill poſſeſſed by ſuch as were diſperſed by families, like the Worons, where they have not ſufficient reſources, ſays Dr. Bancroft, for procuring the moſt neceſſary part of clothing; and it is only with the reticulation found in the cocoa nut, or with ſome bark of trees, that they cover the organs of generation. Natural Hiſtory of Guiana.

Hence we are not to be ſurpriſed, that the New World contained ſo few inhabitants at the time of its diſcovery: for the ſavage life is repugnant to the multiplication of the ſpecies beyond what we ſhould at firſt ſight imagine; ſince the leſs the ſavages cultivate the ſoil, the more ground they want to live upon. In the northern tracts of America diſtricts of forty leagues have been travelled over in all directions, without meeting with a ſingle hut, or perceiving the ſmalleſt veſtige of a habitation. After a march of nine or ten days, keeping always the ſame courſe, the traveller has perhaps come up to a petty horde, or rather a family, ſeparated from the reſt of mankind, not only by mountains and deſerts, but alſo by its language differing from all known tongues. Nothing more ſtrongly proves the little communication then ſubſiſting between the Americans in general, than the incredible number of dialects ſpoken by the different tribes of ſavages. Even in Peru, where ſocial life had made ſome faint advances, a great variety of languages was nevertheleſs found, reciprocally incomprehenſible or unintelligible, and the emperor could not iſſue his commands to the greater part of his ſubjects, except by means of interpreters. It naturally occurs on this occaſion, that the ancient Germans, though diſtributed likewiſe in populations, ſeparated by veſt deſerts, yet ſpoke only one mother-tongue; and a perſon might, before the Auguſtan age, as well as at preſent, make himſelf tolerably well underſtood by means of the Tudeſque, from the centre of Belgium, to the banks of the Oder: whereas, in the New World, we need only, ſays Acoſta, to croſs a valley for hearing another jargon. De procur. Indorum ſalut.

The depopulation was perhaps ſtill greater in the more ſouthern parts of America than in the north, where the foreſts had uſurped every thing; ſo that much of the great game might propagate, and ſuſtain themſelves in them, and at the ſame time afford nouriſhment to the hunters; whereas in the Magellanic countries there are plains upwards of two hundred leagues in extent where no wood is ſeen, but only buſhes, briars, and noxious weeds. (Beſchreib. von Patagonien.) Whether it be that the quality of the briny or acid waters found there is repugnant to the propagation of foreſts, or that the ground there ſecretes depoſitions of gravelly and ſtony ſubſtances, from which the roots of large trees can derive no aliment. In ſhort, for forming ſome idea of the deſolation of the Magellanic regions, it will ſuffice to ſay, that the Engliſh, carried into ſlavery by the Patagonians, have often travelled, in the train of their barbarous maſters, for a whole fortnight together, before they came up with a few miſerable huts covered in with horſe hides. In the village that has been ſtyled the capital of Patagonia, and where the grand cacic reſided, they could reckon in 1741, no more than fourſcore perſons of both ſexes. Anſon's Voyages. Beſides, in the ſouthern degrees of latitude, there are low lands, one part whereof is marſhy, and the other annually overflowed, becauſe the rivers and torrents, which have not channels proportionate to their volume of water, deluge the country to immenſe diſtances on the acceſs of the rainy ſeaſon in the torrid zone. From Sierra Itatin to the extremity of the miſſion of the Moxes, about the fifteenth degree of ſouth latitude, through a ſpace extending upwards of three hundred leagues, are found either theſe ſwamps or thoſe lands where the inundations frequently drive the inhabitants up the mountains: accordingly there were ſeen but few, and they ſpoke thirty-nine languages, not one of which had any affinity with the reſt. Relation de la Miſſion des Moxes.

It is thought that the entire population of the New World, at the time of its diſcovery, might be forty millions; which falls ſhort of the ſixteenth part of the total amount of the human ſpecies, upon the computation of thoſe who give to our globe eight hundred millions of individuals. Yet it is ſuppoſed, that in dimenſion the new continent is nearly equal to the old one: however, it is of conſequence to obſerve, that the calculations of Templeman, Struyck, and ſeveral others, in regard to the ſurface of America, reduced to ſquare miles, are not entitled to much confidence, as the geographical maps are ſtill too defective for ſuch an operation; and it would ſcarcely be believed, that all the known maps contain an error of almoſt a hundred leagues in the longitude alone of ſome ſtations of Mexico, as that longitude has been lately determined by an eclipſe of the moon. But this is not all, inaſmuch as there is a tract of country beyond the Sioux and the Aſſenipoils; the commencement whereof towards the weſt is not known any more than where it terminates towards the north.

M. Buffon had already obſerved, that ſome Spaniſh authors muſt have been guilty of great exaggerations in what they relate concerning the number of perſons who, according to them, were found in Peru. But nothing more completely proves that theſe writers have exaggerated, than what we have mentioned of the ſmall quantity of ground rendered productive in this country, where Zarate himſelf agrees, that there exiſted only one place that had the aſpect of a town, and that town, ſays he, was Cuſco. (Hiſt. of the Conqueſt of Peru, book i. chap. 9.) Nay, ſo long ago as the year 1510, the court of Spain ſaw, that, to remedy the depopulation of the conquered provinces in America, no

other

other means were left than to tranſport negroes thither, wherein the regular traffic began in 1516, and coſt enormous ſums: it is even computed that each African brought to the iſle of St. Domingo came to upwards of two hundred ducats, or more than two hundred chequins, at the rate that the Genoeſe merchants charged for them. The Spaniards have, doubtleſs, contrary to their own intereſt, deſtroyed a great number of Americans, both by the labour of the mines and by atrocious depredations; but it is no leſs certain, that countries whither the Spaniards never penetrated, as the parts adjacent to Hudſon's Bay, are ſtill more deſert than others that fell under the yoke of the Caſtilians.

We now conceive how great the difference in the fifteenth century, between the two hemiſpheres of our globe. In one, civil life was but juſt commencing; literature was utterly unknown: the very names of the ſciences had ſcarcely been heard: the generality of trades were wanting: tillage was in ſo rude a ſtate as hardly to deſerve the name of agriculture, ſince neither the plough nor the harrow had been invented, nor any animal trained to draw them: reaſon, which alone can dictate equitable laws, had not yet cauſed her voice to be heard: human blood was ſhed upon the altars; and even the Mexicans were ſtill in ſome reſpects anthropophagi; an epithet that may alſo be extended to the Peruvians, ſince, by the confeſſion of Garcilaſſo, who is by no means prone to calumniate them, they ſhed the blood of children on the *cancu*, or ſacred bread, if that name may be aſſigned to a paſte, kneaded, ſo as for fanatics to eat it in a kind of temples by way of honouring the deity of whom they had no knowledge. In our continent, on the other hand, ſocieties had ſo long been formed, that their origin is almoſt loſt in the darkneſs of antiquity, and the diſcovery of forged iron, ſo neceſſary and ſo unknown to the Americans, has been in uſe among the inhabitants of our hemiſphere from time immemorial. For, though the proceſs employed for obtaining the malleability of a metal ſo ſtubborn in its mineral ſtate be very complicated, yet M. de Mairan has clearly proved that the ſeveral æras, at which writers have pretended to fix this diſcovery, are to be regarded as fabulous. Lettres ſur la Chine.

It is impoſſible here to enter into a regular analyſis of the ſyſtems propoſed for explaining the cauſes of this difference between the two parts of the ſame globe. It is a ſecret of nature, on which the human mind becomes more and more confuſed in proportion as it obſtinately determines to fathom it. Nevertheleſs, thoſe phyſical viciſſitudes, the earthquakes, the volcanoes, the inundations, and peculiar cataſtrophes, whereof we, who live in the calm of the elements, have not a very accurate idea, may have had ſome influence in its production: and it is well known at preſent that the moſt violent ſhocks of earthquakes, which are ſometimes felt throughout the whole extent of the new continent, communicate no ſucceſſion at all to ours. Had it not been for the private advices received from different parts, we in Europe ſhould never have known that, on the 4th of April, 1768, the whole tract of America was ſhaken: whence we may infer, that anciently dreadful calamities may have happened, whereof the inhabitants of our hemiſphere, ſo far from feeling them, have not had the ſlighteſt intimation. Neither ſhould we, following the example of ſome of the learned, apply to the New World the prodigies found in the Timæus and the Critias of Plato, concerning the Atlantis ſunk by a torrent of rain that laſted only four and twenty hours. The baſis of this tradition was brought from Egypt, but Plato embelliſhed or diſfigured it by a number of allegories, ſome philoſophical and others puerile; ſuch as the victory obtained over the Atlantides by the Athenians, at a period when Athens was not yet in being: theſe anachroniſms occur ſo frequently in the writings of Plato, that it certainly was not without reaſon that the Greeks themſelves accuſed him of being unacquainted with the chronology of his country. Athen. lib. v. cap. 12 & 13. The great difficulty is to know whether the Egyptians, who were no mariners, and conſequently could be but little verſed in poſitive geography, had any accurate knowledge concerning a large iſland or a continent ſituate beyond the pillars of Hercules. Now it muſt be owned that this is not probable; but their prieſts, while ſtudying coſmography, might ſurmiſe that there were more portions of land diſperſed in the ocean than they had knowledge of. The leſs they knew, from the total want of navigation, the more natural it is that they ſhould have fallen on this conjecture; and eſpecially if it could be ſhewn that prior to the menſuration of the earth performed in Egypt by Eratoſthenes, under Euergetes, the prieſts had already an idea of the actual dimenſions of the globe. However this be, their doubts and their ſurmiſes concerning the exiſtence of ſome large tract of country, had no more relation to America in particular than to all other lands with which they were unacquainted; and the limits of the ancient world, preciſely as we have fixed them, remain invariably the ſame.

That the cataclyſm, or inundation of the Atlantis, rendered the ſea beyond the ſtraits of Gibraltar ſo muddy as to make it innavigable, as Plato affirms, is flatly contradicted by all experience from the voyage of Hanno to our own times. And yet M. Geſner, whoſe erudition is univerſally acknowledged, thought that the iſle of Ceres, ſpoken of in a poem of very high antiquity, attributed to Orpheus under the title of Αργοναυτικα, was a fragment of the Atlantis: but this iſle, which is deſcribed by its foreſts of pines, and particularly by the black clouds which ſurround it, has no where been found; ſo that it muſt have been ſwallowed up in the abyſs ſubſequent to the Argonautic expedition, even ſuppoſing, contrary to all probability, or rather contrary to poſſibility, that theſe Arganauts could have come from the Euxine into the Atlantic ocean, by conveying the ſhip Argo from the Boryſthenes into the Viſtula, to enable them afterwards to enter the Mediterranean by the columns of Hercules, as it is mentioned towards the end of that poem aſcribed to Orpheus; whence we may conclude, that there has been no ſparing of the marvellous, and that M. Geſner might have been leſs credulous without any impeachment of his prudence.

If we find any where to the weſt of us ſome traces of a continent converted into a multitude of iſles, it is doubtleſs in the Pacific ocean; and we ſhall not here repeat what the Preſident de Broſſe has advanced on this ſubject in his work, in which he treats of the navigations to the ſouthern parts.

As to thoſe who pretend that the human race has only of late found its way to America, by croſſing the ſea at Kamtſchatka, or the ſtraits of Tſchutſki, either upon the fields of ice or in canoes, they do not conſider that this opinion, beſides that it is extremely difficult of comprehenſion, has not the leaſt tendency to diminiſh the prodigy: for it would be ſurpriſing indeed that one-half of our planet ſhould have remained without inhabitants during thouſands of years, while the other half was peopled. What renders this opinion leſs probable is, that America is ſuppoſed in it to have had animals, ſince we cannot bring thoſe ſpecies of animals from the Old World which do not exiſt in it, as thoſe of the tapir, the glama, and the tajacu. Neither can we admit of a recent organization of matter for the hemiſphere oppoſite to ours: becauſe, independently of the accumulated difficulties in this

hypotheſis,

hypotheſis, and which can by no means be ſolved, we ſhall obſerve, that the foſſil bones diſcovered in ſo many parts of America, and at ſuch ſmall depths, prove that certain ſpecies of animals, ſo far from having been recently organized, have been annihilated a long while ago. It is an indubitable fact, that when Chriſtopher Columbus arrived there, there exiſted neither in the iſlands nor in any province of the new continent quadrupeds of the firſt magnitude: there was neither the dromedary, the camel, the giraffe, the elephant, the rhinoceros, the horſe, nor the hippopotamos. Therefore the large bones that have been dug up have belonged to ſpecies extinct or deſtroyed ſome centuries anterior to the epocha of the diſcovery of that country; ſince the very tradition of them no longer ſubſiſted among the natives who had never ſo much as heard talk of any quadrupeds of larger ſize than thoſe found among them in 1492. Yet the molar tooth, in poſſeſſion of the late Abbé Chappe, who died in California, was eight pounds in weight; as we learn from the extract of the letter addreſſed to the academy of Paris by M. Alzate, who affirms, that at Mexico is ſtill preſerved the bone of a leg, the knob whereof is a foot in diameter. Some of the large ſpecies of the hippopotamos, ſuch as are found in Abyſſinia and on the ſhores of the Zaire, produce grinders weighing upwards of eight pounds; and yet it may be doubted whether there be any elephants having legs that contain parts of ſuch prodigious dimenſions as thoſe mentioned by M. Alzate, whoſe account, however, may not be abſolutely exempt from exaggeration. The ſame may be ſaid of the dimenſions given by Father Torrubia, in his pretended Gigantology, to ſome fragments of ſkeletons dug up in America, and which are are at preſent pretty generally to be ſeen in the cabinets of Europe. The late Mr. Hunter, who made this ſubject his particular ſtudy, thought that they belonged to carnivorous animals; and it was not till after he had gone through a long courſe of comparative anatomy, that he delivered this opinion to the Royal Society of London. [Phil. Tranſact. for the year 1768.] But if this were true, nature muſt have acted upon a contrary plan in America to what ſhe has followed in our continent, where all the terreſtrial quadrupeds of the firſt magnitude are frugivorous and not carnivorous. It is a miſtake in Proſper Alpinus and M. Maillet, to imagine that the hippopotamos is ſarcophagous or carnivorous. The reaſon whereof ſeems to be the difficulty that carnivorous animals of the firſt magnitude would have had in finding ſuſtenance, and that at all times; whereas the vegetables immediately ſpring up, and in ſuch abundance, as to be more than ſufficient for the nouriſhment of frugivorous beaſts of the moſt enormous bulk: accordingly, the opinion of thoſe who attribute theſe relics to zoophagous genera is ſcarcely probable. In vain were the ſavages who dwell on the banks of the Ohio interrogated concerning their notions about the huge bones that were found on the borders of that river in 1738; they threw no more light on the ſubject than the inhabitants of Siberia do on the diſcovery of the foſſil ivory of their country, which ſome of them conſider as the ſpoils of giants, and others as the remains of an animal living under ground, which they call *mammuht*, a being more worthy of appearing in the mythology of the north than in the nomenclature of natural hiſtory. [See Tooke's View of the Ruſſian Empire, vol. i. p. 26.] Nevertheleſs M. Bertrand, that ſagacious obſerver, who traverſed Pennſylvania and a great part of North America, aſſures us, that ſome ſavages, on ſeeing oyſter-ſhells found in the chain of the Blue Mountains, reaching from Canada to Carolina, ſaid that it was not ſurpriſing to find ſhells about the Blue Mountains, ſince they knew that in days of yore the ſea had ſurrounded them with its waters.

This relation is founded on the tradition univerſally diſſeminated among all the tribes of America, from the ſtraits of Magellan as far as Canada. They affirm, that in former times the low lands of their continent were ſubmerged, which obliged their anceſtors to retire to the heights. It is not without ſome degree of aſtoniſhment that we read in Acoſta, that in his time traces ſtrongly marked of that inundation were ſtill ſeen in ſeveral places: "Certe in novo orbe ingentis cujuſdam exundationis non obſcura monumenta a peritis notantur." [De Natura Nov. Orb.]

However this be, we are unable to explain how all the populations of America had ſo little commerce and connection with each other, as is proved from the multiplicity of languages in uſe among them, otherwiſe than by admitting that their manner of living by the chace or by the fiſhery not only prevented them from uniting, but even obliged them to retreat from each other. Accordingly, it has been ſeen, that when diſtinct tribes have come ſo near as to intercept the game, it kindles national wars, which only terminate in the deſtruction or the retreat of the weaker or leſs courageous tribe. Handfuls of men there diſpute for the poſſeſſion of immenſe deſerts; and the enemies are often at the diſtance of above a hundred leagues aſunder: but a hundred leagues are nothing to hunters, who, in the ſearch of game, or in the diſtant purſuit of it, always meet in ſome part or other. The difficulty of fixing boundaries, which is very great even among ſedentary nations, is much greater among hordes who roam from foreſts to foreſts, and yet pretend to be the abſolute proprietors of diſtricts which they only run over.

Such nations as were really fiſhers, or ichthyophagi, exiſted only in the northermoſt regions of the New World: for, though we find between the tropics ſavages who are much addicted to fiſhing, they nevertheleſs plant ſeveral feet of manioc around their huts. But throughout America this culture, as well as that of the maize, was the buſineſs of women, and the reaſon of it is very eaſy to diſcover; but little of it was cultivated, ſo that this employment was not regarded as the principal occupation. Many hunters have even been diſcovered, as well in the ſouth as in the north, who followed no ſpecies of cultivation, living ſolely on game. As it happened that they were more ſucceſsful at ſome ſeaſons than at others, they could only preſerve their meat by broiling it: for the nations diſperſed towards the centre of the continent had not the ſlighteſt knowledge of ſalt; but almoſt all thoſe who dwelt in the torrid zone, and even at the extremities of the temperate zones towards the equator, made great uſe of pimento (capſicum annuum) or other herbs as hot; and this they were taught by nature. We ſhould here obſerve, that the phyſicians of Europe have generally been and are ſtill in an error in regard to ſpices. In burning climes great and continual uſe of them is neceſſary to aid digeſtion, and reſtore to the bowels the heat which they loſe by a too copious tranſpiration. Thus travellers inform us that thoſe ſavages of Guiana, who ſprinkle ſo much pepper over their victuals as to excoriate the tongues of perſons not accuſtomed to it, conſtantly enjoy a more confirmed ſtate of health than the other people of the country, as the Acoquas and the Moroux, who cannot always procure pimento in ſufficient quantities. Even in Europe we ſee how neceſſary this ſpice is to the Spaniards, who ſow whole fields with it as we ſow barley: in ſhort, it is well known that, in proportion as the heat of the climate augments, it has been found all over Aſia and Africa that the conſumption of ſpices has augmented in a direct ratio with that heat.

Among the hunting nations of the New World different compoſitions, to which we commonly give the name of nutritive powders or condenſed aliments, have been diſcovered, which

which they expreſsly reduce to a ſmall compaſs, in order that they may be able the more eaſily to convey them when they are to take a long courſe through the deſerts, where the ground, often covered with ſnow to the height of two or three feet, affords no reſources except what proceed from the game, which are very uncertain, becauſe many animals then keep cloſe to their coverts, which are ſometimes in places at a great diſtance from thoſe in which they are in queſt of them. Moreover, we gather, from various accounts, and even from ſome paſſages in hiſtory, that the generality of ambulatory nations of our continent have had or ſtill have ſimilar practices: the ſavages of Great Britany compoſed a kind of theſe paſtes with karemyle, which is ſuppoſed to be the tubercules of the magion, called by the country folks wild vetches, though in fact it is a *lathyrus*. By ſwallowing a ball of this drug the Bretons were enabled to diſpenſe with all other aliment for an entire day. [Dio Caſſius, in Sever.] The caſe is nearly the ſame with the green powder, in uſe among the ſavages diſperſed along the river Suſquehanna, which falls into Cheſapeak Bay: it will ſuffice here to obſerve, that this ſubſtance is compoſed of torrefied maize, which forms the principal ingredient, roots of angelica and ſalt. It may be conjectured, however, that theſe barbarians, before they had any communication with the colonies of Europe, employed no ſalt in the compoſition, as it cannot add much to the alimentary properties.

As to the method of procuring fire, it was the ſame throughout the whole extent of the New World, from Patagonia to Greenland; that is, by rubbing pieces of hard wood againſt other very dry pieces, ſo long and ſo forcibly till they emitted ſparks or kindled into a flame. It is true, that among certain populations to the north of California, they had the method of inſerting a kind of pivot in the hole of a very thick plank; and by the circular friction produced the ſame effect with that above mentioned. [Muller, Reiſe und Entdeckungen von den Ruſſen.] It ſhould ſeem as if it were inſtinct alone, or, if the expreſſion may be allowed, the innate induſtry of man, that taught him this practice: ſo that, on this ſuppoſition, what ſome accounts relate concerning the inhabitants of the Marianes, the Philippines, Los Jordenas, and the Amicuanes, who were ignorant, as they pretend, of the ſecret of procuring fire, muſt be entirely without foundation. And if we find ſimilar facts in the geographers of antiquity, as Pomponius Mela, in regard to certain tribes of Africa, it is neceſſary we ſhould know that this author drew his information from the relations of Eudoxus, whom Strabo deſcribes as an impoſtor, who, in order to have it believed that he had doubled the Cape of Good Hope, takes the liberty of telling abundance of falſehoods. It appears, from the hiſtory of China, and particularly from the cuſtom ſtill ſubſiſting among the Kamtſhadales, the Siberians, and even among the Ruſſian peaſants, that the method of cauſing wood to take fire by friction muſt have been common in our continent prior to the knowledge of ſteel and of pyrites: the heat felt by ſavage man in his hands on rubbing them taught him the art.

As there were in America a very great number of petty nations, of which ſome were more deeply ſunk in barbariſm than the reſt, and in a total ignorance of all that conſtitutes the rational animal, it is extremely difficult to diſtinguiſh accurately the cuſtoms adopted only by ſome particular tribes from the practices generally followed. There are travellers who have thought that none of the ſavages of the New World had the ſmalleſt idea of inceſt, at leaſt in the collateral line, and that brothers indiſcriminately married their ſiſters, or cohabited with them without marriage; which gave occaſion to ſome perſons to imagine that both the phyſical and moral faculties of thoſe ſavages muſt have undergone an alteration, ſince it is thought that it is with mankind as with domeſtic animals, whereof ſome become ſtunted by inceſtuous copulations; a circumſtance that has pointed the neceſſity of mixing or croſſing the races, for the purpoſe of maintaining the vigour and perpetuating the beauty of them. It is evident, from experiments recently made on a ſingle ſpecies, that the degeneracy is greater and more rapid by a ſucceſſion of copulations in the collateral than in the direct line; a reſult which certainly would not have been expected. However, according to the "Lettres Edifiantes," and the accounts of fathers Lafiteau and Gumilla [Mœurs des Sauvages & Hiſtoire d'Orenoque], it is certain that there exiſted ſeveral tribes in America, among whom marriage was not contracted even in the third degree of parentage; ſo that it cannot be ſaid that the conjunctions which we term illicit, or inceſtuous, were in general practice there, as they undoubtedly were among the Caribs and ſeveral others. Garcilaſſo likewiſe relates [Hiſtoire des Incas] that the grand cacics, or the emperors of Peru, by a curious ſort of polygamy, married their ſiſters and their couſin-germans at the ſame time. He adds, indeed, p. 68. tom. ii. that this cuſtom extended not to the people; but it is a fact that ſeems to us almoſt impoſſible to explain. However, we ought not to give implicit faith to all that we read in Garcilaſſo touching the legiſlation of the Peruvians; beſides, he agrees that, among the hordes of this country, where the authority of the grand cacic or emperor was unſettled, as among the Antis, "marriage was unknown; when nature inſpired them with deſires chance gave them a mate, taking whatever woman they met; their daughters, their ſiſters, their mothers, were indifferent to them; theſe laſt, however, were more excepted. In another canton," he adds, "the mothers kept their daughters with extreme care, and when they married them, *elles les defloroient en public de leurs propres mains, pour montrer qu'elles les avoient bien gardées*," tom. i. p. 14. This laſt cuſtom, if true, would appear ſtill more aſtoniſhing than the inceſt, which muſt have really been in vogue among the petty hordes, compoſed of not above 130 perſons, ſuch as are at preſent ſeen in the foreſts of America, than among the more numerous tribes; and eſpecially if we reflect on the multiplicity of languages reciprocally unintelligible, which prevented theſe petty hordes from procuring wives from their neighbours.

It ſhould here be remarked, that what we have mentioned on the ſubject of the degeneracy that may ariſe from inceſtuous copulations to the human race, as well as to ſeveral ſpecies of animals, is nothing more than a bare ſuppoſition. The truth is, that we are not at preſent, nor are likely ſoon to be, ſufficiently informed on a ſubject of ſuch importance, for being able to ſpeak on it with confidence; for it would be to no purpoſe here to cite the example of ſome nations of antiquity, particularly that of the Egyptians, whoſe laws, which are thought to be the beſt known, are often the leaſt underſtood. The Greeks, who wrote on the hiſtory of Egypt after the death of Alexander, might eaſily have confounded the ſanctions of a foreign code, adopted under the dynaſty of the Lagides, with the ſanctions of the national code, wherein we, who have made it our particular ſtudy, have not been able to find any ſatisfactory proof of the law that is conjectured to have exiſted there prior to the time of the conqueſt of the Macedonians; but a more ample diſcuſſion of this matter would here be certainly out of place. What convinces us, however, that we ought not to inſiſt on the neceſſity of croſſing the races in regard to mankind, as we do when ſpeaking of the domeſtic animals, is, that the Circaſſians and the Mingrelians conſtitute a people who never mingle with any other, and with whom the degrees of conſanguinity that prevent marriage are extremely contracted;

tracted; and yet their blood is generally known to be the beſt in the world, at leaſt in the fair ſex; and it is by no means credible that the men there are as ugly as is pretended by the Chevalier d'Arvieu, in his Voyages au Levant, whoſe teſtimony is in direct oppoſition to M. Chardin, who had been upon the ſpot, whereas M. d'Arvieu never was. On the other hand, the Samoyedes, who intermix neither with the Laplanders nor with the Ruſſians, compoſe a people extremely mean and ill-favoured, and abſolutely beardleſs, although we know, beyond all doubt, from the obſervations of M. Klingſtædt, that the Samoyedes never contract inceſtuous marriages, as has been aſſerted by ſome writers who have been very ill informed.

In the climate of America there may exiſt ſome particular cauſes why certain ſpecies of animals are ſmaller than the analogous races of our continent; ſuch as wolves, bears, lynxes, and ſome others. It is likewiſe in the qualities of the ſoil, of the air, of the nouriſhment that M. Kalm thinks we ſhould ſeek the origin of that baſtardiſement that follows among the cattle tranſplanted from Europe into the Engliſh colonies on the main land, from the fortieth degree of latitude to the extremity of Canada. [Hiſt. Nat. & Civ. de la Pennſylvanie.] And the ſame thing is obſerved in the northern parts of Ruſſia. As to ſavage man, the coarſeneſs of food, and the little inclination he has to labour with his hands, render him leſs robuſt than we ſhould be diſpoſed to believe, were we ignorant that it is the habit of work that principally fortifies the muſcles and nerves of the arm, as the habit of hunting enables the Americans to ſuſtain long marches: and it was probably this that determined M. Fourmont to give thoſe nations the appellation of running nations, [Reflexions Critiques,] though they neither run nor hunt, except when forced to it by the moſt preſſing neceſſity. For while they have any proviſion of fleſh preſerved by broiling after their manner, they remain day and night lying at length in their huts, which neceſſity alone ever forces them to leave; and it is well known at preſent, from repeated obſervations collected in different regions, that all ſavages in general have ſo great a propenſity to idleneſs, that it forms one of the characteriſtics that moſt diſtinguiſh them from civilized people. To this ſhameful vice muſt be added an inſatiable thirſt for ſpirituous or fermented liquors, and then we ſhall have a tolerably juſt idea of all the exceſſes whereof theſe barbarians are capable. Thoſe who imagine that extreme intemperance in drink prevails only among people ſituated in cold climates are much miſtaken, ſince we learn from all accounts, that in the hotteſt as well as in the coldeſt climates, the Americans are as furiouſly addicted to intoxication, as often as they can find opportunity, and they would find an opportunity if they were leſs indolent. But, as they cultivate maize and manioc only in very ſmall quantities, the primary ſubſtance from which inflammatory liquor is extracted is frequently wanting to them; for we know that the caouin, the pivoré, the chica, and other factitious beverages of that nature are moſtly drawn from the flour of maize and caſſave. The hordes that abſolutely cultivate nothing at all, as the Moxes, the Patagonians, and numberleſs others, employ roots, blackberries, and other wild fruits, for giving a taſte to the water, and communicating to it an inebriating quality; which is very eaſily done by means of the fermentation which comes on of itſelf. It is ſuppoſed that the cold and phlegmatic temperament of the Americans conducts them more than other men to thoſe exceſſes, which may be termed, with M. Monteſquieu, a national intoxication: the liquors, however, which they brew themſelves are not by far ſo deſtructive to their health as the brandy ſold to them by the Europeans, making as much havoc among them as the ſmall-pox, which the Europeans likewiſe carried with them into the New World, where it is particularly fatal to ſuch of the ſavages as go naked, becauſe their epidermis, and their mucous texture being always expoſed to the air become thick, and their pores are ſtill more cloſed by the greaſy and oily colours with which they ſmear the whole body, to defend it from the ſtings of the inſects, ſwarming in multitudes, beyond all imagination, in the foreſts and uncultivated places: and it is the perſecution they undergo from the maringuins and muſketoes that has alſo taught them the uſe of ſmoking tobacco.

The ancient accounts talk much of the extreme old age to which the Americans attain; but it is now well known that groſs exaggerations have ſlipt into theſe narratives, and have probably given encouragement to that ridiculous impoſtor that appeared in Europe under the name of Hultazob, attempting to paſs for an American cacic 500 years old. It has been remarked by us, and Dr. Bancroft made the ſame obſervation at Guiana in 1766, that it is impoſſible to know exactly the age of ſavages, becauſe ſome are totally deſtitute of numerical words, and with others the numerical words are ſcarcely carried as far as three; they have no regiſters, nor any thing that can ſupply the place of them; and, for want of calendars, they are often ignorant not only of the day, but even the year of their nativity. In general they live to the uſual term with the reſt of the ſpecies, at leaſt in the northern countries: for the heat between the tropics, by exciting a continual perſpiration in the body, there abridges the courſe or the dream of life. Nothing is more true, however, than that almoſt all the American women bring forth without pain and with extreme facility; ſo that it ſcarcely ever happens that any die in childbirth, or from the conſequences of it: hiſtories relate, that before the arrival of Pizarro and Almagro they had never heard of midwives at Peru. Hence it has been ſurmiſed, that this effect was only owing to a particular configuration of the organs, and likewiſe to that want of ſenſibility obſerved among the Americans, of which ſtriking inſtances are found in the relations of travellers. Almoſt 200 years had elapſed before the method employed by the female ſavages for faſtening the umbilical cord of their children came to our knowledge: it is a great miſtake to pretend that they tie it, and then to add that it is a practice pointed out by nature to all the nations in the world. They do not tie it, but apply a burning coal to it, which carries off one part, and the other ſhrivels up to ſuch a degree that it can never afterwards open. If nature has taught a method of proceſs in this reſpect, it muſt be confeſſed that it is a difficult matter to diſtinguiſh it from thoſe which ſhe has not taught.

Among the Americans very few individuals have been found maimed or deformed from their birth; and the reaſon is, becauſe, like the Lacedæmonians, they had the barbarity to deſtroy ſuch children as by a vicious organization, or ſome natural deformity, were incapable of procuring themſelves a livelihood from the fiſhery or the chace. Beſides, as the ſavages have no arts, ſo neither have they the diſeaſes incident to artizans, and never diſlocate their limbs in raiſing edifices or managing machines. The long journies that pregnant women are obliged to take, ſometimes occaſion them to miſcarry, but it ſeldom happens that the violence of the movement maims the infant in the womb. The abſolute deficiency of all kinds of domeſtic cattle, and of courſe the total want of all milky diet, is the reaſon that the American women keep their babes a long time at the breaſt; and that when they are delivered of twins, they ſacrifice that which appears to them the weakeſt of the two: a monſtrous practice, but introduced among petty roving nations, where the

the men never take any burden that might encumber them in the chace.

Nothing is more ſurpriſing than the obſervations that are found in the memoirs of ſome travellers concerning the ſtupidity of the American children they have attempted to teach. Maregrave aſſerts [Comment. ad Hiſt. Braſiliæ], that in proportion as they approach the term of adoleſcence their capacities ſeem to contract. The miſerable ſtate to which we know that education is reduced in the colonies of South America, that is to ſay, among the Portugueſe and Spaniards, might induce us to ſuppoſe that the ignorance of the maſters may be ſufficient to occaſion that of the ſcholars; but we have not ſeen that even the profeſſors of the univerſity of Cambridge in New England have yet formed the minds of any young Americans, ſo far as to enable them to produce them in the literary world. We ſhall here only remark, that, in order to aſcertain how far the intellectual faculties of the native Americans are extenſive or confined, we ought to take their children while yet in the cradle, and conduct their education with great gentleneſs and patience; for after theſe children have contracted, during a number of years, the barbarous or ſavage manners of their parents, it is extremely difficult to efface from their minds thoſe impreſſions that have ſtruck the deeper root from their being the firſt. Beſides, the experiment ſhould not be confined to two or three ſubjects, but extended to a great number, ſince even in Europe, out of ſuch multitudes of children as are put to ſtudy from their earlieſt years, ſuch a ſmall number of reaſonable men are obtained, and a ſtill ſmaller of enlightened perſons. Is it, however, from a few merchants of America, from a few adventurers, guided in all their actions by the moſt ſordid avarice, that we are to look for theſe arduous attempts? Alas, we ſhould form no ſuch expectations!

There would be no need to mention the Creoles, as their hiſtory is not neceſſarily connected with that of the natives of the new continent, were it not expedient to obſerve, that, even granting that Thomas Gage and Coreal, or the traveller who has borrowed this name, have groſsly exaggerated in their accounts of the imbecility or rather brutalization of the Spaniards born in the Weſt Indies; [Deſcript. & Voy. aux Indes occident.] it is nevertheleſs true, that theſe Creoles have been generally ſuppoſed to have undergone ſome alteration from the nature of the climate; and that being a misfortune and not a crime, Father Fejoo ought to have been a little more candid in what he has written in their juſtification, ſince it ſhould ſeem that he never would have thought of vindicating them had he not conceived that the glory of the Spaniſh name was concerned. Such prejudices, however, are unworthy of a philoſopher, in whoſe ſight the glory of all the nations in the world ſhould be as nothing, when put in the balance againſt truth. Readers of any penetration will eaſily perceive that it was neither to envy nor to any private reſentment againſt the Spaniards that what has been ſeen of the alteration brought on in the temperament of their Creoles is to be aſcribed, ſince to the full as much has been ſaid of the Europeans, eſtabliſhed in the North of America, as any one may convince himſelf by reading the hiſtory of Pennſylvania, which we have already had occaſion to cite. If the Creoles had written works capable of immortalizing their name in the republic of letters, they would not have been in want of the pen and the inflated ſtyle of Jerome Fejoo to make their apology, which they alone could, and they alone ought to have done. Neither was it from want of time that they neglected it, ſince Coreal, who has depicted them, as we obſerved, in ſuch unfavourable colours, ſailed for America in 1666. In ſhort, the farther culture proceeds in the interior of the New World, by draining the moraſſes, by felling the timber, and clearing the woods, the more alſo will the climate change and ſoften; which is a neceſſary conſequence, obſervable from year to year; and that we may here fix exactly the period of the firſt obſervation made in this reſpect, we ſhall remark, that in the laſt edition of the Recherches philoſophiques ſur les Americains, there is a copy of a letter, by which it appears, that ſo long ago as the year 1677, this change of climate was already perceived, at leaſt in the Engliſh colonies, which every one knows to have been the moſt pertinaciouſly bent on tilling and ameliorating the ground, on which the ſavages beſtowed hardly any care; they expected all from nature, and nothing from their own induſtry. It is certainly a grand miſtake to ſuppoſe that the abundance of game, of fiſh, and of fruits obtained without culture, retarded the progreſs of civilized life throughout almoſt the whole extent of America; to the northern point of Labrador, and all along the coaſts of Hudſon's bay, from Munk harbour to Churchill river, the ſterility is extreme and incredible. Now, the ſmall bands of the human ſpecies that have been met there, are as ſavage, at leaſt, as thoſe that roam at the centre of Brazil, of Guiana, and all along the Maragnon and the Oroonoko, where are found more alimentary plants, more game, more fiſh, and where the ice never prevents fiſhing in the rivers. On the contrary, it appears, that the poſſeſſion of a grain ſo eaſily raiſed and multiplied as the maize, might have induced the Americans, in ſome provinces, to leave off the ambulatory life, and forego the chace, which renders the heart of man hard and pitileſs. It is, however, very certain, that ſome of thoſe tribes who poſſeſſed the ſeed of the maize, were ſtill anthropophagi, as the Caribs of the main land, who were ſeen in 1764, to eat the fleſh of the Maroons that had revolted againſt the Dutch, in their ſettlements on the Berbice. (Naturgeſchiehte von Guiana, § 161.) Nevertheleſs it is known to be a fact, that theſe barbarians, of whom we are now ſpeaking, cultivate not only the manioc, but alſo the piſang, *muſa paradiſiaca*; and unhappily they are not the only ones among the Americans, who, without being compelled to it by any ſpecies of dearth, have defiled their tables, by ſerving on them pieces of human fleſh, roaſted on large wooden ſpits, or boiled in marabouts.

There is no difficulty in ſuppoſing that ſome travellers may have exaggerated the number of theſe man-eating hordes; but it is undoubtedly true that they have been found in the ſouth, in the north, and between the tropics. The Atacapas of Louiſiana, who, in 1719, ate up a Frenchman, named Charleville, dwell at the diſtance of more than eight hundred leagues from the diſtrict of the Caribs, in huts between the ſhores of the Eſſequibo and the Oroonoko; and thence again it is neceſſary to make an immenſe journey into the continent to arrive at the Encavellados or long-haired blacks, who likewiſe roaſt their priſoners; ſo that this ſpecies of barbariſm is common to ſuch nations as cannot have borrowed their manners from one another, nor have been corrupted to ſuch a degree by the force of example.

It is not ſurpriſing that, in the immenſe quantity of particulars ſupplied by the accounts concerning the religious practices of the Americans, ſome falſehoods ſhould have ſlipped in, whereof ſome are already perfectly known, and others will be ſo in proportion as travellers ſhall become more enlightened than the generality have hitherto been of thoſe who have ſpoken of the different parts of the New World; monks and people who had no pretenſions to philoſophy, in any ſenſe that this term can be underſtood, have taken upon them to write things that ſenſible perſons have repented that

they ever read. We ſhall only illuſtrate this obſervation by one fact which will ſuffice for enabling the reader to form a judgment on many others. It has been aſſerted that ſeveral ſavages of the ſouthern provinces worſhipped a gourd or pumpkin; now let us examine into the matter a little. Juſt as the pretended ſorcerers of Lapland make uſe of a magical drum which they beat in order to drive away the devil whenever they think him lodged in the body of ſome perſon whom they have not been able to cure by the uſe of their ordinary remedies; ſo ſome conjurers of Florida employ a gourd, which, after extracting the pulp, they fill with pebbles; ſo that on ſhaking it a noiſe is produced that may be heard to a conſiderable diſtance during the night. It is natural enough that the ſavages who are not initiated into the jugglery, ſhould entertain various fancies concerning this myſterious inſtrument, not unmixed with ſome degree of dread; accordingly they do not venture to touch or even to approach it; and this is the whole of the affair about the adoration of the gourd. It is to no purpoſe to interrogate theſe barbarians on the ſubject of practices ſo groſs, and many others infinitely more ſuperſtitious; the poverty of their language, of which the dictionary might be compriſed in a ſingle page, forbids all explanation. We know that even the Peruvians, though united in ſome ſort of political ſociety, had not yet invented terms for expreſſing either metaphyſical beings, or the moral qualities which moſt diſtinguiſh mankind from brutes, as juſtice, gratitude, and mercy. Theſe qualities were in the number of things that had no name; virtue itſelf had none in that country on which ſo many exaggerations have been beſtowed. Now, among the petty wandering hordes, the paucity of words is ſtill incomparably greater, to ſuch a degree that every ſpecies of elucidation on matters of morality and metaphyſics is utterly impoſſible.

They are certainly miſtaken who imagine that among ſavages religion is extremely ſimple, extremely pure, and that its corruptions increaſe in proportion as the people make farther advances in civilization. The truth is, that both ſavages and civilized people equally plunge into horrid and cruel ſuperſtitions, when not under the reſtraints of ſound reaſon; and, if even the profeſſion of Chriſtianity was unable to prevent the Spaniards from aſſaſſinating their brethren to the glory of God, in the grand ſquare of Madrid, it is a plain proof how neceſſary it is that the reaſonable ſervice of Chriſtianity ſhould be well underſtood. Now, it would be flying in the face of our own judgment to imagine there is much philoſophy among ſavages, who likewiſe celebrate *auto da fés* in their way, and indeed unhappily to a great exceſs among the Antis, where were found huge earthen vaſes filled with the dried carcaſes of children, who had been ſacrificed to ſtatues; and they were ſacrificed in this manner, whenever the Antis celebrated an act of faith. As to thoſe who among the ſavages of America are called *loyés*, *jametyes*, *piays*, *angekottes*, *javas*, *tikarangui*, and *autmons*, they ſhould more properly be denominated phyſicians than prieſts, as they are generally called; it is true, they are wont to accompany the medicines they adminiſter to the ſick, with fantaſtical practices, which they think adapted to calm or to expel the evil principle, to whom they ſeem to aſcribe all the diſorders that attack the human body. Inſtead of idly reaſoning on the theology of theſe pretended prieſts, it would be acting far more wiſely to engage them by preſents and a generous treatment to communicate to us the characters of certain plants whereof they make great uſe in their medicaments; for we are not acquainted with the fiftieth part of the vegetables that ſome of theſe practitioners in pharmacy carry always about them in little bags, and in which the whole of their medical knowledge conſiſts. But the miſſionaries, who conſidered theſe American jugglers as their rivals, perſecuted them with fury; and even whenever they have occaſion to mention them in their relations, they ſtill load them with abuſe, which diſguſts us as much as the barbarous dulneſs of the ſtyle in which theſe accounts are written, and the prodigies, manifeſtly falſe, which they affirm to be true. There has been no want of miſſionaries in America, but we have rarely ſeen among them enlightened and charitable men, taking a ſincere concern in the miſeries of the ſavages, and employing ſome means to relieve them. It may ſafely be advanced, that properly ſpeaking, it is only the Quakers who have ſettled in the New World, without committing crying acts of injuſtice and ſhocking enormities. As to the Spaniards, had we no information from other quarters, we might be tempted to believe that Las Caſas was ſtriving to palliate their crimes, by rendering them abſolutely incredible. He has the aſſurance to ſay, in a treatiſe entitled, *De la deſtruction de las Indias Occidentales ſuer los Caſtellanos*, and inſerted in the collection of his works, printed at Barcelona, that in forty years his countrymen maſſacred fifty millions of Indians. This, however, is a groſs exaggeration; and the reaſon of his committing it to paper was, that Las Caſas wanted to eſtabliſh in America an order half-military and half-eccleſiaſtical; his ambition afterwards led him to aſpire at being grand maſter of this order, and ſo to raiſe a prodigious tribute in ſilver from the Americans. To convince the court of the utility of the project, which would have been uſeful only to himſelf, he ſwelled the number of murdered Indians to that extravagant amount.

Nevertheleſs, it is an undoubted fact, that the Spaniards cauſed a great number of ſavages to be torn to pieces by large hounds and a ſpecies of maſtiffs or bull-dogs, brought into Europe about the time of the Alanes; they likewiſe occaſioned the death of vaſt numbers more of theſe poor wretches in the mine, in the pearl-fiſheries, and under the weight of burdens that could only be tranſported on men's ſhoulders, becauſe throughout the whole extent of the eaſtern coaſt of the new continent no beaſt of burden or of draught was found; and it was only at Peru that any glamas were ſeen. In ſhort, they exerciſed innumerable cruelties on the caciques and chiefs of hordes whom they ſuſpected of having concealed any ſilver or gold; no diſcipline was obſerved in their ſmall parties, compoſed of thieves, and commanded by men who deſerved capital puniſhment for their crimes, and had moſtly been taken from the dregs of the people. It is an indiſputable fact, that both Almagro and Pizarro could neither read nor write. Theſe two adventurers were at the head of a hundred and ſeventy foot-ſoldiers, a number of bull-dogs, and a monk named La Valle Viridi, whom Almagro afterwards cauſed to be beat to death with the but end of muſkets, in the iſland of Puna. Such was the army that marched againſt the Peruvians; as to that which went to the attack of the Mexicans, under the conduct of Cortez, it conſiſted of fifteen cavaliers and five hundred infantry at the utmoſt. Now we may form ſome idea of the horrors theſe ſeven hundred and thirty-nine murderers muſt have committed at Peru and at Mexico; we may likewiſe get a notion of the ravages committed in the iſland of St. Domingo. But it is an inſult to common ſenſe to aſſert that they ſlaughtered fifty millions of inhabitants. Thoſe who give credit to ſuch extravagant aſſertions, doubtleſs, have no proper conception of ſo great a number of mankind; all Germany, Holland, the Low Countries, with France and Spain taken together,

do

do not at the preſent day contain fifty millions of people. Yet if we except the interior of Spain, the earth there is tolerably well cultivated, and that by the labour of animals, combined with that of the huſbandman. In America nothing was cultivated by the labour of animals; accordingly we ſee from the journals of the Spaniards themſelves, that it frequently happened that they marched for five or ſix days in Peru without coming to a ſingle habitation. In the expedition to Canella, we are told by Juraba, that they made no uſe of their ſwords but in hewing the briars and brambles, to clear their paſſage acroſs the moſt frightful deſert that can be imagined. In the heart of Paraguay and Guiana, whither the little Spaniſh armies never penetrated, and of courſe committed none of the ravages that have been imputed to them, at firſt only foreſts were diſcovered, and afterwards foreſts again or petty tribes were found, often at the diſtance of a hundred leagues from one another. It is apparent from all that the Jeſuits have publiſhed concerning the eſtabliſhment of their miſſions, how difficult it was to bring together ſavages in countries more extenſive than France, and where the land is better than in Peru, and not inferior to that of Mexico. If we would obtain an idea of the ſtate of the New World at the time of its diſcovery, we muſt doubtleſs ſtudy the accounts, but at the ſame time we ſhould employ a nice diſcernment and a critical ſeverity for removing the falſehoods and prodigies with which they ſwarm; compilers without taſte or judgment, pick up all they find in the journals of travellers, and thus form diſguſting romances, which have but too much increaſed in our days, becauſe it is much eaſier to write without reflecting, than with care and meditation.

The thinneſs of the population of America, and the want of courage in its inhabitants, are the true cauſes of the rapidity of the conqueſts made there; one half of the world fell, as it were, in an inſtant, under the yoke of the other. Thoſe who pretend that fire-arms alone decided the victory, are greatly miſtaken; ſince with thoſe arms it has never yet been practicable to ſubdue the centre of Africa. The ancient Batavians and the Germans were for the moſt part naked; they had neither helmet nor cuiraſs; they had not even iron enough for barbing all their javelins; yet thoſe men, ſupported by their valour, often fought with advantage againſt ſoldiers in coats of mail, helmets, and in ſhort armed with inſtruments no leſs murderous than the pilum was of the Roman infantry. If, therefore, America had been peopled by natives as warlike as theſe Germans and Batavi, ſeven or eight hundred men would never have conquered from them two empires in a month. Nor can it be ſaid that the band commanded by Pizarro was ſupported by auxiliary troops, ſince, at the battle of Caxamalca, the Spaniards alone engaged the army of the emperor Atahualpa, and the event proved that Pizarro had no need of auxiliary forces.

It is not to be denied that by a local diſpoſition extremely remarkable, all the great rivers, namely, La Plata, the Maragnon, the Oroonoko, the river of the north, the Miſſiſſippi, the St. Lawrence, have their mouths at the eaſtern ſhore, where the Europeans muſt make their firſt landing; ſo that by going up theſe rivers they penetrated without difficulty into the heart of the continent; whereas the ſituation, as is well known, is quite different of Peru and Mexico, that is to ſay, on the weſtern ſhore; and they cannot otherwiſe be attacked than by troops already fatigued by the long marches they have made in the interior of the country.

Whatever was the cauſe of it, the New World was ſuch a deſert, that the Europeans might have eſtabliſhed themſelves there without deſtroying any tribe of the natives: and, as they would have given the Americans iron, arts, trades, horſes, oxen, and breeds of all the other domeſtic animals of which they were deſtitute, that would have been in ſome ſort a compenſation for the ſoil of which they would have taken poſſeſſion. Some civilians are known to maintain that the hunting tribes of America were not the right owners of the ſoil; becauſe, according to Grotius and Lauterbach, the property of a country cannot be acquired by hunting in it, by cutting wood or drawing water there; nothing but the preciſe demarcation of limits, and the intention of cultivating, or culture already begun, can eſtabliſh the poſſeſſion. We take the liberty, however, to differ widely from this opinion, and think that the hunting nations of America were well authoriſed to aſſert that they were, as has been obſerved above, the abſolute owners of the ſoil; becauſe, in their method of living, the chace is equivalent to culture; and the conſtruction of their huts is a title againſt which Grotius, Lauterbach, Titius, and all the civilians of Europe, cannot be appealed to without rendering the appellant ridiculous. It is allowed, that in places where there was already ſome ſort of culture, the right was ſtill more incontrovertibly founded; and it is exceedingly hard to conceive how it could ever come into the head of pope Alexander VI. to grant, by a bull of the year 1493, the whole of the continent, with all the iſlands of America, to the king of Spain. Yet he did not think he was diſpoſing of uncultivated and uninhabited regions, ſince he ſpecifies in his donation both towns and caſtles, *civitates & caſtra in perpetuum, tenore præſentium, donamus.* It may be replied, that this act was only ridiculous: yes, it is preciſely, becauſe it was ridiculous that it ought not to have been made, to avoid giving room to weak minds to imagine that the ſovereign pontiffs have contributed as much as lay in their power to all the depredations and to all the maſſacres that the Spaniards have committed in America, where they cited this bull of Alexander VI. whenever they poignarded a cacic and uſurped a province. The court of Rome ſhould have ſolemnly repealed this *act of donation*, at leaſt after the death of Alexander VI.; but unfortunately we cannot find that it ever thought of taking this ſtep in favour of religion.

Another remarkable circumſtance is, that ſome divines maintained, in the 16th century, that the Americans were not men; and it was not merely the want of a beard, and the nudity of the ſavages, that led them to adopt the ſentiment, but the accounts they received concerning the anthropophagi, or the cannibals. This is manifeſt by a letter ſtill extant of Lullus: the weſtern Indians, ſays he, have nothing of the reaſonable animal except the maſk; they ſcarcely know how to ſpeak, and are not acquainted either with honour, or modeſty, or probity; no ferocious animal is ſo ferocious as they; they devour one another, tear their enemies into morſels, ſuck their blood, and always have enemies; for wars are eternal among them, and their vengeance knows no bounds. The Spaniards who frequent them, continues he, become inſenſibly as perverſe, as malicious, as atrocious as themſelves, whether it be from the force of example, or whether it proceeds from the influence of the climate: *adeo corrumpuntur illic mores, ſive id accidat exemplo incolarum, ſive cæli natura.* There is no reaſon, however, to think that the climate has any influence in this matter; ſince we have already obſerved, that in the hotteſt countries, as under the equator, and in the coldeſt, as beyond the fiftieth degree, we have alike ſeen barbarians devour their priſoners, and celebrate in horrible ſongs the memory of their anceſtors, who feaſted in like manner at ſimilar banquets.

Lullus, and the divines above mentioned, muſt have been totally ignorant that the eating of human fleſh was likewiſe extremely common among the ancient ſavages of our continent: becauſe, when man is not enlightened by the ſciences, when neither his hand nor his heart is reſtrained by law, he every where falls into the ſame exceſſes. But, in cloſing this article, we ſhall repeat, that it will be for ever a matter of aſtoniſhment, that in one entire hemiſphere of our globe there was not the leaſt idea of the ſciences in the year 1492, ſo that the human mind was there upwards of 3000 years behind hand. Even at this day there is not, throughout the whole extent of the New World, one American population that is free, and on the point of gaining inſtruction in literature; for the Indians of the miſſions have nothing to do with the ſubject; ſince all concurs to ſhew that they are rather converted into fanatical ſlaves than reduced to a ſtate of humanity.

In regard to the firſt people of America, and whence they came to recite the various opinions that have been advanced would lead us greatly beyond our purpoſe. The ſubject has been copiouſly and elaborately inveſtigated by the abbé Clavigero and Dr. Robertſon, and we may reaſonably content ourſelves with the reſult of their inquiries. The latter, after recapitulating and diſcuſſing the moſt plauſible opinions on the ſubject, comes to the following concluſions: 1. That America was not peopled by any nation from the ancient continent, which had made any conſiderable progreſs in civilization; becauſe, when America was firſt diſcovered, its inhabitants were unacquainted with the neceſſary arts of life, which are the firſt eſſays of the human mind toward improvement; and if they had ever been acquainted with them, for inſtance, with the plough, the loom, and the forge, their utility would have been ſo great and obvious, that it is impoſſible they ſhould have been loſt. Therefore the anceſtors of the firſt ſettlers in America were uncivilized, and unacquainted with the neceſſary arts of life.

2. America could not have been peopled by any colony from the more ſouthern nations of the ancient continent; becauſe none of the rude tribes of theſe parts poſſeſſed enterpriſe, ingenuity, or power, ſufficient to undertake ſuch a diſtant voyage; but more eſpecially becauſe that, in all America, there is not an animal, tame or wild, which properly belongs to the warm or temperate countries of the eaſtern continent.

In ſhort, from theſe and ſeveral other arguments, he thinks it reaſonable to conclude, that the progenitors of all the American nations, from Cape Horn to the ſouthern limits of Labrador, from the ſimilarity of their aſpect, colour, &c. migrated from the north-eaſt parts of Aſia: and that the nations that inhabit Labrador, Eſquimaux, and the parts adjacent, from their unlikeneſs to the American nations, and their reſemblance to the northern Europeans, came over from the north-weſt parts of Europe. Hiſt. of America, vol. ii. p. 22, &c.

On the other hand, the abbé Clavigero, a native of America, and a later writer than Dr. Robertſon, is of opinion, that there remains no other ſolution to this intricate queſtion than by admitting an ancient union between the equinoctial countries of America and thoſe of Africa, and a connection of the northern countries of America with Europe on the eaſt and Aſia on the weſt; ſo that there has probably been a period ſince the flood when there was but one continent. The beaſts of cold climates paſſed over the northern iſthmuſſes which perhaps connected Europe, America, and Aſia; and the animals and reptiles peculiar to hot countries paſſed over the iſthmus that connected South America with Africa; for, from various reaſons, he is induced to believe, that there was formerly a tract of land uniting the eaſternmoſt part of Brazil to the weſternmoſt part of Africa: and that all the tract of land may be ſunk by ſome violent agitation of nature, leaving only ſome traces of it in that chain of iſlands whereof Cape de Verd, Fernandez, De Norona, Aſcenſion, and St. Matthew iſlands make a part; and alſo in thoſe numerous ſand-banks diſcovered by different navigators, and particularly by de Buache, who founded that ſea with great accuracy. Theſe iſlands and ſand-banks may probably have been the moſt elevated parts of that immerged iſthmus. In like manner it is probable that the north-weſtern part of America was joined to the north-eaſtern part of Aſia by a neck of land which has been ſunk or waſhed away; and the north-eaſtern parts of America to the north-weſtern parts of Europe, by Greenland, Iceland, &c.

On the whole, we cannot but believe that the quadrupeds and reptiles of the New World paſſed thither by land, and by different routes, from the old continent. All other ſuppoſitions are ſubject to enormous difficulties; and, though this be not without ſome, yet they are not altogether unſurmountable. The moſt formidable is the ſuppoſition of an earthquake, ſo violent as to ſubmerge a tract of land of more than 1500 miles in length, which, according to our hypotheſis, united Africa and South America. We do not, however, aſcribe this ſtupendous revolution to a ſingle ſhock; it may have been effected by a ſucceſſion of earthquakes. It is well known that theſe convulſions are common in the climates where we ſuppoſe this iſthmus to have been. Neither is it impoſſible, nor even improbable, that ſuch an effect ſhould be produced by earthquakes; nor is hiſtory by any means deſtitute of examples to our purpoſe. The earthquake that was felt in Canada, in 1663, overturned a chain of freeſtone mountains upwards of 300 miles in length, converting the whole of that immenſe tract into one entire plain. And how prodigious muſt have been the convulſion occaſioned by thoſe extraordinary earthquakes recorded in the hiſtories of America, when the world was thought to be on the verge of diſſolution!

It may farther be objected to this ſyſtem, continues the abbé, that if beaſts traverſed by land from one continent to the other, it will be no eaſy matter to aſſign a cauſe why ſome ſpecies paſſed thither without leaving a ſingle individual behind them on the old continent; and, on the contrary, that ſome entire ſpecies ſhould remain in the old continent, and not a ſingle individual of them emigrate to America. But this objection operates with equal force againſt every other opinion, excepting that which employs angels in tranſporting beaſts. Suppoſing, however, that it did not, we have a ſatisfactory anſwer to it. All the quadrupeds of the earth are not yet known; we cannot, therefore, affirm how many are in the one which are not in the other continent. The knowledge of the beſt informed zoologiſts is very imperfect, and they differ among themſelves. The count de Buffon enumerates only two hundred ſpecies of quadrupeds. Bomare, who wrote a ſhort time after him, makes them amount to 265; but to ſay how many more there may be, and of what kinds, until we have explored the interior regions of Africa, a great part of Tartary, the country of the Amazons, the vaſt territory weſt of the Miſſiſſippi, and various other unexplored and extenſive countries, which, together conſtitute a great proportion of the entire globe, would be mere conjecture. No argument, therefore, can be inferred from the difference of the animals in the two continents againſt our ſyſtem, till the animals in theſe unexplored regions ſhall have been examined. Abbé Clavigero's Hiſt. of Mexico, vol. ii. diſſ. 1.

We

We have dwelt the longer on this article, as it muſt be highly intereſting to every inquiſitive mind, and the diſcuſſion of it is blended with much uſeful information.

AMERICA, in *Geography*, or the New World, or the Weſt Indies, is one of the four quarters of the globe, bordered by the ocean, diſcovered by Chriſtopher Columbus, a Genoeſe, in 1492, and denominated America, from Americus Veſputius, a Florentine, who landed, in 1497, on that part of the continent, ſituated to the ſouth of the equator; after which it fell principally under the dominion of the Spaniards, the Engliſh, the French, the Portugueſe, and the Dutch. It is divided into north and ſouth by the gulf of Mexico and the ſtraights of Panama. North America, as far as it is known, extends from the 11th degree of latitude, or 7° 30′, as marked in the map of Lacruz, to the 75th, or, as others ſtate it, to the 72d. Its principal countries are Mexico, California, Louiſiana, Virginia, Canada, Newfoundland, the iſlands of Cuba, St. Domingo, and the Antilles. South America reaches from the 12th degree of north to the 60th degree of ſouth latitude, or, if the ſtrait of Magalhaens be the limit, to the 54th: its countries are, Terra Firma, Peru, Paraguay, Chili, Terra Magellanica, the Brazils, and the country of the Amazons. America, in length from N. lat. 72° to S. lat. 54°, comprehends 126°, or 7560 geographical miles, or in Britiſh miles about 8800. The greateſt breadth of South America from Cape Blanco weſt, to that of St. Roque eaſt, is 48°, or 2880 geographical miles; but in the North, from the promontory of Alaſka to the moſt eaſtern point of Labrador, or even of Greenland, a third part muſt be added. Suppoſing the breadth of North America to be 3840 geographical miles, the average breadth will be about 3360 geographical miles, or nearly 4000 Britiſh miles. This extenſive continent lies between the Pacific ocean on the weſt, and the Atlantic on the eaſt, and is ſaid to contain upwards of fourteen million of ſquare miles.

SOUTH AMERICA, the population of which is eſtimated at about 13,000,000, is an extenſive peninſula, connected with North America by the iſthmus of Darien, and divided between Spain, Portugal, France, Holland, and the Aborigines, as follows:

Spaniſh Dominions, computed at more than 5000 geographical miles, and containing about 9,000,000 inhabitants.	*Chief Towns.*
Terra Firma,	Panama and Carthagena.
Peru,	Lima.
Chili,	St. Jago.
Paraguay,	Buenos Ayres.
Portugueſe, equal, probably in extent to the Spaniſh.	
Brazil,	St. Salvador.
French.	
Cayenne,	Caen.
Dutch.	
Surinam,	Paramaribo.
Aborigines.	
Amazonia.	
Patagonia.	

The climate of TERRA FIRMA, eſpecially in the northern parts, is extremely hot and ſultry during the whole year. From the month of May to the end of November, the ſeaſon, called Winter by the inhabitants, is almoſt a continual ſucceſſion of thunder, rain, and tempeſts; the clouds precipitating the rain with ſuch impetuoſity, that the low lands exhibit the appearance of an ocean. Great part of the country is of conſequence almoſt continually flooded; and this, together with the exceſſive heat, ſo impregnates the air with vapours, that in many provinces, particularly about Papayan and Portobello, it is extremely unwholeſome. The ſoil of this country is very different; the inland parts being exceedingly rich and fertile, while the coaſts are ſandy and barren. It is impoſſible to view, without admiration, the perpetual verdure of the woods, the luxuriancy of the plains, and the towering height of the mountains. This country produces corn, ſugar, tobacco, and fruits of all kinds; the moſt remarkable is that of the manzanillo tree: it bears a fruit reſembling an apple, but which, under this appearance, contains the moſt ſubtile poiſon. The bean of Carthagena is the fruit of a ſpecies of willow, about the bigneſs of a bean, and is an excellent remedy for the bite of the moſt venomous ſerpents, which are very frequent all over this country. Among the natural merchandize of Terra Firma, the pearls found on the coaſt, particularly in the bay of Panama, are not the leaſt conſiderable. An immenſe number of Negro ſlaves are employed in fiſhing for theſe, and have arrived at a wonderful dexterity in the occupation. They are ſometimes, however, devoured by ſharks while they dive to the bottom, or are cruſhed againſt the ſhelves of the rocks. This country was called Terra Firma, on account of its being the firſt part of the continent which was diſcovered, all the lands found previous to this being iſlands.

From the ſituation of PERU, which is within the torrid zone, one would ſuppoſe it to be uninhabitable; but the Andes, thoſe lofty mountains, being on one ſide, and the South ſea on the other, it is not ſo prodigiouſly hot as tropical countries in general are; and in ſome parts it is diſagreeably cold. In one part are mountains of a ſtupendous height and magnitude, having their ſummits covered with ſnow; on the other, volcanos flaming within, while their tops, chaſms, and apertures are involved in ice. The plains are temperate, the beaches and vallies hot; and laſtly, according to the diſpoſition of the country, its high or low ſituation, we find all the various gradations of temperature between the extremes of heat and cold. It is remarkable, that in ſome places it never rains, a defect ſupplied by a dew that falls every night, and ſufficiently refreſhes the vegetable creation; but in Quito they have prodigious rains, attended by dreadful ſtorms of thunder and lightning. In the inland parts of Peru, and by the banks of the rivers, the ſoil is uſually very fertile; but along the ſea-coaſt it is a barren ſand.

The climate of CHILI is one of the moſt delightful in the world, being a medium between the intenſe heats of the torrid and the piercing colds of the frigid zones. Along the coaſt of the Pacific ocean, they enjoy a fine temperate air, and a clear, ſerene ſky moſt part of the year; but ſometimes the winds that blow from the mountains in Winter are exceedingly ſharp. There are few places in this extenſive country where the ſoil is not exuberantly rich; and were its natural advantages ſeconded by the induſtry of the inhabitants, Chili would be the moſt popular kingdom in America.

Some parts of PARAGUAY, ſituated as it is, muſt be extremely hot by reaſon of the almoſt vertical influence of the ſolar rays; while diſtricts muſt be pleaſant and delightful. The heat is in ſome meaſure, however, mitigated by the gentle breezes, which generally begin at about nine or ten in the morning, and continue the greateſt part of the day. Some tracts of the country are very mountainous; but in many others are found extenſive and beautiful plains, where the ſoil is very rich, producing cotton, tobacco, and the valuable herb called paragua, together with a variety of fruits. Here are alſo extremely rich paſtures, in which are bred

ſuch

ſuch herds of cattle, that it is ſaid, the hides are the only part exported, while the fleſh is left to be devoured by the ravenous beaſts of the wilderneſs. Not long ſince a horſe might be purchaſed here for one dollar, and an ox, choſen out of ſeveral hundreds, for a ſtill more trifling ſum.

The climate of *Brazil*, or BRASIL, has been deſcribed by two eminent naturaliſts, Piſo and Maregrave, who made their obſervations with a philoſophical accuracy, and deſcribe it as temperate and mild, when compared with that of Africa; imputing this circumſtance chiefly to the refreſhing wind that blows continually from the ſea. The air is not only cool, but chilly through the night, ſo that the natives kindle a fire every evening in their huts. As the rivers in this country annually overflow their banks, leaving a ſort of ſlime upon the lands; the ſoil here is therefore amazingly rich. The vegetable productions are Indian corn, ſugar-canes, tobacco, indigo, hides, ipecacuanha, balſam, Brazil-wood, which is of a red colour, hard and dry, and is chiefly uſed in dyeing, though not the red of the beſt kind. Here is alſo the ſuſtic, of uſe in dyeing yellow, and a beautiful ſpeckled wood employed in cabinet work. They have five different ſorts of palm trees, ſome curious ebony, and a great variety of cotton trees. This country abounds in horned cattle, which are hunted for their hides alone, 20,000 being ſent annually into Europe. Deer, hares, and other game are likewiſe in great plenty. Amongſt the wild beaſts found here, are tigers, porcupines, jamiveras, and a fierce animal ſomewhat reſembling a greyhound; monkies, ſloths, and the torpiraſſu, a creature between a bull and an aſs, but without horns and entirely harmleſs; the fleſh is very good, and has the flavour of beef. The country abounds with a numberleſs variety of fowl, both wild and tame; and among them turkies, fine white hens and ducks: alſo plenty of fiſh, inſects, and ſerpents.

Of CAYENNE, the land along the coaſt is very low, and greatly ſubject to inundations during the rainy ſeaſon, from the multitude of rivers which ruſh down from the mountains with great impetuoſity. Here the atmoſphere is ſultry, moiſt, and unwholeſome, eſpecially where the woods are not cleared away; but on the higher parts, where the trees are cut down, and the ground is laid out in plantations, the air is more healthy, and greatly tempered by the ſea breezes. The ſoil in many parts is rich and fertile, producing ſugar, tobacco, maize, fruits, and other neceſſaries of life.

In the months of September, October, and November, the climate of SURINAM is unhealthy, particularly to ſtrangers. The common diſeaſes are putrid and other fevers, the dry belly-ach and the dropſy. About a hundred miles within land from the ſea, a quite different ſoil is ſeen, a hilly country, a pure, dry, wholeſome air, where a fire ſometimes would not be diſagreeable. Along the coaſt the water is brackiſh and unwholeſome, the air damp and ſultry. The thermometer ranges from 75° to 90° throughout the year. A north-eaſt breeze never fails to blow from about nine in the morning through the day, in the hotteſt ſeaſons. As the days and nights throughout the year are very nearly of equal length, the air can never become extremely heated, nor the inhabitants ſo greatly incommoded by the heat, as thoſe who live at a greater diſtance from the equator. The ſeaſons formerly were divided regularly into rainy and dry; of late years, however, ſo much dependence cannot be placed upon them, owing, probably, to the country being more cleared, by which means a free paſſage is opened for the air and vapours.

The air in AMAZONIA is cooler than might be expected, conſidering it as ſituated in the torrid zone. This is partly owing to the heavy rains which occaſion the rivers to overflow for one half of the year, and partly to the hazineſs of the weather, which obſcures the ſun great part of the time he is above the horizon. During the rainy ſeaſon the country is ſubject to dreadful ſtorms of thunder and lightning. The ſoil is extremely fertile, producing cocoa-nuts, ananas, plantains, and a great variety of tropical fruits; cedar, redwood, pak, ebony, logwood, and many other ſorts of dying wood, together with tobacco, ſugar-canes, cotton, potatoes, balſam, honey, &c. The woods abound with tigers, wild boars, buffaloes, deer, and game of various kinds. The rivers and lakes teem with fiſh. Here are alſo ſea-cows and turtles; but the crocodiles and water-ſerpents render fiſhing a dangerous employment.

The climate is ſaid to be much colder in PATAGONIA than in the north under the ſame parallels of latitude; a circumſtance aſcribed to its being in the vicinity of the Andes, which croſs it, and are covered with eternal ſnow. It is almoſt impoſſible to ſay what the ſoil would produce, it not being at all cultivated by the natives. The northern parts are covered with wood, among which is an inexhauſtible fund of large timber: but towards the ſouth it is ſaid not to produce a ſingle tree big enough to be of uſe to mechanics. There are, however, good paſtures which give food to incredible numbers of horned-cattle and horſes, firſt carried thither by the Spaniards, and ſince increaſed to an amazing degree.

NORTH AMERICA, bounded on the eaſt by the Atlantic, and on the weſt by the Pacific ocean, extends on the ſouth to the vicinity of Panama; the province of Veragua being univerſally conſidered as part of North America. According to the maps of Lopez, a chain of mountains runs north and ſouth, called Sierras de Canatagua, and terminates in the point of Higuera; which, dividing the provinces of Panama and Veragua, forms a natural boundary between North and South America. Its northern limit is not preciſely aſcertained; but from 72° N. lat., aſſumed as the northern limit, to 7° 30′, the ſouthern boundary, there will be an interval of 64½°, or 3870 geographical miles, ſomewhat more than 4500 Britiſh. Its breadth is very different in different parts.—Thoſe parts of North America not inhabited by Indians, belong (if we include Greenland) to Denmark, Great Britain, the American States, and Spain. Spain claims Eaſt and Weſt Florida, with the whole tract weſt of the Miſſiſſippi, and ſouth of the northern boundaries of Louiſiana, New Mexico, and California. Great Britain claims all the country inhabited by Europeans, lying north and eaſt of the United States, except Greenland, which belongs to Denmark. The remaining part forms the territory of the fifteen United States; the particular countries and provinces whereof are exhibited in the following view:

	Inhabitants.	*Chief Towns.*
To Denmark belongs Greenland, containing -	10,000	New Herrnhut.
Britiſh Provinces.		
New Britain, -	not known.	
Upper Canada, -	20,000	Kingſton, Detroit, Niagara.
Lower Canada, -	130,000	Quebec, Montreal.
Cape Breton iſland, -	1000	Sydney, Louiſburg.
New Brunſwick, Nova Scotia,	35,000	Frederick-town. Halifax.
St. John's iſland, in 1783, -	5000	Charlotte-town.
Newfoundland iſland,	7000	Placentia, St. John's.

UNITED STATES OF AMERICA.

	Inhabitants.	*Chief Towns.*
Vermont, -	85,539	Windſor. Rutland.
New Hampſhire	141,885	Portſmouth, Concord.
Maſſachuſetts }	387,787	Boſton, Salem, Newbury-port
Diſtrict of Maine }	96 540	Portland, Hallowell.
Rhode iſland, -	68,825	Newport, Providence.
Connecticut, -	237,946	Newhaven, Hartford.
New York, -	340,120	New York, Albany.
New Jerſey, -	184,139	Trenton, Burlington, Brunſwick.
Pennſylvania,	434,373	Philadelphia, Lancaſter.
Delaware, -	59,094	Dover, Wilmington, Newcaſtle.
Maryland, -	319,728	Annapolis, Baltimore.
Virginia, -	747,610	Richmond, Peterſburg, Norfolk.
Kentucky, -	73,677	Lexington.
North Carolina,	393,751	Newbern; Edenton, Halifax.
South Carolina,	249,073	Charleſton, Columbia.
Georgia, -	82,548	Savannah, Auguſta.
Territory S. of Ohio,	35,691	Abingdon.
Territory N.W. of Ohio, }		Marietta.

Belonging to SPAIN.

Eaſt Florida,	Auguſtine.
Weſt Florida,	Penſacola.
Louiſiana, (ceded to the United States)	New Orleans.
New Mexico,	Santa Fée.
California,	St. Juan.
Mexico, or New Spain,	Mexico.

NORTH AMERICA, in *Hiſtory*. America was originally peopled by uncivilized nations, who lived moſtly by hunting and fiſhing. The Europeans who firſt viſited theſe ſhores, treating the natives as wild beaſts of the foreſt, which have no property in the woods where they roam, planted the ſtandard of their reſpective maſters wherever they happened firſt to land, and in their names claimed the country by *right of diſcovery*. Prior to any ſettlement in North America, titles of this kind were ſet up by the Engliſh, French, Spaniſh, and Dutch navigators, who came hither for the purpoſe of fiſhing and trading with the natives. Slight as ſuch titles were, they afterwards became cauſes of contention between the European nations. The ſubjects of different princes often laid claim to the ſame tract of country, becauſe both had diſcovered the ſame river or promontory, or becauſe the extent of their reſpective claims was undetermined.

While the ſettlements in this vaſt uncultivated country were inconſiderable and ſcattered, and the trade of it confined to the bartering of a few trinkets for furs, a trade carried on by a ſmall number of adventurers, the interference of claims produced no important controverſy, either among the ſettlers or the nations of Europe. But in proportion to the progreſs of population and the growth of the American trade, the jealouſies of the nations which had made early diſcoveries and ſettlements on this coaſt were alarmed; ancient claims were revived; and each power took meaſures to extend and ſecure its own poſſeſſions at the expence of a rival.

By the treaty of Utrecht, in 1713, the Engliſh claimed a right of cutting logwood in the bay of Campeachy in South America. In the exerciſe of this right the Engliſh merchants had frequent opportunities of carrying on a contraband trade with the Spaniſh ſettlements on the continent. To remedy this evil the Spaniards reſolved to annihilate a claim which, though often acknowledged, had never been clearly aſcertained. To effect this deſign they captured the Engliſh veſſels which they found along the Spaniſh main; and many of the Britiſh ſubjects were doomed to work in the mines of Potoſi.

Repeated ſeverities of this kind at length, in 1739, occaſioned a war between England and Spain, which terminated in 1748 by the treaty of peace ſigned at Aix-la-Chapelle, in which reſtitution was made on both ſides of all places taken during the war.

Peace, however, was of ſhort duration. The French poſſeſſed Canada, and had made conſiderable ſettlements in Florida, claiming the country on both ſides the Miſſiſſippi by right of diſcovery. To ſecure and extend their claims they conſtructed a line of forts from Canada to Florida. They had ſecured the important paſs at Niagara, and erected a fort at the junction of Allegany and Monongahela rivers, called Fort du Queſne. They took pains to ſecure the friendſhip and aſſiſtance of the natives; encroachments were made upon the Engliſh poſſeſſions, and mutual injuries ſucceeded. The diſputes among the ſettlers in America, and the meaſures taken by the French to command all the trade of the river St. Lawrence on the north, and of the Miſſiſſippi on the ſouth, excited a jealouſy in the Engliſh nation, which ſoon broke forth in open war. This war was carried on with various ſucceſs, till a deciſive blow, which proved fatal to the intereſts of the French in America, put an end to it in 1762. This was the defeat of the French army, and the capture of Quebec, by the brave general Wolfe. That hero was ſlain at the beginning of the action on the plains of Abram, and M. Montcalm, the French commander, likewiſe loſt his life. The loſs of Quebec was ſoon followed by the ſurrender of Montreal to general Amherſt, and Canada has remained ever ſince in poſſeſſion of the Engliſh.

In 1763, a definitive treaty of peace was concluded at Paris between Great Britain, France, and Spain, by which the Engliſh ceded to the French ſeveral iſlands which they had taken from them in the Weſt Indies, but were confirmed in the poſſeſſion of all North America on this ſide the Miſſiſſippi, except the iſland of Orleans.

No ſooner was peace concluded than the Britiſh parliament adopted the plan of taxing the colonies; and, to juſtify their attempts, declared that the money to be raiſed was to be appropriated to defray the expence of defending them in the late war. The firſt attempt to raiſe a revenue in America appeared in the memorable *ſtamp act*, paſſed March 22, 1765, whereby it was enacted, that certain inſtruments in writing, as bills, bonds, &c. ſhould not be valid in law, unleſs drawn on ſtamped paper, on which a duty was laid.

Immediately as this act was publiſhed in America it raiſed a general alarm. The people were filled with apprehenſions at an act which they ſuppoſed to be an attack on their conſtitutional rights. The colonies therefore petitioned the king and parliament for a redreſs of the grievance, and at the ſame time entered into aſſociations for the purpoſe of preventing the importation and uſe of Britiſh manufactures until the obnoxious act ſhould be repealed. This ſpirited and unanimous oppoſition of the Americans produced the deſired effect; and on the 18th of March, 1766, the ſtamp act was repealed. The news of the repeal was received in the colonies with univerſal joy, and the trade between them and Great Britain was renewed on the moſt liberal footing.

The parliament, however, by repealing this act, ſo odious to their American brethren, by no means intended to lay aſide the ſcheme of raiſing a revenue in the colonies, but merely to alter the mode. Accordingly, the next year they paſſed an act, impoſing a certain duty on glaſs, tea, paper, and painters' colours; articles which were much wanted, and not manufactured in America. This act, as might reaſonably

have been expected after what had passed, kindled the refentment of the Americans, and excited a general oppofition to the meafure, fo that parliament thought it adviseable, in 1770, to take off thefe duties, except three pence a pound on tea. Neverthelefs this duty, however trifling, kept alive the jealoufy of the coloniſts, and their oppofition to parliamentary taxation continued increafing from day to day.

It will be eafily conceived that the inconvenience of paying the duty was not the fole nor even principal caufe of the oppofition; it was the *principle*, which, once admitted, would have fubjected the colonies to unlimited parliamentary taxation, without the privilege of being reprefented. The *right*, abſtractedly confidered, was denied; and the ſlighteſt attempt to juſtify the claim by precedent was uniformly refifted. Nor could the Americans be deceived as to the views of parliament; for the repeal of the ſtamp act had been accompanied with an unequivocal declaration, that "the parliament had a right to make laws of fufficient validity to bind the colonies in all cafes whatfoever."

The colonies, therefore, entered into meafures for encouraging their own manufactures and home productions, and for retrenching the ufe of foreign fuperfluities, while the importation of tea was prohibited. In the royal and proprietary governments, and in Maſſachuſetts, the governors and people were in a ſtate of continual warfare. Aſſemblies were repeatedly called and fuddenly diffolved; employing the time while fitting in ſtating grievances and framing remonſtrances. As if to inflame thefe difcontents an act of parliament was paſſed, ordaining, that the governors and judges ſhould receive their falaries of the crown; thus rendering them independent on the provincial aſſemblies, and removeable only at the pleafure of the king. Thefe proceedings, with many others of a fimilar tendency, could not fail to produce a rupture.

In 1773, the ſpirit of the Americans broke out into open violence. The Gafpee, an armed fchooner belonging to his Britannic Majeſty, had been ſtationed at Providence, in Rhode Iſland, to prevent fmuggling. The vigilance of the commander irritated the inhabitants to fuch a degree, that about 200 armed men boarded the veſſel under favour of the night, compelled the officers and crew to go aſhore, and fet fire to the fchooner. A reward of 500l. offered by government for apprehending any of the perfons concerned in this daring act, produced no effectual difcovery.

The refolution of the colonies not to import or confume any tea, having, in a great meafure, deprived the Engliſh government of a revenue from this quarter, the parliament formed a fcheme of introducing tea into America under cover of the Eaſt India Company. For this purpofe an act was paſſed, empowering the company to export all forts of teas, duty free, to any place whatever. The company departed from their ufual mode of tranfacting bufinefs, and became their own exporters. Several ſhips were freighted with teas, and fent to the American colonies, and factors were appointed to receive and to difpofe of their cargoes.

The Americans, determined to oppofe the revenue fyſtem of the Engliſh parliament in every poſſible ſhape, confidered the attempt of the Eaſt India Company to evade the refolutions of the colonies, and difpofe of teas in America, as an indirect mode of taxation, fanctioned by the authority of parliament. The peopled aſſembled in various places, and, in the large commercial towns, took meafures to prevent the landing of the teas. In Maſſachuſetts they in like manner viewed the tea as a vehicle of an unconſtitutional tax, and as infeparably aſſociated with it. To avoid the one they refolved to deſtroy the other. About 17 perfons, dreſſed as Indians, repaired to the tea ſhips, broke open 342 cheſts of tea, and, without doing any other damage, difcharged their contents into the water.

No fooner did the tidings of this deſtruction of the tea reach Great Britain than the parliament determined to puniſh that devoted town. A bill was brought in and paſſed, to "difcontinue the landing and difcharging, lading and ſhipping of goods, wares, and merchandizes at the town of Boſton, or within the harbour." This act, paſſed March 25, 1774, and called the Boſton port bill, threw the inhabitants into the greateſt conſternation. The town of Boſton paſſed a refolution expreſſing their fenfe of this oppreſſive meafure, and a defire that all the colonies would concur to ſtop all importations from Great Britain. Moſt of them entered into ſpirited refolutions on this occafion, to unite with Maſſachufetts in a firm oppofition to the unconſtitutional meafures of parliament.

But the port bill was not the only act that alarmed the apprehenfions of the Americans. Determined to compel the province of Maſſachufetts to fubmit to their laws, parliament paſſed an act for "the better regulating the government in the province of Maſſachufetts Bay." The object of this act was to alter the government as it ſtood on the charter of King William, and to make the ſheriffs and judges dependent on the king, and removeable at his will and pleafure.

This act was foon followed by another, which ordained, that any perfon indicted for murder, or other capital offence, committed in aiding the magiſtrates in executing the laws, might be fent by the governor, either to any other colony, or to Great Britain, for his trial.

This was ſhortly after fucceeded by the Quebec bill, which enlarged the bounds of that province, and granted many privileges to the Roman catholics. The view of this act was to fecure the attachment of that province to the crown of England, and prevent its joining the colonies in their reſiſtance to the laws of parliament.

All thefe ſteps, however, far from intimidating, rather exaſperated the Americans, by confirming them in their former apprehenfions of the evil defigns of government, and ferved only to unite the colonies in a more determined oppofition. A correfpondence of opinion, in refpect to thefe acts, produced an uniformity of proceedings in the colonies. The people generally concurred in the propofition for holding a congrefs, in order to concert meafures for the prefervation of their rights. Deputies were accordingly appointed, and met at Philadelphia on the 26th of October, 1774.

Preparations now began to be made to oppofe by force the execution of thefe acts of parliament. The militia of the country were trained to the ufe of arms; great encouragement was given to the manufacture of gun-powder, and meafures were taken to obtain all kinds of military ſtores. At Lexington the firſt blood was fpilt in the war; a war which fevered America from the Britiſh empire. Here was opened the firſt fcene of the great drama, which, in its progrefs, exhibited the moſt illuſtrious characters and events, and clofed with a revolution equally glorious for the actors, and important in its confequences to mankind.

In July, congrefs publiſhed their declaration of independence, which feparated America from Great Britain. This grand event took place 284 years after the difcovery of America by Columbus; 166 from the firſt effectual eſtabliſhment in Virginia, and 156 from the firſt eſtabliſhment of Plymouth in Maſſachufetts, which were the earlieſt Engliſh fettlements in America.

On the 30th of November, 1782, the proviſional articles of peace and reconciliation, between Great Britain and the American ſtates, were figned at Paris; whereby the former acknowledged the independence and fovereignty of the United

United States of America. Theſe articles were ratified by a definitive treaty, September 3, 1783. Thus ended a long and arduous conflict, in which Great Britain expended near a hundred millions of money, with a hundred thouſand lives, and gained nothing. America endured every cruelty and diſtreſs from her enemies, loſt many lives and much treaſure, but delivered herſelf from a foreign dominion, and eſtabliſhed a rank among the nations of the earth. Holland acknowledged the independence of the United States of America on the 19th of April, 1782; Sweden February 5, 1783; Denmark the 25th of February; Spain in March, and Ruſſia in July, of the ſame year. On the 30th of April, 1789, George Waſhington was inaugurated preſident of the United States of America, in the city of New York.

Hitherto the deliberations of the Union have been marked with wiſdom, and the meaſures they have adopted have been productive of great national proſperity.

To conclude, the United States, and indeed all parts of North America, ſeem to have been formed by nature for the moſt intimate union; as it may truly be affirmed, that no part of the world is ſo well watered with ſprings, rivulets, rivers, and lakes, as the territory of the United States. By means of theſe various ſtreams and bodies of water, the whole country is checquered into iſlands and peninſulas. The facilities of navigation render the communication between the ports of Georgia and New Hampſhire far more expeditious and practicable than between thoſe of Provence and Picardy in France, Cornwall and Caithneſs in Great Britain, or Gallicia and Catalonia in Spain. The canals opening between Suſquehanna and Delaware, between Paſquetank and Elizabeth rivers, in Virginia, and between the Schuylkil and Suſquehanna, will form a communication from the Carolinas to the weſtern counties of Pennſylvania and New York. The improvement of the Patomak will give a paſſage from the ſouthern ſtates to the weſtern parts of Virginia, Maryland, Pennſylvania, and even to the lakes. From Detroit to Alexandria, on the Patomak, 607 miles, are only two carrying places, which together do not exceed the diſtance of 40 miles. The canals of Delaware and Cheſapeak will open the communication from South Carolina to New Jerſey, Delaware, the moſt populous parts of Pennſylvania, and the midland counties of New York. Were theſe, and the canal between Aſhley and Cooper rivers, in South Carolina, the canals in the northern parts of the ſtate of New York, and thoſe of Maſſachuſetts and New Hampſhire, all opened, and many of them are in great forwardneſs, North America would thereby be converted into a cluſter of large and fertile iſlands, communicating eaſily with each other, at little expence, and in many inſtances without the uncertainty or danger of the ſeas.

From the numerous competitions in every branch of buſineſs in Europe, ſucceſs in any purſuit may be looked upon in the ſame light as a prize in a lottery. But the caſe is widely different in America. Here is room enough for every human talent and virtue to expand and flouriſh. This is ſo invariably true that it is generally believed there is not an inſtance to be found of an induſtrious, frugal, prudent European, with ſober manners, who has not been ſucceſsful in buſineſs in that country.

American *Earth Nut*, in *Botany*. See Arachis.

American *Graſs*. See Agrostis.

AMERICANA, in *Entomology*, a ſpecies of Chrysomela that inhabits America; a variety of it is found in the ſouth of France. The general colour is greeniſh gold, with five ſanguineous red lines upon the wing caſes. Fab. & Gmel. Feeds on the lavandula. A red ſpot on the head is a ſecondary diſtinction of this ſpecies.

AMERICANORUM, a ſpecies of Apis, deſcribed by Fabricius as a native of North America. It is hairy and black; anterior part of the thorax yellow; abdomen yellow, black at the end. Fab. Spec. Inſ. Obs. Fabricius, in his laſt work, "Entomologia Syſtematica," gives the apis americanorum preciſely the ſame ſpecific character as he had previouſly aſſigned to apis africana, ſo that at preſent they are both deſcribed as "hirſuta nigra, thoracis dorſo flavo, abdomine virеſcente: ſegmento primo flavo." To increaſe the confuſion, the lateſt editor of the "Linnæan Syſt. Nat." Gmelin, adopts the ſame error; apis africana, p. 2780, and apis americanorum, p. 2784, and the deſcription in the Spec. Inſ. of Fab. is only added as a ſynonym to the latter. It is probable they are both the ſame ſpecies.

AMERICIMA, in *Zoology*, a name given by ſome early naturaliſts to a ſmall kind of lizard found in Braſil. The preciſe ſpecies is uncertain; it is ſaid to be very ſmall; not above three fingers breadth long, and of the thickneſs of a ſwan's quill. Its body appears ſquare; its whole back is covered by deep grey ſcales; its head, legs, and ſides with brown ones; and its tail with blue. It is very gloſſy, the legs extremely ſlender, and it is generally eſteemed poiſonous.

AMERIGO, or Americus Vespucius. See Vespucci.

AMERIMNUM, or Amerimnon, in *Botany*, a genus of the *diadelphia decandria* claſs and order, of the natural order of *papilionaceæ* or *leguminoſæ*; the characters of which are, that the *calyx* is a one-leafed perianthium, tube bell-ſhaped, five-toothed, the teeth ſharp; the *corolla* papilionaceous, ſtandard with an oblong claw, roundiſh heart-ſhaped, expanding and convex, wings lanceolate, ſhorter than the ſtandard, and keel ſhort; the ſtamina have 10 filaments conjoined, anthers roundiſh; the *piſtillum* has a germ pedicelled, oblong, compreſſed leafy, varicoſe, with lateral veins, within woody, not gaping; cells diſpoſed longitudinally within; the *ſeeds* ſolitary, kidney-ſhaped, thicker at the baſe, appendicled at the top. There are two ſpecies, *viz.* 1. A. Brownei, "unarmed, with leaves petioled, alternate, ſubcordate-ovate; racemes compound, axillary, and lateral." This ſhrub riſes commonly to the height of ten feet, and ſupports itſelf on other ſhrubs. It is a native of Carthagena, Jamaica, and Domingo. 2. A. *Ebenus*, prickly A. or Jamaica ebony, pterocarpus feſſilifolius of Lin. p. buxifolius of Murray and Aiton, aſpalathus ebenus of Lin. Spec. and Reich. brya of Browne Jamaic. ſpartium arboreſcens of Miller and Sloane; "ſpiny, with leaves ſubſeſſile, aggregate, obovate-oblong, and peduncles two-flowered." This is common in Jamaica and ſeveral other parts of the Weſt Indies, where the wood is cut, and ſent into England under the name of ebony, though the true ebony is a native of the eaſtern country, and of a different genus. This wood is of a fine greeniſh brown colour, and admits of poliſhing well, ſo that it is much valued by the inſtrument makers; and it is of a very hard durable nature. Dr. Browne ſays, that the trunk ſeldom exceeds three or four inches in diameter; that the ſlender branches being very tough and flexible are uſed for riding ſwitches, and kept at all the wharfs about Kingſton to ſcourge the refractory ſlaves.

This ſpecies may be propagated by ſeeds procured from its native country. The ſeeds ſhould be ſown in pots filled with light freſh earth early in the ſpring, and plunged into a hot bed of tanners' bark, or placed in tan under pots. In about ſix weeks the plants will appear, and being very tender ſhould be carefully treated; air ſhould be admitted to them in warm weather, and they ſhould be often refreſhed with water. In five or ſix weeks more they ſhould be tranſplanted into ſeparate pots filled with light rich earth, and plunged again into the hot-bed, ſhading them from the ſun till they have taken root; they ſhould then have air every day in warm weather, and water once in two or three days, and in cold nights covered with glaſſes. In this hot-bed they may remain till autumn,

when they ſhould be removed into the ſtove, and plunged into the bark bed. Thoſe whoſe roots have filled the pot ſhould be removed into thoſe of a larger ſize. In winter the plant ſhould be kept warm, and have but little water, eſpecially in cold weather; and their leaves, when they contract filth, ſhould be cleared by waſhing them with a ſponge, otherwiſe the plants will not thrive. Theſe tender plants will not live in the open air in this country, even in the warmeſt ſeaſon; they muſt therefore be conſtantly kept in the ſtove or bark bed, and allowed much air in ſummer when the weather is warm; and when they have acquired ſtrength, they may be expoſed for three months in a warm ſituation in the ſummer. Martyn's Miller.

AMERINÆ, in *Entomology*, a ſpecies of CYNIPS, that forms unequal galls at the ends of the branches of the ſweet willow (ſalix pentandria). It is black except the legs, which are pale. Linnæus.

AMERIOLA, in *Ancient Geography*, a town of Latium, mentioned by Pliny; but not now exiſting.

AMERQUE, in *Geography*, a city of Mauritania, three leagues from the river Egnile, in the province of Habat, anſwering, according to Marmol, to the ancient Tocoloſida.

AMERSBURY, in *Geography*. See AMBRESBURY.

AMERSFORT, a town of the Netherlands, in the province of Utrecht, ſituate in a fertile and pleaſant country on the river Ems. The objects moſt worthy of notice in this town are the town-houſe, the triangular grand palace, the public walks planted with trees, and the great church dedicated to St. George. In its vicinity is the mountain called Amersfort berg, on which trees are planted in a kind of vitta, which reaches to Utrecht. The Ems becomes navigable at this town; and all the goods formerly brought out of Germany by Heſſian waggons, and conſigned to Amſterdam, were ſhipped at this port. A manufacture of dimity and bombazine has been eſtabliſhed in this place. Its trade in beer, rum, and tobacco is now decayed. It is 11 leagues eaſt-ſouth-eaſt from Amſterdam, and $5\frac{1}{2}$ north-eaſt from Utrecht. N. lat. 52° 12′. E. long. 5° 4′.

AMERSHAM. See AGMONDESHAM.

AMERUTHA, or AMERYTHA, in *Ancient Geography*, a village of Upper Galilee, mentioned by Joſephus, who fortified it againſt the Romans, probably the ſame as Meroth, which terminates Upper Galilee weſtward.

AMES, JOSEPH, in *Biography*, an induſtrious antiquarian, was originally a ſhip-chandler in Wapping, and acquired reputation at an advanced period of life by his ſtudy of antiquities. His "Typographical Antiquities," or Hiſtorical Account of Printing in England, with Memoirs of our ancient Printers, and a Regiſter of the Books printed by them from 1471 to 1600, with an Appendix concerning Printing in Scotland and Ireland to the year 1749, 4to. is a book well known and often cited. This work was conſiderably augmented, both in the memoirs and number of books, by Mr. William Herbert, and printed in three volumes, 4to. in 1785. Mr. Ames alſo publiſhed in 8vo. "A Liſt of Engliſh Heads engraved and mezzotinto;" and he drew up the "Parentalia" from Mr. Wren's papers. He was ſecretary to the ſociety of antiquarians, and died in 1759. Nichols's Anecdotes of Bowyer.

AMES, WILLIAM, an Engliſh divine, and a famous controverſial writer, was deſcended from an ancient family in Norfolk, and was born in 1576. He was educated at Chriſt's college, Cambridge, under Mr. William Perkins, from whom he probably imbibed the calviniſtical and puritanical ſentiments that diſtinguiſhed his writings. Whilſt he was fellow of his college he preached a ſermon about 1610-11, in which he inveighed with great vehemence againſt cards and dice, as the invention of the devil. By this mode of preaching he gave ſuch offence, that he withdrew from the univerſity in order to avoid expulſion. In the ſame year he publiſhed his "Puritaniſmus Anglicanus," in which he contraſts the principles and conduct of the puritans againſt thoſe of other perſons with a ſpirit and language equally illiberal and offenſive. No other alternative remained, according to his ſtatement, but either "to ſuppreſs epiſcopacy, or to bring back the pope from hell." Mr. Ames, ſoon after leaving Cambridge, removed to Holland, and officiated as miniſter to the Engliſh church at the Hague. In 1613, he began his controverſy with Grevinchovius, miniſter at Rotterdam, on the doctrines of election and reprobation, and it was continued from the preſs. The reputation he thus acquired induced the ſtates of Frieſland to invite him to the theological chair in the univerſity of Franeker; and he continued in this reſpectable ſtation for twelve years. In 1618, he attended the ſynod of Dort, and from time to time communicated information to the ambaſſador of king James of the debates of this aſſembly. From Franeker he removed to Rotterdam, where he preached to a congregation of his own countrymen; and where, after being for ſome time afflicted with an aſthma, he died in 1633. In the laſt year of his life he wrote his "Freſh Suit againſt Ceremonies;" but it was not publiſhed till after his death.

He was eſteemed a learned divine, an excellent caſuiſt, a rigid Calviniſt in doctrine, and a zealous advocate for the independent form of church diſcipline. His writings were numerous, both in Latin and Engliſh; moſt of them were printed abroad; and the principal of them, beſides thoſe already mentioned, are the following: "Diſceptatio Scholaſtica inter N. Grevinchovium and G. Amelium," 8vo.; "Diſputatio Altera," 8vo. "Coronis ad Collationem Hagienſem," 12mo. written againſt the Arminians; "Medulla Theologica," 12mo.; "De Incarnatione Verbi," 8vo. againſt the Socinians; "Bellarminus enervatus," 8vo. againſt the Papiſts; "De Conſcientia," 12mo. and in Engliſh under the title of "A Treatiſe on Conſcience," 4to. "Antiſynodalia," 12mo. againſt the Remonſtrants; "Demonſtratio Logicæ Veræ," 12mo.; "Diſputatio Theologica," againſt Metaphyſics; "Technometria," 8vo. on the purpoſe and bound of Arts; "Reply to Biſhop Morton on Ceremonies," and other tracts in the ſame controverſy; "Chriſtianæ Catecheſeos Sciographia;" and "Lectiones in Pſalmos Davidis," 8vo. a poſthumous work, dedicated to the magiſtracy of Rotterdam by Hugh Peters, the colleague of Ames in the Engliſh church of Amſterdam. Neal's Hiſt. Purit. vol. i. p. 579. Biog. Brit.

AMESA, in *Ancient Geography*, a river of Africa in Numidia.

AMESTRATUS, a city of Sicily, called Mutiſtratus by Polybius, Muſtraton by Diodorus Siculus, and Amaſtra by Silius Italicus; now Miſtretta, in the Val di Demona, on the river Haleſus. The inhabitants are called by Cicero (in Verrem) Ameſtratini. It was a ſtrong fort of the Carthaginians, beſieged by the Romans for ſeven months with great loſs, and, after another ſiege, taken and razed.

AMESTRIS, in *Entomology*, a ſpecies of PAPILIO, with angular indented wings, above black, with rufous and blue lunated marks; beneath obſcure. Fab. & Gmel.—Inhabits India. The anterior wings are black, with two rufous ſpots, and two blue ſpots in the middle of each: behind theſe a ſtreak of reddiſh lunules, which terminates in two white ſpots at the anterior margin, and along the exterior margin a ſtreak of blue lunated marks. Underſide entirely brown, waved with black ſtreaks, and a row of cinereous points. Fabricius.

AMETHYST, in *Mineralogy*. This ſtone was well known to the Greeks and Romans, from whom it obtained the

the name αμεθυστος, amethyſtus, from α and μεθυσος, *non vinoſus*, becauſe, according to Pliny, its colour was ſimilar to, but not ſo deep as that of wine; hence, by the abſurd doctrine of ſympathies, it came to be eſteemed as an antidote againſt drunkenneſs.

There are two kinds of amethyſts, the oriental and common. The oriental amethyſt is of a reddiſh or yellowiſh violet colour; and in hardneſs, in the form of its cryſtals, and in ſhort in every phyſical and chemical property, except that of colour, is the ſame as the ruby, the ſapphire, and oriental topaz, being a mere variety of CORUNDUM. It is a rare gem, and is very ſeldom brought to Europe. By being heated it loſes its colour, and becomes perfectly tranſparent, and of great brilliancy, ſo as to be ſcarcely diſtinguiſhed from the diamond; ſo nearly indeed does it reſemble this precious ſtone, as to be occaſionally ſubſtituted for it in jewellers work. De Boot, in his Hiſtoria Gemmarum, mentions an amethyſt, thus rendered colourleſs, eſtimated at 200 rix-dollars, which being cut to the ſame pattern, and ſet in a ſimilar manner as a diamond of the value of 18,000 gold crowns, ſo nearly equalled it in luſtre that he could not tell the difference between them.

The common amethyſt is cryſtallized QUARTZ, or rock cryſtal, tinged naturally of a full violet colour; its properties and characters will therefore be mentioned under the article QUARTZ. The common amethyſt, like th oriental, loſes its colour in the fire, but is at the ſame time ſpoiled by being rendered of an opaque white, owing to a multitude of minute cracks. The beſt European amethyſts come from the vicinity of Carthagena in Spain.

To imitate the amethyſt in paſte or glaſs, take ten pounds of clear glaſs or paſte, made without manganeſe, and fuſe it down with one ounce and a half of black manganeſe, and one dram of zaffer. The proceſs recommended by Porta is one dram of Manganeſe to one pound of frit. Neri's receipt is totally erroneous as to the proportion of colouring matter. He recommends to each pound of glaſs an ounce of colour compoſed of eleven parts manganeſe and one part zaffer, which would produce a deep black glaſs. Weidenmann Handbuch der Mineralogie. De Boot. Hiſt. Gemmarum, lib. ii. c. 32. Plinii Hiſt. Nat. lib. xxxvii. c. 40. Neri, Art de la Verrerie, c. 48. Handmaid to the Arts, vol. ii. p. 308.

AMETHYST, in *Heraldry*, ſignifies the purple colour in the coat of a nobleman, which, in gentlemen's eſcutcheons below that degree, is called *purpure*, and in thoſe of ſovereign princes, *Mercury*.

AMETHYSTEA, *amethyſt*, ſo called from the amethyſtine colours of the flowers, in *Botany*, a genus of the *diandria monogynia* claſs, of the natural order of *verticillatæ* and *labiatæ* of Juſſieu; the characters are, that the *calyx* is a perianthium one-leafed, tube bell-ſhaped, angular, ſemiquinquefid, ſubequal, acuminate and permanent; the *corolla* is one-petalled, ringent, little longer than the calyx, border five-parted and ſubequal; upper lip erect, rounded, concave, two-parted, gaping, lower three-parted, the ſides rounded, erect, ſhorter, the middle quite entire, concave, the length of the upper lip; the *ſtamina* have filaments filiform, approximating under the upper lip and longer than it, anthers ſimple and roundiſh; the *piſtillum* is a quadrifid germ, ſtyle ſize of the ſtamens, ſtigmas two and acute; no *pericarpium*, but the calyx becomes more bell-ſhaped and ſpreading; the *ſeeds* are four, ſhorter than the calyx, obtuſe, and angular within. There is one ſpecies, *viz.* A. *cærulea*, mountain upright A, which is a native of the mountains in Siberia, from whence the ſeeds were ſent to the Imperial garden at Peterſburgh, and in 1759 to Chelſea garden, where the plants annually produce ſeeds.

It is annual, and hath an upright ſtalk, which riſes about a foot high, and towards the top puts out two or three ſmall lateral branches; theſe are garniſhed with ſmall trifid leaves, ſawed on their edges, and of a very dark green colour; at the extremity of the branches the flowers are produced in ſmall umbels; theſe are of a fine blue colour, as are alſo the upper part of the branches, and the leaves immediately under the umbel; ſo that though the flowers are ſmall, yet from their colour with that of the upper part of their ſtalks, the plants make a pretty appearance during their continuance in flower. If the ſeeds of this plant are ſown in Autumn, or are permitted to ſcatter, the plants will come up early in the following Spring, and theſe will flower in the beginning of June; but thoſe ſown in the Spring will not flower until July. The beſt time for ſowing is Autumn. The flowers have an agreeable ſmell.

When the plants come up they will require no other care than to keep them clean from weeds, and where they are too cloſe to thin them, for they do not thrive when tranſplanted; the ſeeds, therefore, ſhould be ſown where they are to remain.

AMETHYSTINE is applied, in *Antiquity*, to a kind of purple garment dyed of the hue of *amethyſt*.

In this ſenſe *amethyſtine* differed from *Tyrian*, as well as from *hyacinthine* purple, being a kind of medium between both.

AMETHYSTINA, in *Entomology*, a ſpecies of CHRYSOMELA. Above blue-violet, beneath green and violet. Shells with ſcattered hollow dots.—Thorax large, antennæ ſhort and black. Fabricius.

AMETHYSTINUS, in *Conchology*, a ſpecies of VENUS, deſcribed by Argenville; it is of an ovate ſhape, and violet colour, with perpendicular ſtriæ: about two inches in length, and nearly the ſame in breadth.—Native place unknown. Gmelin.

AMETHYSTINUS, in *Entomology*, is likewiſe the ſpecific name of an inſect of the APIS genus: it is nearly naked, black: wings violet. A native of the Eaſt Indies. Fabricius.

AMETHYSTINUS, a ſpecies of CARABUS, that inhabits Cayenne; the wing-caſes and abdomen are blue: the head and thorax ſhining, bronze.—The antennæ are hairy, ferruginous at the baſe: wing-caſes ſtreaked. Fabricius.

AMETHYSTINUS, in *Ornithology*, a ſpecies of TROCHILUS, or humming bird, found in Cayenne; its colours are chiefly green gold variegated beneath with grey and brown; throat amethyſtine blue: tail forked. Gmelin. Size of the red-throated humming-bird, T. Colubris. Linn.—Trochilus amethyſtinus is le petit oiſeau-mouche à queue fourchue & l'amethyſte, of Buffon, and amethyſtine humming-bird of Latham.

AMETZ, in *Geography*, a town of France, in the department of Moſelle, and chief place of a canton in the diſtrict of Longwy, three leagues weſt-north-weſt of Thionville, and three ſouth eaſt of Longwy.

AMEVILLE, a town of Savoy, in the valley of Aoſta, near the Doria, two miles weſt of Aoſta.

AMEWELL, a populous town of America, in Hunterſdown county, New Jerſey; containing 5201 inhabitants, of whom 283 are ſlaves.

AMGAILA, or AMGAILAM, in the *Materia Medica of the Ancients*, a name given by Avicenna and others to a plant ſometimes called ACANTHA *Arabica*, and *Amicantha* by the Greeks; the roots of which were called *bunkon*, and much uſed in medicine by the Arabian phyſicians.

The amgaila, called alſo *fucaha*, or *zucahai*, is deſcribed as a prickly herb, having roots like thoſe of the cyprus, formed of ſeveral joints or knots. They were uſed in ſtomachic and cardiac compoſitions, and were choſen by their lightneſs and good ſmell.

AMGINSKAIA, in *Geography*, a town and fortreſs of Ruſſia, ſituate on the river Amba, 100 miles ſouth-eaſt of Yakutſk.

AMHARA, a kingdom of Abyſſinia, ſituate between the two rivers Baſhilo and Geſhen, occupying almoſt the central part of the country; and having Begemder to the north, to the weſt the Nile and the kingdom of Gojam, to the ſouth Walaka, and to the eaſtward Angot, about N. lat. 11° and E. long. 39°. The length from eaſt to weſt is about 120 miles, and its breadth ſomewhat more than 40. It is a very mountainous country, full of nobility: the men are reckoned the handſomeſt as well as the braveſt in Abyſſinia. With the ordinary arms, the lance and the ſhield, they are thought to be ſuperior to double the number of any other ſoldiers in the kingdom. The dignity of this province derives acceſſion from the high mountain of Geſhen, or the graſſy mountain, on which the king's ſons were formerly impriſoned, till they were ſurpriſed and murdered there in the Adelan war. Ludolf enumerates 36 provinces in this kingdom. The Amharic dialect was ſubſtituted for the ancient Ethiopic or Geez, in common uſe and converſation; after the reſtoration of the royal family from their long baniſhment in Shoa. This was denominated the king's or royal language, becauſe it was introduced by the ſovereigns of the country, when they were called to the government from their exile in the rocks of Amhara, and extended in the court and camp over the whole kingdom. With the ſanction of this origin and authority it obtained an aſcendency over all other dialects, and even over the ancient Ethiopic language itſelf. It differs from the Ethiopic both in conſtruction and grammar; and ſeven new characters were added to anſwer the pronunciation of this new language, which is very difficult both to be written and learned. But no book was ever yet written in any other language but the Geez. Although the Amharic dialect be the court language, the Ethiopic retains its original dignity, not only in their books, but in their worſhip, and alſo in the king's letters patent, and commiſſions which are diſpatched in his council. Mr. Bruce ſays, there is an old law in the country, handed down by tradition only, that if any one ſhould attempt to tranſlate the holy Scripture into Amharic, or any other language, he ſhould have his throat cut after the manner in which they kill ſheep, his family ſhould be ſent into ſlavery, and his houſe razed to the ground: and the awe of this law was a great obſtacle to his obtaining thoſe tranſlations of the Song of Solomon, which he propoſed as ſpecimens of the different languages of thoſe diſtinct nations. The dialects of the neighbouring kingdoms, though they differ from one another, approach the neareſt to the Amharic.

Ludolf has written a ſhort eſſay towards a dictionary and grammar of the Amharic. See Ludolf's Hiſt. Æthiop. p. 78. and Bruce's Travels, vol. i. p. 425.

AMHERST, one of the MAGDALEN iſles in the gulf of St. Lawrence.

AMHERST, a county of Virginia in North America, lies between the blue ridge and the tide waters, on the north of James river, and contains 13,703 inhabitants, including 5296 ſlaves.

AMHERST, a townſhip in Cumberland county, Nova Scotia, ſituate on Chignecto baſon, on the ſouth ſide of La Planch river, and on the rivers Napan and Macon. The town was ſettled by North Iriſh, Yorkſhire, and New England people.

AMHERST, the ſhire town of Hilſborough county in New Hampſhire, is a town of ſome note, formerly *Souhegan Weſt*, and was originally granted from Maſſachuſetts. It has 2369 inhabitants, and was incorporated in 1762. The Aurean academy was founded here in 1790. This townſhip was formerly much infeſted by wolves, but they were driven away with diſmal howlings by inceſſant firing of guns and beating of drums for a whole day, and they have never ſince done any miſchief in the town. Amherſt lies on a northern branch of Souhegan river, which falls into Merrimack river, and is 60 miles weſt of Portſmouth, and 53 north-weſt of Boſton. N. lat. 42° 54'. W. long. 71° 33'.

AMHURST, NICHOLAS, in *Biography*, an Engliſh poet and political writer of the eighteenth century, was born at Marden in Kent, received his grammatical education at Merchant Taylors' School, and removed to St. John's college, Oxford, whence he was expelled for miſconduct. He attributes his expulſion to the liberality of his ſentiments, and his attachment to the principles of the revolution and of the Hanoverian ſucceſſion. Hence he took occaſion to ſatirize the learning and diſcipline of the univerſity of Oxford, and to expoſe the character of ſome of its moſt reſpectable members, in a poem, entitled "Oculus Britanniæ," and publiſhed in 1724; and in his "Terræ Filius," a work blending abuſe and ſcurrility with a conſiderable portion of wit. It had been an ancient cuſtom in the univerſity, at public acts, for a perſon under the denomination of "terræ filius," to mount the roſtrum, and divert a crowd of ſpectators with a merry oration in the *Feſcennino* manner, interſperſed with ſecret hiſtory, raillery, and ſarcaſm, as the circumſtances of the times ſupplied matter; and on this cuſtom the title of this latter work was founded. It was originally written in 1721, came out twice a week in periodical papers, and contained fifty numbers. When Mr. Amhurſt quitted Oxford he ſettled in London as a writer by profeſſion. He firſt publiſhed a volume of Miſcellanies on a variety of ſubjects, both ſacred and profane. He afterwards publiſhed a poem, entitled, "The Convocation," in five cantos, which is a kind of ſatire againſt all the writers who had oppoſed Biſhop Hoadly, in the famous Bangorian controverſy. He alſo tranſlated Mr. Addiſon's Reſurrection, and ſome other of his Latin poems. But his principal literary undertaking was the political paper called "The Craftſman," which was written againſt Sir Robert Walpole's miniſtry, and was carried on for a number of years with great ſpirit and ſucceſs. In the execution of this work, and in the effect which it produced, he was aſſiſted by Lord Bolingbroke and Mr. Pulteney, and probably by other leaders of the oppoſition. In 1737 there appeared in this publication an ironical letter, ridiculing the act that had juſt paſſed for licenſing plays, in conſequence of which Mr. Amhurſt was arreſted and confined, but the proſecution was dropped. He was at length totally deſerted by his party, when they made their terms with the crown: and his death happened ſoon after, *viz.* in April, 1742. We ſhall cloſe this article with Mr. Ralph's reflection on the ſubject. "Poor Amhurſt! after having been the leader of his party for the beſt part of twenty years together, was as much forgotten in the famous compromiſe of 1742 as if he had never been born! And when he died of what is called a broken heart, which happened a few months afterwards, became indebted to the charity of a bookſeller for a grave, not to be traced *now*, becauſe *then* no otherwiſe to be diſtinguiſhed than by the freſhneſs of the turf, borrowed from the next common to cover it." This anecdote furniſhes an inſtructive leſſon to men of literary talents, and teaches them to form, as the baſis of their proſpects of reputation and happineſs, a character for integrity, diſcretion, and virtue. Biog. Brit.

AMIA, in *Ichthyology*, a ſpecies of SCOMBER, briefly characterized by Linnæus, as having the laſt ray of the dorſal fin longer than the reſt, "pinnæ dorſalis poſterioris radio ultimo longiore." Linn. — Country unknown.

AMIABLE, or AMICABLE *numbers*, in *Arithmetic*, denote pairs of numbers which are mutually equal to the whole ſum of each others aliquot parts. Such are the numbers 284, 220, the aliquot parts of which, with their ſums, are as follows, *viz.*

Of 220, 1, 2, 4, 5, 10, 11, 20, 22, 44, 55, 110,——
——————————————————their ſum is 284;

Of 284, 1, 2, 4, 71, 142,——————and their ſum is 220.

The ſecond pair of amicable numbers are 17296, and 18416, which have the ſame property.

The third pair of ſuch numbers are 9363584 and 9437056.

Schooten, § 9, of his "Exercitationes Mathematicæ," found out theſe three pairs, and called them *amicable* numbers; though the properties of ſuch numbers had been before treated of by Rudolphus, Des Cartes, and others. Schooten, after Des Cartes, gives the following rule for inveſtigating theſe numbers. Aſſume the number 2, or ſome power of 2, ſuch that if 1 be ſubtracted from each of theſe three following quantities, *viz.* 3 times the aſſumed number, 6 times the ſaid number, and 18 times the ſquare of the ſame number, the three remainders may be all prime numbers; then the laſt prime number being multiplied by double the aſſumed number, the product will be one of the amicable numbers ſought, and the ſum of its aliquot parts will be the other. Thus, let $a=2$, and n be ſome integer number, ſuch that $3a^n-1$ and $6a^n-1$ and $18a^{2n}-1$ be all 3 prime numbers; then will $\overline{18a^{2n}-1} \times 2a^n$ be one of the amicable numbers: and the ſum of its aliquot parts is the other.

AMIANTHINITE of Kirwan, in *Mineralogy*. See Strahlstein.

AMIANTHUS, or Mountain Flax, in *Mineralogy*, Αμιανθος, Gr. *Amianthus. Byſſus montanus. Linum montan. Lana montan. Linum incombuſtibile. Lapis Cyprinus*, Lat. *Amianth. Bergflachs. Federweiſs*, Germ. *Berglin*, Sweed. *Bierghor*, Dan. *Amianth Kölen*, Hung. *Amiant*, Ruſſ. *Lin foſſile. Amianth.* Fr. *Amianto. Fior di pietra.* Ital. *Talcum aſbeſtus amianthus*, Werner.

The colour of amianthus is generally greeniſh or ſilvery white, approaching to mountain green, more rarely yelloviſh white, olive, or leek green, ochre yellow, or pale fleſh red.

It occurs uſually amorphous, but ſometimes in ſmall ſeparate bundles. Its luſtre varies from glimmering to ſlightly ſhining, and is either weak-pearly or ſilken.

Its fracture is fine, and for the moſt part alſo ſtrait, and even fibrous, rarely curved. It flies, when broken, into long ſplintery fragments.

It is found uſually ſlightly tranſparent, but often opaque. Is ſoft enough to be ſcratched by the nail, and is conſiderably elaſtic. It has a ſoft, ſomewhat greaſy feel.

The ſpecific gravity of amianthus, according to Muſchenbroeck, is 2.444. According to Briſſon, before it has abſorbed water, it varies from 0.9088 to 2.3134; after abſorption it is from 1.5662 to 2.3803.

This mineral is principally met with in pot-ſtone or ſerpentine rocks, either diſperſed through them as a conſtituent part, or accumulated in their clefts and crevices unmixed with any other ſubſtance. The Tarentaiſe, in Savoy, furniſhes the pureſt and moſt beautiful. It is alſo met with in Corſica, the Iſle of Elba, and Crete; near Zoblitz in Saxony, Salberg, and Swartwick in Sweden; in Cornwall and the iſle of Angleſea in England, and at Portſoy in Scotland.

A filament of the Tarentaiſe amianthus, when expoſed to the flame of the blow-pipe, melts into an opaque globule, which becomes dark-coloured by the continued action of the flame. It diſſolves quietly in borax and microcoſmic ſalt, and effervesces with carbonated ſoda. If expoſed in an earthen crucible to a high heat it melts into a denſe ſcoria, ſtrongly adherent to the bottom of the veſſel, of a yellowiſh grey colour, but almoſt white where it is in contact with the crucible, which laſt is in ſome degree penetrated and corroded. The ſurface of this ſcoria is overſpread with cryſtalline

needles croſſing each other in all directions, or radiating from a common centre; ſimilar acicular cryſtals are diffuſed through the ſubſtance of the maſs. Theſe needles are a little thicker than a hair, and when viewed by a magnifier, appear perfectly tranſparent, of a quadrangular, priſmatic figure, whoſe angles and faces are remarkably brilliant and well defined; whereas, the filaments of the amianthus, in its natural ſtate, are much too fine to allow of their form being determined even by a very powerful lens. This ſcoria, on expoſure to a greater heat, changes into a green glaſs, incapable of cryſtallizing, and which, in a ſhort time, paſſes through the crucible. A ſpecimen of greyiſh white amianthus afforded Mr. Kirwan, at 162°.5 Wedgewood, a greeniſh black, perfectly compact glaſs. A ſpecimen of amianthus from Greenland, according to Klaproth's experiments, being incloſed in a charcoal crucible, and expoſed to the full heat of a porcelain furnace, fuſed into a ſcoria of a dirty pearl grey, covered externally with ſmall grains of iron; its fracture ſhewed a dull, finely porous texture, inlaid with ſeparate, gloſſy particles.

The action of the mineral acids on amianthus is very feeble; the nitric and ſulphuric take up no more than three or four per cent.; the nitro-muriatic, in the proportion of ten parts to one of the foſſil, diſſolves about 12 per cent. conſiſting of lime, magneſia, and a little barytes.

Carbonated potaſh, even aſſiſted by ignition, is equally ineffiacious with the acids in decompoſing this ſubſtance. The Tarantaiſe amianthus, mixed with four parts of pure ſalt of tartar, and ignited for two hours, only afforded 12 per cent. of matter ſoluble in ſulphuric acid.

The real ſolvent of this refractory mineral is cauſtic potaſh, as appears from Bergman, who, by mixing equal parts of amianthus, carbonated potaſh, and charcoal, and igniting them for two hours, obtained a maſs perfectly ſoluble in nitro-muriatic acid. This eminent chemiſt was not, indeed, aware that the addition of charcoal rendered his alkali cauſtic, the reaſon of his uſing charcoal being to decompoſe the ſulphat of barytes, to which he attributes the extraordinary refractorineſs of this ſubſtance.

The Tarentaiſe amianthus, according to Bergman, is compoſed of

Sulphated barytes	6.
Carbonated Lime	6.9
Carbonated Magneſia	18.6
Alumine	3.3
Silex	64.
Oxyd of iron	1.2
	100.0

That of Swartwick contains—

Carbonated Lime	13.9
Carbonated Magneſia	17.2
Alumine	2.7
Silex	64.
Oxyd of iron	2.2
	100.0

That of Corias in Auſtria yields—

Carbonated Lime	10.5
Carbonated Magneſia	12.9
Alumine	3.3
Silex	72.
Oxyd of iron	1.3
	100.0

It is rather ſingular that ſulphated barytes ſhould have been found in the Tarentaiſe amianthus, as this earthy ſalt does not once occur among the analyſes of the Swediſh or Auſtrian

Auſtrian ſpecimens, or among thoſe of aſbeſtus, ſteatite, and other minerals that have the neareſt analogy to the amianthus; it is therefore greatly to be wiſhed that ſome able chemiſt, in poſſeſſion of the modern improved means of analyſis, would undertake afreſh the examination of this mineral.

Amianthus is often confounded with the more flexible kinds of Asbestus, to which it bears a near reſemblance in external characters and chemical compoſition. Its fibres are, however, for the moſt part, more diſtinct and flexible than thoſe of aſbeſtus; it is more fuſible *per ſe*, and is conſiderably leſs acted upon by acids.

The fibrous texture of amianthus, its incombuſtibility, and the little alteration that it undergoes even in a ſtrong heat, were early noticed, eſpecially among the eaſtern nations; and methods were found out of drawing the fibres into thread, and afterwards weaving it into cloth: this, when dirtied with greaſe or other inflammable matter, was cleaned by throwing it into a bright fire; the ſtains were burnt out, and the cloth was then removed, but little altered in its properties, and of a dazzling white; hence it obtained from the Greeks the name of Αμιαντος (undefiled.) In the rich and luxurious times of the Roman empire, this incombuſtible cloth was purchaſed at an enormous price, for the purpoſe of wrapping up the bodies of the dead previouſly to their being laid on the funeral pile, that the aſhes of the corpſe might not be ſcattered and mixed with thoſe of the wood. This practice was indeed probably confined to a few of the richeſt families, but of its reality there can be no doubt, eſpecially ſince a funeral urn was diſcovered in 1702 at Rome, near the Porta Nævia, in which there was a ſcull and other calcined bones, together with a quantity of aſhes incloſed in a cloth of amianthus nine Roman Palms long, and about ſeven palms wide. This intereſting relic of antiquity was depoſited, by order of pope Clement XI. in the Vatican library.

The diſuſe of burning the dead occaſioned the manufacture of amianthine cloth to be neglected, and at length entirely forgotten in Europe; but though it has ceaſed to be an article of neceſſity or luxury, yet the method of its preparation has occaſionally attracted the notice of travellers, and occupied the time of the curious. Marco Polo aſſerts, that in the eaſt the mineral is gently bruiſed in a mortar to ſeparate the fibres, and, being waſhed till the water comes off clear, is dried and then manufactured as flax or wool. Ciampini of Rome, in 1691, and then Mahudel, after many trials, publiſhed the following as the beſt way of preparing the incombuſtible cloth. Having previouſly ſteeped the amianthus in warm water, divide its fibres by gently rubbing them with the fingers, ſo as to looſen and ſeparate all the extraneous matters, then pour on repeatedly very hot water, as long as it continues to be in the leaſt diſcoloured. Nothing will now be left but the long fibres, which are to be carefully dried in the ſun. The bundles of threads are to be carded by very fine cards, and the long filaments thus obtained are to be ſteeped in oil to render them more flexible. A ſmall quantity of cotton or wool is to be mixed, and by means of a thin ſpindle the whole is to be drawn into thread, taking care that the amianthus may in every part be the principal material. The cloth being then woven in the uſual manner, is to be placed in a clear charcoal fire to burn off the cotton and oil, when the whole remaining tiſſue will be pure white amianthus. The ſhorter fibres that are incapable of being woven have been ſometimes made into paper; the proceſs of which is the ſame as that employed for common paper, except that a greater proportion of paſte or ſize is required: after having been once made red hot, however, the paper becomes bibulous and brittle. For written documents of great importance, it might be worth while to be at extraordinary expence for incombuſtible paper and indelible ink; the former of theſe may be prepared from the longer fibres of amianthus, ſo as to be much leſs brittle than when the ſhorter ones are alone made uſe of; and for the ink the following receipt will be perfectly efficacious. Take one part of ſulphat of iron (green vitriol) and two parts of alum, diſſolve them together in warm water, and then add pearl-aſh as long as any precipitate takes place; boil the mixture, and throw it on a filter, allow the precipitate to drain after being waſhed with warm water, and, while yet ſoft, diſſolve it in diſtilled vinegar; uſe this moderately concentrated for ink, and the characters, after combuſtion, will be of a yelloviſh brown colour, and ſufficiently legible.

Amianthus threads are alſo ſometimes uſed as perpetual wicks for lamps; they, however, occaſionally require cleaning from the ſoot that collects about them; and in the hotteſt part of the flame the fibres are apt to run together, in a ſtate of ſemifuſion, ſo as to prevent the due ſupply of oil. Weidenmann, Handbuch der Mineral. p. 465. Lenz. Verſuch, &c. vol. i. p. 371. Ciampiani, de Incombuſtibili Lino, Romæ, 1691. Mahudel de Lino Incombuſt. Mem. de l'Acad. des Inſcriptions, vol. vi. Sauſſure, Voyages dans les Alpes, § 113. and following, § 1914. Bomare, Dict. d'Hiſt. Nat. article Amiante.

AMIATUS, in *Entomology*, a ſpecies of Hesperia. Wings entire, black, poſterior margin yellow: head and tail red. Inhabits America. The antennæ hooked, black: wings uniformly black, except the yellow margin, body black, head and tail red. Fabricius.

AMIAZ *Iſland*, in *Geography*, lies on the coaſt of Brazil, in which the city of Santos is ſituated, and hence it is called the gulf or bay of Santos. St. Vincent's is in another part of the ſame iſland, and before both there is good anchoring.

AMICABLE *benches*, *ſcamma amicabilia*, in *Antiquity*, are generally ſuppoſed to denote the ſeats in the Roman courts, whereon the advocates were placed. Some think that theſe had but little title to the denomination of *amicable*, and therefore will have the word to be here uſed for the benches whereon the *aſſeſſors*, or thoſe called *judices pedanei*, were placed.

Amicable *compounder*, *amicabilis compoſitor*, is uſed by ſome ancient law-writers for an arbitrator.

Amicable, or *amiable compounder*, among the French, is a perſon who acts the part of a common friend, to reconcile two merchants or traders who have diſputes, or are at law together. He differs from the *arbiter*, in that, in order to make the two diſputants agree, he often prevails upon both to give up ſome part of their right or claim, which an arbiter, who performs the functions of a judge, is not, it ſeems, at liberty to do.

Amicable *Numbers*. See Amiable.

Amicable *ſociety*. See Assurance.

AMICIA. See Almucium.

AMICITIA.—*Tenure in* Amicitia, is applied in *Ancient Writers* to land granted freely, and of mere good will, to be enjoyed at the diſcretion of the donor.

AMICLÆ, or Ad Lantulas, now *Portella*, in *Ancient Geography*, a town of Italy between Terracina and Foretti.

AMICONI, Jacopo, in *Biography*, a painter of hiſtory and groteſque, is ſuppoſed to have been born in the territory belonging to the republic of Venice, to have ſtudied the art of painting for ſome years at Venice, and to have completed himſelf in his profeſſion at Rome. The livelineſs of his imagination,

imagination, the readineſs of his invention, and the freedom of his hand, ſoon recommended him to the public eſteem, and he found encouragement and employment in moſt of the courts of Europe. He is ſaid to have poſſeſſed many of the accompliſhments of a good painter; but though his merit in many reſpects muſt be allowed, and his drawing is generally correct, yet his colouring is much too cold, too pale, and, as it is termed by the artiſts, too mealy. His compoſitions are well known in this kingdom, and many of his pictures are admitted into the collections of the firſt nobility; but nevertheleſs few particulars of his life have been aſcertained. Pilkington.

AMICTUS, in our *Ancient Writers*, the uppermoſt of the ſix garments, worn by prieſts; the others are *alba*, *cingulum*, *ſtola*, *manipulus*, and *planeta*. It was tied round the neck, *Ne inde ad linguam tranſeat mendacium*; and covered the breaſt and heart, *Ne vanitates cogitet*.

This garment is otherwiſe called *anabolagium*; ſometimes *amblolagium*, *anagolagium*, and *humerale*. In ancient Engliſh writers it is called *amitte*.

The amict is alſo worn by deacons, ſub-deacons, and *acoluthi*, when they officiate at the altar.

The prieſts and deacons, in ſome dioceſes, wear amicts on their heads from All-ſaints to Eaſter; though, by the canons, they be expreſsly forbid to wear the amict without ſome conſiderable occaſion.

Mr. Thiers aſſerts, that the uſe of amicts was introduced into the Latin church before the twelfth century. Dom. de Vert maintains the contrary, chiefly from a figure of St. Firmin, firſt biſhop of Amiens, ſuppoſed to have ſuffered martyrdom towards the beginning of the ſeventh century, whereon he is repreſented in his pontifical habit, with the amict on his head.

AMICTUS, in Roman *Antiquity*, denotes any upper garment worn over the tunica.

AMICU, in *Geography*, a lake in the province of Cumana, South America, whoſe waters run ſoutherly through Parima river, into the Amazon.

AMICULATUS, in *Conchology*, a ſpecies of CHITON, that inhabits the Kurile iſlands. Shells of eight valves, kidney ſhaped, and very brittle. External covering a ſcabrous coriaceous membrane.—Length ſix inches. Gmelin.

AMICULUM, in *Antiquity*, denoted an upper garment worn by the women. The amiculum is ſaid to have differed from the *palla*; but wherein the preciſe difference lay does not appear. An amiculum was alſo in uſe among the men. This ſeems to have been the ſame with the *chlamys*, or *paludamentum*.

AMICUS, or AMICONESOS, in *Ancient Geography*, an iſland of the Red Sea, according to Ptolemy. Amicus was the epithet of Hercules among the ancients, and hence it is ſaid was derived the name of this iſland. This is probably the ſame with the *Amicuſia* of Steph. Byz.

AMICUS *Curiæ*, in *Law*. If a judge is doubtful, or miſtaken in matter of law, a ſtander-by may inform the court, as amicus curiæ. 2 Co. Inſt. 178. Any one as amicus curiæ may move to quaſh a vicious indictment; for if there were a trial and verdict, judgment muſt be arreſted. Comberb. 13.

AMID AMID, in *Geography*, a ridge of mountains in Abyſſinia, lying behind the two ridges of Litchambara and Aformaſha, commence behind Samſeen, in the ſouth-weſt part of the province of Maitſha, and become high only from the mountain of Adama; reſembling in their ſhape the former ridges, and embracing them in a large curve, like a creſcent. Between Amid Amid and the ridge of Litchambara is the deep valley known by the name of St. George, through the middle of which runs the river Jemma, the ſources of which are in the mountains of Amid Amid. This triple ridge of mountains, diſpoſed behind one another in the form of three concentric circles, ſuggeſt an idea that they are the MOUNTAINS *of the moon*, or the *montes lunæ* of antiquity, at the foot of which the Nile was ſaid to riſe. Amid Amid may perhaps exceed half a mile in height; they certainly are not three quarters of a mile, and fall much ſhort of the fabulous height aſcribed to them by Kircher. Theſe mountains have excellent ſoil, and are every where covered with fine paſture; but as this unfortunate country has been for ages the theatre of war, the inhabitants have only ploughed and ſown the top of them, out of the reach of enemies or marching armies. On the middle of the mountain are villages built of a white ſort of graſs, which makes them conſpicuous at a great diſtance; the bottom is altogether graſs, where their cattle feed conſtantly under their view; and upon any alarm, they are driven up to the top of the mountains, ſo as to be out of danger. The hail lies often upon the top of Amid Amid for hours, but ſnow was never ſeen in this country; nor have they in the Amharic dialect any word by which to expreſs it. The hail, nevertheleſs, which frequently occured at Gondar, even when the ſun was vertical, happened only when the wind blew directly from Amid Amid. Bruce's Travels, vol. iii. p. 583, &c.

AMID, or AMIDA, in *Ancient Geography*, a famous city of Meſopotamia, was ſituated in a fertile plain, watered by the natural and artificial channels of the Tigris, one ſtream of which bent in a ſemicircular form round the eaſtern part of the city. It was alſo called Conſtantia, in honour of the emperor Conſtantius, who fortified it with ſtrong walls and lofty towers. It was provided with an arſenal of military engines, and the ordinary garriſon had been reinforced to the amount of ſeven legions, when the place was inveſted by the arms of Sapor, king of Perſia. The operations of this ſiege are minutely deſcribed by Ammianus Marcellinus (xix. 1—9.) who himſelf acted an honourable part in the defence of it, and eſcaped with difficulty when the place was ſtormed by the Perſians. After a very obſtinate combat between the aſſailants and the beſieged, Amida was betrayed by the treachery of a deſerter, who pointed out to the Barbarians a ſecret and neglected ſtaircaſe, ſcooped out of the rock that hangs over the ſtream of the Tigris. But this ſtratagem failed, and Sapor was under the neceſſity of recurring to the ſlower but more certain operations of a regular ſiege, in the conduct of which he was inſtructed by the ſkill of the Roman deſerters. His works, artfully and laboriouſly conſtructed, were more than once deſtroyed by the fire of the Romans; but at length the ſtrength of the garriſon, waſted by the ſword and by diſeaſe, was exhauſted and conſtrained to yield to the fury of the aſſault. The ſoldiers, the citizens and their wives, all of them who had not time to eſcape through the oppoſite gate, were involved by the conquerors in a promiſcuous maſſacre. The ſiege, however, laſted 73 days, and 30,000 of the veterans of Sapor fell under the walls of Amida. Conſtantius, the emperor, is ſaid to have wept over its ruins. When the inhabitants of Niſibis were reduced to the neceſſity of leaving their own city, in conſequence of Jovian's treaty with the Perſians, they retired to a new-built quarter of Amida; and this city, with the reinforcement of a very conſiderable colony, ſoon recovered its former ſplendour, and became the capital of Meſopotamia. In the year 501 it again ſuſtained a long and deſtructive ſiege; and after three months it was taken by Cabades, Cavades, or Kobad, the Perſian king. Moſt of the inhabitants were put to the ſword, and the town was pillaged. It was again in 505, reſtored to the

Romans, on condition of their paying to the king of Perſia 50 talents. Upon the decline of the Roman empire, it reverted to the Perſians; from them it was transferred to the Saracens; and it is now poſſeſſed by the Turks. Amida aſſumes in modern times the provincial appellation of Diarbekir, and is alſo called by the Turks *Kara-amed*; the epithet *kara* being derived from the blackneſs of the ſtone which compoſes the ſtony and ancient wall of Amida.

AMIDA, in *Mythology*, a god worſhipped by the Japaneſe, who has many temples erected to him in the iſland of Japan, of which the principal is at Jeddo. They ſuppoſe that he flouriſhed many thouſand years ago, and that after a life of voluntary mortification and auſterity, and of ſignal miracles and exemplary virtue, extended to 1000 or 2000 years, he paſſed by a voluntary death to another ſtate, where he was advanced to the dignity of a god. The Japaneſe have ſuch a confidence in their idol Amida, that they hope to attain eternal felicity by the frequent invocation of his name. One of the figures of this idol is repreſented at Rome.

Cano, the ſon of Amida, is likewiſe held in great veneration, and has a ſtately temple near the city of Meaco, in which are 1000 images or ſtatues of him, beautifully carved and regularly arranged.

AMID-SHIPS, a *nautical* term, denoting the middle of a ſhip, either with regard to her length or breadth.

AMIENS, in *Geography*, a city of France, and capital of the department of the Somme; before the revolution it was the capital of Picardy, and the ſee of a biſhop, the ſuffragan of the archbiſhop of Rheims. It is ſituated in a plain, on the river Somme, which paſſes through it in three diſtinct channels, that afterwards unite; and may be ſeen at a great diſtance, decorated with a number of lofty towers, among which the cathedral commands peculiar notice. This is an elegant Gothic edifice, beautifully proportioned and delicately wrought; and the nave is particularly admired. It has many other collegiate, parochial, and public buildings, and an academy of arts and ſciences founded in 1750. It is defended by a citadel and ramparts, on which are planted trees, which form a pleaſant walk. The river Somme is navigable to the town. The houſes are well built in the old taſte; and the number of inhabitants has been reckoned between 40 and 50,000. Tinſeau (Statiſtical view of France,) eſtimates them at 40,289. Its 4 cantons contain 45,157; its whole territory includes 100 kiliometres and 12 communes. The commerce of Amiens has been very conſiderable, particularly in woollen ſtuffs, camlets, and ſhags. It has alſo been famous for its ſoap-manufacture.

Amiens, in Latin *Ambianum* and *Samarobriva*, is a place of great antiquity. It appears from Cæſar's account in his Commentaries to have been one of the principal cities of Gaul; he held a general aſſembly of the Gauls in it, and committed it to the guard of a legion. Cicero refers to it in ſeveral parts of his epiſtles as a place of note; and Ammianus Marcellinus (lib. xv. c. 27.) mentions it as "a city eminent among others." It was enlarged by the emperors Antoninus and Marcus Aurelius; and it was the place in which Conſtantine, Conſtans, Julian, and other emperors frequently reſided. The earldom of Amiens, comprehending a great part of the territory of the Ambiani, and ſince called Picardy, was formerly conferred by the kings on the biſhops of this city. Philip Auguſtus, in 1193, annexed it to the crown. The ſtates of France were ſummoned at Amiens by Lewis XI. in 1264, on the appeal made to him by Henry III. and the barons of England; and the appeal was decided in favour of Henry. Charles VII. granted it to Philip the Good, duke of Burgundy, in 1435; and Lewis XI. reunited it to the crown in 1477. Amiens was taken by the Spaniards in 1597, by the following ſtratagem. Soldiers, diſguiſed like peaſants, conducted a cart, loaded with nuts, and let a bag of them fall juſt as the gates were opened. Whilſt the men in garriſon were buſily employed in gathering up the nuts, the Spaniards entered in a body, and made themſelves maſters of the city. Henry IV. however, retook it in the ſame year. Amiens is diſtinguiſhed as the native place of Voiture, Rohault, Du Cange, and Greſſet. It has lately, *viz.* in 1802, acquired celebrity by the negociation, which terminated the war between England and France, and other belligerent powers, and by the ſignature of the definitive treaty, by the plenipotentiaries of the four contracting parties, Spain, Holland, France, and Great Britain, on the 27th of March, which eſtabliſhed peace. Amiens is ſituated in N. lat. 49° 53′ 58″, and E. long. 2° 17′ 56″.

AMIESTES, in *Commerce*, cotton cloths which come from the Eaſt-Indies.

AMIGONI, Octavio, in *Biography*, a painter of hiſtory and portrait, was born at Breſcia, in 1605, and was a diſciple of Antonio Gandino. His expreſſion, and taſte of deſign, were very remarkable and very elegant; and his compoſitions, executed with a free, firm, and maſterly touch, and with figures as large as life, were much applauded in ſeveral parts of Italy. Pilkington.

AMILICHUS, in *Ancient Geography*, a river of Greece, in Achaia, ſituate to the north-weſt.

AMILICTI, in the Chaldaic *Theology*, denote a kind of intellectual powers, or perſons in the divine hierarchy. The amilicti are repreſented as three in number, and conſtitute one of the triads, in the third order of the hierarchy.

AMILO, in *Ancient Geography*, a river of Mauritania, mentioned by Pliny.

AMILOS, or Amilus, a town of Arcadia, to the north-weſt of Orchomane.

AMILPAS, in *Geography*, two volcanoes in the province of Guatimala, in New Spain, near the mountains of Soconuſco.

AMINEI, in *Ancient Geography*, a people of Theſſaly, who, according to Ariſtotle, tranſported their vines into Italy, whence the expreſſion *amineæ vites*.

AMINEL, in *Geography*, a ſmall town of Africa, in Barbary, ſituate on the eaſtern ſide of the kingdom of Tripoli.

AMINIUS, in *Ancient Geography*, a river in the ſouthern part of Arcadia, which runs from north-eaſt to ſouth-eaſt into the Heliſſus.

AMIRANTE, a great officer in Spain, anſwering to the lord high-admiral in England.

Amirante, or Carnibaco Bay, in *Geography*, a large bay on the north coaſt of the iſthmus of Darien, and near the limits of North and South America. It is in the province of Veragua, on the north-weſt of the Toro channel and bay of Conception, from which it is ſeparated only by a congeries of rocks, which lie in the ocean, near the coaſt. N lat. 9° 5′. W. long. 82° 30′.

Amirante Islands. See Almirante.

AMISENUS Sinus, *gulf of Amiſenus*, in *Ancient Geography*, a gulf or bay of the Euxine ſea, ſituate to the eaſt of the mouth of the Halys, on the coaſt of the kingdom of Pontus; ſo called from the town of Amiſus.

AMISIA. See Ems.

AMISS *Drawing*. See Drawing.

AMISSA Lex. See Lex.

AMISSEN or Misseren, in *Geography*, a point on the gold coaſt of Africa, eaſt of Cormantine, between it and Dajou or Tagu, near the rough point. N. lat. 5°. E. long. 1° 10′.

AMISTOWES, a town of Bohemia, in the circle of Konigingratz, 10 miles weſt-ſouth-weſt of Biezow.

AMISUS,

AMISUS, in *Ancient Geography*, a conſiderable city of Aſia Minor, in the kingdom of Pontus, was ſituated on the coaſt of the Euxine ſea, near the mouth of the Halys and Iris, founded by the Mileſians, and peopled alſo by a colony of Athenians. It was at firſt a free city, like the other Greek cities in Aſia, but afterwards ſubdued by Pharnaces, king of Pontus, and made the metropolis of his kingdom. Pliny ſays, that it maintained its republican and popular form, till it was conquered by the Perſians; but Alexander reſtored its liberty, of which it was deprived by the king of Pontus. It was in extent the largeſt city of the kingdom, except Sinope. Mithridates had a palace in this city, and it was adorned with temples and many magnificent buildings, when Lucullus took it. Its inhabitants were maſſacred by Pharnaces, the ſon of Mithridates; but it was retaken by Cæſar, and made a free city.

AMITERNUM, a town of Italy, north-eaſt of Rome, in the country of the Sabines, ſituate, according to Strabo, on the declivity of a mountain, and having, in his time, the remains of a theatre and a temple. It was taken by Sp. Carvilius, in the year of Rome 460, and ſubſiſted to the time of the conteſt between the Guelphs and Gibellines, when it ſunk under the town of Aquila, newly erected by the emperor. It was famous as the native place of the hiſtorian Salluſt. Some remains of it are ſtill diſcernible near S. Vittorino and the ſprings of the Aternus.

AMITHOSCUTA, a country of Arabia Felix, according to Pliny.

AMITIENSES, a people of Etruria, according to Pliny.

AMITTERE *legem terræ*, a law-phraſe, ſignifying the forfeiture of the right of ſwearing in any court or cauſe; or the becoming infamous.

This is the puniſhment of a champion overcome, or yielding in the combat: of jurors found guilty in a writ of attaint; and of perſons outlawed. Vide Glanvil. lib. ii. and ſee the ſtat. 5 Eliz. cap. 9. againſt *perjury*.

AMIXOCORES, in *Geography*, a people of America, in Brazil, near the country of Rio-Janeiro.

AM-KAS, in *Hiſtory*, a name given to a ſpacious ſaloon in the palace of the great Mogul, where he gives audience to his ſubjects; and where he appears on ſolemn feſtivals with extraordinary magnificence. His throne is ſupported by ſix large ſteps of maſſy gold, ſet with rubies, emeralds, and diamonds; and eſtimated at 60,000,000l.

AMLAK, in *Geography*, one of the Fox iſlands, at the diſtance of about 15 verſts from ATCHAK, and nearly of the ſame ſize. It has a harbour on its ſouth ſide. It lies in about N. lat. 52° 30′. W. long. 173° 30′.

AMLAMGODE River is on the ſouthweſt-coaſt of the iſland of Ceylon, between Barberin iſland on the north-weſt, and Regama point on the ſouth-eaſt, about eleven leagues diſtant. It is not navigable: it is known by a garden of cocoa trees.

AMLET. See Omelet.

AMLING, Carl. Guſtav. Ab, in *Biography*, a painter and engraver, was born at Nuremberg, in 1651, and learned the art of engraving from Francis de Poilly, whoſe ſtyle he imitated but never equalled. He chiefly excelled in portraits, and failed in hiſtorical ſubjects. He was engraver to the duke of Bavaria, and died in 1702. Among his portraits are "Maximilian Emanuel," elector of Bavaria, a large upright plate, eſteemed as one of his beſt; and among his hiſtorical ſubjects are "the hiſtory of the emperor Otho," from the tapeſtries at Munich, in 13 plates, and "the Four Seaſons," from the ſame tapeſtries. Strutt.

AMLWCH, in *Geography*, a ſmall village in the iſland of Angleſea, adjoining to the mines of the Paris mountain, and raiſed into eminence by the works and wealth which they occaſion. The two great proprietors of theſe mines, Lord Uxbridge and Mr. Hughes, have adorned this village with two elegant houſes for their occaſional reſidence, one called the Mona, and the other the Paris Lodge. The little port of Amlwch is placed in a ſmall cove, among the cliffs, about half a mile below the village, and is admirably formed for receiving and arranging the ſeveral veſſels which are employed in the copper and brimſtone trade. It often alſo affords a ſafe haven to thoſe ſhips, which, in their paſſage from Ireland, are driven to the north-eaſt, round the point of Holyhead, and cannot make that harbour.

AMMA, in *Ancient Geography*, *Lemma*, a river of Swiſſerland, which runs into the Aar, near Soleure.

Amma, a town of Aſia, in Paleſtine, belonging to the tribe of Aſer; called, by Jerom, Amma.

Amma, in *Middle Age Writers*, denotes a ſpiritual mother. In this ſenſe, the word was chiefly underſtood of an abbeſs, or ſuperior of a nunnery.

Amma, or Hamma, from *αμμα*, *vinculum*, in *Surgery*, a technical term, denoting the bandage employed to ſuſtain ruptures or herniæ. This important inſtrument will be more properly deſcribed under the article Hernia, which ſee.

AMMÆA, in *Ancient Geography*, a town of Meſopotamia, near the Euphrates, towards the Perſian gulf, according to Ptolemy.

AMMÆDARA, a town of Africa Propria, in that part called by Ptolemy Numidia Nova.

AMMAENSIA Juga, a name given by Pliny to the mountains of Luſitania.

AMMAITTIA, a town of Aſia, in Aſſyria.

AMMAN, or Amana, a town of Aſia, in Arabia; it was the principal town of the Ammonites, and called alſo Rabbath.

Amman, in the German and Belgic *Policy*, denotes a judge who has the cognizance of civil cauſes.

The word is alſo written *amant*. Thus it occurs in writers on the French officers, where it ſtands for a notary, or parochial officer, who draws acts or inſtruments.

Amman, John Conrad, in *Biography*, was born at Schaffhauſen, in Swiſſerland, graduated at Baſil in 1687, and practiſed phyſic at Amſterdam, towards the cloſe of the 17th and beginning of the 18th centuries. He applied himſelf with particular attention to the diſcovery of a method of teaching perſons born deaf and dumb to ſpeak; and from obſerving the motions of the lips and mouths of perſons addreſſing them, to underſtand their meaning. In this art he attained great perfection, and many perſons born with thoſe defects, were reſtored to ſociety, through his ſkill and perſeverance. In the year 1692, he publiſhed an account of the proceſs by which this was effected, firſt in Dutch, under the title of "Surdus Loquens;" and in 1702, in Latin, adding to the title, "Seu Diſſertatio de Loquela:" Opus, Haller ſays, vere aureum; no material addition having been made to his directions, which are now every where practiſed, by perſons profeſſing that art. The work has always been held in high eſtimation, has been tranſlated into moſt of the European languages, and paſſed through numerous editions. Haller Bibl. Med. pract. et Chirurg.

Amman, John, ſon of Conrad, alſo doctor in medicine, ſettled in Peterſburgh, where he gave lectures in botany. He publiſhed "Icones et deſcriptiones ſtirpium rariarum Ruthenicarum." Petropoli, 1739, 4to.

The figures were principally taken from a collection of dried ſpecimens of plants, preſerved at the Imperial academy, Peterſburgh. Eloy Dictionaire Hiſtor. de la Med.

Amman, Paul, was born at Breſlaw, Auguſt 1634. After finiſhing his ſchool education, he travelled for improvement over various parts of Germany, Holland, and England. In October 1662, he was admitted doctor in medicine at Leipſic, and in ſucceſſion, profeſſor of medicine, botany and phyſiology in the ſame univerſity, in which offices he acquired conſiderable reputation. He died, February 4th. 1691.

Haller gives a long liſt of diſſertations publiſhed by him, but his principal works are, "Ammanni parzenenſis ad docentes occupata," 1673, 12mo.; "Praxis vulnerum lethalium ſex decadibus Hiſtoriarum rariarum, Franco," 1701, 8vo. For the titles of his other works, ſee Haller's Bib. Med. Pract.

Amman, or Ammon, Jost or Jodocus, a deſigner and engraver, was born at Zurich, in Switzerland, A. D. 1539, reſided at Nuremberg, and died there in 1591. He was an indefatigable artiſt, and poſſeſſed conſiderable merit as an engraver. The number of his deſigns and plates is very great. His engravings were chiefly on wood, and are much ſuperior to thoſe on copper. Although he does not manifeſt much invention, his figures are well proportioned; and his animals are touched with great ſpirit. His manner of engraving is ſaid to have been neat and decided. Among his performances we may ſelect his "πανοπλια, omnium liberalium mechanicarum et ſedentarium artium genera continens, &c." Francof, 1564, amounting to 115 prints, and exhibiting the different artiſts and tradeſmen in their reſpective employments. He alſo engraved in wood ſome detached pieces, and on copper "The Illuſtrious Women," beginning with Eve; a ſet of "Figures of Warriors," 1590; "The Four Seaſons and the Four Elements," 1569. Strutt.

Amman John, an artiſt and bookſeller, lived at Hanau, in Germany, about the year 1640. A ſet of ſmall wooden cuts, repreſenting "the Paſſion of our bleſſed Saviour," executed very much in the ſtyle of the former artiſt, and publiſhed at Amſterdam, with Latin verſes, in 1623, is reckoned to poſſeſs a conſiderable ſhare of merit. Strutt.

AMMANATI, Bartholomeo, a celebrated ſculptor and architect, was born at Florence, in 1511, and ſtudied ſculpture in his native town under Bandinelli, and at Venice under Sanſovino. He deſigned the porticoes of the Pitti palace, and the bridge Della Trinita, at Florence, which is accounted one of the moſt beautiful works, ſince the revival of the arts. At Rome he built the palace Ruſpoli, and the noble front of the Roman college. On his return to Florence he expended his wealth in building the church of San Giavanino, belonging to the Jeſuits, in which he was interred. Ammanati's large work "La Citta," comprehends the deſigns of all the public buildings neceſſary in a capital city. He died either in 1586 or 1592. His wife, Laura Battiferi, was diſtinguiſhed for her poetical productions, of which a collection was printed at Florence, in 1560. Nouv. Dict. Hiſt.

AMMANNIA, named by Houſtoun in honour of J. Amman, in *Botany*, a genus of the *tetrandria monogynia* claſs and order, of the natural order of *calycanthemæ* and *ſalicariæ* of Juſſieu; its characters are, that the *calyx* is a perianthium bell ſhaped, oblong, erect, with eight ſtreaks and folds, quadrangular, eight-toothed, teeth alternate bent in, and permanent; *corolla* none, or four-petalled, petals vertically ovate, ſpreading, inſerted into the calyx; the *ſtamina* have filaments, (four or eight) briſtly, the length of the calyx into which they are inſerted, anthers twin; the *piſtillum* is a germ ſubovate, large and ſuperior, ſtyle ſimple, very ſhort, and ſtigma headed; the *pericarpium* is a roundiſh, four-celled capſule (berry) covered with the calyx; the *ſeeds* are numerous and ſmall. There are ſeven ſpecies, viz. 1. A *latifolia*, ſinardia of Brown. Jamaic. aparines of Sloane Jamaic. A. purpurea of La Marck, or broad-leaved A. "with leaves half-ſtem-claſping, ſquare ſtalk, and erect branches." This ſpecies grows about a foot and a half high, with leaves long, narrow and triangular, as long as the ſtem, of a pale green colour; and the flowers proceed in cluſters from the joints where the leaves adhere. It is a native of moiſt places in Jamaica, whence the ſeeds were ſent about 1731 by Dr. Houſtoun to England, and from Chelſea they have been diſtributed to moſt of the botanic gardens in Europe. 2. A. *ramoſior*, ludwigia of Clayt. Virg. branching A. "with leaves half-ſtem-claſping, ſtalk ſquare, and ſpreading branches." This is an annual plant, and grows naturally in Virginia and Carolina; riſes about a foot high, with red ſucculent ſtalks, putting out ſide branches, oppoſite, round, and ſimple, the flowers are produced ſingle from the axils on the lower part of the branches, and toward the top in cluſters; they have little beauty; cultivated in 1759, and preſerved for variety. 3. A. *baccifera*, A. verticillata of La Marck, cornelia verticillata of Ard. Spec. "with leaves ſub-petiolate, capſules larger than the calyx and coloured;" it has four-toothed calyxes. This is a native of China, and naturalized in Italy. It has little beauty, and is rarely preſerved in gardens. 4. A. *octandra*, eight-ſtamened A. "with ſeſſile linear-lanceolated leaves, and flowers petal-bearing, and eight-ſtamened;" the petals are blood red; found by Koenig in the Eaſt Indies. 5. A. *pinnatifida*, pinnatifid-leaved A. "with ſtalks procumbent, rooting, compreſſed, and leaves linear, pinnatifid." The flowers are ſmall, corolla red, and capſules four-cornered; found by Sonnerat in the iſle of Java. 6. A. *debilis*, cluſter-flowered A. "with leaves lanceolate, attenuated at the baſe, ſtem branching, flowers in bundles from the axils, and capſules two-celled." This ſpecies is annual, the calyx angular, petals pale-purple, filaments ſhorter than the calyx, anthers ovate and yellow, capſule ovate and two celled; a native of the Eaſt Indies; introduced in 1778 by Sir Joſeph Banks; and flowers in July and Auguſt. 7. A. *ſanguinolenta*, "with leaves, half-ſtem-claſping, cordate at the baſe, flowers ſub-peduncled, eight-ſtamened, petal-bearing;" a native of Jamaica and Domingo.

Culture. The three firſt ſpecies muſt be raiſed from ſeeds on a hot-bed in ſpring, and afterwards removed to another hot-bed in order to bring them forward. When the plants have acquired ſtrength they ſhould be tranſplanted into pots filled with rich light earth, and placed under a frame, ſhading them till they have taken freſh root; they ſhould then be placed in a glaſs caſe or ſtove, to ripen their ſeeds, for the plants are too tender to thrive in the open air in this country, unleſs the ſummer be very warm. The ſecond ſort, raiſed in a hot-bed, in the ſpring, and planted in a warm border, will perfect its ſeeds in the open air. The other ſpecies are ſtove-plants. Martyn's Miller.

AMMANO, in *Geography*, a town of Japan, in the province of Fida.

AMMATA, or Ammatha, in *Ancient Geography*, a town of Aſia, in Paleſtine, belonging to the tribe of Juda.

AMMER, in *Geography*, a powerful but infamous tribe of Arabs, who inhabit the province of Conſtantina, in Africa, and who, contrary to the practice of their brethren, proſtitute their wives and daughters. Shaw's Travels, p. 53.

AMMER-

AMMERCOT, a town of Hindooſtan, ſituate in a ſandy deſert, 138 miles north-eaſt of Nuſſerpour, and 256 ſouth of Moultan. Feriſhta reckons it about 100 coſſes from Tatta. In the Ayin Acbaree it is claſſed as belonging to the Naſſerpour diviſion of the province of Sindy. N. lat. 25° 40'. E. long. 70°.

AMMEREN, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers, ſix miles eaſt-north-eaſt from Ruremond.

AMMERSEE, a lake of Germany, in the circle of Bavaria, 12 miles long, and from two to three broad, 80 miles weſt of Salzburg.

AMMESPACH, a river of Germany, runs into the Erlebach, in the archduchy of Auſtria, on the borders of Stiria.

AMMI, formed from *αμμος, ſand*, in *Botany*, a genus of the *pentandria digynia* claſs and order; of the natural order of *umbellatæ* or *umbelliferæ*; its characters are, that the *calyx* has its univerſal umbel manifold, frequently of 50 rays, the partial ſhort and crowded, the univerſal involucre of many linear, pinnatifid, acute leaflets, ſcarcely the length of the umbel, the partial many-leaved, leaflets linear, acute, ſimple, ſhorter than its umbellet, the proper perianthium ſcarcely apparent; the *corolla* univerſal uniform, with all the floſcules fertile, the proper of five inflex, heart-ſhaped petals, of unequal ſize in the ray, almoſt in the middle of the diſk; the *ſtamina* have capillary filaments. anthers roundiſh; the *piſtillum* has a germ inferior, ſtyles reflex, and ſtigmas obtuſe; no *pericarpium*, fruit roundiſh, ſmooth, ſmall, ſtreaked, and bipartile; the *ſeeds* two, convex and ſtreaked on one ſide, and flat on the other. Martyn reckons three, and Gmelin four ſpecies. 1. A. *majus*, common biſhop's weed, ammioſelinon, "with lower leaves pinnate, lanceolate and ſerrate, upper ones multifid and linear." This ſpecies is annual, and grows in vineyards and fields, in the ſouthern parts of Europe, and in the Eaſt. There is a variety reckoned by Bauhin a diſtinct ſpecies, under the title of A. majus foliis plurimum inciſis, et nonnihil criſpis; but Mr. Martyn has raiſed this variety from the beds of the former. 2. A. *copticum*, "with leaves ſuper-decompound, linear, and ſeeds muricate." This is of the ſtature of Dill, green, ſtem ſmooth and ſtreaked; leaves tripinnate, oblong, ſmooth, and linear; umbels with ten rays; involucre five-leaved; partial involucre ſeven-leaved; corollas white, equal and five angled; fruit ovate and muricate on every ſide, ſeeds ſtreaked with five ſwellings, aromatic; found by Forſkahl in Egypt; annual, introduced in 1773 by John Earl of Bute. 3. A. *glaucifolium*, daucus petræus glaucifolius of Bauhin, perennial biſhop's weed, "with the ſubdiviſions of all the leaves lanceolate." This has the appearance of a variety of the firſt ſpecies; is a native of the ſouth of France; deſcribed by Miller as a perennial plant, preſerved for variety, but having little beauty. 4. A. *laurifolium*, "with bipinnate leaves, the winged leaflets trifid, the firſt connected in whirls with the common rib" La Marck has referred to this genus, the DAUCUS *viſnaga* of Linnæus, and the *ammi anethifolium*, with oblong pinnated leaves, the leaflets multifid and capillary, and the petioles canaliculated; the daucus meoides of Hort. Reg. brought originally from the Levant, and flowering in the beginning of Autumn.

Culture. The 1ſt ſpecies is propagated by ſeeds ſown in Autumn in the place where they are to remain; in the Spring the ground ſhould be hoed and the plants thinned as in the management of carrots, leaving them four or five inches aſunder, or in good ground at the diſtance of ſix inches; after which they will require no further care, beſides being kept free from weeds. They will flower in June, and the ſeeds will ripen in Auguſt, and ſhould be gathered as they ripen, for they will ſoon ſcatter. The 3d ſpecies will grow in any open ſituation, is very hardy, and thrives beſt in a moiſt ſoil. Martyn's Miller's Dict.

AMMI, or *ſemen ammios veri*, in the *Materia Medica*, a kind of aromatic ſeed, the produce of the ſtrong *ammi* of Linnæus, ſometimes though now rarely brought from the Levant, and formerly uſed in medicine. The ſeed is ſmall, whence, according to Lemery, the name of the plant ammi, from *αμμος, ſand*, ſtriated, of a greyiſh brown colour, ſomewhat bitteriſh taſte, and fragrant ſmell, approaching to that of origanum. This ſeems to have been the ammi of Dioſcorides and Hippocrates. It is now very rarely preſcribed. Theſe ſeeds, diſtilled with water, yield a conſiderable quantity of a yellowiſh eſſential oil, containing their whole ſmell and flavour; the remaining decoction is unpleaſantly bitteriſh. Spirit of wine carries off, in its exhalation, the odorous principle of the ammi. Theſe ſeeds have been recommended as a ſtomachic, emmenagogue, diuretic, and an elegant aromatic carminative. Linnæus gives the denomination of *ſemen ammios veterum* to that of the LAGOECIA *Cuminoides*. The ſeeds of the *ammi majus* above deſcribed, or *ammi vulgare*, are ſubſtituted for the former in medical uſe. They are weaker both in ſmell and taſte; nor does their flavour reſemble that of origanum. The eſſential oil and the ſpirituous extract are both leſs grateful and leſs pungent.—Lewis and Murray.

AMMI. See BUNIUM, CICUTA, SESELI, SISON and SIUM

AMMIANUS MARCELLINUS, in *Biography*, a Roman hiſtorian of the fourth century, was a native of Antioch, where his family made ſome figure, and in early life ſerved ſeveral years in the army in quality of protector domeſticus, which was then an honourable poſt. In 350 he accompanied Urſicinus, a general of the horſe under the emperor Conſtantius, into the Eaſt; and followed him in ſeveral expeditions, from 350 to 359, in which he acquired military reputation. He attended Julian in his Perſian expedition in 363, and was either at or near Antioch in 371, when the conſpiracy of Theodorus was diſcovered in the reign of Valens, and was a witneſs of the torments of many perſons whom Valens ordered to be put to death on that occaſion. It is not certain whether he obtained any higher rank in the army than that of domeſtic protector. When he quitted the army, he reſided at Rome, and employed himſelf in writing the hiſtory of the affairs of the empire, during a period of three centuries. Though he was a Greek, he choſe to write in Latin: but his Latin, in the opinion of Voſſius, indicates that he was a Greek and a ſoldier. His hiſtory was divided into 31 books, commenced with the reign of Nerva, where Tacitus ends, and terminated with the reign of Valens.—The firſt 13 books, ending with the reign of Conſtantius, and containing a ſuperficial epitome of 257 years, are loſt; the laſt 18 books, now extant, begin with the 17th year of Conſtantius, A. D. 353, and conclude with the year 375; though ſome particulars of a later date are mentioned, from which we may infer, that the hiſtorian lived at leaſt to the year of Rome 1142, or A. D. 390. The ſtyle of his hiſtory is reckoned harſh and verboſe; but this defect is amply compenſated by the variety of information which he communicates from his own perſonal knowledge, and by the fidelity and impartiality of his relation. Mr. Gibbon (Hiſt. vol. iv. p. 426.) repreſents him as "an accurate and faithful guide, who has compoſed the hiſtory of his own times, without indulging the prejudices and paſſions, which uſually affect the mind of a contemporary." Some have ſuppoſed that he was a Chriſtian; but of this

there is no ſufficient evidence. As he wrote under Chriſtian emperors, he might not judge it proper to profeſs his religion unſeaſonably, and he might think it moſt prudent to be cautious in his reflections upon Chriſtianity. Although he was a pagan, as is evident from the reſpect with which he ſpeaks concerning the pagan divinities, and from his defence and recommendation of heathen auguries, and ſuch methods of inveſtigating futurities, he nevertheleſs manifeſts no animoſity againſt the Chriſtian religion; on the contrary, he bears honourable teſtimony to the plain and ſimple nature, and the equitable and gentle ſpirit of Chriſtianity, to the moderation of ſome Chriſtian biſhops, whilſt he condemns the ſeverity with which ſome Chriſtians treated one another, and to the firmneſs and fidelity of the Chriſtian martyrs. Hence Moſheim concluded that Marcellinus and ſome other learned men about his time were neuters; alleging, that they neither rejected the Chriſtian religion, nor forſook the religion of their anceſtors. But the inſtances already cited merely prove, that he was a faithful and candid hiſtorian. The remaining works of Ammianus Marcellinus have paſſed through ſeveral editions; all of which have been ſuperſeded by that of Valeſius, printed in folio, at Paris, in 1681. This edition was reprinted by Gronovius at Leyden, in 1693, with valuable notes. Valeſii Præf. ad Amm. Marc. Fabric. Bib. Lat. cap. xii. tom. ii. p. 98, &c. Lardner's Works, vol. viii. p. 464, &c.

AMMINEA *uva*, in *Botany*, a name given by the old writers, to the grapes of a wild vine, common in the hedges of Italy, and ſome other places. They uſed to make wine of theſe grapes, which they mixed with other richer wines, and had in common uſe. Columella ſays, that this wine was firſt brought from the country of the Amineans in Theſſaly, and that the wine produced from its grapes was the firſt and the moſt ancient known among the Romans. According to Macrobius, the Falernian wine was more anciently called Aminean. Some write the word *taminea*, inſtead of amminea.

AMMIRABEA or Ommirabih, corruptly Marbea, and Umarbea, in *Geography*, a river of Africa, which has its ſpring on mount Magrau, one of the heads of the Atlas near the confines of Fez, which runs through the plains of Adachſon, where it has a beautiful bridge built by Abu'l Haſchen, the fourth monarch of the Benimerini, and thence winding ſouthwards and watering the ſpacious plains between Dukala and Temeſena, becomes wider in its approach to the ocean, into which it diſcharges itſelf, and forms a capacious bay, on the eaſt ſide of Azamor. This river is fordable neither in Summer nor Winter, ſo that the inhabitants are forced to ferry their effects over it by the help of baſkets, faſtened to leathern pontoons, or over rafters. Its fiſh not only furniſhes all that country; but is exported to Spain and Portugal.

AMMIRAGLIO, a ſmall river of Sicily, anciently Orethus.

AMMIRALIS, in *Entomology*, a ſpecies of Cerambyx found in Surinam. Thorax rather ſpinous; fourth joint of the antennæ bearded, ſecond ſpinous. Gmelin. General colour black; baſe of the wing caſes and ſides of the thorax reddiſh.

AMMIRATO, Scipio, in *Biography*, an eminent hiſtorian of the 16th century, was born at Lecce in Naples, in 1531, and deſcended from a conſiderable family, which was expelled from Florence by the Gibelines. He was originally deſigned for the profeſſion of the law, and with this view went to ſtudy at Naples in 1547; but his taſte for polite literature diverted his attention from this kind of ſtudy. His father was much offended, and withheld from him neceſſary ſupplies, whilſt he viſited Venice and Padua, ſo that he was obliged to return to Lecce, to take orders, and to accept a canonry which was conferred upon him by the biſhop of this city. At Venice, whither he afterwards removed, his life was endangered by an intrigue; and at Rome he had a quarrel with the pope's ſiſter, which obliged him to return to Lecce, where he founded the academy of the "Transformati." After many projects and wanderings in Italy, he at laſt ſettled at Florence, where in 1570, he was engaged by the Grand Duke Coſmo to write the Florentine hiſtory. Though he was of an inconſtant and querulous temper, he continued in the poſſeſſion of a canonry, and in the apartments provided for him by the duke for the remaining 30 years of his life. Here he died in 1601, and appointed the aſſiſtant of his ſtudies, Chriſtophoro del Bianco, for his heir, who, in conformity to his will, took the name of "Scipio Ammirato the younger." His "Florentine Hiſtory," firſt publiſhed in 1600, contains the events of Florence from its foundation to 1574, and is much eſteemed for its extent and accuracy. The ſecond part was publiſhed by Ammirato the younger in 1641, who gave a new edition of the firſt part, with many additions.

Ammirato the elder wrote alſo genealogical accounts of the principal families of Florence and Naples, which were very favourably received; and he publiſhed "Diſcourſes on Tacitus," with ſeveral eſſays, hiſtorical, moral, and political. He wrote arguments in verſe, to all the cantos of "Orlando Furioſo," and other pieces of poetry; but in this kind of compoſition he did not excel. Gen. Dict.

AMMITES, or Hammites, in *Mineralogy*, a ſpecies of lime-ſtone. See Roestone.

AMMOCŒTUS, in *Ichthyology*, an obſolete name given by Geſner and ſome others, to the Ammodytes Tobianus of Linnæus.

AMMOCHOSIA, from αμμος, *ſand*, and χεω, *I lay along*, in the *Ancient Phyſic*, a kind of a remedy, or operation for drying the body, by lying along on warm ſand, and having the body covered with it. Some prefer ſalt for this purpoſe to ſand.

AMMOCHOSTOS, in *Ancient Geography*, a promontory of the iſland of Cyprus ſouth of Salamis; whence, by corruption, is derived the modern name Famagouſta.

AMMOCHRYSOS, the ſame as *golden* mica, which ſee.

AMMOCHYSUS, in *Natural Hiſtory*, a kind of gem, ſuppoſed to be the ſame with the *avanturine*.

AMMODES, in *Ancient Geography*, a promontory of Cilicia, between Pyramus and Cydnus.

AMMODYTES, in *Zoology*, a ſpecies of Coluber, very nearly allied to the viper. It inhabits many places in the eaſtern regions, and the mountainous parts of Illyria; and hence it has been called *vipera illyrica*. The Linnæan ſpecific character is taken, as in general throughout the genus, from the abdominal plates and ſubcaudal ſcales which are 142—32. Its general deſcription is ſometimes brown, ſometimes pale bluiſh, with a black dentated dorſal band; the dentations being turned backwards. Noſe terminated by an erect wart.

This ſpecies is ſaid to be extremely poiſonous, and, according to Matthiolus, proves fatal in the ſpace of three hours.

Ammodytes, in *Ichthyology*, the name of a genus in the Linnæan ſyſtem, of which only one ſpecies has been hitherto diſcovered. The generic character is, head compreſſed, narrower than the body; upper lip doubled, lower jaw narrow and pointed: teeth ſharp pointed. Gill membrane

brane of ſeven rays. Body long, ſquare. Tail-fin diſtinct. This ſpecies is Tobianus. Linnæus. This ſpecies inhabits the ſandy ſhores of the Northern ſeas, and is known by the name of tobian, tobis, ſandaal, ſandibz, and ſand launce. It is uſually from nine to twelve inches in length, its general colour ſilvery white, greeniſh on the back.

The name is formed from *αμμος, ſand,* and *δυτης, a diver,* expreſſing the quality of this creature, to dive into, or bury itſelf under the ſand.

AMMON, or Hammon, in *Antiquity*, an epithet given to Jupiter in Lybia, where was a celebrated temple of that deity under the denomination of Jupiter Ammon, which was viſited by Alexander the Great.

There has been a great diſpute about the origin of this name.—Some derive it from *αμμος, ſand,* becauſe the temple was ſituated in the burning ſands of Lybia; others borrow it from the Egyptian *anam, a ram;* as having been firſt diſcovered by that animal.—Others will have Ammon to ſignify the ſun, and the horns wherewith he is repreſented the ſun-beams. To this purpoſe Macrobius obſerves, (Saturn. i. c. 18.) that the inhabitants of Egypt worſhipped the ſun as the only divinity and ſoul of the univerſe; and they repreſented him under different forms, according to the various appearances of this luminary; in his infancy at the winter ſolſtice, in his youth at the vernal equinox, or in ſpring, in his maturity at the ſummer ſolſtice, and in his old age at the autumnal equinox.

The word Amoun, compoſed of Am ouein, ſhining, according to Jablonſki (tom. i.) denoted the deſired effects produced by the ſun on attaining the equator, ſuch as the increaſe of the days, a more ſplendid light; and, above all, the fortunate preſage of the inundation and abundance.

Ammon is ſaid to have been originally derived from Ham, the ſon of Noah, who firſt peopled Egypt and Lybia, after the flood; and when idolatry began to gain ground ſoon after this period, he was the chief deity of theſe two countries, in which his deſcendants continued. A temple, it is ſaid, was built to his honour, in the midſt of the ſandy deſerts of Lybia, upon a ſpot of good ground, about two leagues broad, which formed a kind of iſland or oaſis in a ſea of ſand. He was eſteemed the Zeus of Greece, and the Jupiter of Latium, as well as the Ammon of the Egyptians. In proceſs of time theſe two names were joined, and he was called Jupiter Ammon. For this reaſon the city of Ammon, No-ammon, or the city of Ham, was called by the Greeks Dioſpolis, or the city of Jupiter. Plutarch ſays, that of all the Egyptian names which ſeemed to have any correſpondence with the Zeus of Greece, Amon or Ammon was the moſt peculiar and appropriate. From Egypt his name and worſhip were brought into Greece; as indeed were almoſt all the names of all the deities that were there worſhipped. Bryant's Mythol. vol. i. p, 5.

However this be, Jupiter Ammon, or the Egyptian Jupiter, was uſually repreſented under the figure of a ram; though in ſome medals he appears of a human ſhape, having only two rams horns growing out beneath his ears.

The Egyptians, ſays Proclus, in Timæus of Plato, had a ſingular veneration for the ram, becauſe the image of Ammon bore his head, and becauſe this firſt ſign of the zodiac was the preſage of the fruits of the earth. Euſebius (Præp. Evang. lib. iii.) adds, that this ſymbol marked the conjunction of the ſun and moon in the ſign of the ram. Jupiter Ammon, the object of worſhip in every part of Egypt, was honoured in a peculiar manner at Thebes; and the Greeks, from this circumſtance, denominated it Dioſpolis. Herodotus, Diodorus Siculus, and Pliny have given particular deſcriptions of the magnificent temple of Ammon at Thebes; and although it was deſpoiled and ruined by Cambyſes, there ſtill remain veſtiges of its ancient grandeur. In this temple there was a ſtatue of Jupiter Ammon. The Ethiopians came down the Nile once a year to worſhip this deity at Thebes, and they had a ſmall portable temple of this deity, which they carried with them to their habitations and to thoſe of the Lybians, for the purpoſe of celebrating proſperous events by feaſts and dances. This aſſociation for religious exerciſes of the Egyptians, Ethiopians, and Lybians, continued under the reign of Theodoſius the younger. The Greek mythologiſts repreſent Bacchus, after his conqueſt of Aſia, paſſing with his army through Africa, and reduced to diſtreſs for want of water; when his father Jupiter, aſſuming the ſhape of a ram, led him to a fountain where he and his exhauſted troops were refreſhed with water; and in gratitude for this ſeaſonable relief they ſay, that he built a temple to Jupiter, under the name of Ammon, from *αμμος, ſand,* alluding to the ſandy deſert where it was built.

Ammon, or Ben-Ammi, in *Scripture Biography*, the ſon of Lot, was the father of the Ammonites, and lived about 1900 years before Chriſt.

Ammon, in *Entomology*, a ſpecies of Formica, with a double-ſpined thorax, petioled ſquama, and the two ſpines incurved. It is found in New Holland. Fabricius.

Ammon, a ſpecies of Scarabæus, found in America. Thorax, with three teeth; a recurved horn on the head; wing-caſes ſtriated. Linnæus.

Ammon, in *Ancient Geography*, a city of Marmarica, in Africa, which belonged to the Ammonii, according to Ptolemy; but Arrian ſays, that it was only a ſpot of ground in which the temple of Ammon was erected. It ſeems probable from Herodotus, (lib. iii. c. 25, 26.) that the Ammonii were a populous nation, and had a king of their own, though part of their territory could only be conſidered as a barren, ſandy deſert. From this ancient hiſtorian we learn, that Cambyſes, having advanced to Thebes, in his way to Ethiopia, detached from thence a body of 50,000 men to lay waſte the country of the Ammonii, and burn the temple of Jupiter Ammon; but that, after ſeveral days march over the deſerts, a ſtrong and impetuous wind blowing from the ſouth, raiſed ſuch a torrent of ſand, as to overwhelm and deſtroy the whole army. Alexander the Great, about 200 years after this time, was more ſucceſsful in his journey to that temple. Pliny places the temple of Ammon at the diſtance of about 12 days journey from Memphis, and mentions the Ammoniac nome of Egypt. Diodorus Siculus and Quintus Curtius (lib. iv. c. 7.) relate, that though this temple was ſurrounded by a ſandy deſert, yet its proper diſtrict abounded with trees bearing great plenty of fruit, and was ornamented with fountains. It had alſo ſeveral ſtreets or villages in the neighbourhood of the temple, a caſtle fortified with a triple wall, and near it a holy fountain, called the Fountain of the Sun, becauſe the qualities of the waters varied wonderfully every 24 hours; being warm in the morning, cool at noon, warm in the evening, and ſcalding hot at midnight. Strabo (lib. xvii.) informs us, that, under the reign of Auguſtus, the verſes of the Sybils, and the Tuſcan divinations, had depreciated the reputation of the oracle of Ammon; and in the 13th century it was forgotten; though the Arabs aſſert, that the diſtrict, in which it was ſituated, was ſtill inhabited. The Fountain of the Sun, deſcribed by Quintus Curtius, was nothing more, according to their account, than a hot ſpring, which ſeemed to be warmer in the night than in the day.

Ammon, in *Zoology*, a ſpecies of Ovis, or ſheep, in

Gmelin's

Gmelin's Linnæan fyftem; the characters of which are, that the horns are large, femicircular, arched backwards, and divergent, wrinkled on their upper furface, and flattifh on the under fide; and the neck has two pendant hairy wattles. This is the capra ammon of the Syft. Nat. Linnæus, or capra orientalis of Briffon, mufmon et ophion of Pliny, mufinon, or mufimon of Gefner, mufimon et tragelaphus Bellonii of Ray, tragelaphus, or muflon of Klein, rupicapra cornibus arietinis of J. G. Gmelin nov. com. petrop. ovis fera Sibirica, vulgo argali dicta of Pallas, mouflon of Buffon, ftepnie baranni of J. G. Gmelin, It. Siber. kamenoi barani oder mufimons of Steller, das wilde fchaaf, et der weiffers der alten of Gefner, [illegible] t of S. G. Gmelin, wild fheep of Pennant, and Siberian chamois of Briffon. It inhabits, in fmall flocks, the rocky and defert tracts of the Alpine region in the centre of Afia, in Kamtfchatka, the Kurile iflands, probably on the weft fide of North America and California, and more certainly on the higheft mountains of Barbary, Sardinia, Corfica, Greece, and the deferts of Tartary. It is very wild, fwift, and active, and fights violently with its horns, acquires its full growth in two years, and feldom lives more than 14; the female produces one or two lambs in the month of March. The general colour in Summer is a brownifh afh, mixed with grey on the upper parts of the body, and a whitifh afh on the lower parts; in Winter the former changes to a rufty grey, and the latter to a whitifh grey; the tail is very fhort, of a whitifh colour, and brownifh at the tip; the hair in Winter is about an inch and a half long, which falls off in Spring, and in Summer the coat is very fhort; the ears are erect and fharp pointed; the eyes are large, and generally of a brown or blue colour; the horns, which arrive at their full fize in three years, are whitifh, angular, wrinkled tranfverfely, large, clofe at their bafes, and placed on the top of the head, rifing at firft nearly upright, reflected backwards, divergent, and turned downwards and outwards at their ends: thofe of the female are fmaller and more hooked, but are fometimes entirely wanting; the horns of the old rams are faid to grow to fuch an enormous fize, that each of them weighs between 30 and 40 Ruffian pounds, and meafures, with its curvatures, two Ruffian ells in length; the hind-legs are rather longer than the fore-legs, by which the animal is better adapted for running up hill than on level ground; the flefh and fat are efteemed great delicacies in Siberia; the Kamtfchatkans clothe themfelves with the fkins of thefe animals. Mr. Pennant diftinguifhes between the Corfican argali, or ovis ammon Europea, and that of Siberia; though the difference feems to confift chiefly in colour; the former being of a brown colour tinged with tawny on the upper parts, with a white mark on each fide pointing to the belly. A fpecimen, brought from Corfica to England by Paoli, differed from the above in colour, having a large white fpot on the front of the neck, and being black on the fhoulders. In Corfica this animal is denominated Mufro. It is probable that the argali once inhabited Britain, as Boethius mentions fheep in St. Kilda larger than a he goat, with horns as big as thofe of an ox. In confirmation of this account, the figure of a mufmon has been difcovered in a piece of Roman fculpture, taken from Antoninus's wall, near Glafgow. Buffon fays, that the mouflon feems to be the primitive ftock of all the different varieties of fheep.

The Kamtfchatkans have not attempted to domefticate the argali; but they fpend the Summer in hunting them on the wild and precipitous mountains on which they feed. Sometimes they fet bent crofs-bows in the paths through which they expect the argali to pafs, in fuch a pofition, that when the animal treads on a ftring belonging to the bow, the arrow is difcharged and lodged in its bowels. Sometimes they employ dogs in the chace. The dog never overtakes the wild fheep; but while the fheep's attention is engaged by the dog, the hunter, without being obferved, approaches near enough to fhoot him with a ball or an arrow. The Mongols and Tungufi attack them in a different manner. They take out a great number of horfes and dogs, and endeavour to encompafs the flocks by furprife; but this is not eafily done, as they are fo fwift, and fo cunning, that when they diftinguifh, either by fight or by fmell, the approach of an enemy, they infallibly make their efcape.

AMMONIA, in *Agriculture*, a term applied to volatile alkali, a fubftance which has lately been found ufeful in vegetation. It is formed from the decompofition of all animal and fome vegetable matters during the procefs of putrefaction. It has been fuggefted by Dr. Darwin, in his treatife on agriculture and gardening, that in the decompofition of water, which partially takes place after being abforbed by the roots of vegetables, the hydrogen, by its union with azote, produces ammoniac, which may contribute to the nutriment of plants by its mixture with oils, and thus producing foaps which become diffufible in water, and alfo by decompofing infoluble faline earths, as gypfum or metallic falts, as vitriol of iron, and by this means producing more foluble or innocuous faline matters in the foils.

AMMONIA, in *Antiquity*, feafts celebrated at Athens, mentioned by Hefychius.

AMMONIA, or VOLATILE ALKALI. Alkali volatile, *Ammoniaque*, Fr.—*Alkali fluchtiges*; *Harnfalz*, *urinfalz. fluchtiges*, Germ.

Under the article ALKALI we noticed fome of the peculiar properties of the *volatile* alkali whereby it is diftinguifhed from the *fixed*. We fhall, in this place, give a more particular account of ammonia, which requires confiderable notice from its high importance as a chemical agent, and from the numerous refearches which have been made into all its properties and combinations, with more fuccefs than perhaps has fallen to the fhare of any other fubftance of equal value to the chemift.

As ammonia is never found native in an uncombined ftate, and is, in moft cafes, a *product* of various natural or artificial proceffes, we fhall refer the reader to the articles ANIMAL matter, CARBONAT of ammonia, MURIAT of ammonia, and falt of HARTSHORN, for every thing that relates to the natural hiftory of this alkali and its production in the large way as a manufacture, and fhall here confine ourfelves to the purely chemical defcription.

The volatile alkali (like fo many other chemical agents) when perfectly pure and uncombined, is only known to us in the form of a gas; and, as it is the only one of the alkalies which is capable of affuming this form in any common degree of heat, the term *alkaline* air, ufed by Dr. Prieftley and many other chemifts, is fynonymous with ammoniacal gas. This gas has the following properties: It poffeffes a moft pungent fmell, which, when ftrongly fnuffed up the noftrils, provokes to coughing, and gives a temporary fenfe of fuffocation, owing to the conftriction of the fauces which it produces. To the tafte it is highly ftimulating and acrid, and quickly corrodes the fkin of the tongue and lips, fo that it cannot be taken into the mouth in the undiluted form with fafety. It is fpeedily fatal to animals that are immerfed in it, and it extinguifhes a taper; but the flame of this laft is firft enlarged, and becomes of a pale yellow colour. Ammoniacal gas is, next to hydrogen, the lighteft of all the gafeous bodies. Its fpecific gravity,

gravity may be reckoned about 0.735 (diſtilled water being 1000.) whereas atmoſpheric air is 1.23, or nearly twice as heavy as alkaline air. The abſolute weight of 100 cubic inches of this gas at 30" bar. and 61° therm. is reckoned by Kirwan to be 18.16 grains. It is highly dilatable by heat, and at a very high temperature is decompoſed. It is alſo very rapidly and copiouſly abſorbed by moſt liquids, eſpecially by water, and hence it cannot be kept over water; but, for the purpoſes of experiment, it muſt be confined in well cloſed bottles or over mercury.

Ammoniacal gas is given out during the diſtillation of almoſt every animal, and ſome vegetable matters, but it cannot in this method be procured ſufficiently pure for chemical experiments. For this purpoſe the muriate of ammonia (or common crude ſal-ammoniac is the moſt convenient material for yielding the gas. This ſalt is readily decompoſed by quicklime, which laſt unites with the muriatic acid of the ſalt, and expels the ammonia in its pureſt and moſt cauſtic form of gas. The decompoſition is ſo ſpeedy, that a very pungent ſmell of volatile alkali is perceived merely on rubbing together theſe two ſubſtances. If one part of dry ſal-ammoniac is mixed with two parts of well burnt lime (or leſs if the lime is good), put into a dry phial or earthen tube, and heated gently, the ammoniacal gas riſes in great abundance, and may be directed by means of a bent tube under a jar full of dry mercury, where it may be preſerved in the gaſeous form for any length of time. Many of the metallic oxyds, eſpecially minium or litharge, will ſupply the place of the lime and expel the gas from the muriate of ammonia in very great purity. A ſtill more ſimple method of obtaining the gas is to apply a gentle heat to the liquid or watery ſolution of ammonia, which expels from it the alkaline air that the water had previouſly been made to abſorb at a lower temperature. It may be remarked that the diſcovery of ammonia in a gaſeous form, as well as many of the moſt intereſting properties of this alkali, is due to Dr. Prieſtley.

Ammonia, diſſolved in water (forming the *liquid ammonia* of modern chemiſts, the *fluor volatile alkali* of former times, or the *aqua ammoniæ puræ* of the London Pharmacopœia) is the form in which the cauſtic ammonia is the moſt familiar to us, and in which many of the properties of the alkali can be moſt conveniently examined. This when pure ſhould be perfectly tranſparent and colourleſs as water, ſhould have the ſtrong burning taſte and pungent ſmell of ammonia, and ſhould give no effervescence with acids. This latter teſt deſerves attention on account of the variety of volatile alkaline liquors that are prepared, all of which, except the *aqua ammoniæ puræ*, contain more or leſs carbonic acid, and are much milder in all their ſenſible properties.

Ammoniacal gas is abſorbed by water with great rapidity, and at the ſame time a conſiderable quantity of heat is given out from the gas, which is ſufficient to raiſe the temperature of the water, and to be ſenſible to the hand. The ſame gas, when put in contact with ice, melts it with apparently as much rapidity as if the ice were put into a fire, and is greedily abſorbed, at the ſame time that conſiderable cold is produced. At a moderate temperature water may be made to diſſolve nearly one third of its weight, or many hundred times its bulk, of this gas. The bulk of the water is ſo much increaſed by this proceſs that it becomes ſpecifically lighter than diſtilled water. Mr. Davy, in his experiments on this ſubject, (Reſearches into nitrous Oxyd, 1800.) found that at the temperature of 52°, 100 grains of liquid ammonia, holding in ſolution 9.502 grains of the alkali, gave a ſpecific gravity of .9684. When *perfectly ſaturated*, 100 grains of the liquid alkali contained 25.37 grains of ammonia, which is ſtill one-third of the weight of the water employed, and had the ſpecific gravity of .9054. Other writers, however, make the ſpecific gravity of ſaturated liquid ammonia as little as .897. The gentle heat of a ſpirit lamp again expels the alkali in the form of gas, but the laſt portions require a ſtrong ebullition before they can be made to quit the water. When liquid ammonia is expoſed to a very intenſe cold, ſufficient to freeze mercury, as Meſſrs. Fourcroy and Vauquelin have obſerved, it becomes a grey ſemi-tranſparent maſs, of the conſiſtence of a very ſtiff jelly, and with ſcarcely any odour.

The liquid ammonia is prepared in two methods. That which is the oldeſt and the moſt uſually practiſed, is to mix together quick-lime, muriate of ammonia, and water, and to diſtil the mixture with a gentle heat. The London Pharmacopœia orders for the preparation of the pure liquid ammonia, two pounds of lime ſlacked in two pints of water, and one pound of ſal-ammoniac, which are to be mixed with ſix pints of hot water, and to be kept in a covered veſſel till cold. The liquor is then to be diſtilled, and the firſt pint which comes over is the pure liquid ammonia. This liquor, however, is by no means ſaturated with the alkali, for during the heat, even of a gentle diſtillation, the ſolvent power of the water is much leſſened. The moſt elegant and effectual way of preparing this liquor is to diſengage the gas from the *dry* materials; and by uſing the beautiful APPARATUS of Woulfe, to cauſe the alkaline air to paſs into cold water where the abſorption is much more ſpeedy; and if neceſſary, the increaſe of temperature produced by this abſorption may be prevented by ſurrounding the bottles with ice. The proportions of the ingredients here uſed, may be two parts of lime ſlacked in as little water as poſſible, mixed with one part of dry muriate of ammonia and put into a retort for the production of the gas; and in the condenſing bottles, about as much water as the weight of the ſal-ammoniac employed. The liquid ammonia is known to be thoroughly ſaturated with the alkaline gas, when the bubbles paſs through the water undiminiſhed, and no further abſorption takes place.

Many of the combinations of ammonia with different chemical agents are highly curious and important; but as moſt of them produce alterations which depend on the decompoſition of this alkali, they will be better underſtood by the reader, if we firſt relate ſome of the multitude of facts by which the analyſis of ammonia has been aſcertained. The conſtituent parts of the volatile alkali are, hydrogen (or the baſis of inflammable air), and azot (the baſis of phlogiſticated air), the proportions of theſe two ſubſtances are, about 29, (in weight) of the former, and 121 of the latter; and it may be remarked that this is the only ſimple combination of theſe two ſubſtances with which we are certainly acquainted. The proofs of this analyſis we ſhall relate nearly in the order of diſcovery by the various eminent chemiſts who have thrown light on the ſubject.

Dr. Prieſtley was the firſt who remarked a very intereſting change produced on alkaline air by means of electricity. For this purpoſe he confined a known portion of this gas in a jar over mercury, and paſſed a number of ſucceſſive electric exploſions and ſparks. He found after every ſhock that the bulk of the confined air increaſed, and continued to do ſo till it had expanded to nearly three times its original bulk. The air was now much altered in its properties, for on letting up ſome water into the jar, ſcarcely any of the gas was abſorbed, whereas before electrization every par-

ticle of it would have rapidly united with this fluid. The gas was found to be highly inflammable, and exploded when mixed with common air, in the fame manner as the inflammable air procured from iron by an acid. The gas likewife after being a fhort time in contact with water had entirely loft its alkaline fmell. The colour of the electric fpark taken in the alkaline air was red, but white in the centre, when any confiderable explofion had been taken.

The fame eminent chemift likewife found alkaline air to be decompofed by paffing through a red hot tube, though not fo completely as by the electric fpark. In performing this experiment he found the tube, through which the alkaline vapour had paffed, lined with a black matter, and the liquor collected after this diftillation alfo obfcured with the fame fubftance. This is probably owing to fome fiffure in the tube which admitted carbonaceous matter from the hot coals, as we fhall mention hereafter. Another property of alkaline air, highly illuftrative of its compofition, is the reduction of feveral metallic oxyds which it effects when they are heated in contact with it. Dr. Prieftley confined fome litharge, or oxyd of lead, in this gas, and by heating it with a burning lens (a method of applying heat of all others the moft accurate), he revived the lead in its metallic form, and a quantity of phlogifticated air remained. The red mercurial oxyd, or *red precipitate*, was heated in the fame manner, and the mercury was revived, and at the fame time a confiderable quantity of *water* was produced fo as to run down in drops on the fides of the jar, which before appeared perfectly dry. The red precipitate, however, gave out during this reduction a large quantity of uncombined dephlogifticated air, which appeared in the refidual air after the reduction was completed. This, in another experiment with the fame materials, united with fome of the inflammable air contained in the alkaline gas and caufed a confiderable explofion. The antiphlogiftic theory will readily explain the production of *water* during the experiment from the union of the oxygen of the red precipitate, and the hydrogen of the ammoniacal gas; but this fact more properly belongs to the fubjects of WATER aud PHLOGISTON.

Thefe experiments were foon repeated by various chemifts, and with fimilar refults. Landriani found, that in paffing ammoniacal gas through a tube heated white hot, the alkaline properties were entirely loft, inflammable air was produced, and likewife a fmall portion of carbonic acid fufficient to give a precipitate with lime water.

Van Marum, in his experiments on the effect of electricity on the gafes, found the fame refults with ammoniacal gas that we have juft mentioned. Two cubic inches and feven eighths of the alkaline gas were enlarged to four inches, and the air was no longer abforbed by water, and was highly inflammable.

Whilft the properties and compofition of the volatile alkali were made the fubject of fo much ingenious aud fucceffful refearch by Dr. Prieftley, they received full elucidation by the labours of one of the moft eminent of the French chemifts, M. Berthollet.

This excellent experimentalift found, that when the oxygenated marine acid is added to liquid ammonia perfectly cauftic, a confiderable effervefcence takes place, and a quantity of gas is collected from the two liquids, which, when examined by the ufual chemical tefts, proves to be pure azotic gas. At the fame time the oxygenated acid lofes its peculiar pungent fmell, and becomes converted into fimple marine acid. The explanation given of thefe phenomena is, that the ammonia is decompofed by the oxygenated acid; the hydrogen of the alkali unites with the excefs of oxygen contained in the acid, and forms water, which mingles with the acid; whilft the azot, the other conftituent part of the ammonia, appears uncombined in the form of gas. The gas was found by Berthollet to be azotic, both by the common methods of examination, and by its forming nitrous acid when united with oxygen by means of the electric fpark, in the method that Mr. Cavendifh had difcovered. The fame decompofition takes place if the oxy-muriatic acid and the ammonia are ufed in form of gas. See OXY-MURIATIC ACID.

This theory of the decompofition of ammonia was alfo beautifully illuftrated by the fame ingenious chemift, in his accurate and original experiments on the nature and preparation of fulminating gold. Thefe will be given more at length under the article GOLD; but it may be here mentioned that the fulminating compound is formed by precipitating a folution of gold in aqua regia by the volatile alkali. This precipitate conffifts of the metal, of oxygen which it acquires during folution in the acid, and of a part of the ammonia employed to feparate it from its menftruum, which is retained by the metallic oxyd, and which gives it the property of exploding in a very gentle heat. M. Berthollet ventured to explode fmall and known quantities of this preparation in copper tubes, and found the products to be water and azotic gas, and the oxyd of gold completely reduced. The ammonia therefore is here decompofed, its hydrogen produces water with the oxygen of the gold, and its azot is fet at liberty in the form of gas. Some other of the metals which have a weak affinity for oxygen are reduced to a reguline ftate by means of the volatile alkali, which is alfo decompofed in the procefs. M. Berthollet alfo repeated Dr. Prieftley's experiment of the analyfis of ammoniacal gas by electricity, taking every poffible precaution in order to enfure an accurate refult; and the calculations deduced from it have been very generally acquiefced in, and confirmed by fubfequent enquirers. For this purpofe he paffed a fucceffion of electric fparks through 1.7 cubic inches of ammoniacal gas till it acquired its utmoft degree of expanfion, when it occupied 3.3 cubic inches, a degree intermediate between the refults of Dr. Prieftley and M. Van Marum. A certain quantity of this enlarged gas was then detonated with a fuperabundance of oxygen gas in Volta's eudiometer, whereby water was produced and the azotic gas of the ammonia remained unaltered. Then (affuming the quantity of oxygen entering into the compofition of water to be to the hydrogen, as 74 to 145, according to the calculations of M. Monge, given in the Memoirs of the French Academy) M. Berthollet eftimates the proportions of the conftituent parts of ammonia to be 2.9, in *bulk*, of hydrogen, to 1.1 of azot, or, in *weight*, (affuming the hydrogen to be eleven times lighter than the azot) 150 grains of ammoniacal gas will contain 121 grains of azot, and 29 grains of hydrogen.—Journal de Phyfique for 1786.

The above are the principal facts which have been brought to prove the *decompofition* of ammonia. A number of others, equally important and curious, will throw light on the mode of its *formation* from the union of its conftituent parts.

An accidental production of ammonia in circumftances where it had not been expected had frequently been remarked by various chemifts. Dr. Prieftley, in his numerous experiments on nitrous air, found by accident that when iron filings had been long kept in a jar, and moiftened with a diluted folution of copper in the nitrous acid, a thick

faline

ſaline red incruſtation was formed, mixed with a green matter, which, when broken, had a ſtrong ſmell of volatile alkali. Repeating the experiment he found that the ſame effect would be produced, though more ſlowly, by ſimply allowing iron to ruſt in nitrous air, when, after ſome weeks, the ſmell of volatile alkali plainly appeared. The nitrous gas likewiſe underwent a conſiderable change, being diminiſhed about one third, and then ſupporting combuſtion in a high degree, which laſt property was, however, loſt by waſhing in water, and a large reſiduum of phlogiſticated air was left.

A production of ammonia, in ſomewhat ſimilar circumſtances, is likewiſe particularly noticed by Mr. Hauſſman of Colmar. (Journal de Phyſique for 1787.) He relates, that on mixing nitrous gas with phlogiſticated precipitate of iron, a large quantity of the gas is abſorbed, leaving only a ſmall reſidue of phlogiſticated air; and on adding cauſtic fixed alkali to the iron precipitate, a ſmell of volatile alkali is very perceptible, and a ſtraw moiſtened with nitrous acid and held over the mixture alſo indicates the preſence of ammonia by forming denſe white fumes. Mr. Hauſſman diſtinguiſhes accurately between the phlogiſticated and the dephlogiſticated ſolutions of iron, the former being formed by diſſolving the metal in acetous acid, or in the vitriolic without previous preparation; and the latter being a ſolution in vitriolic acid of iron which has been previouſly precipitated from a nitrous ſolution, and is therefore fully dephlogiſticated, or, as is now ſaid, in the higheſt ſtate of oxygenation. The ſame chemiſt employed the ſolutions of iron in various ſtates, and found, that wherever nitrous gas was abſorbed by the iron, a certain quantity of ammonia is alſo produced, which, he alſo obſerves, probably remains in union with the vitriolic acid till it is diſplaced by cauſtic fixed alkali. The properties of this compound of nitrous gas and oxyd of iron will be examined more particularly under the article EUDIOMETRY, as it is intimately connected with this ſubject.

Still further light was thrown on the curious phenomenon of the production of ammonia, by ſome intereſting experiments of Dr. Auſtin. (Philoſoph. Tranſact. for 1788, vol. lxxviii.) The compoſition of ammonia having been fully aſcertained by the experiments of Prieſtley, Berthollet, and others, Dr. Auſtin attempted to produce the alkali by a direct union of its conſtituent parts. For this purpoſe he mixed inflammable and phlogiſticated airs in different proportions, and added to them ſome of the acid airs in order to favour their combination, tried the effects of cold, of heat, of electricity; and laſtly, he decompoſed alkaline air, and endeavoured to reunite the identical parts, but in no inſtance could he ſucceed in forming ammonia from the conſtituent parts of this alkali, *when both were employed in a gaſeous form.*

Hydrogen and azot, however, are certainly the conſtituent parts of ammonia, and their refuſal to unite when in the form of gas led Dr. Auſtin to vary his experiments by mixing theſe ſubſtances together in ſuch a manner that the hydrogen ſhould be involved in an atmoſphere of azotic gas juſt at the time when it was itſelf beginning to aſſume the gaſeous form. This has with great propriety been termed the *naſcent ſtate* of a gas, and this experiment was ſuggeſted to Dr. Auſtin by another very ſtriking production of ammonia from nitrous acid and tin, which we ſhall preſently mention. He therefore incloſed in a glaſs tube ſome azotic or phlogiſticated air, and along with it ſome iron filings moiſtened with water, which laſt were known to yield inflammable air after ſtanding together for ſome hours; and this air therefore in its naſcent ſtate, or at the inſtant of its formation, was in full contact with the azotic gas. To detect the minuteſt quantity of ammonia he alſo incloſed in the tube ſome paper ſtained with the blue of the rind of the radiſh, which is turned to green by alkalies. In twenty-four hours he found the colour entirely green. Another teſt was alſo uſed to indicate the preſence of ammonia, which was paper ſtained with a ſolution of nitrated copper; the green of which was, in a few days, converted to blue, the proper colour of a ſolution of copper in ammonia. Dr. Auſtin found nitrous air to effect a much more ſpeedy production of ammonia when uſed inſtead of the azotic gas. Atmoſpheric air will alſo ſucceed, but requires a longer time than the azotic air, ſo that ammonia ſhould always be formed whenever iron in contact with water ruſts in the open air. In this formation of ammonia by the direct combination of its principles, it is neceſſary, as Dr. Auſtin obſerves, that the hydrogen ſhould be only in the naſcent ſtate when it comes in contact with the azot, for if it is already in the form of gas it cannot be made to unite with the azot in any form ſo as to produce ammonia.

We may here remark, that this mode of effecting chemical union between bodies which, when uncombined, are only known in the gaſeous form, (ſuch as oxygen, hydrogen, and azot) by preſenting one to the other when in the naſcent ſtate, ſhould always be kept in mind in experiments of reſearch, as it may be the means of very important diſcoveries in this difficult part of experimental chemiſtry. Mr. Kirwan, in his valuable experiments on hepatic air, obſerved the formation of volatile alkali when this air was mixed with nitrous gas. At the ſame time ſulphur is depoſited.

Another very ſtriking experiment on the formation of ammonia, which is eaſily made and ſeldom fails of ſucceſs, is the following. Take ſome powder, or filings of tin or zinc, pour on them ſome moderately dilute nitrous acid, which will act on them with great vehemence, and the diſengagement of copious red fumes. After a ſhort time ſtir into the mixture ſome quicklime or cauſtic alkali, and a very ſtrong pungent ſmell of ammonia will be produced. In this caſe the ammonia is formed by the decompoſition of the nitrous acid and the water, this ammonia inſtantly unites with a portion of the acid, forming nitrated ammonia, and the lime again decompoſes this ammoniacal ſalt by ſimple affinity, and by diſplacing the alkali from its union with the acid, cauſes it to aſſume the gaſeous form and to become evident to the ſenſes.

Before we quit the ſubject of the compoſition of ammonia, we ſhall make a few obſervations on the decompoſition of nitrous gas and nitric acid in the experiments above related, whereby the volatile alkali is produced. In the ſimpler methods of forming ammonia, ſuch as in Dr. Auſtin's experiments, the union of the naſcent hydrogen with azotic gas, the affinities which operate in forming the alkali, may be ſuppoſed to be tolerably ſimple. But when the nitric acid, or nitrous gas are uſed, the affinities appear to be extremely complex, and perhaps hardly made out with much certainty. It ſhould be noted, however, that, along with the production of ammonia, there appears conſtantly a proportionate quantity of that ſingular gas diſcovered by Dr. Prieſtley, and called by him dephlogiſticated nitrous air; and of late denominated *nitrous oxyd* by Mr. Davy, to whoſe highly ingenious "Reſearches" we are indebted for much important addition to this curious and difficult part of chemiſtry. It is a ſtriking property of the nitrous oxyd to ſupport combuſtion in a very eminent manner, and very ſimilar to oxygen gas, although it contains a leſs proportion of oxygen, and more azot than *nitrous gas*,

which is unfit for combuſtion. This reſemblance to oxygen gas in the nitrous oxyd has miſled ſome chemiſts in the nature of the air left after the formation of ammonia from nitrous gas and naſcent hydrogen, who have ſuppoſed a production of oxygen, and have been obliged to account for it accordingly. To explain the changes that take place with moiſtened iron filings, confined in an atmoſphere of nitrous gas, we muſt obſerve, that the new compounds, which we know are formed out of theſe materials, are ammonia, conſiſting of azot and hydrogen, and nitrous oxyd, compoſed of much azot and little oxygen. The iron likewiſe is ruſted or oxygenated. The ſource of the hydrogen in the new products may be ſuppoſed to be ſome of the water decompoſed, from which the metal, in ruſting, has abſtracted its other conſtituent part, the oxygen. The only ſource of the azot (allowed by the antiphlogiſtic theory) is the nitrous gas, which is compoſed merely of this principle, and of oxygen. But if merely a portion of the azot of the nitrous gas was abſtracted from it, the remainder, by loſing azot, would be a ſubſtance containing (proportionally) *more* oxygen than nitrous gas; whereas, the nitrous oxyd, which is this remainder, contains leſs. There muſt, therefore, be an additional method of getting rid of this exceſs of oxygen, in order to produce a ſatisfactory explanation; and the only ſubſtance that offers is the hydrogen of the water decompoſed by the metal, which may be ſuppoſed to unite with enough of the oxygen of the nitrous gas to reduce it to the ſtate of nitrous oxyd. Thus then, according to this hypotheſis, the metal decompoſes the water, the hydrogen ſet at liberty by this decompoſition unites with a ſmall part of the azot of the nitrous gas to form ammonia, and with a greater part of its oxygen, to form water, and the reſidue of the nitrous gas is in that proportion and mixture which conſtitutes nitrous oxyd.

We ſhall not purſue this ſubject farther at preſent, as it will apply to all the caſes of the production of ammonia by nitrous acid, and it may, perhaps, be thought too hypothetical to be further inſiſted on, though there are many ſimilar examples to be met with, of very extenſive and complicated affinities being ſet in motion by a ſingle diſturbance of the quieſcent attractions of the conſtituent parts of any of the ſubſtances contained in the mixture.

Having now enumerated ſome of the leading facts by which the compoſition of the volatile alkali has been eſtabliſhed, we ſhall proceed to mention ſome of the mixtures of ammonia with various chemical agents. It may be obſerved that though the uncombined volatile alkali is in the form of gas when pure, all its combinations are either ſolid or liquid, and hence every ſubſtance added to the ammoniacal gas cauſes an abſorption of it where any chemical action takes place. However, the tendency to the aëriform ſtate is ſo far retained by ammonia in all its combinations as to render them volatile, and to weaken its adheſion for them, whenever the temperature is raiſed to a certain degree. The force of affinity which ammonia exerciſes is therefore remarkably weakened by heat, where the ſubſtance to which it is united is naturally fixed in the fire, and many of the ammoniacal compounds at a high temperature are totally decompoſed, and entirely new products reſult from the operation.

No union takes place by any ſimple mixture of ammonia with oxygen, hydrogen, or azotic gaſſes. Under particular circumſtances, and by the agency of complicated affinities, theſe ſubſtances may however be mutually decompoſed, and new compounds produced. Thus, ammoniacal gas paſſed over heated oxyd of manganeſe forms NITROUS ACID, as diſcovered by the ingenious experiments of Dr. Milner.

Ammonia unites with all the acids with very great eaſe and rapidity, forming with them very eaſily ſoluble ſalts. Theſe will be particularly mentioned under the reſpective acids, but ſome of their properties may here be mentioned. The union of alkaline air with the acid gaſſes, as diſcovered by Dr. Prieſtley, forms ſome of the moſt ſtriking and beautiful experiments which chemiſtry furniſhes. If ammoniacal gas is paſſed up into a jar containing carbonic acid there is a thick white fume immediately produced, the two gaſſes by uniting loſe their gaſeous form, ſo that there is a complete vacuum ſuddenly made in the jar, cauſing the mercury over which it is confined to riſe and fill it entirely, a ſenſible quantity of heat is given out, and a number of minute cryſtals of carbonated ammonia lining the inſide of the jar, is the product of the mixture.

With the muriatic acid gas the appearances are exactly ſimilar, only the white fume is ſtill more denſe and copious, the heat greater, and the union more rapid. Cryſtalline feathers of MURIATED ammonia are the reſult, and this furniſhes one of the moſt ſtriking inſtances of alteration in form, and in ſenſible properties, which two bodies may undergo by chemical affinity; for each of the ingredients when ſeparate are in the ſtate of an inviſible gas with a highly pungent ſmell, and, when united, a ſcentleſs ſolid ſalt is the product. In making this beautiful experiment both the gaſſes ſhould be confined over mercury; and, on account of the much ſuperior ſpecific gravity of the acid gas over the alkaline, if the former is thrown into a jar of the latter, the white cloud will form ſlowly, beginning from the point of contact of the gaſſes; but if the alkali be added to the acid gas, it riſes through it immediately, and the combination takes place with great rapidity.

The nitrous acid unites with ammonia with great eaſe, and with the production of white fumes when the two ſubſtances are gaſeous. The reſulting ſalt NITRAT of ammonia poſſeſſes very intereſting properties, which will be mentioned under that article.

It may be of uſe to know that the preſence of ammoniacal gas, where it cannot conveniently be detected by the ſmell, will be readily ſhewn by holding a piece of glaſs rod or any other ſubſtance wetted with nitrous or muriatic acid, over the part where ammonia is ſuſpected, when thick white fumes will be ſeen to form around the acid.

Phoſphorus will not unite with ammonia at a low temperature. In a red heat the alkali is decompoſed, and phoſphorated hydrogen, and azotic gas are produced.

With ſulphur, ammonia unites with ſome difficulty, forming the SULPHURET of ammonia, or *Boyle's fuming liquor*.

Charcoal and the volatile alkali do not unite in a moderate heat, but at high temperatures the alkali is decompoſed, and, by particular management, that ſingular ſubſtance, the PRUSSIC acid, may be formed.

The affinity of ammonia for the different acids is much weaker than that of the other alkalies, and ſeveral of the earths. In ſeveral ſolutions of earths or metals in acids, where the affinity of ammonia for the acid is only in a ſmall degree greater than of the earth or metal, only a part of the ſubſtance diſſolved is precipitated by the addition of this alkali, and the ſolution retains the remainder, united with the ammonia, forming together an ammoniacal triple ſalt. Thus if to a ſolution of magneſia ammonia is added, part only of the earth is precipitated, and the remaining ſolution is an ammoniaco magneſian ſalt. Alſo the affinities of ammonia are much weakened by heat, owing to the great tendency to volatilization which the alkali poſſeſſes.

Ammonia has a very ſtriking property of reducing to the metallic ſtate (either entirely or partially) the oxyds of the ſeveral metals. This is performed, as we have already mentiond

tioned in the inſtance of fulminating gold, by a decompoſition of the alkali, its hydrogen uniting with the oxygen of the metallic oxyd to form water, and its azot appearing uncombined in the form of gas. Thus, as M. Fourcroy has obſerved, (*An. Chym. tom.* 2 & 6.) if the black oxyd of manganeſe is moiſtened with liquid ammonia, and gentle heat be applied, the oxyd paſſes to the ſtate of the white oxyd, (which is nearer the metallic ſtate) and an effervescence with diſengagement of azotic gas takes place. The red oxyd of mercury, treated in a ſimilar manner, gives the ſame reſults, and the metal is left in the ſtate of a black powder, which ſimple expoſure to light and air will convert to globules of running mercury. This affords a ready way of cleaning the ſurface of mercury that has been tarniſhed and oxydated by acid vapours.

Some of the moſt difficultly reducible metals, ſuch as manganeſe or tungſten, are on this account beſt prepared for reduction by being previouſly united with ammonia.

The volatile alkali may be made to unite with oils, ſo as to form ammoniacal Soaps; but this combination is leſs perfect than the fixed alkaline ſoaps, on account of the impoſſibility of applying heat to promote union without driving off much of the alkali in the form of gas. The volatile oils are equally ſoluble in ammonia with the fixed, an example of which is that union of oil of amber with ammonia, which forms Eau de luce.

A great variety of vegetable and animal ſubſtances are diſſolved or decompoſed by this alkali, which renders it of the higheſt importance in the Analysis of animal and vegetable matters.

The uſes of the volatile alkali are numerous and important. To the chemiſt, as a re-agent of very extenſive utility, it is an indiſpenſable requiſite, as there is hardly a ſingle analyſis of mineral, vegetable, or animal matter performed (where at all complicated) in which ammonia is not largely employed.

In medicine this alkali is highly valuable, on account of its ſtrong and diffuſibly ſtimulant properties. When taken internally, its firſt effect is generally upon the throat and fauces, owing to its partial volatilization by the heat of the mouth. Every one is familiar with its uſe in relieving faintings and ſickneſs when ſnuffed up the noſtrils, though from the great acrimony of the cauſtic ammonia, the milder form of the carbonated ammonia, or *ſal volatile* is generally preferred. The ſtrong and ſudden ſtimulus which it gives to the ſyſtem, when applied to the noſtrils, renders it alſo one of the moſt powerful applications in many of the more ſerious ſuſpenſions of the vital powers. The pure liquid ammonia is much too acrid to be uſed by itſelf, even as an external application, but when mixed with oil it forms a very uſeful liniment for ſtrains, indolent ſwellings, and any caſe in which a powerful ſtimulant is required. Simple agitation with oil will unite the two liquors into an uniform milky ſaponaceous liquid, in which the ſenſible properties of the alkali are only blunted and not neutralized. A peculiar uſe of the liquid ammonia largely diluted with water, and taken internally, is in checking the ſudden and dreadful effects produced by the bite of venomous ſerpents.

Prieſtley on Air.—Journal de Phyſique for 1785, 6, *and* 7. *—Philoſ. Tranſact. for* 1788.—*Anal. de Chimie, tom.* ii. & vi. *—Davy's Reſearches*, &c. &c.

Ammonia, in *Mythology*, an appellation of Juno, to whom the Eleans ſacrificed, alluding, perhaps, to Jupiter Ammon.

AMMONIAC, *Gum*, or, as it is ſometimes, though improperly, called, Armoniac, is a concrete, gummy, reſinous juice, which is ſaid to ooze from a plant of the umbelliferous kind, as may be inferred from the ſeeds and pieces of ſuch a plant with which it is intermixed. Ammoniacum is very analogous to Galbanum, and the former, as well as the latter, is probably procured from a ſpecies of the Bubon. The ſeeds that are found among the tears reſemble thoſe of anethum or dill, except that they are larger.

Dioſcorides ſays, it is the juice of a kind of *ferula*, growing in Barbary, and that the plant which produces it was called *agaſyllis*. Pliny calls the plant whence it flows *metopion*, and ſays the gum took its name from the temple of Jupiter *Ammon*, in the weſtern part of Egypt, now the kingdom of Barca, near which it grew. At preſent it is brought here from Turkey, and from the Eaſt Indies.

The good ammoniac ought to be in dry drops, white within, yelloviſh without, eaſily fuſible, reſinous, ſomewhat bitter and nauſeous, and of a very ſharp taſte and ſmell, ſomewhat like garlick. The white drops or tears are obſerved to change to a yelloviſh or browniſh colour, on being expoſed for ſome time to the air. It ſhould not be mixed with any ſcrapings of wood, ſtone, or ſand; this, by the Greeks, was called Θραυσμα, *fragment*. The other, which is full of ſtone or ſand, was called Συγμα, that is, *mixture*. It is purified from the ſeeds, ſmall ſtones, &c. commonly intermixed with it, by ſoftening or diſſolving it in a little boiling water, preſſing it, while hot, through a ſtrainer, and then inſpiſſating it to its former conſiſtence. For internal uſe the larger and finer tears, unpurified, are preferable to the common ſtrained gum.

From an ounce of this gum-reſin ſix drams may be diſſolved by ſpirit of wine, or ſix drams two ſcruples and a half may be diſſolved by water. Neumann.

This gum ſoftens by the heat of the fingers, and adheres to them. It is brittle when cold; it is eaſily melted in an iron ſpoon; applied to a candle it burns and fumes. The more milky grains are contained in it, ſo much the more excellent is its quality. If theſe only be ſelected it will require no purification.

Some ſay it ſerved the ancients for incenſe in their ſacrifices. It enters ſeveral medicinal compoſitions, and its principal virtue is that of reſolving obſtructions, in which intention it is frequently uſed in aſthmas and difficulty of expectoration, in menſtrual ſuppreſſions, and cachectic indiſpoſitions. In obſtructions of the breaſt it is reckoned the moſt effectual of the aperient gums. It is moſt commodiouſly taken in the form of pills; the doſe is a ſcruple, or half a dram, every night or oftener; in larger doſes, as a dram, it generally looſens the belly. In phthiſical caſes, where no injury is to be apprehended from a ſtimulus, this gum may be elegantly combined with oxymel of ſquills, diſtilled water, and ſyrup. Applied externally, it is ſuppoſed to diſcuſs hard indolent tumours; and for this purpoſe it enters into the compoſition of many plaſters. Plaſters formed with vinegar of ſquills, and with wine vinegar, have been employed for curing the fungus of the joints or dropſy of the knee, and are ſaid to have proved effectual. Plaſters of this kind applied to the head, and allowed to remain for ſix or eight weeks, have removed the tinea capitis. Dr. Cullen (Mat. Med. vol. ii. p. 369.) affirms, that he has ſeldom found the expectorant power of this gum very remarkable, and that the miſchief ariſing from its heating qualities has more than counterbalanced the benefit obtained by its expectorant powers. He adds, that its efficacy in reſolving indurated tumours is very doubtful, and that he has had no clear proof from experience of its having any ſuch power.

Ammoniacum, triturated with water, diſſolves into an emulſion, or milky liquor, lac ammoniaci, and in this form acts rather more powerfully than in the ſolid one of a pill. Simple penny royal water is commonly

monly uſed for this purpoſe, in ſuch proportion, that four ſpoonfuls, that is, two ounces, of the emulſion contain thirty grains of the gum. Some have diſſolved it in vinegar of ſquills, and thus obtained a very powerful but unpalatable expectorant. When theſe milky ſolutions are kept for ſome time they depoſit a conſiderable quantity of reſinous matter, and become clear. Inſpiſſated they yield an extract of no ſmell, and of only a weak bitteriſh taſte. In diſtillation no eſſential oil is obtained, and the diſtilled water is but ſlightly impregnated with the flavour of the ammoniacum. In this reſpect ammoniacum differs remarkably from moſt of the other deobſtruent gums, as aſſafœtida, galbanum, and ſagapenum, which afford not only a ſtrong diſtilled water, but an actual oil, containing the concentrated flavour of the gums. Lewis. Murray.

AMMONIAC, *ſal*, in *Chemiſtry* and the *Materia Medica*. See MURIATE of *Ammonia*.

AMMONIACAL *preparations*, in *Pharmacy*. There are ſeveral pharmaceutical preparations, into which the volatile alkali, under one form or another, enters as a principal ingredient. Of theſe the only one in which the alkali is employed in its cauſtic ſtate is the *aqua ammoniæ puræ*, (Pharm. Lond.) alſo called *cauſtic ſpirit of ammonia*, or *ſpirit of ammonia with quicklime (ſpiritus ammoniæ cum calce vivâ)*, the methods of preparing which have been deſcribed under *liquid ammonia* in the preceding article. It may be obſerved, that though it is called a *ſpirit* it only conſiſts of water, impregnated with pure ammonia through the medium of diſtillation. The appellation "with quick-lime" is added to diſtinguiſh it from the ſimple *ſpirit of ſal ammoniac*, which is prepared (from the diſtillation of muriated ammonia in both caſes, but) with chalk, and is therefore not cauſtic, but carbonated, and effervеſces with acids.

The ſeveral preparations of the CARBONAT of *Ammonia*, employed in medicine, will be mentioned more particularly under that article and HARTSHORN. The principal are the *prepared ammonia, ammonia preparata*, (Pharm. Lond.) *Sal volatile, ſalt of hartſhorn*, which is the ſolid carbonat of ammonia in its pure ſtate, prepared for the moſt part by ſublimation of ſome of the neutral ammoniacal ſalts with chalk.

Aqua ammoniæ, (Pharm. Lond.) or *ſpirit of ſal ammoniac*, is prepared by diſtilling muriate of ammonia, chalk, and water; and is in fact nothing but a ſolution of carbonat of ammonia in water, effected by the medium of diſtillation, and perhaps containing a ſmall portion of the cauſtic ammonia, where the chalk is not perfectly mild. Sometimes this liquor is prepared with pearl-aſh, or carbonat of pot-aſh inſtead of chalk. The effect will be the ſame upon the ammoniacal liquor, only when the pearl-aſh is uſed, as it is always in a ſemi-cauſtic ſtate, it will render the volatile alkali ſomewhat leſs carbonated.

Spiritus ammoniæ, (Pharm. Lond.) *ſpiritus ſalis ammoniaci dulcis ſive vinoſus*. This differs from the preceding in being a real diſtilled ſpirit, as proof ſpirit of wine is the menſtruum employed for the alkali inſtead of water. The term *ſpirit* is therefore, in the preſent London Pharmacopœia, very properly confined to the ammoniacal preparations where ſpirit of wine is employed; and the term *water* of ammonia is adopted where this liquid is the ſolvent for the alkali.

The true ſpirit of ammonia is made the baſis of ſeveral powerful compound preparations, in which either an aromatic oil and water, or a fetid gum, is united with the alkaline ſpirit, according to the intention which it is to anſwer. Of the former kind is the *ſpiritus ammoniæ compoſitus*, or *volatile aromatic ſpirit*, prepared by diſſolving bergamotte eſſence and oil of cloves in the alkaline ſpirit (either with or without the help of diſtillation); of the latter is the *ſpiritus ammoniæ fœtidus*, in which a certain quantity of aſſafœtida is diſſolved in the ſpirit. The ammoniacal ſpirit is likewiſe made the baſis of ſome tinctures, inſtead of ſimple ſpirit of wine, where the operation of the volatile alkali properly combines with that of the gum or reſin diſſolved in the tincture.

For external applications, both the watery and the ſpirituous ſolution of ammonia, and both cauſtic and effervеſcent, are employed according to the ſtrength of the remedy required. The cauſtic ſolution makes by much the moſt rapid and permanent union with oils, whence it is preferred in that delicate preparation, the EAU DE LUCE.

AMMONITE, or SNAKESTONE.

Cornu Ammonis—Ammonita—Ophiomorphita, Lat. *Ammonſhörner — Widderhörner — Poſthörner — Belſchnecken — Drachenſtein — Schlangen*, Germ. *Corne d'Ammon — Pierre de ſerpent — Cornette de Poſtillion—Cornette chambrée*, Fr.

The ammonite is a foſſile univalve many chambered ſhell, of a flattened ſpiral figure, containing many circumvolutions, which decreaſe in bulk gradually from the circumference to the centre: all the circumvolutions may be divided by the ſame horizontal plane, and therefore the whole of the ſpiral is viſible on each of the flattened ſides. From its reſemblance to a ram's horn, or rather to the compreſſed ſpiral horn with which the figures of Jupiter Ammon are generally repreſented, it has derived its common name. The vulgar conſider it as a petrified ſnake; hence its appellation of ſnakeſtone, &c. The leaſt reflection, however, ought long ago to have deſtroyed this error, if men in general were as capable of finding out differences as they are willing to ſee reſemblances. A ſnake always coils himſelf up, ſo as to have his head in the centre of the ſpiral, and therefore the volume of the ſpires diminiſhes as they approach the circumference, whereas in the ammonite preciſely the reverſe takes place.

Ammonites are found of all intermediate ſizes, between thoſe which are ſcarcely viſible to the naked eye, and a ſpecimen in the Britiſh Muſeum, above three feet in diameter, and weighing about one cwt. The number of circumvolutions, however, is by no means according to the ſize of the ſhell: there are few perfect ſpecimens which contain leſs than ſix, and hardly any that exhibit more than twelve. Of ſome the external ſurface is ſmooth, of others it is rugoſe, or ſtriated, or tiled, or toothed. In fact there ſeems to be included, under the term ammonite, a very large natural family of ſhells, agreeing in certain eſſential characters, but remarkably differing in others; not fewer than thirty different kinds have been found in the neighbourhood of Bath. Scheuchzer, in his "Natur. hiſtorie des Schweitzerlandes," enumerates 149 varieties, and Roſinus has ſwelled the catalogue to nearly 300.

There are three ſpecies of foſſil ſhells, which have been occaſionally confounded with the ammonite.

The firſt of theſe is the nautilite, or foſſil nautilus; and although the extremes of the two ſpecies are readily diſcriminated from each other, yet the intermediate varieties of the ammonitiform nautili, and the nautiliform ammonites may without much impropriety be claſſed under either ſpecies. In general, however, the nautilite has much fewer circumvolutions, and theſe do not gradually increaſe in capacity from the centre to the circumference, as is the caſe in the ammonites, but the exterior volute is rapidly and largely dilated, ſo as to be of much greater dimenſions than that which immediately precedes it.

The ſpurious ammonite, or umbilicite, in external appearance, has a great reſemblance to the real ammonite, but totally differs in its interior ſtructure by not being divided into cells or chambers.

The

The lituite is another ſpiral many-chambered ſhell, but may, without much difficulty, be diſtinguiſhed from the ammonite, as its volutes are fewer, do not touch each other, and the exterior one approaches nearly to a ſtraight line.

Of all the foſſil ſhells ammonites are perhaps the moſt numerous and moſt generally diffuſed: they are found principally in calcareous ſtrata, and are the only organiſed remains that have been met with at very great heights: De Luc has diſcovered them on Mount Grenier, 7800 feet above the level of the ſea: they alſo occur in marl, ſlate, indurated clay, and argillaceous iron ore. The interral cavities of the ſhell are uſually filled with calcareous ſpar, at other times the whole ſubſtance is penetrated with pyrites, and occaſionally is met with completely agatized

The race of animals, of which theſe are the remains, has probably been long extinct, no naturaliſt having met with living ammonites more than a few lines in diameter, and even theſe have been, for the moſt part, proved to be only nautili. In the account of the ill-fated voyage of La Peroufe is a memoir by Lamanon, deſcribing a living ammonite, four lines in diameter, found in the ſtomach of a bonetta, caught in the South Sea, between the tropics; but this ſuppoſed ammonite, from the figure and deſcription, is probably a nautilus; the exterior volute is by much the largeſt, and the number of circumvolutions is only two and a half. It was, indeed, an opinion of Linnæus, that living ammonites, correſponding to all the foſſil varieties, were ſtill exiſting in the depth of the ocean; hence they have obtained the name of Pelagian ſhells: this, however, cannot be proved, and is rendered improbable for the following reaſons: firſt, the ſhell of the ammonite is very thin, whereas thoſe of animals that live at great depths is always thick. Secondly, ammonites are almoſt always found mixed with turbines, buccina, and other common ſhells, which, while alive, are now known to inhabit ſhallow ſeas, and are daily thrown up on every coaſt; the living ammonite, therefore, if ſtill in exiſtence, would probably be found in ſimilar ſituations, and be occaſionally thrown upon the ſhore, together with thoſe ſhells by which, in a foſſil ſtate, it is commonly found to be accompanied.

Schroter, vollſtandige einleitung in die kentniſs der Steine, vol. iv.—Schröter, Lithologiſches real, &c. vol. i.—Linn. Syſtema Naturæ.—De Luc, Lettres a la Reine.—La Perouſe's Voyage, vol. iii.

AMMONITES, in *Ancient Hiſtory*, the deſcendants of Ammon, took poſſeſſion of the country called by their name, after having driven out the Zamzummims, who were its ancient inhabitants. The preciſe period at which this expulſion took place is not aſcertained; nor does hiſtory inform us to any great degree concerning the manners and cuſtoms of theſe people. They had kings, and were uncircumciſed, (Jer. ix. 25, 26.) and ſeem to have been principally addicted to huſbandry. They, as well as the Moabites, were among the nations whoſe peace or proſperity the Iſraelites were forbidden to diſturb, (Deut. ii. 19, &c.) However, neither the one nor the other were to be admitted into the congregation to the tenth generation, becauſe they did not come out to relieve them in the Wilderneſs, and were concerned in hiring Balaam to curſe them. Their chief and peculiar deity is, in Scripture, called Moloch; and Chemosh was alſo a god of the Ammonites. Before the Iſraelites entered Canaan, the Amorites conquered a great part of the country belonging to the Ammonites and Moabites; but it was retaken by Moſes, and divided between the tribes of Gad and Reuben. Before the time of Jephthah, ante Chriſt. 1188, the Ammonites engaged as principals in a war, under an anonymous king, againſt the Iſraelites. This prince, determining to recover the ancient country of the Ammonites, made a ſudden irruption into it, reduced the land, and kept the inhabitants in ſubjection for 18 years. He afterwards croſſed Jordan with a deſign of falling upon the tribes of Judah, Benjamin, and Ephraim. The Iſraelites reſiſted the invader: and aſſembling at Mizpeh, choſe Jephthah for their general, and ſent an expoſtulatory meſſage to the king of the Ammonites (Judges x. and xi.) The king replied, that theſe lands belonged to the Ammonites, who had been unjuſtly diſpoſſeſſed of them by the Iſraelites when they came out of Egypt, and exhorted Jephthah to reſtore them peaceably to the lawful owners. Jephthah remonſtrated on the injuſtice of his claim; but finding a war inevitable, he fell upon the Ammonites near Aroer, and defeated them with great ſlaughter. On this occaſion the Ammonites loſt 20 cities; and thus an end was put, after 18 years bondage, to the tyranny of Ammon over the Iſraelites beyond Jordan. In the days of Saul (1 Sam. xi.) ante Chriſt. 1075, the old claim of the Ammonites was revived by Nahaſh their king, and they laid ſiege to the city of Jabeſh. The inhabitants were inclined to acknowledge Nahaſh as their ſovereign; but he would accept their ſubmiſſion only on condition that every one of them ſhould conſent to loſe his right eye, and that thus he might fix a laſting reproach on Iſrael; but from this humiliating and ſevere requiſition they were delivered by Saul, who vanquiſhed and diſperſed the army of Nahaſh. Upon the death of Nahaſh, David ſent ambaſſadors to his ſon and ſucceſſor Hanun, to congratulate him on his acceſſion; but theſe ambaſſadors were treated as ſpies, and diſmiſſed in a very reproachful manner. 2 Sam. x. This indignity was puniſhed by David with ſignal rigour. Rabbah, the capital of Hanun, and the other cities of Ammon, which reſiſted the progreſs of the conqueror, were deſtroyed and razed to the ground; and the inhabitants were put to death with circumſtances of extreme ſeverity. In the reign of Jehoſhaphat the Ammonites united with their brethren the Moabites, and the inhabitants of Mount Seir, againſt this king of Judah; but their hoſtile attempts were reſiſted, and they were completely routed. They were afterwards overthrown by Uzziah, king of Judah, and made tributary. 2 Chron. xxvi. 8. But rebelling in the reign of his ſon Jotham, they were reduced to the neceſſity of purchaſing peace at a very dear rate. After the tribes of Reuben, Gad, and the half tribe of Manaſſeh were carried into captivity by Tiglath Pileſer, ante Chriſt. 740, the Ammonites and Moabites took poſſeſſion of the cities belonging to theſe tribes, and were reproached for it by Jeremiah. Ch. xlix. 1. Their ambaſſadors were exhorted to ſubmit to Nebuchadnezzer, in the typical language of the prophet, and threatened, on their refuſal, with captivity and ſlavery. Ch. xxvii. 2, 3, 4. The prophet Ezekiel, ch. xxv. 4.—10, denounces their entire deſtruction, and informs them, that God would deliver them up to the people of the eaſt, and that the Ammonites ſhould no more be mentioned among nations; and this puniſhment they were to ſuffer for inſulting the Iſraelites on account of their calamities, and the deſtruction of their temple by the Chaldeans. This puniſhment is ſuppoſed to have been inflicted upon them in the fifth year after the taking of Jeruſalem, when Nebuchadnezzar made war againſt all the people around Judea, A. M. 3420 or 3421, ante Chriſt. 583. It is probable that Cyrus granted to the Ammonites and Moabites liberty to return into their own country, whence they had been removed by Nebuchadnezzar; for they were expoſed to the revolutions that were common to the people of Syria and Paleſtine, and ſubject, ſometimes to the kings of Egypt, and ſometimes to the kings of Syria. Polybius (lib. v.) informs us, that Antiochus the Great took Rabboth,

or Philadelphia, the capital of the Ammonites, demolished the walls, and put a garrison into it, A. M. 3840, ante Christ. 108. During the persecutions of Antiochus Epiphanes, the Ammonites manifested their hatred to the Jews, and exercised great cruelties against such of them as lived in their parts. At length their city Jaser, and the neighbouring town fell a prey to the Jews, who smote the men, carried their wives and children into captivity, and plundered and burnt the city. Thus ended their last conflict with the descendants of Israel. About the beginning of the second century of the christian æra they were thought worthy of being called a numerous nation. Justin Martyr says (Dial. cum Tryphone, p. 272.) that in his time there were still many Ammonites remaining; but about this period their name vanished, and they were blended with the Arabians; for Origen assures us in (Job lib. i.), that in his days they were only known under the general name of Arabians. In this respect the prophecy of Ezekiel above cited was literally accomplished. Josephus Ant. l. v. c. 9. l. vii. c. 6, 7. l. xii. c. 12. Prideaux Conn. P. ii. book 4. Calmet.

AMMONITIS, in *Ancient Geography*, the country of the Ammonites. It was a district of Arabia Deserta, extending from south to north to the east of Palestine. The limits to the west and partly to the north were the river Jabbok, which ran, according to Josephus, between Rabboth-Ammon, or Philadelphia, the capital of Ammonitis, and Gerasa, and fell into the Jordan. They had also the river Arnon on the west, which divided them from the land of Gilead, or the tribe of Gad; on the south they had the Ishmaelites, on the east the deserts of Arabia, and on the north the hills of Gilead and Bashan. The territories of the Ammonites seem, according to the sacred historians, to have been anciently confined by the river Arnon and Jabbok; but their frequent conquests on their neighbours occasioned their boundaries to be in a state of constant fluctuation. Reland. lib. i. p. 104—113.

AMMONIUS, in *Biography* and *History*, was general of Alexander Balas's troops, and accused by Ptolemy Philometer of a design to poison him. In his attempt to escape from Antioch, in the disguise of a female dress, he was apprehended and put to death, A. M. 3859, ante Christ. 145.

Ammonius, a Peripatetic, was a native of Eygpt, and flourished about 140 years before Christ. He was the preceptor of Plutarch, and is frequently mentioned by him, without either commendation or reproach. He attempted to extend the authority of Aristotle beyond the limits of his own sect, by blending the Platonic and Stoic doctrine with the Peripatetic. He taught and died at Athens. Suidas. Fabricius. Brucker's Phil. by Enfield, vol. ii. p. 104.

Ammonius, *Saccas*, so called, as it is supposed, from his early occupation as a porter in the harbour of Alexandria, was an eminent Alexandrian philosopher, and flourished about the beginning of the third century. He was born of Christian parents, and was betimes instructed in the catechetical school established at Alexandria. Under the Christian preceptors, Athenagoras, Pantænus, and Clemens Alexandrinus, by whom this school was conducted, and who united Gentile philosophy with the Christian doctrine, he acquired a strong propensity towards philosophical studies, and became exceedingly desirous of reconciling the different opinions which at that time subsisted among philosophers. To him we must refer the complete constitution of the sect of the Eclectics, which had been first projected by Potamo, a Platonist. Porphyry asserts, that Ammonius passed over to the legal establishment, that is, apostatised to the Pagan religion. Eusebius and Jerom, on the contrary, affirm, that Ammonius continued in the Christian faith to the end of his life. But it is probable, that these Christian fathers refer to another Ammonius, who, in the 13th century, wrote a Harmony of the Gospels, or to some other person of this name; for they refer to the sacred books of Ammonius; whereas, Ammonius Saccas, as his pupil Longinus attests, wrote nothing. Porphyry's testimony is more worthy of reliance than that of Eusebius, because he was nearer Ammonius Saccas than the Christian father, and he must have derived his information from his master Plotinus, who spent 11 years with Ammonius. Besides, it is not easy to account for the particulars related of this philosopher, without supposing that he renounced the Christian faith. It seems improbable that a Christian would have accepted the chair in a Pagan school, or would have been followed by disciples who waged perpetual war against Christianity. However, it sufficiently appears, that he was well acquainted with the Christian doctrine, and endeavoured to incorporate it into his system. According to Hierocles, Ammonius was induced to execute the plan of an Eclectic school, by a desire of terminating the contentions which had long distracted the philosophical world; and he bestows great praise on the institution of philosophy, which he established for this purpose; or with a view of evincing the harmony that subsisted between the doctrines of Plato and Aristotle in all the great and essential points, and introducing a system free from dispute.

Ammonius had many eminent followers, both Pagan and Christian. He taught his select disciples certain sublime doctrines and mystical practices, and was called Θεοδίδακτος, the heaven-taught philosopher. These mysteries were communicated to them under a solemn injunction of secrecy. Porphyry relates, that Plotinus, with the rest of the disciples of Ammonius, promised not to divulge certain dogmas which they learned in his school, but to lodge them safely in their pure minds. This circumstance accounts for the fact mentioned by Longinus, that he had left nothing in writing. Ammonius probably died about the year 243. Amongst those disciples who were admitted to the knowledge of his mysteries were Herennius, Origines, Longinus, and Plotinus. The two former violated their promise by divulging the secrets of the school of Ammonius; in consequence of which Plotinus thought himself no longer bound by his promise, and became a public preceptor in Philosophy upon Eclectic principles. Porphyr. Vit. Plotini. Suidas. Fabric. Bib. Græc. tom. iv. c. 26. p. 154, &c. Lardner's Works, vol. ii. p. 414. Brucker by Enfield, vol. ii. p. 62, &c.

Ammonius, a Christian writer of Alexandria, lived about the year 220, according to Cave, and though his time is uncertain, has been confounded by him and many other learned men with Ammonius Saccas. Eusebius mentions a person of this name, who was a presbyter of Alexandria, and suffered martyrdom in the Diocletian persecution; and we might be apt to think this to have been the writer, if Eusebius had not been of a different mind. St. Jerom speaks of Ammonius as an eloquent and very learned man, who, among many excellent monuments of his genius, composed an elegant work of the consent of Moses and Jesus, and invented the evangelical canons, which Eusebius of Cæsarea afterwards followed. The former is quite lost; of the latter we are informed by Eusebius, that Ammonius of Alexandria has left us a gospel composed out of the four with great labour, subjoining to Matthew's gospel the consonant passages of the other evangelists; and that he had composed, in another method, ten canons, which are there subjoined. The evangelic canons, though they are reckoned among the works of Ammonius, may have been probably Eusebius's invention, whilst the harmony of Ammonius might have suggested the design. Whether this harmony be still extant is a subject

a fubject in diſpute. Cave and Mill agree in ſuppoſing, that it is the larger of the two which we now have in Latin. Mr. Jo. James Wetſtein will not allow this work to have been compoſed by Ammonius, but thinks it the production of ſome writer ſince Euſebius. Dr. Lardner ſuppoſes this work to have been interpolated ſince it was firſt compoſed, and even the form of it to have been altered.

Ammonius, the Grammarian, lived in the fourth century, and, according to Socrates, the eccleſiaſtical hiſtorian, was a pupil of the grammarian Helladius of Egypt. He fled from Alexandria in 389, when the heathen temples were deſtroyed by order of the emperor Theodoſius. Photius ſpeaks of him as a great admirer of the Greek poets, and an induſtrious critic in the Greek language; and to him we owe a treatiſe on Greek ſynonyms, entitled "περι ομοιων και διαφορων λεξεων," "On words of ſimilar and different ſignifications," in the form of a dictionary. It was firſt publiſhed in Venice in 1497, and afterwards at the preſs of Aldus, as an appendix to a Greek and Latin lexicon, publiſhed in folio, at Venice in 1524, at Paris in 1521, at Baſil in 1532, and annexed to Stephens's Theſaurus in 1572, and to Scapula's Lexicon. Fabricius Bib. Græc. lib. iv. c. 26. tom. iv. p. 173.

Ammonius, a Peripatetic philoſopher, was the ſon of Hermeas, flouriſhed at the beginning of the ſixth century, and taught at Alexandria under the reign of Anaſtaſius. He was the diſciple of Proclus, and the preceptor of Simplicius, Aſclepius the Trallian, John Philoponus, and Damaſcius, by the latter of whom he is repreſented as ſuperior to the other philoſophers of his age, and particularly excelling in mathematical learning. His commentaries upon Ariſtotle and Porphyry are ſtill extant. His commentary upon Ariſtotle's book, "De Interpretatione," together with a Commentary on the Categories, was printed by Aldus in folio, at Venice, in 1503. An extract from this work on Providence and the fore-knowledge of God, and free will of man, was publiſhed by Grotius, at Paris, in 1648, and at Amſterdam, in the third volume of his theological works, in 1679. His Commentary "In Iſagogen Porphyrii de quinque Prædicabilibus," was printed by Aldus, at Venice, in 1500, and has paſſed through ſeveral editions. Fabric. Bib. Græc. vol. iv. lib. iv. cap. 26. p. 161.

Ammonius, Alexandrinus, an ancient ſurgeon of Alexandria, called alſo Lithotomus, from having invented an inſtrument, a kind of file or ſaw, for breaking or dividing ſtones generated in the bladder, and which are too large to paſs through the natural paſſages in their entire ſtate. With what ſucceſs this art, (which is obſcurely hinted at by Celſus) was practiſed, we are not acquainted. It has long ſince been loſt, and the title Lithotomiſt, given to perſons cutting into the bladder, and extracting the ſtones through the wound. But thoſe, Le Clerc obſerves, ſhould rather be called Cyſtotomiſts. Haller, Bib. Chirurg.

Ammonius, Andrew, a native of Lucca, who ſettled in England in the beginning of the 16th century, and lived for ſome time in the houſe of Sir Thomas More, and afterwards in St. Thomas's college, not being in circumſtances that allowed his having a houſe of his own. At length he was appointed ſecretary to Henry VIII. and honoured by Pope Leo X. with a public character at the court of this prince; but his views of higher and more lucrative advancement were diſappointed in middle age by his death, occaſioned by the ſweating ſickneſs in 1517. He was diſtinguiſhed by the intimate friendſhip and frequent correſpondence that ſubſiſted between him and Eraſmus. Eraſmus, in the humorous advice which he gives him as to the moſt effectual method of advancing his fortune, deſigned to ſatirize the uſual methods that are adopted for this purpoſe. "In the firſt place," ſays he, "throw off all ſenſe of ſhame; thruſt yourſelf into every one's buſineſs, and elbow out whomſoever you can; neither love nor hate any one; meaſure every thing by your own advantage; let this be the ſcope and drift of all your actions. Give nothing but what is to be returned with uſury, and be complaiſant to every body. Have always two ſtrings to your bow. Feign that you are ſolicited by many from abroad, and get every thing ready for your departure. Shew letters inviting you elſewhere, with great promiſes." Eraſm. Epiſt. xiii. lib. 8. p. 414. Eraſmus (Epiſt. v. lib. 23.) thus laments his death. "How many of my companions have I loſt! in the firſt place, Andrew Ammonius of Lucca: Good God! what a ſprightly genius! of what a faithful memory! how noble was his ſoul! how free from envy and every meanneſs! when his own qualifications, and the applauſe of princes had opened him a way to the greateſt affairs, he was ſuddenly ſnatched off before he was forty years of age, the loſs of whom I cannot but lament, as often as I reflect how delighted I was with his acquaintance!" What he writes to Eraſmus in one of his letters, *viz.* that the burning of ſo many heretics had raiſed the price of wood, muſt be regarded as an hyperbole. Ammonius wrote ſome Latin poetical pieces. Gen. Dict.

AMMOSCHISTA, in *Natural Hiſtory*, a genus of ſtones of a laminated ſtructure, and ſplitting only horizontally, or into flat plates.

The *ammoſchiſta* are coarſe, harſh, and rough ſtones, of a very looſe texture, and appearing ſomething porous. They are conſiderably heavy, and compoſed of a large, coarſe, and obtuſely angular grit, ſurrounded, and in part held together, by a looſe earthy ſpar. They are very ſoft, and friable in the maſs, but much more ſo when reduced to ſmall pieces. They make a violent effervescence with aqua fortis, and will not eaſily ſtrike fire with ſteel.

The ſpecies of *ammoſchiſta* are ſix.

AMMUNITION, in general, ſignifies all ſorts of warlike ſtores and proviſions, more eſpecially powder and ball.

The word is *amonitio*, which, according to Du-Cange, was uſed in the corrupt ſtate of that language for *ſubſiſtence*.

Ammunition for ſmall arms, in the Britiſh ſervice, is generally packed in half barrels or kegs, each containing 1000 muſket or 1500 carbine cartridges. An ammunition waggon will carry 20 of theſe kegs or barrels, and an ammunition cart 12 of them. The cartouch boxes of the infantry are made of ſo many different ſhapes and ſizes, that it is impoſſible to ſay exactly what ammunition they will contain; but moſt of them can carry 60 rounds. See Cartridge. The French pack all their ammunition in waggons without either boxes or barrels, by means of partitions of wood. Their 12-pr. waggons will contain 14000 muſket cartridges, and their 4-pr. waggons only 12,000 each.

Ammunition, or gun-powder, may be prohibited to be exported at the king's pleaſure, by 12 Car. II. cap. 4. ſect. 13.

By 1 Jac. II. cap. 8. ſect. 2. *ammunition*, arms, utenſils of war, or gun-powder, imported without licence from his Majeſty, are to be forfeited with treble the value. Such licence obtained, except for the furniſhing of his Majeſty's public ſtores, is to be void, and the offender to incur a premunire, and be diſabled to hold any office from the crown.

Whoever is curious to know the quantity of ammunition neceſſary for the ſiege of a place, may conſult the chevalier de St. Julian's treatiſe, De la Forge de Vulcain; and the quantity requiſite for the defence of a place, will be found in Suireg. de St. Remy's Memoires d'Artillerie. See Artillery.

Ammunition-*bread*, *ſhoes*, &c. what is provided for, and diſtributed to, the ſoldiers of an army or garriſon.

Such an officer has ſo many rations of ammunition-bread, &c.

Ammunition *Cart*, a two-wheel carriage with ſhafts, the ſides of which, as well as the fore and hind parts, are incloſed with boards.

Ammunition *Waggon*, is generally a four wheel-carriage with ſhafts; the ſides are railed in with ſtaves and raves, and lined with wicker work, ſo as to carry bread, and all ſorts of tools.

AMNA, in *Phyſical Writers*, denotes the water found in limy ſoils, and which is conſequently tinged with a whitiſh colour, as in many places of England.

In this ſenſe Paracelſus ſpeaks of the medical virtues and uſes of *amna*.

AMNESIA, in *Medicine*, loſs of memory. It is ſometimes a conſequence of febrile diſeaſes, generally receding as the patient gains his ſtrength.

When it is the conſequence of old age it can hardly be expected to be cured.

AMNESTY, or Amnisty, from α, *not*, and $\mu\nu\alpha\sigma\mu\alpha\iota$, *I remember*; a kind of general pardon, which a prince grants to his ſubjects, by a treaty or edict, wherein he declares, that he forgets and annuls all that is paſt, and promiſes not to make any farther enquiry into the ſame.

The word is $\alpha\mu\nu\eta\sigma\tau\iota\alpha$, *amneſtia*; which was the name of an ancient law of this kind, paſſed by Thraſybulus upon the expulſion of the thirty tyrants out of Athens. Andocides, an Athenian orator, whoſe life is writen by Plutarch, and of whom we have an edition of the year 1575, gives us, in his Oration upon Myſteries, a *formula* of the amneſty, and the oaths taken thereupon.

Amneſties are uſually practiſed upon reconciliations of the ſovereign with his people, after rebellions, general defections, &c.

Amneſty is either general and unlimited, or particular and reſtrained, though moſt commonly univerſal, without condition or exceptions; ſuch as that which paſſed in Germany, at the peace of Oſnaburgh, in the year 1648.

Amneſty, in a more limited ſenſe, denotes a pardon granted by a prince to his rebellious ſubjects, uſually with ſome exceptions; ſuch was that granted by king Charles II. at his reſtoration.

Amneſty alſo, in a military ſenſe, ſignifies the pardon granted by a ſovereign to deſerters, on condition of their rejoining their regiments.

AMNIAS, in *Ancient Geography*, a river of Paphlagonia, that roſe in the country called Domanitis, north weſt of Germanicopolis, and diſcharged itſelf into the gulf of Amiſus.

AMNICA, in *Conchology*, a ſpecies of Tellina. Shell ſomewhat heart-ſhaped and tranſverſely grooved with an obtuſe protuberance. Linnæus. This is an European ſhell, and inhabits pools and ditches; it is leſs globoſe than tellina cornea, but about the ſame ſize. Inſide blue, ſhining; out ſide whitiſh or yellow brown, with one or two blackiſh ribs. Young ones entirely white and pellucid.

AMNIMODAR, in *Aſtrology*, the planet that rectifies a geniture, or rather a method of rectifying a nativity, and finding the preciſe degree in the horoſcope at the time of an infant's birth, from the condition of the planet, which had the rule in the laſt preceding conjunction, or oppoſition of the luminaries. Vital. Lex. Math.

AMNIOS, or Amnion, in *Anatomy*, the innermoſt membrane of the ovum, which contains the fœtus and the waters.—The word ſeems to be derived from $\alpha\mu\nu\sigma\varsigma$, *a lamb*; q. d. *pellis agnina, lambs ſkin*. See Generation.]

Amnios, *liquor of the*, chemical properties of. Although the analyſis of vegetable and animal ſubſtances is as yet leſs ſatisfactory than that of inorganiſed matter, a multitude of improvements have, nevertheleſs, been introduced of late years into this branch of the ſcience for which we are principally indebted to the French philoſopheis. Vauquelin, Berthollet, and Foureroy, by aboliſhing the old method of analyſis by fire, according to which all animal ſubſtances afforded the ſame reſults, and introducing in its ſtead the uſe of the ſimpler menſtrua, have been enabled to diſcover many peculiar products of animalization. According to the ancient mode, in which Neumann was ſo long and ſo fruitleſsly employed, of deſtructive diſtillation, any animal matter was made to yield firſt an inſipid, faint-ſmelling phlegm, then an impure ammoniacal oil, after which a portion of concrete ſalt was ſublimed, and there remained in the retort a ſpungy coal of difficult incineration, which, by burning in an open fire, was reduced into a white aſh or caput mortuum. If this had continued to be the way of analyſis, we ſhould have contented ourſelves with giving an inſtance of one as a ſpecimen of the whole; but ſince a better method has been found out, it will be right to particularize, in their proper places, moſt of the modern analyſes and experiments on animal ſubſtances, as, if not quite ſatisfactory, they are at leaſt well deſerving of mention, in a work like the preſent, and have already been applied to explain the *rationale*, and improve the practice of ſome of the moſt difficult and important among the arts and manufactures.

The liquor of the amnios is a fluid in which all the young of the mammalia are incloſed previouſly to their birth; and chemiſtry is indebted to Vauquelin and Buniva for an examination of this ſecretion, as afforded by the human female and the cow.

The firſt of theſe liquors preſented the following properties.

It has a mild faint odour, like that of all the white or colourleſs animal fluids. To the taſte it is ſlightly ſaline. Its colour is a dilute white, owing to its containing ſome particles of a caſeous matter; by filtration, however, it becomes perfectly tranſparent. Its ſpecific gravity is $= 1.005$. By agitation it froths conſiderably. On being heated it acquires a ſemiopacity like that of milk with a large proportion of water, at the ſame time a ſmell is developed like that of boiled white of egg. It decidedly changes the colour of tincture of violets to green, and yet ſlighly reddens that of tourneſol. Potaſh occaſions a flocculent precipitate, reſoluble by a weak acid. The acids appear to have no other effect than that of clarifying it. Alcohol throws down a light precipitate, which, when dry, becomes brittle and tranſparent like glue. With infuſion of gall-nut it yields a very copious brown precipitate. Nitrat of ſilver cauſes a white precipitate inſoluble in nitric acid.

Hence this fluid appears to contain albuminous matter, ſimilar to that of the blood; a muriatic ſalt, probably muriated ſoda; and a ſmall quantity of free or carbonated alkali.

When evaporated to dryneſs it leaves a reſidue no greater than 0,012 of the maſs. This, by lixiviation and evaporation, affords cryſtals of common ſalt and carbonated ſoda, and the remaining animal matter, on being burnt, exhales a fetid ammoniacal odour like horn, and leaves a few white aſhes, compoſed of carbonated ſoda, and phoſphat, and carbonat of lime.

The amniotic liquor of the cow remarkably differs from the preceding.

It is of a browniſh red colour; an acid bitteriſh taſte; an odour approaching to that of vegetable extract; its ſpecific gravity is $= 1.028$, and it has a viſcous conſiſtence, like a ſolution of gum.

It reddens very decidedly the tincture of tournesol. It gives an abundant precipitate with muriat of barytes; and deposits a large quantity of reddish matter, by the action of alcohol.

When submitted to evaporation a thick scum rises to the surface, and after being reduced to a quarter of its bulk, a number of long acid needleform crystals are produced as the liquor cools; these being all deposited, and the matter further brought by evaporation to the consistence of honey, a fresh production of crystals takes place; these, however, differ in form from the preceding, and are sulphat of soda.

The extractive matter being separated from the acid crystals, and from the water which held them both in solution, by means of alcohol, assumes the appearance of a compact adhesive cement; in colour reddish brown, and of a peculiar indescribable flavour. It is readily soluble in water, to which it gives a viscosity, and the property of frothing by agitation; in this respect it resembles animal mucilage, but differs from this substance in not forming a jelly, nor combining with Tannin. When exposed to the fire it swells greatly, and gives out at first an odour of burnt mucilage, then of an empyreumatic ammoniacal oil, and finishes with the disengagement of prussic acid. The coaly matter which it yields is bulky, easily incinerated, and affords a light white ash, composed of phosphated magnesia, with a slight trace of phosphat of lime.

The concrete needleshaped crystals are brilliant, transparent, slightly acid, reddening the tincture of tournesol. They are scarcely soluble in cold water, but readily so in boiling water, from which by cooling they are deposited in long slender needles. This acid combines without difficulty with the caustic alkalies, forming a very soluble salt, but will not decompose the carbonated alkalies, except assisted by heat. It is separated from its alkaline combinations by the mineral acids, in form of a white crystalline powder. It produces no change in the aqueous solution of the alkaline earths, nor does it alter the nitrats of silver, lead, or mercury. By heat it is destroyed, exhaling an ammoniacal odour, mixed with that of prussic acid, and leaves a spungy coal. It is different in its properties from all the known acids, and may be received into the modern nomenclature by the name of the amniotic acid. Annales de Chimie, vol. xxxiii. p. 269.

AMNISUS, in *Ancient Geography*, a small river in the island of Crete, mentioned by Callimachus, Apollonius, and Suidas.

Amnisus, a port in Crete, probably at the mouth of the above-mentioned river, in which the Cretans pretended, according to Pausanias, that Lucina was born, and where this goddess had a temple and was worshipped. Strabo says, that Amnisus was the port of the town of Cnossus.

AMNITÆ, an ancient people, who seem to have been the same with the Samnitæ of Strabo, whom he places in a small island to the west of Gaul, and near the mouth of the river Loire. According to him, the women were a sort of Amazons, who allowed intercourse with men only once a year, and who offered sacrifices to Bacchus.

AMNON, a river of Arabia Felix, according to Ptolemy.

AMODOCI, one of the mountains which encompassed the European Sarmatia, according to Ptolemy.

AMOENUS, in *Entomology*, a species of curculio, described by Fabricius as a native of New Holland; it is black with two snowy-white spots on the thorax, and five on the wing-cases.

AMOEBÆUM, in the *Ancient Poetry*, denotes a kind of poem, or composition, wherein two parties speak alternately in the same number of verses, but so as that he who answers, either goes beyond or contradicts the other.

The word is ἀμοιβαῖον, signifying *mutual* or *alternate*. Hence also we meet with *epistolæ amabææ*. Such, *e. g.* are those of Pliny and Trajan.

AMOGABARI, a kind of ancient Spanish soldiery, in great repute for their bravery.—These are otherwise denominated by some writers, *almugaveiri*.

AMOGLOSSUS, in *Ichthyology*, a name of a peculiar kind of flat fish, somewhat resembling the sole, and called in some parts of England, the *lantern*. It is of a very slender, pellucid, and white body, never exceeds three inches in length, and is very smooth to the touch, being covered only with a number of very thin scales, which fall off on touching it. Its flesh is very finely tasted, and requires very little dressing.

AMOK, a term signifying slaughter, and used as the exclamation of the Bokanese slaves in the island of Batavia. These slaves, who are brought from the island of Celebes, when irritated by ill usage, are exceedingly dangerous; as in this case they intoxicate themselves with opium, sally into the street, and murder every person whom they happen to meet. This is called *running amok*, this word being the cry of these desperate wretches. Some have supposed, that from this practice Steele borrowed the idea of the mohock club, mentioned in the Spectator.

AMOL, or Amu, in *Geography*, a town of Asia, in the country of the Usbecks, in Independent Tartary, seated on the Gihon, 115 miles west of Samarcand. N. lat. 39° 30′. E. long. 64° 35′.

AMOMI, is used, by the Dutch traders, for what we otherwise call Jamaica pepper.

AMOMUM, in *Botany*, a genus of the *monandria monogynia* class and order, of the natural order of *scitamineæ* and *cannæ* of Jussieu, the characters of which are that the *calyx* is a perianthium one-leafed, cylindraceous and unequally trifid; the *corolla* is monopetalous and funnel-shaped, tube cylindraceous, border three-parted, parts oblong and spreading; the nectary two-leaved or two-lipped, lower lip inserted under the upper segment of the corolla, spreading, almost erect, entire or three-lobed; the *stamina* have no filament, except the upper lip of the nectary, smaller than the lower, and opposite to it, acuminate or three-lobe the tip; along the middle or at the end of which grows longitudinally a large oblong anther, geminate, or divided by a longitudinal furrow into two which are one-valved; the *pistillum* has an inferior, oblong germ, style filiform, drawn through the future of the anther, stigma turbinate, obtuse and ciliate; the *pericarpium* a fleshy capsule, ovate, three-cornered three-celled, and three-valved; the *seeds* are several, covered with a sort of berried aril. Obs. The inflorescence is in a spike, on a distinct scape. Willdenow enumerates 11, Martyn 12, and Gmelin, in his edition of Linnæus, 20 species. 1. A. *zinziber* or *zingiber*, zingiber majus of Rumph. zingiber of Bauhin, inschi of Rheed, ächter ingwer of Willd. narrow-leaved ginger, with a middle-sized (naked, G. and W.) scape, ovate spike, (ovate scales, W.) and leaves linear-lanceolate, (ciliate at the tip, W.) The root is creeping by palmate, compressed, fleshy tubers, which become fibrous with age; the culm annual, two feet high, single, solid, and upright; leaves half a foot long, smooth, alternate, on short, embracing petioles; the scape separate, eight inches high, thick, round, scaly, usually without leaves; the spike composed of large ovate, subacuminate, coloured scales, half closing the flowers; calyx a small double spathe; corolla yellowish green with a long slender tube, the segments of the body conical, and nearly equal; nectary reddish brown, ovate, petal-shaped, winged on each side at the base, and somewhat shorter than the corolla; filament, or upper lip of the nec-

tary filiform, placed on the corolla and ſhorter; anther ovate, cloven longitudinally, embracing the filiform ſtyle; ſtigma cylindraceous, ciliate at the tip; capſule ſmooth, containing many oblong ſeeds. This ſpecies, cultivated here by Miller, in 1731, and flowering in September, is a native of the Eaſt Indies, and other countries of Aſia, and is much cultivated there and in the Weſt Indies. The dried roots furniſh a conſiderable article of commerce from our Weſt India iſlands; they are of great uſe in the kitchen and in medicine, and preſerved green as a ſweet-meat, are preferable to every other ſort. For the dietetical and medical uſe of ginger, ſee GINGER. 2. A. *zerumbet*, zingiber latifolium ſylveſtre of Herm. lampujum of Rumph. katou-inſchi-kua of Rheed, black ingwer of W. broad leaved G. or zerumbet, with a naked ſcape, oblong, obtuſe ſpike, ſubrotund ſcales, and leaves ovate and ſmooth at the margin. According to Murray, the A. zingiber is more aptly diſtinguiſhed from the A. zerumbet, by its narrow leaves, called enſiform by Jacquin, than by the ovated ſpike, and the latter is more juſtly diſtinguiſhed from the former by its broad leaves than by its oblong obtuſe ſpike, for the A. zerumbet has equally an ovate ſpike. This ſpecies has the tubers of the root much larger, round, twiſted, thick, branched, horizontal, pale-coloured, with little ſmell and a bitteriſh taſte, but not an ardent flavour like true ginger; culm four feet high, perennial, ſtraight, round and ſolid like the preceding ſpecies; leaves lanceolate, large, ſmooth, petioled, embracing and aſcending obliquely; the ſcape a foot high, diſtinct, thick, ſcaly and red; ſpike large, with rounded, cloſe, one-flowered, red ſcales; calyx a ſingle acute ſpathe; corolla pale, with a long tube; nectary of the ſame colour, petal-ſhaped, very blunt, bifid, faſtened to the throat of the corolla; filament flat, ſubulate, bent in, adhering to the hinder ſegment of the corolla, and nearly equal to it; another oblong, faſtened to the middle of the filament; cultivated at Hampton Court, in 1690, and flowering with us from September to November, when the ſtalks periſh like thoſe of the true ginger; a native of the Eaſt Indies, Cochinchina, &c. and alſo in Otaheite, and the other Society iſles. This is uſed externally in the Eaſt in cataplaſms and fomentations, but not internally, as ſpice or medicine; though Garcias ſays, that it makes a better preſerve with ſugar than the other. 3. A. *zedoaria*, with a naked ſcape, looſe cylindric truncated ſpike, and ovated acuminated leaves. This is the A. latihumile, with larger ovated acuminated leaves, and ſcape terminated by an oblong ſpike of La Marck, zedoaria longa of Bauhin, zedoaria officinarum of Petiv. zedoaria ſeu Indorum tamog of Cam. luz. kua of Rheed, zerumbed tommon of Rumph. and zittwer ingwer of W. This ſpecies grows in Malabar, and other parts of the Eaſt Indies. The flowers have an agreeable ſmell; the root has an acrid pungent, aromatic, and ſomewhat bitteriſh taſte; its ſmell is ſtrong, but pleaſant; dried and reduced to powder it loſes its acrid taſte, and it is formed into bread by the Indians in a time of ſcarcity. See ZEDOARY. 4. A. *ſylveſtre*, paco ceroca of Piſo, Braz. zingiber ſylveſtre majus, &c. of Sloane, wald ingwer of W. great wild ginger, with a naked ſcape, ſpike elongated, with oblong ventricoſe bractes, and leaves broad-lanceolate. This does not differ from the ſecond ſpecies, except that the ſtalk riſes eight or nine feet high, that it has much larger leaves, and that, inſtead of the flowers and fruits being on the end of the ſame ſtalk, they are on another about three feet high, immediately ſpringing from the root. It is a native of the wood of Jamaica; the root is warm and ſtimulates gently, and may be properly adminiſtered as a ſtomachic and alexipharmic. 5. A. *mioga*, dsjooka vulgo mioga of Kæmpfer, Japaniſcher ingwer of W. Japaneſe ginger, with a very ſhort ſcape, ovate capſule, and enſiform acute leaves. This approaches very near to the A. cardamomum of Java, in having the ſpike of flowers diſtinct from the leaves, and ovate capſules, but differs from it in having the ſcape more faſcicled and ſhorter, not oblong and imbricate, the leaves enſiform, and merely acute, whereas in the other they are obovate-elliptic, with a long briſtle at the tip; they are alſo much ſhorter, only about a ſpan in length, but in the other they are often four feet long. In the leaves it much reſembles A. zinziber and A. zerumbet; but the ſpike of flowers is radical, with ſcarcely any ſcape. It is a native of Japan, where it flowers in September. 6. A. *anguſtifolium* of Sonnerat, A. Madagaſcarienſe majus, &c. of La Marck, ſchmalblattriger ingwer of W. narrow-leaved ginger, with a naked, very ſhort ſcape, capitated ſpike, and linear-lanceolate leaves. The ſtem is eight or ten feet high, the pedal leaves are very narrow and linear-lanceolate, the ſcape very ſhort, the ſpike globoſe, and few-flowered, and the capſules ovate. It is a native of the marſhes of the iſland of Madagaſcar. The ſeeds have a pleaſant aromatic taſte; and their ſmell is agreeable; and hence, ſays Geoffroy, ſome have called them grains of paradiſe; a denomination that more properly belongs to another ſpecies. 7. A. *cardamomum*, cardamom, with a very ſimple and ſhort ſcape, and alternate, looſe bractes, or with the ſpike radical, ſeſſile and obovate, and leaves obovate-elliptic and cuſpidated, W. This ſpecies has thick fleſhy roots, reſembling thoſe of the large flag iris, which in the Spring ſend forth many green reed-like ſtalks, that riſe to the height of ſeven or eight feet, garniſhed with very long narrow leaves, alternate and embracing; the ſtalks decay in Autumn, and new ones ariſe from the roots in Spring; the roots thrive and increaſe, but it has not yet produced flowers in England. In Malabar cardamom is an object of conſiderable commerce. The Indians alſo themſelves make great uſe of it, mixing the ſeeds with their bread, under a notion that it facilitates digeſtion. See CARDAMOM. 8. A. *villoſum* of Loureiro, globba criſpa rubra of Rumphius, rauher ingwer of W. with ſhort reclining ſcape, linear bractes and villoſe fruit, or with very ſhort, vaginated ſcape, roundiſh ſpike, and bractes lanceolate and longer than the flower. The ſmell of the whole plant is aromatic, mild, with a ſmall degree of ſharpneſs, the taſte of the fruit, when freſh, ſweetiſh and pleaſant. It is a native of the mountains of Cochinchina; the ſeeds are much valued by the Chineſe, and uſed medicinally in China. 9. A. *medium* of Loureiro, with ſpike cauline, branched; and fruit oblong, and ſtreaked, without a valve. In Gmelin's Linnæus, A. medium is characteriſed as having an oblong three-cornered pyramidal coriaceous capſule and three valves. This ſpecies is a native of China, in the province of Yunan, to the weſt of Canton. The ſeeds are uſed in agues, for culinary purpoſes, and for increaſing the ſtrength of odours in general. 10. A. *minus*, with a ſubgloboſe, three-furrowed, coriaceous, valveleſs capſule. Gmelin. 11. A. *globoſum* of Loureiro, with ſpike cauline, branched, and fruit globoſe, with an even ſurface; a native of the mountains of China and Cochinchina, and uſed in both countries medicinally, in diſorders of the bowels, &c. 12. A. *hirſutum* of Loureiro, tsjane-kua of Rheed, paco-caatinga of Marcgrave and Piſo, with ſpike cauline, ſimple, reclining, and fruit roundiſh and hirſute; or with ſtalks folioſe and ſpiked, under-ſide of the leaves ſlightly hirſute, and large flowers of a yelloviſh white colour; a native of Cochinchina, Malabar, and of Brazil, in woods. La Marck ſuggeſts that this ſpecies is the COSTUS *arabicus* of Linnæus. 13. A. *echinatum*, amomum 2. of Koenig, globba criſpa viridis of Rumphius, ſtachlicher ingwer of W. with ſpike radical, ſeſſile and ſubgloboſe, and capſules furrowed, echinated and globoſe;

globoſe; a native of the thick woods of India. 14. A. *repens* of Sonnerat, elettari 1, of Rheed, enſel of Herm. kriechender ingwer of W. with ramoſe decumbent ſcape, and lanceolate leaves, W. or procumbent ſcapes, racemoſe flowers in the baſe of the ſpathe, and leaves lanceolate and acuminate on both ſides; a native of the mountains of Malabar. 15. A. *granum paradiſi*, grains of paradiſe, elettari 2. of Rheed. paradies ingwer of W. with ſcape branching and very ſhort. This ſpecies is little known. It is a native of Guinea, and of the Iſlands of Ceylon and Madagaſcar, and was introduced into Kew Garden, in 1785, by Lee and Kennedy. See GRAINS *of paradiſe*. 16. A. *galanga*, MARANTA *galanga* of Linnæus, galanga of Rumphius, galangale, with cauline, erect ſpike, ſubtriflorous ſpathes, and capſule three-cornered-ovate, and ſmooth. The galangale has an horizontal, creeping root, compoſed of roundiſh, twiſted, knotty tubers; culm perennial, upright, ſmooth and ſix feet high, leaves ovate, lanceolate, nerveleſs, ſmooth, upright, large, on embracing petioles; ſpike oblong; perianthium inferior tubuloſe, and bluntly trifid; corolla ſuperior, yellowiſh white, ſegments oblong-ovate, concave, and nearly equal; nectary petal-ſhaped, roundiſh, emarginate, nearly equal to the ſegments of the corolla; filament linear, thick, grooved longitudinally, longer than the corolla; anther oblong, bifid, embracing a ſtyle longer than itſelf; ſtigma thickiſh, emarginate; ſeeds roundiſh; the ſmell of the whole plant is aromatic, and it has a biting taſte. Linnæus has made the galangale a ſpecies of maranta, but Profeſſor Martyn obſerves, that the corolla is not ringent, nor five-cleft, nor has two ſegments ſpreading, but all the ſegments, which are three in number, are nearly the ſame in ſize and figure. It is properly a ſpecies of amomum, as Bergius has made it. It is a native of China and Cochinchina, and is cultivated in both countries. The root and ſeeds are uſed there medicinally. See GALANGALE. 17. A. *arboreum* of Loureiro, with ſtem arboreous and calycine fruit. This is a tree about 10 feet in height, with many twiſted, ſpreading branches. It has ſcarcely any taſte or ſmell, and its uſe is unknown; the wood is very light, and not even fit for the fire; a native of the iſland of Sumatra, in a wood, on the eaſtern coaſt. 18. A. *curcuma* of Jacquin, with a ſcape, having looſe ſpathes from the centre of the leaves. The limb of the corolla is ſexfid. Gmelin. See CURCUMA. 19. A *globba* of Koenig, and Rumphius, with ſtalks ſolitary, very ſhort ſcapes, ovated ſpathes, and leaves alternate, petiolated, bifary, oblong and acuminated. Gmelin. 20. A. *littorale* of Koenig, with very ſhort ſquamoſe ſcapes, ovated ſpathes, very numerous ſtalks, and leaves nodding at the apices. Gmelin. 21. A. *Koenigii*, with ſhort ſcapes, cordated ſpathes, and leaves elongated at the apex and twiſted. Gmelin. 22. A. *uliginoſum* of Koenig, with ſcapes erect-curvated, ovated ſpathes, ſingle flowers, with double bractes, and ſeſſile leaves. Gmelin. 23. A. *ſpurium* of Koenig, with ſolitary ſcaly ſcapes, ovated ſpikes, imbricated bractes, and leaves ſubpetiolated and oblong. Gmelin. 24. A. *ſcyphiferum* of Koenig, with ſpikes ſubſeſſile, erect and oblong, imbricated bractes and ſeſſile leaves. Gmelin. 25. A. *leonurus* of Koenig, with ſhort ſcapes, erect and oblong ſpikes, adpreſſed bractes, and petiolated leaves. 26. A. *nigrum* of Gaertner, with a berry ovate-globoſe and ſingle-celled, the baſe of the corolla funnel-ſhaped and coronated. Gmelin. Of the ſeveral ſpecies above-enumerated, the 1ſt, 2d, 4th, 7th, 8th, 9th, 11th, 12th, 15th, 16th, 17th, are mentioned and deſcribed by Profeſſor Martyn.

As to their propagation and culture, he obſerves, that they are tender, and require a warm ſtove to preſerve them in this country. They are eaſily propagated by parting their roots, which ſhould be done in the Spring, before they put out new ſhoots. In parting the roots, they muſt not be divided into ſmall pieces, eſpecially if they are deſigned to have flowers, nor ſhould they be planted in very large pots. They thrive beſt in a light rich earth, ſuch as that of the kitchen garden; and with this the pots ſhould be filled within two inches of the top, and the roots ſhould be placed in the middle of the pots, with their crowns upwards, and the pots ſhould then be filled with the ſame earth; they ſhould then be plunged into a hot-bed of tanner's bark, and ſparingly watered, till their ſtalks appear above ground, when they will admit of more moiſture, eſpecially in the Summer months: but in Autumn the waterings muſt not be frequent nor plentiful, and during Winter very ſparing. The pots muſt conſtantly remain plunged in the tan-bed; for if they are taken out and placed on ſhelves in the ſtove, their fibres often ſhrink, and thus their roots decay. By this management theſe plants have greatly multiplied, and the common ginger has produced roots, weighing five or ſix ounces; but the others have been near a pound weight.

In the Weſt Indies the ginger thrives beſt in a rich cool ſoil; in a more clayey ſoil the root ſhrinks leſs in ſcalding. The land laid out for the culture of it is firſt well cleared and hoed, and then ſlightly trenched, and planted in March or April; it flowers about September; and when the ſtalks are wholly withered, the roots are fit to be taken up, which is generally done in January and February. Browne cited by Martyn.

AMOMUM. See ALPINIA, COSTUS, MYRTUS, and SISON.

AMOMUM *Curcuma*. See CURCUMA.

AMOMUM *Plinii*. See SOLANUM.

AMOMUM, in the *Materia Medica*, a ſmall and rich aromatic fruit, growing in bunches like grapes, valued highly for its medicinal virtues. It is commonly claſſed among the *ſeeds*.

The commentators on Pliny and Dioſcorides, have never been able to agree upon the ancient amomum; the generality of them ſeek it in fruits different from our's. Some will have the roſe of Jericho paſs for it.—F. Camelli is poſitive he has diſcovered the real amomum of Dioſcorides, and that it is the *tugus* or *birao*, or *caropi*, growing in the Philippine iſlands; the grains or berries whereof are worn by the natives about their necks; both on account of their agreeable odour, and of their ſuppoſed virtue in preſerving from infection, curing the ſting of the ſcolopendra, &c. Phil. Tranſ. N° 248.

Scaliger is confident, that the amomum of the ancients was not a fruit, but the wood itſelf, which bore ſome reſemblance to a bunch of grapes, and was particularly uſed in embalming of bodies, and hence, ſays he, the term MUMMY was given to the bodies of Egyptians, embalmed with it. On this account, likewiſe, all medicines and unguents uſed in the embalming and preſerving of dead bodies, were called *amomia*.

The ancient amomum was of divers kinds; but the Armenian was moſt eſteemed. It was a heater, drier, and aſtringent; uſed as a narcotic, to appeaſe pain, cure poiſonous bites, inflammation of the eyes, &c.

The true amomum of the ancients reſembles the muſcat grape, and grows like it, in cluſters; it is about the bigneſs of a large chich-pea, or middling grape, round, membranous, and divided into three cells, which contain ſeveral brown angular ſeeds; the fruit, on being opened, appears to contain three of them. Ten or 12 of theſe capſules ſtand together, without pedicles, upon a woody ſtalk, about an inch long; each ſingle capſule is ſurrounded with ſix leaves, ſet in form of a ſtar; and the part of the ſtalk, void of fruit, is clothed with leafy ſcales; of a very ſtrong aromatic taſte and ſmell; the taſte is warm and pungent, approaching to that of camphor, and the ſmell is quick, penetrating,

and

and fragrant, reſembling that of lavender, but more agreeable. In diſtillation they yield a large portion of a ſubtile eſſential oil; the huſks gave the ſame kind of flavours in a lower degree. Theſe ſeeds have long been a ſtranger to this country.

This fruit was brought from the Eaſt Indies; and makes part of the compoſition of Venice treacle: but the ſeeds of the amomum vulgare have been uſed inſtead of it; and cloves have been alſo employed as a ſuccedaneum to it.

The modern amomum, uſed in the ſhops, under the denomination of *amomum vulgare*, or *amomum officinarum*, appears to be the ſeed of the *ſiſon* or *ſium* of the ancients, anſwering to what in Engliſh we call baſtard-ſtone parſley.

It is eſteemed a powerful diuretic, and good in nephritic caſes. It is alſo commended as an aperient in general, and preſcribed in obſtructions of the liver and ſpleen, and in ſuppreſſions of the menſes. The people in ſome parts of England bruiſe the ſeeds, and give them in warm ale, in colics; but thoſe of caraway, or aniſe, are better. Lewis. See Sison.

AMONA, in *Geography*, a river on the coaſt of Guiana, weſt of Arwacas bay, is deep and navigable far into the country, and capable of containing a large fleet. It falls into the ocean about N. lat. 6°, and W. long. 55° 50′.

Amona, a river of Italy, which runs into the Adriatic, about three miles ſouth of the Po.

AMONOOSUCK, the Indian name of two rivers of America, in New Hampſhire; the one called Upper Amonooſuck, riſes near the north end of the White hills, runs northerly about 15 miles to a carrying place of about three miles to Amariſcoggin river, thence it purſues the direction of ſouthweſt and weſt nearly 18 miles, and diſcharges itſelf into the Connecticut at Northumberland, near the Upper Coos; the other, called Great or Lower Amonooſuck, riſes on the weſt ſide of the White Mountains, and falls into the Connecticut juſt above the town of Haverhill, in Lower Coos, by a mouth 100 yards wide. About two miles from its mouth it receives Wild Amonooſuck, 40 yards wide, from Franconia and Lincoln mountains. This laſt river is ſubject to very ſudden and impetuous floods.

AMONTONS, William, in *Biography*, an ingenious experimental philoſopher, was the ſon of a lawyer, who removed from Normandy to Paris, and born in 1663. In very early life he was ſeized with a deafneſs, which deprived him in a great degree of the pleaſures of ſocial intercourſe, and led him, for his relief and amuſement, to apply with peculiar attention to the ſtudy of geometry and mechanics. From theſe ſtudies he derived ſo much ſatisfaction, that he ceaſed to regret his defect of hearing as an evil, and declined, it is ſaid, ſeeking any remedy. He alſo acquired the arts of deſigning, land-ſurveying, and building; and extended his reſearches to the ſublime laws by which the univerſe is governed. He likewiſe directed particular attention to the nature and conſtruction of barometers, thermometers, and hygrometers; and in 1687 he preſented a new hygroſcope to the royal academy of ſciences, which was very much approved. In 1695 he publiſhed a book, in French, entitled, "Obſervations and Experiments concerning the Conſtruction of a new Hour-glaſs, and concerning Barometers, Thermometers, and Hygrometers." To the royal academy, of which he was choſen a member in 1699, he read his "New Theory of Friction," by which he has admirably elucidated an important part of mechanics. He alſo diſcovered a method of conveying intelligence to a great diſtance, in a ſhort interval of time, by means of ſignals, from one perſon to another, placed at the greateſt intervals from which they could be ſeen with teleſcopes; ſomewhat in the manner of our modern telegraphs. He had a happy talent in deviſing and executing experiments; and he communicated a great number of diſſertations on the various ſubjects of air, action of fire, barometers, thermometers, hygrometers, friction, machines, heat, cold, rarefaction, pumps, &c. to the royal academy, which are contained in the volumes of its memoirs, for 1696, 1699, 1702, 1703, 1704, and 1705. His character for integrity, modeſty and candour, was no leſs diſtinguiſhed than his philoſophical genius. His elogy, by M. Fontenelle, is printed in the volume of the Memoirs of the Academy for 1705. In October 1705, an inflammation of the bowels occaſioned his death at the age of only 42 years. Gen. Dict.

AMOOD, in *Geography*, a town of Hindooſtan, in the country of Guzerat, 51 miles north of Sœurat, and 58 ſouth of Ahmedabad.

AMOOR. See Amur.

AMOPHILA, in *Entomology*, a name propoſed by the Rev. Mr. Kirby for a new genus of hymenopterous inſects, in the Tranſactions of the Linnæan Society, vol. iv. The ſpecies of this genus are vulgaris, hirſuta, affinis, and argentea; the two firſt are deſcribed inſects, vulgaris being ſphex fabuloſa of Linn. and Donov. Brit. Inſ. and hirſuta, ſphex arenaria of Linn. and Fabr. The two others belong to the genus of ſpheges in the Linnæan arrangement by Gmelin alſo. See Sphex.

The eſſential character of Mr. Kirby's new genus Amophila is, beak conic, inflected, concealing a bifid, retractile, tubular tongue. Jaws forcipated, three teeth at the tip; antennæ filiform in either ſex, with about fourteen articulations; eyes oval; wings flat; ſting pungent, and concealed within the abdomen. The Linnæan character of the ſphex genus is not ſtrictly applicable to thoſe inſects Mr. Kirby has ſelected for his new genus, nor to many other exotic ſpecies; for the mouth of the Linnæan ſpheges has no tongue. Gmelin has corrected this error by dividing the genus into families, the firſt has no tongue, and the ſecond is furniſhed with one.

AMOR, in *Entomology*, a ſpecies of Hesperia in the Fabrician ſyſtem. Wings three-tailed, brown; beneath the diſk variegated with white, black and yellow, and a golden marginal ſtreak on the poſterior wings. Fabricius. This is truly a Papilio of the *plebeii rurales* family in the Linnæan arrangement. It is the papilio triopus of Cramer, and inhabits the Eaſt Indies.

AMORA, in *Geography*, a town of Aſia, in the Arabian Irac, ſituate on the Tigris, 120 miles ſouth-eaſt of Bagdad.

AMORÆANS, from אמר, *dixit*, in *Literary Hiſtory*, a ſect or order of *gemaric* doctors, or commentators on the Jeruſalem Talmud.

The word is otherwiſe written *amoræi*, and *amoraitæ*, *amoraim*. The amoræans are alſo called, by Scaliger, *ſophiſtæ*; by Alting, γνωμολογοι, or *ſpeakers of ſentences*; by Bartoloccius, *dicentes*, or *diſceptantes*, becauſe they conferred and diſputed together in a ſcholaſtic manner.

The amoræans ſucceeded the *miſchnic* doctors. They ſubſiſted 250 years; and were ſucceeded by the *ſeburæans*.

AMORBACH, in *Geography*, a town of Germany, in the circle of the Lower Rhine, 12 miles north-eaſt of Heidelberg.

AMORDI, Amardi, or Amarbi, in *Ancient Geography*, a people of Scythia, according to Pliny.

AMORE, in *Ichthyology*, the name of a tribe of fiſhes in Maregrave's Hiſt. of Brazil, of which he deſcribes three ſpecies. 1. The *amore pixuma*. 2. The *amore guacu*. And, 3. The *amore tinga*.

The *amore pixuma*, or Gobius *piſonis*, in Gmelin's Linnæan ſyſtem, has a very broad head, and a very large mouth, but has no teeth. Its body is oblong, and its back and ſides are of a duſky iron colour. Its belly,

belly, which is protuberant, is white. Its ſkin is ſoft; and it has ſeven fins, beſides the tail, which is rounded, at the end. Its fleſh is firm and well-taſted.

The *amore guacu* is like the former, of an oblong figure; but it grows to ſix inches in length. Its head is thick, its gills large, and its mouth is furniſhed with ſmall teeth. Its eyes are ſmall, their pupil black, and the iris yellow. It has ſeven fins, beſides the tail, which is long, and rounded at the end. This ſpecies is covered with ſomewhat larger ſcales, and is of a ruſty iron colour, but ſomewhat paler on the belly than on any other parts.

The *amore tinga* is of the ſame ſhape with the former, but is much ſmaller, and is covered with whitiſh ſcales all over, but ſpotted with brown ſpots. Its tail is brown, and waved with different degrees of that colour. All the three ſpecies are eaten, but the firſt is eſteemed the beſt. They are caught about the American ſhores.

AMOREVOLI, Angelo, in *Biography*, a celebrated tenor ſinger in the ſerious opera, was a native of Venice. In 1740 he was the principal tenor in the king of Poland's famous opera at Dreſden under the direction of his then maeſtro di Capella, Haſſe. In 1742 he arrive d in England with Monticella at the beginning of lord Middleſex's regency, and remained here 2 or 3 ſeaſons. He ſurpaſſed in taſte and expreſſion all the tenor-ſingers of his time. He died in 1782.

AMORGO, in *Geography*, an iſland of the Archipelago north-weſt of Stampalia, which, in the time of Pliny (ſee H. N. lib. iv. c. 12.), bore the ſame name of Amorgos, or Amorgus: more anciently it was called Hypera, and Patage, or Platæa; and, according to Steph. Byz. Paucale, Pſychia, and Carceſia, containing three principal towns, *viz.* Arceſinos, Minoë, and Ægiale. This iſland is not quite ſo large as Stampalia; its ſhores are leſs winding, and it has fewer capes and points, and of courſe fewer retreats to navigators. There are none along its eaſtern coaſt, which is very ſteep, and on its weſtern ſhore there are not more than two tolerably commodious harbours or havens; the one to the north, is called *Porto Sent' Anna*, and the other to the ſouth, which is the beſt, is denominated *Porto Vathi*. The inhabitants of Amorgo were formerly friends to the ſciences and fine arts; but they are now devoted to ignorance and ſuperſtition. In the country, which gave birth to Simonides, the famous Greek poet, are now to be found no others than papas and caloyers, without genius and without knowledge, and diſtinguiſhed merely by their credulity. They ſhow, in a ſmall chapel, a vaſe, which they affirm to be a certain oracle, and which the ignorant conſult, in order to aſcertain the iſſue of a voyage or enterpriſe: the vaſe full of water is a ſign of ſucceſs, but if it be almoſt empty, it announces ill fortune. The three ancient towns, Arceſinos, Minoë, and Ægiale, are ſo completely deſtroyed, that their ſite is doubtful; and there remains only a little town, or village, built on an eminence, and monaſteries, where miracles are the occupation and the principal revenue of the monks or caloyers, who inhabit them. High mountains, and naked and ſteep rocks, occupy ſome parts of the iſland, and in other parts it preſents fertile plains and vallies. The abundance of its wines, oil, corn, and fruits, was renowned; and though it ſtill ſubſiſts, in a leſs conſiderable degree, it has to ſurmount the obſtacles and difficulties of a bad adminiſtration. A few diſtricts are ſtill well cultivated, and yield rich harveſts; olive trees furniſh a tolerably large quantity of oil, in proportion to the extent of the territory; figs are good and common; and the corn is of an excellent quality. That ſpecies of large grape with oval ſeeds, and a ſucculent and perfumed pulp, called by the Greeks *ox-eye*, and in France *raiſin d' Alexandrie*, here becomes of a conſiderable ſize and very delicious. Agriculture retains, in ſome degree, its ancient proſperity; but the arts, as well as the ſciences that direct them, are extinct. At Amorgos are no longer fabricated thoſe rich ſtuffs, which, under the name of *amorgis*, were in great requeſt, both on account of the fineneſs of their tiſſue, and of the beauty of the colour with which they were dyed. The inhabitants, nevertheleſs, ſtill apply themſelves to dyeing; and they know how to give to their linen cloths a red colour with archil, a ſpecies of lichen which not only clothes the rocks of Amorgos, but alſo grows on thoſe of ſeveral other iſlands of the Archipelago. Amorgos is diſtinguiſhed by the mildneſs and affability of its inhabitants, and by the beauty of its women, who, attached to ancient habits, diſguiſe themſelves by the peculiarity of their dreſs. In this reſpect they reſemble thoſe of Nilo, and Argentiera; with this difference, that the women of Amorgos paſs a ſhawl, or large yellow handkerchief, made of fine wool, over the forehead and the lower part of the face, twiſt it round the head in the form of a turban, tie it behind, and ſuffer a long end of it to hang down the back. To this iſland criminals were formerly baniſhed; and hither Tiberius exiled Vibius Serenus.

South of the iſland of Amorgos, and at the diſtance of about three leagues, is ſeen an uninhabited iſlet, which is called *Amorgo Poulo*, or *little Amorgo*. Between the ſame iſland and that of Naxia, or to the weſt of the former, are other iſlets equally uncultivated and uninhabited, ſome of which, covered with lentiſks (lentiſcus vulgaris of Tournefort) ſmall cypreſs-leaved cedars (cedrus baccifera, folio cupreſſi, &c. of Tournefort) and other wild plants, ſerve for the feeding of the flocks which are kept on them; while the others, which conſiſt of ſteep maſſes of rocks, deſtitute of all verdure, are the abode of a multitude of birds of prey. Sonnini's Travels in Greece, &c. c. xiv. p. 173—180.

AMORIS Pomum, in *Botany*. See Solanum.

AMORITES, in *Ancient Geography* and *Hiſtory*, were a people deſcended from Amorrhæus (according to the Septuagint) Hæmori (האמרי, according to the Hebrew) or the Emorite (in our verſion), the fourth ſon of Canaan, (Gen. x. 16.) who firſt occupied the mountains lying weſt of the Dead Sea. They alſo extend themſelves to the eaſt of the ſame ſea, between the brooks Jabbok and Arnon, from whence they expelled the Ammonites and Moabites. This conqueſt of Sihon, king of the Amorites, is celebrated by the moſt ancient poem extant. Numb. xxi. 27—30. Numb. xiii. 29, 30. Joſhua, v. 1. Judges xi. 19, &c.

When Moſes ſent meſſengers to Sihon, entreating a free paſſage through his country, he rejected his requeſt; and marched out againſt him; but ſuſtained a total overthrow at Jaazer, and loſt his whole dominion. Og likewiſe, king of Baſhan, who eſpouſed the cauſe of Sihon, and attempted to ſtop the progreſs of Moſes and his people, was vanquiſhed, and fell in battle; and his whole kingdom was transferred to the Iſraelites. This conqueſt of the Amorites happened, A. D. 2553, ante Chriſt. 1451. The prophet Amos (ch. ii. 9.) repreſenting their gigantic ſtature and valour, compares their height to the cedar, and their ſtrength to the oak. The lands poſſeſſed by the Amorites on this ſide Jordan were given to the tribe of Judah, and thoſe which they had enjoyed beyond Jordan to the tribes of Reuben and Gad. In Scripture, the name Amorite is often uſed for the Canaanites in general.

AMORIUM, a city of Aſia Minor, which ſome authors place in Phrygia, but it was afterwards compriſed in Galatia. It was in the territory of the Toliſtobii, on the river Sangarius. After the 6th century it became an epiſcopal ſee, and at length the metropolis of the new Galatia. Michael,

[illegible] father of Theophilus, the emperor of Conſtantinople, was a native of Amorium; and this original ſeat of the imperial houſe was adorned with many privileges and immunities; nor was Conſtantinople itſelf of much greater value in the eſtimation of the ſovereign and his court. Amorium gives denomination to a war which ſubſiſted between the emperor Theophilus and the Caliph Motaſſem, A. D. 838; when the emperor penetrated into Syria, beſieged the obſcure town of Sozopetra, the birth-place of the Caliph, took it, levelled it with the ground, and marked or mutilated the Syrian priſoners with ignominious cruelty. In revenge of this injury, Motaſſem prepared to attack Amorium. The name of Amorium was inſcribed on the ſhields of the Saracens, and their three armies were united under the walls of the city. Although the wiſeſt counſellors on this occaſion propoſed to evacuate the city, to remove the inhabitants, and to abandon the deſerted buildings to the reſentment of the barbarians, Theophilus determined to defend, in a ſiege and battle, the country of his anceſtors. The Greeks, in a previous engagement, were repulſed and vanquiſhed; and the emperor vainly hoped, after this defeat, to deprecate the fate of Amorium. But the inexorable Caliph rejected with contempt his prayers and promiſes, and detained the Roman ambaſſadors to be the witneſſes of his great revenge. The vigorous aſſaults of fifty-five days were encountered by a faithful governor, a veteran garriſon, and a deſperate people; and the Saracens muſt have raiſed the ſiege, if a domeſtic traitor had not pointed out the weakeſt part of the wall, which was decorated with the ſtatues of a lion and a bull. The vow of Montaſſem was accompliſhed with unrelenting rigour; nevertheleſs in the ſiege of Amorium above 70,000 Moſlems had periſhed, and their loſs had been revenged by the ſlaughter of 30,000 Chriſtians, and the ſufferings of an equal number of captives, who were treated as the moſt atrocious criminals. The Caliph's forces being diſtreſſed for want of water, in their return to his new palace of Samaria, in the vicinity of Bagdad, the Chriſtian priſoners roſe upon ſome of them and murdered them; by which action the Caliph was ſo much exaſperated, that he put to death 6000 of the Greeks who had been principally concerned in that commotion. On the bridge of the river Lamus in Cilicia, one day's journey weſtward of Tarſus, 4460 Moſlems, 800 women and children, and 120 confederates, were exchanged for an equal number of Greeks. They paſſed each other in the middle of the bridge, and when they reached their reſpective friends, they ſhouted *Allah acbar* and *Kyrie eleiſon*. Many of the priſoners of Amorium were probably among them; but in the ſame year (A. Heg. 231.) the moſt illuſtrious of them, the 42 martyrs, were beheaded by the Caliph's orders. Gibbon's Hiſt. vol. x. p. 67, &c.

The medals of Amorium were bronze, gold, and ſilver; and Greek medals were ſtruck in this city in honour of Trajan, Caracalla, Geta, and Veſpaſian.

AMOROSO, in Ital. Muſ. implies tenderly; with affection and ſupplication.

AMORPHA, formed of *α priv.* and *μορφη, form*, in *Botany*, a genus of the *diadelphia decandria* claſs and order, and of the natural order of *papilionaceæ* or *leguminoſæ*; its characters are, that the *calyx* is a perianthium one-leafed, tubulous, cylindrical and turbinate, mouth erect, five-toothed, obtuſe, the two upper teeth larger than the others; permanent; the *corolla* compoſed of one ovate, concave petal, ſcarcely larger than the calyx, erect, inſerted into the calyx, between the two larger and upper teeth, and placed at the upper ſide of it; the *ſtamina* have filaments very ſlightly united at the baſe, erect, unequal in length, longer than the corolla, anthers ſimple; the *piſtillum* has a roundiſh germ, ſubulate ſtyle, of the length of the ſtamina, and ſimple ſtigma; the *pericarpium* is a legume, lunulate, reflex, larger than the calyx, compreſſed, more reflex at the tip, one-celled, and tubercled; the *ſeeds* are two, oblong kidney-ſhaped. There is one ſpecies, *viz.* A. *fruticoſa*, baſtard indigo. La Marck mentions a variety. *β.* A *foliolis pellucido-punctatis leguminibus glabriuſculis*, which he ſuggeſts may be a conſtant ſpecies.

This ſhrub grows naturally in Carolina, where formerly the inhabitants made a coarſe ſort of indigo from the young ſhoots, which occaſioned their giving it the title of *baſtard indigo*. It riſes with many irregular ſtems to the height of twelve or fourteen feet, with very long winged leaves, in ſhape like thoſe of the common ACACIA. At the extremity of the ſame year's ſhoots, the flowers are produced in long ſlender ſpikes, which are very ſmall, and of a deep purple colour; appearing in the beginning of July. After the flowers are paſt, the germen turns to a ſharp pod, having two kidney-ſhaped ſeeds; but theſe do not ripen in England. They were ſent to England by Mark Cateſby in 1724.

This ſhrub, which Thunberg obſerved in the great iſland of Nipon belonging to Japan, is become very common in all the gardens and nurſeries near London, where it is propagated as a flowering ſhrub, for the ornament of the ſhrubbery. It is generally propagated by ſeed, ſent annually to England from different parts of America, which arrive in February, and are ſown in a light ſoil; they may be alſo cultivated by laying down the young branches, which in one year will make good roots, and may then be taken off and planted, either in the nurſery, or the places where they are deſigned to remain.

AMORTIZATION, or AMORTISEMENT, in *Law*, the act of turning lands into mortmain, *i. e.* of alienating or transferring them to ſome corporation, guild, or fraternity, and their ſucceſſors.

The word is formed of the French *amortir, to extinguiſh*. See EXTINGUISHMENT.

The term is alſo uſed for the licence or privilege which the king or ſuperior lord grants, to enable ſuch a corporation, &c. thus to receive lands in MORTMAIN; which otherwiſe they cannot do.—There is always ſuppoſed to be ſome fine or acknowledgment paid to the king, or the lord, in conſideration hereof; to make them ſatisfaction for ſeveral incidental dues and profits, which would have fallen to them in the common way, which are hereby cut off.

This practice was borrowed from the ancient *Lex Papiria*, whereby it was forbidden to conſecrate any land to religious uſes without the conſent of the people. Cic. pro Dom. 49.

AMORY, THOMAS, in *Biography*, a preſbyterian divine, was born at Taunton in Somerſetſhire, A. D. 1700. Having finiſhed his preparatory claſſical education under Mr. Chadwick, he commenced his academical ſtudies at a reſpectable ſeminary for the education of diſſenting miniſters, under the tuition of Mr. Stephen James and Mr. Henry Grove. In 1722 he began to officiate as an occaſional preacher; and removed to London to purſue a courſe of philoſophy under Mr. John Eames, an eminent tutor among the diſſenters. In 1725 he became the colleague of his uncle Mr. Grove, in the department of claſſics and natural philoſophy; and at the ſame time he preached occaſionally at Hull Biſhops, and ſome other places in the neigbourhood of Taunton. From the year 1730 to the year 1759 he was paſtor of a congregation at Taunton; and in 1738 he ſucceeded Mr. Grove, and became ſole tutor of the academy under his care. As a miniſter and a tutor he was much reſpected and eſteemed, on account of his

his comprehenſive knowledge, unimpeachable integrity, and exemplary moderation. In 1759 he removed to London, to the great regret of his friends at Taunton, but principally with a view of more advantageouſly ſettling his family; and accepted an invitation to become colleague with Dr. Chandler, and afternoon preacher to the congregation at the Old Jewry; and at the death of Dr. Chandler in 1766, he was choſen to ſucceed him as joint-paſtor with Mr. White. His real merit entitled him to a greater degree of popularity than he experienced in the metropolis; but though his talents were not of ſuch a nature as to command a numerous audience, he was diſtinguiſhed by the reſpectful and cordial attachment of many judicious and liberal friends. In 1768 he received the honour of the degree of doctor in divinity from the univerſity of Edinburgh; an honour to which his talents, learning, and character juſtly entitled him. He was morning preacher to the congregation at Newington Green, in connection with the celebrated Dr. Price, of whom a particular account will be given in the courſe of this work; and he was alſo appointed one of the ſix preachers at the Merchants' Lecture at Salter's Hall, and a truſtee of the charities of the late Dr. Daniel Williams, whoſe library contains a valuable collection of books, and is, under its preſent regulations, daily improving both in extent and utility. He retained his faculties, and his capacity of uſefulneſs, to his death, which happened in the year 1774. His funeral ſermon was preached by his intimate friend Dr. Flexman; who, after an intercourſe of more than 40 years, declared, "that their friendſhip had never once been interrupted by diſtaſte, or darkened by a frown." Dr. Amory left a widow and ſix children, one of whom was for many years an eminent banker of the city of London. The ſubject of this brief memoir, as the writer of it can teſtify from perſonal acquaintance, was diſtinguiſhed by a ſound judgment and amiable diſpoſition. His piety and benevolence were eminent features of his character, and were ſo intimately blended as to command reſpect and eſteem from all who knew him. In the more advanced period of his life, his ſtudies were chiefly directed to ſubjects of theology and ethics. His ſentiments, with reſpect to ſome of the principal diſputed points, coincided very nearly with thoſe of Dr. Samuel Clarke; his mode of preaching was judicious, practical, and devotional: and though he did not attract the multitude, he approved himſelf to the ſenſible and candid. His ſermons have been collected in two volumes, *viz.* firſt, "Eighteen ſermons on various Subjects," printed in 1758, 8vo.; the ſecond, "Twenty-two ſermons on ſeveral Subjects," in 1766, 8vo. Dr. Amory alſo publiſhed "A Dialogue on Devotion, after the manner of Xenophon," with "A Tranſlation of the Converſation of Socrates on the Being and Providence of God," 8vo. 1733 and 1746; "A Family Prayer-Book," 1763; "An Account of the Life and Writings of Mr. Grove," prefixed to his poſthumous works, 1740; "Mr. Grove's Syſtem of Moral Philoſophy, reviſed and enlarged," 1749; "Memoirs of the Life of Dr. Benſon," prefixed to his hiſtory of the life of Chriſt, and "Memoirs of Dr. Samuel Chandler," prefixed to his four volumes of Sermons. He was alſo the author of "A letter to a Friend," on the ſtudy of religion, publiſhed in the memoirs of literature, 1731: of "Some poetical pieces, ſacred and moral;" and of a volume of poſthumous ſermons, publiſhed after his death. Flexman's funeral Sermon. Biog. Brit.

AMOS, in *Scripture Biography*, the third of the twelve minor prophets, in the order of the Hebrew Scriptures, but the ſecond in the order of time, was the ſon of a ſhepherd, and, though probably born in the territories of Iſrael, retired to Tekoah, a village of the tribe of Judah, about five miles from Jeruſalem. Under Uzziah, and Azariah, king of Judah, whoſe reign commenced in the 27th year of Jeroboam II. king of Iſrael, B. C. 804, Amos began to propheſy; but the preciſe year is not aſcertained. Archbiſhop Newcome dates the commencement of his prophetic office in the year 823, B. C.; but Falconer in his "Chronological Tables," aſſigns it to the year 805, B. C. His firſt predictions were delivered at Bethel, whence he was driven back to his own country by Amaziah, the high prieſt of Bethel, who accuſed him before Jeroboam. Theſe occur in the ſeventh chapter; and the others were pronounced in Tekoah, whither he retired after his baniſhment from Bethel. His two firſt chapters contain his prophecies againſt Damaſcus, the Philiſtines, Tyrians, Edomites, Ammonites, Moabites, Judah, and Iſrael; and the evils he threatened refer to the invaſions of Salmanazer, Tiglath-pileſer, Sennacherib, and Nebuchadnezzar. Amos alſo foretold the calamities that would befal the kingdom of Iſrael, after the death of Jeroboam II. who was then living; the death of king Zechariah; the invaſion of Iſrael by Phul and Tiglath-pileſer, kings of Aſſyria; the captivity of the ten tribes, and their ſubſequent reſtoration. He remonſtrates againſt the prevalent iniquities of Iſrael, their effeminacy, avarice, and obduracy with regard to the poor, the ſplendor of their buildings and the delicacy of their tables. He reproves the children of Iſrael for their pilgrimages to Bethel, Dan, Gilgal, and Beerſheba, which were the moſt famous at that period, and for ſwearing by the gods of theſe places. The ſtyle of Amos is characteriſed by its ſimplicity, and by frequent alluſions to paſtoral life. Jerom (Proem. Comment. in Amos.) referring to the words of St. Paul, calls him rude in ſpeech, but not in knowledge. Succeeding writers, on the authority of this ancient father, have repreſented him, as if he were quite rude, and deſtitute of all the beauties of compoſition. But a very competent judge has given a very different opinion. Let any one, ſays biſhop Lowth, (Prælectiones de Sacra Poeſi. præl. xxi. p. 286.) who has ſufficient diſcernment and candour for forming a juſt judgment, from the writings of this prophet and not from the man, turn over the volume of his predictions, and he will pronounce, that our ſheepherd is "not a whit behind the chief of the prophets." 2 Cor. xi. 5. He will think, that as in ſublimity and magnificence he is almoſt equal to the greateſt, ſo in ſplendor of diction and elegance of expreſſion, he is ſcarcely inferior to any. The ſame celeſtial ſpirit indeed, as this excellent prelate adds, actuated Iſaiah and Daniel in the court, and Amos in the ſheep-folds; ſelecting always ſuch interpreters of the divine will, as were beſt adapted to the occaſion, and ſometimes "from the mouths of babes and ſucklings perfecting praiſe;" occaſionally diſplaying the natural eloquence of ſome, and occaſionally making others eloquent.

The time and manner of the death of Amos are unknown. It appears (2 Chron. xxvi. 22. Iſ. i. 1.) that Amos was the father of the prophet Iſaiah, and of the family of Aſhur, (1 Chron. ii. 24.) from whoſe ſon Tekoah derived its name. Calmet and many others, however, have thought that Amos the father of Iſaiah, was a different perſon, and of royal rank; but there ſeems to be no ſufficient reaſon for this opinion.

AMOS, or AMUS, in *Ancient Geography*, a city of Aſia Minor, in Caria. Steph. Byz.

AMOTAPE, in *Geography*, a town of South America in Peru, ſituated near Tumbez, on the coaſt of the South Sea. The adjacent country, watered by a fine river, is highly improved,

AMOU, a town of France in the department of Landes, and chief place of a canton in the district of St. Sever, five leagues south of Tartas, and four leagues and an half south-west of S. Sever. The town contains 1731 and the canton 14,915 inhabitants; the territory includes 182½ kiliometres and 17 communes.

AMOVING, in *Law*, the act of removing or expelling another from his place, office, or the like. We have statutes for removing papists out of London and Westminster, and ten miles round the same. 1 W. and M. cap. 9.

Amoving a guardian, a warde, &c. See CUSTODE.

AMOUR, WILLIAM DE ST. in *Biography*, a French ecclesiastic of the 13th century, was born at St. Amour, in Franche Comte, and became canon of Beauvais, and doctor of the Sorbonne. He distinguished himself in the controversy of 1228 between the Dominicans and the university of Paris. The Dominicans claimed two professorships in the university; but the secular doctors resisted their claim, and passed a law, restricting persons of the regular order to one. The dispute was referred to the court of Rome, and Amour was an able and zealous advocate in favour of the university. In a book "Concerning the perils of the last Times," he attacked the whole mendicant tribe, and attempted to prove, that the prophecy of St. Paul relating to the perilous times (2 Tim. iii. 1.) was fulfilled in the establishment of the friars of this order. The book was condemned by pope Alexander IV. and the author was sentenced to perpetual exile from France. Upon the accession of Clement IV. Amour returned to Paris, and in a collection and enlargement of his works, renewed his attack on the character and conduct of the mendicants. By favour of this pope, who respected his talents and merit, he remained unmolested till his death in 1272. The mendicants reproached him as a heretic; but by the doctors of the Sorbonne he was highly respected. His spirited remonstrances against idleness and hypocrisy, masked by humility and sanctity, justify the panegyric of Mosheim, who represents him as "a man of true genius worthy to have lived in better times, and to have adorned a more enlightened age." His works were published at Paris, in 4to. by Cordesius in 1632; but the editor concealed his name, and the place of publication under the enigmatical inscription, "Constantiæ ad insigne bonæ fidei apud alitophilos." Cave, H. L. tom. ii. p. 302. Mosheim. Eccl. Hist. vol. iii. p. 202.

AMOUSHE, RASEL, in *Geography*, the Battal of Edrisi, a large cape formed by the mountains of the Shenooah, on that part of the sea-coast of Africa, called the Western Province or the province of Tlemsan. At a small distance is the Mers 'el Amoushe, or port of Amoushe, which is very safe in westerly winds. Shaw's Travels, p. 20.

AMOY, an island on the south-west coast of China, where the English East India Company had once a factory, since removed to Canton. It lies west from the nearest part of Formosa island, somewhat more than 3° of longitude, and from the south-east point of China, which is east from Macao, about north north-east. The port of Amoy has been described as one of the most convenient and safe harbours in India, on account of the road which is formed by that island between it and the continent, and it is so deep and large as to be capable of receiving 1000 ships of the greatest size, and of protecting them from every wind. N. lat. 24° 30'. E. long. 118° 45'.

AMPARES, a jurisdiction under the archbishop of Plata, eastward of that city, in the empire of Peru; abounding in grain and cattle.

AMPANA, in *Botany*, a name given in the Hortus Malabaricus to a genus of plants, since described by Linnæus, under the name of BORASSUS.

AMPASA, in *Geography*, a small country and kingdom of Africa, on the coast of Zanguebar, between the line and Melinda. It has a capital of the same name; the king is a vassal of the Portuguese. S. lat. 1° 30'. E. long. 60° 20'.

AMPATRES, a people of Madagascar, on the southern coast between Carembouli and Carcanessi, who live in the midst of forests and subsist by plunder.

AMPELIS, in *Botany*, the *vine*. See VINE.

AMPELIS, in *Ornithology*, a genus of birds in the Linnæan system, belonging to the order *passeres*. The characters of this genus are, bill straight, convex: upper mandible longest, and somewhat incurvated: each mandible notched. Nostrils covered with bristles. Tongue acute, cartilaginous, bifid. Linn. & Gmel. Dr. Latham's generic character of ampelis is somewhat different, *viz.* bill strait, convex, bending towards the point; near the end of the upper mandible a small notch. Nostrils hid in the bristles. Middle toe connected to the outer at the base.

Gmelin describes eleven species of this genus, *carnifex*, *caruculata*, *cyana*, *coccinea*, *cotinga*, *cristata*, *garrulus*, *maynana*, *pompadora*, *tersia*, and *variegata*, which see.

AMPELITES, or candle-coal. See COAL.

AMPELLA, or AMPULIA, in *Geography*, a city and seaport in Guatimala gulf, in that of Mexico, 350 miles south-east of the city of Guatimala, which carries on a brisk trade in cochineal, cocoa, hides, indigo, &c.

AMPELONA, in *Ancient Geography*, a colony of Milesians, in Arabia Felix, transported thither by the Persians.

AMPELOS, or AMPELUS, a promontory of the island of Samos, to the west of that island, and opposite to that of Icaria. *Ampelos* was also a promontory of Macedonia, according to Ptolemy, in the country called Parania; probably near the mouth of the Axius. *Ampelos* was also a town of Italy, in Liguria.

AMPELUSIA, called also *Cape Cottes*, is a promontory of Mauritania Tingitana, not far from Tingis, mentioned by Strabo, Ptolemy, and Mela. It is denominated by the moderns *Cape Spartel*. From Mela and Bochart it appears that Cottes and Ampelusia were, in the Phenician and Greek languages, terms of the same meaning, and that they were deduced from the grapes with which that country abounded. *Ampelusia* was also a town and promontory of Crete, now called *Capo Sagro*. It was also a town and promontory of Macedonia, near the gulf of St. Anne, and now called *Capo Canistro*.

AMPERES, from ἀμφὶ, *on both sides*, in *Antiquity*, a kind of vessels, wherein each mariner wrought two oars at the same time, one with the right hand, and the other with his left, answering to our *scullers*. This is also called *amphericum*.

AMPEZO, in *Geography*, a town of Germany, in the country of Tyrol, ceded to Austria by the Venetians in 1505, 12 miles south of Bruneck.

AMPHANÆ, in *Ancient Geography*, a town of Greece in the Doride. Stephan. Byz.

AMPHANÆ is also a strong place of Thessaly, probably the same as that called by Scylax *Anaphinæum*.

AMPHAXITIS, a district of Macedonia, in which was situated the city of Thessalonica.

AMPHIA, or AMPHEA, a town of Messenia, mentioned by Steph. Byz. and also by Pausanias, who places it in the vicinity of Laconia.

AMPHIARAUS, in *Mythology*, a famous prophet among the Pagans, was the son of Oicleus, and great grandson of Melampus, to whom part of the kingdom of Argos was assigned, as a recompence for some public service. In consequence of this division of Argos, Adrastus, its king, was overpowered by the party of Amphiaraus, and obliged to abandon the kingdom. Amphiaraus afterwards married Eriphyle, the sister of Adrastus, and he was restored to the throne. During the preparations for the expedition against Thebes,

Thebes, Amphiaraus, who poſſeſſed the faculty of divination, was forewarned that he ſhould loſe his life in this war, and therefore he concealed himſelf, in order to avoid engaging in it; but his wife, being prevailed upon by a preſent of a gold chain, diſcovered the place where he was hidden, ſo that he was obliged to accompany the other princes, who marched againſt Thebes. The expedition was fatal to him; for the earth being ſplit aſunder by a thunder-bolt, both he and his chariot were ſwallowed up in the gulf. Pindar and Apollodorus mention this circumſtance; and they aſcribe the event to the kind interpoſition of Jupiter, who thus prevented the diſhonour of his being killed by Periclymenes, by whom he was purſued. After his death he was ranked among the gods, temples were dedicated to him, and his oracle, as well as the ſports that were inſtituted in honour of him, were very famous. He was believed to excel chiefly in divining by dreams, and is ſaid to have been the firſt who divined by fire. He left in charge with his children to put his wife to death, as ſoon as they were able to do it. Apollodorus reckons him among the Argonauts.

AMPHIARTHROSIS, in *Anatomy*, a neutral or dubious kind of articulation; diſtinguiſhed from the *diarthroſis*, in that it has no conſpicuous motion; and from the *ſynarthroſis*, in its not being without ſenſible motion.

The word is derived from αμφι, *both*, and αρθρωσις, *articulation*, the *amphiarthroſis* being compounded of both the other ſorts.

Mr. Winſlow cites, as ſpecimens of this kind of articulation, the conjunction of the firſt rib and ſternum by a ſingle cartilage, and the connections of the vertebræ with each other by the intervertebral ſubſtance.

AMPHIBALUS, in *Biography*, a monk of Caerleon, who is ſaid by ſome to have been a Roman by birth, and to have made his eſcape into Britain in the time of Dioclefian's perſecution. Others ſay, that he was born at Caerleon, the metropolis of Wales, and that he was rector of the univerſity of Cambridge. He was the preceptor of St. Alban, and inſtrumental in his converſion; and was crowned with martyrdom.

AMPHIBALLUS, Amphiballum, or Amphimallum, among *Middle Age Writers*, denoted a large mantle, ſuch as were the ſurplices of the monks, which encompaſſed the body on both ſides, (whence it was called amphiballus, from αμφι and βαλλω, and amphimallum, from αμφι and μαλλος, a fleece of wool) and which was not barely thrown over the ſhoulders, like the toga. See Caracalla.

AMPHIBIA, in *Zoology*, the third claſs of animals in the Linnæan ſyſtem, including thoſe which poſſeſs, in a certain degree, the power of reſpiration, and are thereby enabled to live either in water or upon land. The characters aſſigned by early naturaliſts to animals of this claſs are, in many reſpects, exceptionable; and thoſe of Linnæus are liable to ſome objections, as the writings of Count de Cepede, Mr. Schneider, M. Schoepff, and Dr. Shaw have proved in various inſtances; yet the Linnæan arrangement is ſtill adopted with ſome amendments, and upon the whole this is moſt adviſable, till this obſcure tribe of creatures is more completely aſcertained.

The amphibia are either naked, or defended by an external covering; the ſkins of ſuch as are denominated naked, are in general marked by ſoft, puſtular warts; the coverings of the others are either horny ſhields, coriaceous integuments, or ſcales. The lungs of the amphibia differ materially from thoſe of other animals in the two preceding claſſes, mammalia and aves, conſiſting in general of a pair of large bladders or membranaceous receptacles, variouſly ſubdivided in different ſpecies; and the heart is furniſhed with one ventricle only. Some late phyſiologiſts have, however, ventured to aſſert, that the hearts of the amphibia are in reality double, or furniſhed with two ventricles, with a free or immediate communication between them.

In the Linnæan arrangement, the amphibia were formerly divided into four orders, *viz.* 1. *Reptilia pedati*, reptiles; amphibious animals, which breathe through the mouth by lungs only, and are furniſhed with four feet. 2. *Serpentes apodes*, ſerpents; amphibious animals, breathing through the mouth by means of lungs only, and deſtitute of feet, fins, and ears. 3. *Meantes*, gliders; animals breathing by means of gills and lungs, and furniſhed with arms and claws; and 4. *Nantes pinnati*, breathing fiſhes, which reſpire arbitrarily by means of gills and lungs, and of which the fin-rays are cartilaginous. The amphibia claſs in the laſt edition of the Syſtema Naturæ, by Gmelin, conſiſts of two orders, *reptilia pedata*, and *ſerpentes apodes*, which are ſufficiently diſtinguiſhed, the reptiles being furniſhed with feet, and the ſerpents deſtitute of them. The Nantes *pinnati*, or breathing fiſhes, being placed in their natural order amongſt the Pisces, under the title Chondropterygii; that order now includes the genera *Acipenſer*, *Chimæra*, *Squalus*, *Raja*, and *Petromyzon*: the Lophius genus is ſeparated from the others, and arranged amongſt the Pisces branchiostegi.

The order of reptiles is divided into four genera, *viz.* Testudo, Draco, Lacerta, and Rana; and that of ſerpents into ſix genera, *viz.* Crotalus, Boa, Coluber, Anguis, Amphisbæna, and Caecilia. This is the arrangement of Gmelin, to which muſt be added the genus Siren; a kind of reptile, whoſe ambiguity of character induced Linnæus to form the new order Meantes. Linn. Amoen. Acad. vii. p. 311.—et Syſt. Nat. vol. i. part ii. Addend. Gmelin has conſigned this creature to the firſt genus of fiſhes, Muræna; and Dr. Shaw reſtores it to the Siren genus in the appendix to his Zoology, vol. iii. p. 2, Amp. It may ſtill be doubted whether this, and two other known kinds of the ſame family be complete animals, or only the larvæ or firſt ſtate of ſome lacertæ, as Dr. Shaw very judiciouſly ſuggeſts.

The new genera of ſerpents, not noticed by Gmelin, are Acrochordus, Hydrus, and Langaya.

Of the amphibia in general, it has been obſerved, that their bones are more cartilaginous than thoſe of other animals, and many poſſeſs the ſingular power of reproducing their tails, legs, and other parts when deſtroyed; in this reſpect bearing ſome affinity to many marine inſects, as crabs, lobſters, &c. Some are viviparous, or hatch the young ones in the eggs, internally, and bring them forth alive; others depoſit their eggs, and hatch them afterwards. The eggs differ alſo, ſome are covered with a calcareous ſhell, others with a tough ſkin reſembling parchment, and many, as in the Rana genus, are perfectly gelatinous. Numbers undergo a metamorphoſis, or caſt their ſkins; all are extremely tenacious of life, and, from their peculiar internal ſtructure, capable of enduring a longer abſtinence than any of the larger tribes of animals. During Winter many remain in a ſtate of torpidity.

Very few of the reptile tribes are venomous; and of the ſerpents not more than one-fifth are known as ſuch. Thoſe creatures, therefore, which are naked, and without limbs, ſeem perfectly defenceleſs, but nature has armed the reſt, not only with the means of defence, but the moſt dreadful means of aggreſſion; and the poiſonous ſerpents, collectively, are undoubtedly the moſt hideous and formidable tribe of creatures known. The poiſonous kinds are furniſhed with tubular fangs, which are perfectly diſtinct from the teeth, and ſituated upon a glandular veſicle on the anterior part of the upper jaw: in this veſicle the fatal fluid is ſecreted, and when the wound is inflicted, diſcharges its contents into the fangs, through which it oozes by the linear apertures on one

fide, and effects its malignant purpoſe. The jaws of the ſerpents are extremely dilatable, and the œſophagus ſo lax, that they can ſwallow, without maſtication, an animal twice or thrice as large as the neck.

Amphibia, *Anatomy of.* See Classification *of Animals* and Reptiles in *Comparative Anatomy.*

AMPHIBIOUS, in *Natural Hiſtory*, a term applied to thoſe animals which live both on land and in water. In technical language it is confined to thoſe creatures which conſtitute the *amphibia* of naturaliſts; in a general ſenſe it includes the otter, ſeal, beaver, and various other animals of the mammalia tribe, who live on land, and occaſionally go into the water in ſearch of prey; the word being derived from αμφι, *utrumque, both ways*, and βιος, *vita*, life; as living in both places.

Dr. Parſons, in an ingenious paper publiſhed in the Tranſactions of the Royal Society, after conſidering the economy of amphibious creatures, divides them into two ſections; *firſt*, ſuch as enjoy their chief functions on land, but occaſionally go into the water; and *ſecondly*, ſuch as chiefly inhabit the water, but occaſionally go aſhore. Of the firſt kind he conſiders the phocæ, otters, beavers, and ſome kinds of rats, frogs, and lizards, the hippopotamus and teſtudo; all which, he obſerves, are capable of remaining for an inconſiderable length of time in the water, to collect their prey, but are compelled to riſe to the ſurface to breathe, and return aſhore to perform moſt of the ordinary functions of nature. The laſt are but of two kinds, eels, or water-ſerpents, or ſnakes of every kind.

Moſt of the amphibious kinds, the caſtor, or beaver, and otter excepted, have peculiar proviſions in their ſtructure to fit them for ſuch a various way of living; particularly in the heart, lungs, foramen ovale, &c.

In ſome of theſe animals, as the frog, tortoiſe, &c. the heart has but one cavity, with an artery to receive the blood coming out of it, and a vein to convey it thither. In others, the foramen ovale appear to be ſtill open for the paſſage of the blood from the *vena cava* to the *arteria venoſa*, without the help of breathing.

In the *caſtor*, diſſected by the academiſts of Paris, though the foramen was not found actually open, yet the marks of it appeared; and the cauſe of its cloſure might be well enough accounted for, from the animal's having been detained a good while from the water, by which the part, having been in diſuſe, cloſed up. In the otter the caſe is different; there is no appearance of any thing like a *foramen*; and hence the neceſſity the creature is under of riſing, from time to time above water, to take in air. Phil. Tranſ. N° 124.

The ſtructure of the feet of the *caſtor* pronounces it amphibious at firſt ſight, the fore feet being formed like thoſe of terreſtrial animals, who hold their food in their feet, *e. gr.* ſquirrels, while the hind-feet are faſhioned after the manner of river fowl, with webs or membranes between the toes, as the gooſe, duck, &c.

Some kinds of inſects, in different ſtages of life, may be ſaid to be amphibious. The dytiſcus, notonecta, and nepa, undergo all their tranſformations from the egg, larva, and pupa ſtate in the water, and though furniſhed in the perfect ſtate with wings, and conſequently deſtined to live on land, ſeldom quit the water except in the evenings, and conſtantly return to it when their flight is over: theſe are called water-beetles. Others remain in the water only in the firſt ſtages of their tranſformations, and would periſh in their native element from the moment they become winged creatures, as is frequently obſerved of the libellula, ephemera, and phryganea, and ſome of the muſcæ and culices; amongſt the latter the tranſformation of the ſpecies *pipiens*, common gnat, is a ſtriking inſtance of this remark. In fact many of thoſe creatures, which are miſtaken for aquatic worms, are no other than the larva, or pupas of *amphibious* inſects, which their parents depoſit in the egg ſtate, on the leaves and ſtalks of plants, &c. that grow in the water; and thoſe hatching inſtinctively, remain in the water till they become winged inſects.

Birds are in a much leſs degree amphibious. Amongſt thoſe which are denominated water-fowl, from almoſt conſtantly living on that element, the divers and corvorants are capable of remaining a conſiderable length of time under water; perhaps nearly as long as the otter. Swallows would certainly well deſerve the title of amphibious, if, as ſome have imagined, they paſſed the whole winter in a ſtate of torpidity under water.

Dr. Hunter obſerves, that, properly ſpeaking, there are no *amphibious* animals; for that fiſh cannot live long without air, though much longer than men.

The term *amphibious* has been ſometimes alſo extended to men, who have the faculty of living a long while under water. We have various inſtances of ſuch amphibious men: the divers employed in the pearl-fiſheries poſſeſs this faculty in an eminent degree. Credulity itſelf is ſtaggered at the ſtory of a Calabrian monk, who once offered the king of Spain to continue twice twenty-four hours under water; but it is believed that a Sicilian, named the *Fiſh-Colas*, by a long habitude from his youth, had ſo accuſtomed himſelf to live in water, that his nature ſeemed to be quite altered, ſo that he lived rather after the manner of a fiſh than a man. Kircher.

AMPHICEDA, in *Entomology*, a ſpecies of Papilio. Wings indented, above brown, with a connected diſk of cinereous waved with brown; beneath, tips grey with black lunated marks. Fab. et Gmel.—This ſpecies inhabits Africa. Above, the baſe and margins are entirely brown; cinereous in the middle, with two large undulated waves, the firſt brown, the ſecond black. Beneath, pale at the baſe with rufous ſpots, and undulated lines, apex grey with a row of lunated black marks. Fabricius.

AMPHIBLESTROIDES, in *Anatomy*, a tunic or coat of the eye, more uſually call Retina.

The word is compounded of αμφι, βλησσειν, *net*, and ειδος, *form*; on account of its net-like texture; whence the Latins alſo call it *retiformis*.

AMPHIBOLOGY, from αμφιβολος, *ambiguous*, and λογος, *diſcourſe*, or Amphibolia, in *Grammar*, a fault in language, whereby it is rendered obſcure, and liable to be underſtood in a double ſenſe.

Amphibology is chiefly uſed in reſpect of a phraſe, as equivocal is in reſpect of a word.

Of this kind was that anſwer which Pyrrhus received, from the oracle, "Aio te, Æacida, Romanos vincere poſſe;" where the amphibology conſiſts in this, that the words "te," and "Romanos," may either of them precede, or either of them follow the words "poſſe vincere," indifferently. See Oracle.

The Engliſh language uſually ſpeaks in a more natural manner, and is not capable of any amphibologies of this kind; nor is it ſo liable to amphibologies in the articles as the French, and moſt other modern tongues.

AMPHIBRACHYS, the name of a foot in the *Latin* and *Greek poetry*; conſiſting of three ſyllables, the firſt and laſt whereof are ſhort, and that in the middle long.

The word comes from αμφι, *circum*, and βραχυς, *brevis*, q. d. a foot ſhort at both ends, and long in the middle.—Among the Ancients it is alſo called *ianius*, and *ſcolius*. Diom. iii. p. 475.

Such are the words *ămārĕ*, *ăbīrĕ*, *pătĕrnŭs*, Ομηρος, &c.

AMPHICLEA, in *Ancient Geography*, a city of Phocis in Græcia Propria, mentioned by Steph. Byz. and called by Pauſanias

Pauſanias and Herodotus, Amphicæa. The Amphictyons, in their decree againſt the Phocian cities, gave it the name of Ophitea. This city belonged to the Dryopes, and was pleaſantly ſituated to the left of the river Cephiſus, and near Mount Oeta. Amphiclea was famous for a temple and oracle of Bacchus, who, under the character of a phyſician, pretended to cure all diſeaſed perſons that applied to him.

AMPHICTYONS, Amphictyones, in *Antiquity*, the deputies of the cities and people of Greece, who repreſented their reſpective nations in a general aſſembly; having a full power to concert, reſolve, and appoint what they ſhould think fit for the ſervice of the common cauſe. They were empowered to employ not only the rigour of the laws, in the execution of their decrees, but even to raiſe troops, if it were neceſſary, to compel ſuch as rebelled to ſubmit to them.

The amphictyones very much reſemble the ſtates-general of the united Provinces; or rather, what in Germany they call the diet of the empire.

Some ſuppoſe the word αμφικτιονες, to be formed of αμφι, *about*, and κτιειν, or κτιζειν, becauſe the inhabitants of the country round about met here in council. Others, with more probability, derived it from *Amphictyon*, ſon of Deucalion, whom they ſuppoſe to have been the founder of this aſſembly; though others will have Acriſius, king of the Argives, to have been the firſt who gave a form and laws to this body.

Androtion, in his Hiſtory of Attica, quoted by Pauſanias, (lib. ii. c. 8. p. 815.) informs us, that from the moſt early period, deputies from the neighbouring ſtates aſſembled at Delphi, and that theſe deputies were, *from that circumſtance*, called Amphictyons; and that conſequently, in proceſs of time, this became the prevailing denomination of that high court. According to this account, whether the author's etymology be right or not, this was an original inſtitution, deriving its eſtabliſhment from neither Amphictyon nor Acriſius, but exiſting from the earlieſt ages of antiquity. Dr. Doig (Edinb. Tranſ. vol. iii. p. 150, &c.) ſuggeſts, that as the Hellenes had founded the oracle of Dodona, they probably eſtabliſhed alſo the oracle of Delphi. This oracle acquired great reputation, and the concourſe of the people to the temple of Delphi was immenſe. Its ſituation was well choſen for this purpoſe; and it lay nearly in the centre of thoſe petty tribes that afterwards formed the Amphictyonic aſſociation. Theſe ſtates, becoming jealous of the growing power of the oriental colonies, determined to hold their conventions at Delphi, in order to concert meaſures for their mutual ſecurity. Both its ſanctity and central ſituation pointed it out as a place well adapted to this purpoſe. The Hellenic prefects of the temple, ſuperior to the Barbarians in political ſagacity, would ſtrain every nerve to promote a ſcheme calculated to advance both their honour and their intereſt. Common ſacrifices have, in all ages, been deemed an infallible ſign of amity and concord, and alſo the means of maintaining and promoting them. The confederates would therefore aſſemble at Delphi to offer ſacrifices, and to perform other religious rites on behalf of all the aſſociated tribes. Theſe would ſerve as an indiſſoluble bond of their federal union. The confederates, on this occaſion, would preſent liberal donations, and thus greatly enrich the treaſury of the temple. It muſt therefore occur to them, that it would conduce both to their honour and intereſt to appoint officers for ſuperintending this treaſure. Strabo ſays expreſsly, (lib. ix. p. 420.) that this was one of the ends of the inſtitution of the Amphictyons. Hence it appears, that the original Amphictyons were a kind of wardens of the temple of Delphi, elected by the ſuffrage of the confederated tribes. In proceſs of time another claſs of perſons would naturally be added to the former, whoſe province it ſhould be to watch over the civil intereſts of the confederacy. Theſe two claſſes of ſuperintendents gradually coaleſced into one, and both united in diſcharging the ſacred and civil functions annexed to their office. A tribunal, thus formed and eſtabliſhed, reflects immortal honour upon Greece, and demonſtrates the wiſdom and ſagacity of the Hellenes, to whom its inſtitution is aſcribed by the ingenious writer above cited, and which he connects, in its origin, with the oracular eſtabliſhment at Delphi. Had its members been always animated by a ſpirit of peace, of juſtice, and of good order, it would have rendered itſelf for ever reſpectable; and the aſſociated ſtates under its direction would never have become a prey to the deſpiſed Macedonians.

This council was principally inſtituted with a view of uniting in the ſacred band of amity the ſeveral people of Greece that were admitted into it, and of obliging them, by that union, to undertake the defence of each other, and to be mutually vigilant for the tranquillity and happineſs of the country. The Amphictyons were alſo created to be the protectors of the oracle of Delphos, and the guardians of the wealth of that temple; and alſo to adjudge the differences that might ariſe betwen the Delphians and thoſe who came to conſult that oracle.

Authors give different accounts of the number of the Amphictyons, as well as the ſtates who were entitled to have their repreſentatives in this council; according to Strabo, Harpocration, and Suidas, they were twelve, from their firſt inſtitution, ſent by the following cities and ſtates; the Ionians, Dorians, Perrhæbians, Bœotians, Magneſians, Achæans, Phthians, Melians, Dolopians, Ænianians, Delphians, and Phocæans. Æſchines only reckons eleven, inſtead of the Achæans, Ænianians, Delphians, and Dolopians, he only gives theſe three, the Theſſalians, Œtans, and Locrians. Laſtly, Pauſanias's liſt only contains ten Amphictyons; namely, the Ionians, Dolopians, Theſſalians, Ænianians, Magneſians, Melians, Phthians, Dorians, Phocians, and Locrians.

In the time of Philip of Macedon, the Phocæans were excluded the alliance, for having plundered the Delphian temple, and the Lacedæmonians were admitted into their place; but the Phocæans, ſixty-eight years after, having behaved gallantly againſt Brennus and his Gauls, were reſtored to their ſeat in the amphictyonic council. Under Auguſtus, the city Nicopolis was admitted into the body; and, to make room for it, the Magneſians, Melians, Phthians, and Ænianians, who till then had diſtinct voices, were ordered to be numbered with the Theſſalians, and to have only one common repreſentative. Strabo ſpeaks as if this council were extinct in the times of Auguſtus and Tiberius; but Pauſanias, who lived many years after, under Antoninus Pius, aſſures us it remained entire in his time, and that the number of amphictyons was then thirty.

When the Lacedæmonians, in order to paſs any decrees which they thought proper, were for excluding the Theſſalians, Argives, and Thebans, Themiſtocles (Plut. in Them. p. 122.), in the ſpeech he made to the Amphictyons for preventing that deſign from taking effect, ſeems to inſinuate that there were at that time 31 cities which had the right of ſending deputies to this council.

The members were of two kinds; each city ſending two deputies, under different denominations, one called ιερομνημων, whoſe buſineſs ſeems to have been more immediately to inſpect what related to ſacrifices and ceremonies of religion; the other πυλαγορας, charged with hearing and deciding cauſes and differences between private perſons. Both had an equal right to deliberate and vote, in all that related to the common intereſts of Greece. The former was elected by lot; the latter by plurality of voices.

Though

Though the amphictyons were firſt inſtituted at Thermopylæ, M. De Valois (Mem. Acad. Belles Lettres, vol. iii.) maintains, that their firſt place of reſidence was at Delphi, where, for ſome ages, the tranquillity of the times found them no other employment than that of being, if we may ſo call it, church-wardens of the temple of Apollo. In after times the approach of armies frequently drove them to Thermopylæ, were they took their ſtation, to be nearer at hand to oppoſe the progreſs of enemies, and to order timely ſuccour to the cities in danger. When they aſſembled at Thermopylæ, they held their ſeſſions in the temple of Ceres, near the mouth of the river Aſopus. Their ordinary reſidence, however, was at Delphi.

Here they decided all public differences and diſputes between any of the cities of Greece; but before they entered on buſineſs, they jointly ſacrificed an ox, cut into ſmall pieces, as a ſymbol of their union. Their determinations were received with the greateſt veneration, and even held ſacred and inviolable.

The Amphictyons, at their admittance, took a ſolemn oath, the form of which is preſerved by Æſchines (in Orat. περι παραπρεσβειας) never to diveſt any city of their right of deputation, never to avert its running waters; and if any attempt of this kind were made by others, to make mortal war againſt him; more particularly, in caſe of any attempt to rob the temple of any of its ornaments, that they would employ hands, feet, tongue, their whole power, to revenge it. This oath was enforced by terrible imprecations againſt ſuch as ſhould violate it; *e. gr.* May they meet all the vengeance of Apollo, Diana, Latona, and Minerva, &c. their ſoil produce no fruit, their wives bring forth nothing but monſters, &c. loſe all ſuits at law, be conquered in war, have their houſes demoliſhed, and be themſelves and their children put to the ſword!

The ſtated times of their meetings were Spring and Autumn; the Spring meeting was called Εαρινη Πυλαια, that in Autumn Μετοπωρινη. On extraordinary occaſions, however, they met at any time of the year, or even continued ſitting all the year round.

Philip of Macedon uſurped the right of preſiding in the aſſembly of the Amphictyons, and of firſt conſulting the oracle, which was called Προμαντεια. From this time the authority of the Amphictyons began to decline; for he claimed the right of preſiding even by proxy both in this aſſembly and in the Pythian games, of which games the Amphictyons were judges and agonothetæ in virtue of their office. This Demoſthenes reproaches him with in the third Philippic: "When he does not deign," ſays he, "to honour us with his preſence, he ſends his *ſlaves* to preſide over us." After the conqueſt of Greece by the Macedonians, this tribunal was deprived of its luſtre. Auguſtus, too, made ſome new regulations with reſpect to the ſtates, which were inveſted with the privilege of ſending deputies to this council. Though it ſubſiſted in the days of Pauſanias, as we have already mentioned, it was probably of ſo little repute in the age of Strabo, that this geographer looked upon it as in a manner annihilated.

The Romans never thought fit to ſuppreſs the meeting of the Amphictyons. Potter's Arch. Græc. Mem. Acad. Inſer. tom. iv. & vii. Æſchin. Orat.

AMPHIDOLI, in *Ancient Geography*, a ſmall town of Triphylia, in the territory of Elis. Steph. Byz.

AMPHIDROMIA, from αμφι, and δρομος, a *courſe*, in *Antiquity*, a feaſt celebrated the fifth day after the birth of a child, called *dies luſtricus*, or LUSTRAL *day*.

AMPHIDRYON, in *Eccleſiaſtical Writers*, a veil or curtain uſually drawn before the door of the BEMA in ancient churches.

AMPHIGENIA, in *Ancient Geography*, a town mentioned by Homer, ſituate in the ſouthern part of Elis, comprehended by the ancients in Meſſenia. In this town was a temple of Latona; and the inhabitants pretended that their town had given birth to Apollo.

AMPHILOCHI, a town of Spain, in Gallicia, founded by Teucer after his return from the Trojan war; and ſo called, as Strabo informs us, from the name of Amphilochus, one of his companions, now *Orenſe*.

AMPHILOCHIA, a country of Acarnania, ſituate to the eaſt of the Ambracian gulf, and watered by the river Inachus. The inhabitants were called Amphilochi, deriving their name from Amphilochus, the ſon of Amphiaraus, and their capital was denominated *Argos Amphilochicum*.

AMPHILOCHIS, a place of Peloponneſus, in Elis. Steph. Byz.

AMPHILOCHIUS, in *Biography*, a native of Cappadocia, was appointed biſhop of Iconium, the chief city of Lycaonia, about the year 370 or 374. In his youth he ſtudied rhetoric and practiſed law; but afterwards devoting himſelf to a religious life, he retired, with his friends Baſil and Gregory Nazianzen, into a ſolitary part of Cappadocia, called Ozizaia. After he was advanced to the epiſcopal office, he aſſiſted at the firſt general council of Conſtantinople in 381, and alſo at ſubſequent councils in 385 and in 394, ſoon after which he died. His eminence may be inferred from the ſeveral letters written to him by Baſil, and from the character given of him by Theodoret and others. Jerom joins him with Baſil, Gregory, and others, who were equally ſkilful in ſecular learning, and in the ſacred ſcriptures. Of his zeal againſt the Arians we have ample teſtimony from Theodoret Eccl. Hiſt. (lib. v. c. 16.) and Sozomen (lib. vii. c. 6.) and others. Being very deſirous of prohibiting Arian aſſemblies, and finding the emperor Theodoſius remiſs in complying with his wiſhes, he contrived to accompliſh his object by the following expedient. Whilſt he was in the palace with other biſhops, who were paying their reſpects to Theodoſius, he took no notice of his ſon Arcadius, who had lately been declared Auguſtus. When the emperor reminded him of this ſeeming diſreſpect, and recommended his ſon to notice, Amphilochius apologiſed by ſaying, that he had paid reſpect to him, and that was ſufficient. The emperor was diſpleaſed, and ſaid, that a ſlight put upon his ſon was an indignity to himſelf. You are angry, replied Amphilochius, with thoſe who ſlight your ſon, and cannot endure it: perſuade yourſelf then, that the God of the whole world is offended with thoſe who blaſpheme his only begotten Son, and hates them as ungrateful to their Saviour and Benefactor. This mode of reaſoning produced the wiſhed-for effect; and Theodoſius ſoon afterwards, A. D. 385. forbade the aſſemblies of heretics. But this was not the only way in which the biſhop manifeſted his diſlike of heretics; and the law procured for this purpoſe, and dated July 25, A. D. 383, is ſtill extant, which prohibits all heretics, particularly Eunomians, Arians, and Macedonians, to hold any aſſemblies of worſhip in public places, or private houſes. He wrote a book againſt the Maſſalians, and another work, entitled, "Of Pſeudepigraphal Books compoſed by Heretics," both which are loſt. "If they had been extant," ſays Dr. Lardner, "I ſuppoſe they would have given me more ſatisfaction than the law of Theodoſius, which affords not any argument:" nor was Amphilochius to be commended, adds this mild and candid writer, for procuring that law. A few fragments are preſerved of Amphilochius's book "Concerning the Divinity of the Holy Spirit," and his "Synodic Epiſtle," edited by Cotelerius. The Iambic poem, addreſſed to Seleucus, and containing a catalogue of the books of the Old and New Teſtament, has been aſcribed by many to Amphilochius;

philochius; but others are of opinion, that it was written by Gregory Nazianzen; they allege that the ſtyle is his, and that we have no information that Amphilochius ever wrote verſe. The poem, however, affords evidence of the care and caution of the ancient Chriſtians concerning books received as a part of ſacred ſcripture, and the rule of their faith. This and other pieces, probably ſpurious ones, were publiſhed by Combefis, at Paris, in 1644. Cave H. L. tom. i. p. 251. Lardner's Works, vol. iv. p. 411, &c.

AMPHILOCHUS, in *Hiſtory* and *Mythology*, the ſon of Amphiaraus, was no leſs famous as a diviner than his father. He accompanied Alcmeon, his brother, to the ſecond war of Thebes, and aſſiſted in killing his mother, according to his father's injunction. After the war of Thebes, he aſſiſted Mopſus in building the city of Mallus in Cilicia, where he had an oracle; and it is ſaid that he had an altar erected to him at Athens. The anſwers of the oracle at Mallus were given by dreams; thoſe who came to conſult it ſlept a night in the temple, and that night's dream was the anſwer required. Dion Caſſius mentions a picture done by order of Sextus Condianus, and repreſenting the anſwer he received from the oracle in the reign of the emperor Commodus. In the time of Lucian (in Philopſeud. tom. ii. p. 500.) Amphilochius was regarded by the ſuperſtitious and credulous multitude as a great prophet, and his oracle maintained its reputation. Gen. Dict.

AMPHIMACER, a foot in the *Ancient Poetry*, conſiſting of three ſyllables; the firſt and laſt whereof are long, and that in the middle ſhort.

The word is derived from the Greek αμφι, *circum*, and μακρος, *longus*, by reaſon both extremes are long.

Such are the words *ōmnĭūm, cāſtĭtās, γρᾱμμᾰτῶν*, &c. This foot is alſo called *creticus*, and ſometimes *feſcennius*.

AMPHIMACUS, in *Entomology*, a ſpecies of Papilio. Wings indented, above, black, with a broad bar of ſhining blue in the middle. Beneath, anterior wings white, poſterior wings cinereous. Inhabits India. The body is black. Wings above entirely black except the interrupted bright blue that extends towards the anterior margin. Beneath, from the baſe to the middle of the wings white, variegated with brown marks: on the poſterior pair behind a large white ſpot, and ſeven ſmall brown ones, with whitiſh pupils and circles along the poſterior margin. Fabricius.

AMPHIMALIA, or Amphimallium, in *Ancient Geography*, was a town of the iſland of Crete, according to Pliny, ſituate on the north ſide, and eaſt of Sydonia. It gave name to a gulf in the ſame part of the iſland. Sonnini ſuppoſes, that the Amphimale of the ancients is that narrow gulf, which is now formed by Cape Melecca on the weſt part, and Cape Trepani on the eaſt, and which penetrates nearly two leagues inland. Others place the harbour of Amphimale between Suda and Retimo, where is only a bad haven. Sonnini's Travels in Greece, p. 243. Olivier (Travels, vol. ii. p. 198.) informs us, that the ruins of Amphimale are ſtill viſible half a league from the ſea to the ſouth of the gulf of Suda. Theſe ruins are now the foundation of a Greek monaſtery.

AMPHIMALLUM, from αμφι and μαλλος, *a fleece of wool*, in *Eccleſiaſtical Writers*, *amphibalum* and *amphibolum*, from αμφι and βαλλω. See Amphiballus.

AMPHIMASCALOS, in *Antiquity*, a tunic or coat worn by the Greeks, with two ſhort ſleeves, ſo as to cover part of the arm to the elbow. In general the tunics of the men and women had not ſleeves like theſe parts of modern dreſs. The coats of freemen were amphimaſcaloi, or had two ſleeves; thoſe of ſlaves only one, and were called ετερομασκαλοι.

AMPHIMEDON, in *Entomology*, a ſpecies of Papilio, with wings uniformly brown, the anterior pair radiated with white: five connected red ſpots in the middle of the poſterior pair, with white lunules. The body is large, brown; anterior part of the thorax variegated with three red lines. From Amboyna. Fabricius.

AMPHIMONE, a ſpecies of Phalæna, of the *Bombyx* family. Wings entire, pale aſh-colour, with two black ſtreaks, and a fulvous dot in the middle of the anterior pair. Deſcribed by Fabricius from a ſpecimen in the cabinet of Sir Joſeph Banks. Inhabits Terra del Fuego. The antennæ are greatly pectinated, body hairy, two yellowiſh lines on the thorax, abdomen with black belts, a ſingle ſtraight ſtreak on the poſterior wings beneath. Fabricius.

AMPHINOME, a ſpecies of Papilio, with indented wings, above black, clouded with numerous blue marks: an oblique white bar acroſs the anterior wings; beneath the lower wings radiated with red. A native of South America. Linnæus.

Amphinome, in *Mythology*, one of the 50 Nereids, according to Homer.

AMPHION, in *Entomology*, a ſpecies of Hesperia. Wings entire, blue, margins black: beneath cinereous, with black ocellated ſpots; poſterior wings, with red lunated marks, black points, and golden characters. A native of Germany. Fabricius.

Amphion, in *Ancient Hiſtory*, the twin brother of Zethus, was the ſon of Antiope, the greateſt beauty of Greece, by Epopeus, king of Sicyon, or, as Homer ſays, by Jupiter. Having ſeized the crown of Thebes, in Bœotia, from Lagus, the father of the unfortunate Oedipus, he called the metropolis of the Theban government, or at leaſt the lower city, Thebes, in honour, as it is ſaid, of Thebe, their aunt by the mother's ſide. Homer ſays, that to ſecure the crown which he had uſurped, he incloſed the city of Thebes with a wall, fortified with ſeven gates, and a number of ſtately towers at a convenient diſtance from each other. Homer, however, does not ſay a word of the miraculous powers of Amphion's muſic, nor of his building the wall, as fable reports, by the ſound of his lyre. Pauſanias and Pliny concur in relating, that he acquired his muſical reputation from his alliance with the family of Tantalus, whoſe daughter, Niobe, he had married: and both theſe authors ſay, that Amphion learned muſic in Lydia, and, bringing it from thence into Greece, was called the inventor of the Lydian mode. As to the effect of muſic in building the wall, we may obſerve, that he might probably captivate the people to carry on the work, by diverting them with the muſic of his harp, as well as perſuade them by his eloquence, which contributed to induce them, though in a ſtate of barbarity, to live ſociably and harmoniouſly together. We learn from Horace (Ars Poetica, i. 391.) that Amphion, after the example of Horace, employed the united powers of muſic and philoſophy in civilizing the Thebans.

> "Silveſtres homines ſacer interpreſque deorum
> Cædibus et victu fœdo deterruit Orpheus;
> Dictus ob hoc lenire tigres rabidoſque leones.
> Dictus et Amphion, Thebanæ conditor arcis,
> Saxa movere ſono teſtudinis, et prece blanda
> Ducere quo vellet. Fuit hæc ſapientia quondam,
> Publica privatis ſecernere, ſacra profanis;
> Concubitu prohibere vago; dare jura maritis;
> Oppida moliri; leges incidere ligno;
> Sic honor et nomen divinis vatibus atque
> Carminibus venit."

> "The wood-born race of men when Orpheus tam'd,
> From acorns and from mutual blood reclaim'd,

This

'This prieſt divine was fabled to aſſuage
The tiger's fierceneſs, and the lion's rage.
Thus roſe the Theban wall; Amphion's lyre,
And ſoothing voice, the liſt'ning ſtones inſpire.
Poetic wiſdom marked, with happy mean,
Public and private, ſacred and profane;
The wand'ring joys of lawleſs love ſuppreſs'd;
With equal rites the bonds of Hymen bleſs'd;
Plann'd future towns, and inſtituted laws;
So verſe became divine, and poets gained applauſe."
FRANCIS.

AMPHIPAGUS, in *Ancient Geography*, a promontory of the iſland of Corcyra, to the north weſt.

AMPHIPNEUMA, αμφιπνευμα, among *Ancient Phyſicians*, a great degree or ſpecies of difficult reſpiration.

AMPHIPOLES, from αμφι and πολις, *city*, in *Antiquity*, archons, or chief magiſtrates of the city of Syracuſe.

They were firſt eſtabliſhed by Timoleon, in the 109th Olympiad, after his expulſion of Dionyſius the Tyrant. They governed Syracuſe for the ſpace of three hundred years; and Diodorus Siculus aſſures us they ſubſiſted even in his time.

AMPHIPOLIS, in *Ancient Geography*, a city of Macedonia or Thrace, which was an Athenian colony, on the river Strymon, which ſeparated Macedonia from Thrace; but it is not certain on which ſide of the river it was ſituated. Pliny places it in Macedonia, but Scylax in Thrace. Thucydides (lib. iv. p. 320.) reconciles this difference of opinion by obſerving, that it was waſhed on two ſides by the river Strymon, which was divided from its mouth into two channels, in the middle of which the city ſtood, whence its name Amphipolis. *i. e.* αμφι and πολις; and on the ſide towards the ſea there was a wall built from channel to channel. M. d'Anville gives another etymology of the name, and ſays, that it ſignifies a town belonging to two countries, *viz.* Macedonia and Thrace. The ancient name, according to Herodotus, (lib. vii. c. 114.) and Thucydides (ubi ſupra) was Εννεα οδοι, or the *nine ways*; and it was called *Acra*, *Eion*, whence the Turks have formed *Jamboli*, *Myrica*, *Chrademna*, *Chryſopolis*, or *Chriſtopolis*. The inhabitants were denominated *Amphipolitani*. Livy. It was founded thirty years after the defeat of the Perſians in Greece; and Miltiades conducted a colony into it. Philip, king of Macedon, drove the Athenians from Amphipolis, and permitted the inhabitants to form a republic. The Athenians, however, always conſidered it as belonging to them; and Braſidas, the Lacedæmonian general, took it from them. Nevertheleſs, Philip recovered it, and promiſed to reſtore it to the Athenians: but when he became maſter of it, he obtained a ſurrender of it by a treaty of peace.

AMPHIPOLIS was alſo a town of Syria, on the Euphrates; its Syrian name was *Turmeda*. It was either founded by Seleucus, or enlarged and adorned by him; and he changed its ancient name. It is the ſame with the *Thapſacus* of Pliny.

AMPHIPPI, in *Antiquity*, thoſe who practiſed riding on two horſes, by jumping from one to the other.

The word is Greek, αμφιπποι; they are ſometimes alſo called ἱππαγωγοι, and ſometimes by corruption, ανιππει. The appellation was given to a ſort of cavalry in the Grecian armies, who, for their conveniency, had two horſes a piece, on which they rode by turns, leading the other.

AMPHIPRORÆ, from αμφι and πρωρα, *prow*, were ſhips which had prows at both ends, that no time might be loſt in turning them, and alſo on account of the rapidity of ſtreams, and narrowneſs of channels.

AMPHIPROSTYLOS, or AMPHIPROSTYLE, in *Ancient Architecture*, is characteriſtic of a particular kind of TEMPLE, which had a PORTICO of four columns, crowned with a PEDIMENT in front, and another of the ſame form in the back, front, or rear. The portico in front was denominated the PRONAOS, and that in the rear the POSTICUM. The word is compoſed of αμφι *both*, προ *before*, and στυλος *column*, and ſignifies "columns in both fronts."

Vitruvius, in the firſt chapter of his third book, deſcribes ſeven ſpecies of temples differing from each other in the number and arrangement of their columns, of which the amphiproſtylos is the third. It is diſtinguiſhed from the firſt and ſecond ſpecies, by having columns in both its fronts, and from the peripteral and pſeudo-peripteral kinds, by having only four columns in each front, and more eſpecially by not having any on the flanks. It is remarked by Saumaiſe that the Chriſtians never made entrances in the rear of their temples with PORCHES or porticos, ſimilar to thoſe in the front, and for this reaſon the French have no word to expreſs the poſticum of the Latins, as diſtinguiſhed from the pronaos, which they denominate the "*Porche*." The ſame remark is true with regard to the Engliſh, and probably to all other Chriſtian nations.

AMPHISA, in *Ancient Geography*, a river of Greece in Meſſenia, which diſcharged itſelf into the Balyra, according to Pauſanias, lib. iv. Meſſen. c. 23.

AMPHISO, in *Mythology*, one of the nymphs called Oceanides.

AMPHISBÆNA, in *Zoology*, the name of a genus of ſerpents in the Linnæan ſyſtem, in ſome reſpects allied both to that of Anguis and Lacerta; like the Cæcilia it is deſtitute of ſcales, but its ſkin appears completely annulated, or marked with numerous circles that ſurround the body and tail. This is the Linnæan character of the genus, to which may be added that the body is equally ſmooth and cylindrical; and the tail obtuſe, and ſcarcely to be diſtinguiſhed from the head.

Gmelin enumerates five ſpecies of this genus, *viz. fuliginoſa*, *varia*, *magnifica*, *flava*, and *alba*.

1. *Fuliginoſa*. Rings of the body two hundred; of the tail thirty. This ſpecies is white, variegated with black or dark brown, and the head is without ſpots.

2. *Varia*. Variegated with white, black, cheſnut and grey.

3. *Magnifica*. Variegated with purple, violet, and yellow; head yelloviſh, and a purpliſh ſtreak over the eye.

4. *Flava*. Variegated with white and brown; head yellow.

5. *Alba*. Rings of the body two hundred and twenty-three; of the tail ſixteen. The head of this is annulated on the fore-part, and narrowed into an obtuſe ſnout. Found near ant-hills. Gmelin has relied chiefly on Seba in diſcriminating the characters of theſe ſpecies; yet it may be doubted whether that authority is ſufficient. The number of annular rings round the body and tail, and which Linnæus conſidered as the beſt ſpecific diſtinction, is only mentioned in two ſpecies, *fuliginoſa* and *alba*; the characters of the others, being only taken from the variations in their colours, are not ſatisfactory. The five kinds mentioned by Gmelin are natives of America.

Dr. Shaw ſeems to have conſidered the three ſpecies, *varia*, *magnifica*, and *flava*, as varieties of *fuliginoſa*; for he obſerves, that only two ſpecies of this genus, *amphiſbæna*, have hitherto been diſcovered, *viz. alba* and *fuliginoſa*. A. alba is from fifteen to eighteen inches, and ſometimes two feet in length; the colour white, but ſometimes inclining to pale yellow or brown; the head very ſhort, the eyes very ſmall; the mouth of moderate width, the teeth ſhort, ſtrong, not very ſharply pointed, and conſtituting a ſingle row of about fourteen or ſixteen in each jaw; the tongue very large broad, thick, flattiſh, and bifid only at the tip, the ſurface of the

the baſe appearing ſcaly. This is found in woods preying on inſects, worms, &c. It is a harmleſs animal, but it is ſaid, that on handling it for ſome time the ſkin becomes affected with a ſlight itching, accompanied by ſmall puſtules, owing to an acrimonious moiſture exuding from the animal. A. fuliginoſa is rarely ſo large as the preceding ſpecies, which it reſembles in its manners, and is equally harmleſs. The Count de Cepede obſerves, that above the vent is a row of ſmall perforated papillæ, ſimilar to thoſe in many of the lizard tribe. The ſkin of the amphiſbæna is remarkably ſtrong and tenacious, and of a ſmooth and gloſſy ſurface, and it is probable that they are enabled with great facility to perforate the ground ſomewhat in the manner of earth worms, in order to obtain occaſional ſupplies of food. Dr. Shaw. Zool.

AMPHISBÆNA *aquatica*, a name given by Bertrutius, Albertus, Geſner, and other authors, to that long, ſlender worm, called by Aldrovandus and others, the *ſeta aquatica*, &c. This is the *Gordius aquaticus* of Linnæus. See GORDIUS.

AMPHISCII, formed from αμφι, *about*, and σκια, *ſhadow*, in *Geography* and *Aſtronomy*, the people who inhabit the torrid zone.

They are thus denominated, as having their *ſhadow* turned ſometimes one way and ſometimes another, *i. e.* at one time of the year to the north, and at another to the ſouth.

AMPHISMILA, or AMPHISMELA, an anatomical knife, edged on both ſides.

The word is formed from αμφι, *utrinque*, *on both ſides*, and σμιλη, *knife*.

AMPHISSA, called by Herodotus AMPICEA, in *Ancient Geography*, the chief city of the Ozolean Locrians, about 15 miles to the weſt of Delphi, ſituate on the river Evenus, and ſo called becauſe it was ſurrounded by mountains, according to Steph. Byz. but Pauſanias deduces the origin of the name from Amphiſſa, who had a monument erected to her honour in this place. On the ſummit of a hill near the town was a temple of Minerva, with her ſtatue in bronze. The people of the country thought this was one of the ſpoils of Troy, but Pauſanias repreſents it as an ancient Greek work. Amphiſſa was taken by the Phocians, and deſtroyed with the reſt of the Phocian cities in the holy war; and when it was rebuilt, Pauſanias ſays that it took the name of *Ophitea*, if the text has not been corrupted by his tranſcribers. *Amphiſſa* was alſo ſaid to have been the name of a town of Magna Græcia, at the mouth of the Sagra, in the Farther Calabria, ſituate between Locri and Caulona, and now called *Rocella*; but ſome have doubted the exiſtence of ſuch a city.

AMPHITAPÆ, in *Antiquity*, a kind of carpets, or clothing, having a ſoft warm knap on each ſide.

AMPHITHEATRE, in *Architecture*, is an edifice of an elliptical form, conſiſting externally of two or more ſtories of open ARCADES with a number of interior GALLERIES and arched paſſages, ſuſtaining and ſerving as communications to ſeveral ranges of ſeats, riſing one over another round a ſpacious area, called the ARENA, on which the combats of wild beaſts and other ſpectacles were exhibited.

The word is derived from αμφι, *around*, and θεατρον, *theatre*, ſo that amphitheatre ſignifies a place in which the ſpectators, ranged circuitouſly, ſaw equally well from every ſide. It was alſo called *viſorium* by the Latins.

The hiſtory of amphitheatres, though it occupies no remote or extenſive period of time, is intereſting from its peculiar connection with the manners of the ancient world, and thoſe which ſucceeded the eſtabliſhment of the Chriſtian religion; the riſe and ſplendour of theſe edifices being occaſioned by the ferocious barbarity of the former, and their ſubſequent diſuſe and ruin by the milder character of the latter. They are undoubtedly of Roman invention, in the latter ages of the republic; yet becauſe the combats of GLADIATORS were, among other ſpectacles, exhibited on the Arena, their origin has been aſcribed to the ETRURIANS, with whom it is ſaid they were ſacred edifices ſet apart for ſuch combats, and with them deſcended from that people to the Romans. "Religion," we are told, "in ETRURIA preſided at theſe games, and elevated amphitheatres." An aſſertion that is certainly unfounded. Among the Etrurians gladiatory combats were exhibited at feaſts as well as at funerals, and probably they were no otherwiſe religious inſtitutions than as the occaſion made them ſo, like the foot-races and other conteſts with which the ancients honoured the dead. In the earlieſt times they were preſented before the funeral pile, or at the tomb of the deceaſed, and afterwards in the ſquares and open places of cities, as we learn from Vitruvius, who informs us that the Italians made the INTERCOLUMNS of their FORUMS more ſpacious than thoſe of the Greeks, "becauſe, by ancient, cuſtom, the ſhows of gladiators were uſually given in the forum." This continued to be the practice of the Romans for upwards of 200 years after the introduction of thoſe combats among them, from whence it may be inferred, that neither the Etrurians nor the Romans had any edifice like an amphitheatre till the period we have mentioned; and it is evident that ſuch edifices were not ſo neceſſary for the exhibition of gladiatory combats, as to be religiouſly appropriated to them from time immemorial.

The Romans had an inordinate paſſion for ſpectacles of every kind, and eſpecially for ſuch as were ſanguinary and terrible; a diſpoſition which their rulers politically encouraged, as tending to preſerve that unconquerable ſpirit which made them maſters of the world. In the year of Rome 490, the firſt gladiatory combats were exhibited in that city not long after the ſucceſsful termination of the Samnite war had extended the Roman dominion not only over Etruria, but the whole peninſula of Italy. And in the year 502 wild beaſts were introduced among the public ſpectacles of Rome, by Lucius Metellus, who brought into the CIRCUS the elephants he had taken from the Carthaginians in Sicily. Theſe two kinds of ſhows were ſo conſonant to the taſte of the Romans, that they were ſoon converted into engines of political influence, and the candidates for popular favour vied with each other in exhibiting them with the greateſt ſplendour and expence. Gladiators were trained to fight as to a profeſſion, and hundreds of them were compelled to butcher one another in the forum, while every ſavage animal that could be procured from the foreſts of Africa or Aſia was brought to parade in chains, or to be hunted in the circus.

In the time of Pompey and Cæſar the combats of beaſts were given with a magnificence which we read of with aſtoniſhment, though far inferior to thoſe preſented by the emperors; and it is to theſe combats that we owe the invention of amphitheatres, as the name of *theatrum venatorium*, or *the theatre for hunting*, by which they were at firſt denominated, ſufficiently proves. It was found that theſe ſpectacles could not be ſeen equally well from every part of ſuch an extenſive place as the circus, interrupted as the proſpect was by the METÆ, and other buildings on the SPINA, nor could they be gazed on with the ſame eaſe and ſecurity as the combats of gladiators; for in the games given by Pompey the elephants made efforts to break down the barriers which confined them in the circus. Theſe circumſtances induced Cæſar, when not long after he entertained the people with

ſimilar games, to remove the metæ, and to ſurround the arena of the circus with a ditch, and probably ſuggeſted the expediency of conſtructing edifices, in which the people might enjoy their favourite diverſions without interruption or danger. This purpoſe amphitheatres were peculiarly adapted to anſwer; and, being equally convenient for gladiatory ſhows, they afterwards became the common THEATRE of both.

It is believed that the firſt building like an amphitheatre was formed of thoſe curious machines conſtructed by Caius Curio, one of the partizans of Cæſar, for the games he preſented at the funeral of his father. Curio cauſed two ca- [illegible] theatres to be built of timber, [illegible] ed [illegible], and placed back to back, [illegible] the people [illegible] diverſions till noon, when the [illegible] the two theatres, with [illegible] crowd of people [illegible] and formed an amphitheatre, in which gladiators contended [illegible]. This information we have from the elder Pliny; who, although he applauds the invention, exclaims against the [illegible] of the man, who dared to place the [illegible] of the world in ſuch imminent danger. [illegible] we are not told, and how much [illegible] have been exaggerated by Pliny, it is impoſſible to know, as the fact is not mentioned by any other writer [illegible] to determine whether [illegible] the firſt idea of an amphitheatre [illegible] Be this as it may, Julius Cæſar, a few years after, "erected a *hunting theatre* of timber, called [illegible] an *amphitheatre* becauſe the ſeats were placed round it without ſcenes," in which he exhibited both the combats of wild beaſts and of gladiators. This edifice, from the words of Dio above quoted, [illegible] claim to be conſidered as one of the firſt fabrics of the kind.

From this time, during the reign of Auguſtus and the ſucceeding emperors down to Veſpaſian, many other amphitheatres of timber were erected in Rome and in the provinces; but not any of thoſe, except one by Statilius Taurus, in the time of the firſt-mentioned emperor, which does not appear to have been held in much eſtimation, as it was ſeldom uſed in the ſplendid ſpectacles ſubſequently exhibited; nor could it be entirely of ſtone, as it was deſtroyed by fire in the reign of Nero. Theſe timber amphitheatres were ſometimes only temporary ſtructures, raiſed and taken down as occaſion required, though ſome of them were fixed and embelliſhed as permanent buildings. Auguſtus, whoſe policy induced him to encourage every public amuſement that intereſted the people, is ſaid to have conſtructed ſeveral. Caligula began one, but did not live to complete it. Nero, who delighted in gladiatory combats, alſo erected an amphitheatre of timber, which was near a year in building. This is deſcribed by Tacitus as a ſumptuous fabric, and capable of containing a great number of perſons. In the time of Auguſtus, Herod of Judea built amphitheatres at Jeruſalem and Cæſarea. In the reign of Tiberius a large one was erected at Fidenæ, a town in the vicinity of Rome, which ſuddenly fell while the games were exhibiting, when, according to Tacitus, upwards of 50,000 perſons were either killed or dangerouſly hurt. There was another at Placentia, celebrated as the largeſt in Italy, which was burnt in the war between Vitellius and Otho.

Accidents like thoſe at Fidenæ and Placentia, both in theatres and amphitheatres, had undoubtedly been frequent in Rome, as well as in the provinces, and turned the public attention to ſtructures that were ſecure from conflagration, and of ſtrength ſufficient to ſuſtain the multitudes by which they were crowded. With regard to theatres an example had been given by Pompey, who firſt conſtructed a theatre of ſtone, and drew upon himſelf the cenſure of the ſatiriſts for thus luxuriouſly deviating from the ſimplicity of ancient practice. Statilius Taurus, as already mentioned, had alſo erected a ſtone amphitheatre, though it appears to have been of little conſideration; and Auguſtus, who, as it is ſaid, intended to have conſtructed one of more ample dimenſions in the centre of Rome, on the very ſpot where the coliſeum was afterwards erected, did not carry his deſign into execution. This was reſerved for Veſpaſian and Titus; the former began the Flavian amphitheatre in his eighth conſulate, which was completed by his ſon Titus, and is deſervedly celebrated as a prodigy of building among the ancients. Martial is laviſh in its praiſe, and Caſſiodorus aſſerts, that the expence of it would have built a capital city. At the ſolemn games exhibited when this fabric was dedicated, 5000 wild beaſts, according to Eutropius, and 9000, according to Dio, were deſtroyed on its arena. When the hunting was concluded, the arena was ſuddenly filled with water, in which aquatic animals were made to contend; and afterwards a ſea-fight was exhibited repreſenting a conteſt between the Corinthians and Corcyrians, whoſe wars are related by Thucydides. If Martial may be credited, people from every part of the world crowded to Rome to be preſent at theſe games. This ſtupendous pile has been, from time immemorial, called the Coliſeum, according to ſome authors, from a coloſſal ſtatue of Nero, which ſtood at a ſmall diſtance from it; but more probably from its coloſſal ſize, when compared with other buildings.

The Flavian amphitheatre became the model of many others that were ſubſequently erected by the emperors, or by the people of different countries deſirous of ſharing in the diverſions of the imperial city. Of theſe the moſt remarkable were at Capua and Verona in Italy, at Nimes in Languedoc, at Pola in Iſtria, and Italica in Spain. The veſtiges of others are ſaid to be ſeen at Alba, a ſmall city of Latium, and at Otricoli, a city of Umbria; the remains of one are found near the Garigliano, formerly the river Lyris. At Puzzuoli ſome of the arches and cells of another are ſtill exiſting. There are veſtiges of one at the foot of Mount Caſſino, near the houſe of Varro, and of one at Pœſtum in Lucania; of others at Syracuſe, Agrigentum, and Catania in Sicily; at Gortina and Gerapitna in Candia, and at Argos and Corinth in Greece. In France there was one at Arles, and one at Autún. The latter, it is ſaid, conſiſted of four ſtories, like the coliſeum. There are alſo veſtiges of amphitheatres in Britain, near Sandwich in Kent, at Caerleon in Monmouthſhire, (the *Iſca Silurum* of the Romans), and in other places.

But it cannot be ſuppoſed that all theſe amphitheatres could deſerve to be named as edifices, when compared with the original model, "*the Flavian Amphitheatre.*" Some were little more than natural vallies, with benches cut in the declivities of the ſurrounding hills like the amphitheatre at Corinth. In ſome places benches of ſtone were placed on the declivities of two hills, and the ellipſis completed by works of maſonry at the extremities, like that of Gortina in Candia. Some were elliptical excavations with benches of turf, like that near Sandwich in Kent, and moſt of the Caſtrenſian amphitheatres (for ſuch was the general rage for amphitheatric diverſions, that ſcarcely any camp, or fixed military ſtation, was without its amphitheatre of turf or timber). Some were partly excavated and partly conſtructed with maſonry, like the amphitheatres of Pœſtum and Caerleon; ſome had their exterior circuit conſtructed of maſonry, and the ſeats and ſtaircaſes of timber, like that of Pola in

in Iſtria; while others aroſe on a ſimilar plan, and with nearly the ſame ornaments of architecture as the Flavian amphitheatre. Such were the amphitheatres of Capua, Verona, Nimes, and Autun.

In theſe various ſtructures, the combats of gladiators and the battles of beaſts continued to be exhibited for near 250 years, in which time an incredible number of beaſts and men were deſtroyed, and not unfrequently were they ſanctified by the blood of the early Chriſtians, who were devoured at a ſtake, or compelled to fight, for the gratification of the Pagan populace. At length Providence ordained that Chriſtianity ſhould become the religion of the ſtate, and its lenient ſpirit gradually changed the barbarous amuſements of the ancient world for others more congenial to the humanity of its doctrines. In the year of our Lord 325, Conſtantine the Great prohibited by law the exhibition of gladiatory combats in the eaſt, but they were not finally aboliſhed in Rome till the reign of Honorius, who, in the beginning of the fifth century, baniſhed all profeſſional gladiators out of the country. This was occaſioned by the murder of a monk named Telemachus, who, on ſome ſolemn day, was deſtroyed by the people, while he was exhorting them to deſiſt from their ſanguinary diverſions. The combats of wild beaſts, however, continued both in the eaſtern and weſtern empires for ſome time after theſe events, but gradually became leſs frequent and leſs magnificent, till in the courſe of the ſixth century, they were every where totally aboliſhed; and amphitheatres being diſuſed for theſe purpoſes, were, in a great degree, abandoned to the depredations of men and the injuries of weather. At Verona and other places, during the middle ages, they were ſometimes uſed for judicial combats and for tilts and tournaments; but theſe cuſtoms having alſo paſt away, they have ſince fallen into general neglect, and conſequent ruin.

It is not eaſy by a verbal deſcription to convey an adequate idea of the conſtruction of an amphitheatre, and the means by which ſuch a number of perſons crowding to theſe edifices could have ingreſs and egreſs without confuſion; but, with the aſſiſtance of the ſectional diagram in *Plate* II. of *Architecture*, and an occaſional reference to the plans and ſections of ſuch amphitheatres as yet remain, theſe particulars may be eaſily underſtood. We have already obſerved, that the exterior circuit conſiſted of two or more ſtories of arcades; theſe varied in number according to the extent of the amphitheatre. On the ground floor they opened to an equal number of arched paſſages, and ſtaircaſes, tending like radii towards the arena, and were interſected by two or more arched paſſages, or CORRIDORS, that ſurrounded the whole edifice, and gave an uninterrupted communication to every part. Sometimes in the middle o the fabric there was an intermediate gallery, which, like thoſe on the ground floor, ſurrounded the whole, and ſerved as a common landing-place to all the ſtaircaſes that led to the higher galleries, as in the amphitheatre of Nimes; and ſometimes each ſtaircaſe had its diſtinct landing, without any gallery of general communication, as in the amphitheatre of Verona. Of the radiating paſſages the four which were placed on the diameters of the ellipſis were uſually made wider than the reſt, and were alſo, by lateral arches, laid open to the adjoining paſſages on either ſide of them. Thoſe two which were placed on the ſhorter diameter were the principal entrances, by which the emperor, the ſenate, and other diſtinguiſhed perſonages were conducted to their ſeats on the PODIUM. The other two led directly into the arena by large arched gateways, and were appropriated to the beaſts and gladiators, who probably entered in ſome proceſſional manner, that required more width and elevation than the ordinary inlets. Theſe interior gateways ſtill exiſt at the extremities of the ellipſis, in the amphitheatres of Verona and Pœſtum, and in the former interrupt the continuity of the lower benches. Through the other paſſages the different orders of the people paſſed to the ſtaircaſes which led to their reſpective ſeats; and as every arch in the exterior circuit was numbered, and alſo the CUNEI, which ſeparated the people into claſſes, in the manner we ſhall hereafter mention, every one knew the paſſage which would conduct him to the place aſſigned by the laws of the amphitheatre to his rank and condition. Thoſe perſons whoſe dignity entitled them to a ſeat on the podium paſſed forward to the ſtaircaſe A, and aſcended to the doorways that opened upon that diſtinguiſhed place. Thoſe of the Equeſtrian order, or of ſuch rank as entitled them to a ſeat in the diviſion of benches next above the podium, aſcended by the ſtaircaſe B; while the other claſſes made uſe of the ſtaircaſe C, which aroſe to the floor of the intermediate landing or corridor E; and then either aſcended by the ſtaircaſe F to the ſecond diviſion of benches, or by the ſtaircaſe D to the ſecond exterior corridor, and from thence by the ſtaircaſe G to the third diviſion of benches, and higher ſtill by other ſtaircaſes in a different direction, to the third exterior corridor, which communicated with the uppermoſt diviſion of benches. Thoſe different ſtaircaſes were reſpectively oppoſite to different arches, and approached by diſtinct paſſages, though, for the ſake of perſpicuity, we have repreſented them in a ſingle diagram.

The doorways, which opened from the ſtairs and paſſages, were denominated VOMITORIES. The number of theſe varied, according to the ſize of the amphitheatre, and the number of exterior arches. In the amphitheatre of Verona there were 60 of them, placed in four elliptical rows alternately over alternate radii, ſo that the firſt and third were on one radius, and the ſecond and fourth on another. In the higheſt circuit there were 16, in the next to it 16, placed at equal diſtances, in the next to that 16, but not all at equal diſtances, as the BALCONIES over the great gates of entrance to the arena occupied the places of two at the extremities of the ellipſis; but the number was ſupplied by two over the ſhorter diameter, where otherwiſe there would have been but one. On the lower line there were 12 which opened upon the podium. The number of benches between the ſeveral ranges of vomitories was unequal, and probably was not determined by any poſitive rule. The benches were about two feet four inches broad, and one foot eight inches high. Before every range of vomitories one bench was omitted, which left a platform four feet eight inches broad, (having a wall on the aſcending ſide three feet four inches high) which encompaſſed the whole, and ſerved as a communication to all the vomitories on the ſame level. Theſe platforms were called PRECINCTIONS, and the fronts of the walls, which bounded them on one ſide, were denominated BELTS. The latter were ſometimes embelliſhed with Moſaic work, and ſurmounted by BALLUSTRADES, to protect thoſe from falling, who were ſeated on the benches immediately above them. The podium was a platform that ſurrounded the arena, more ſpacious than the precinctions. Oppoſite to every vomitory a flight of ſtairs, two feet ſix inches wide, deſcended from one precinction to the belt or balluſtrade of the other. In the top of the benches, and cloſe to the edges adjoining to the ſtairs, ſmall channels were cut, by which the rain-water or urine flowed from bench to bench, till it reached certain pipes or conduits that conveyed it to the drains below. As theſe ſtairs radiated from the uppermoſt bench to the podium, they, with the precinctions, divided the whole interior concavity into wedge,

like portions, in which the ſpectators were ſeated according to their rank. Theſe were the Cunei, ſo frequently mentioned by writers, and which do not appear to have been well underſtood, has the term as been applied to very different parts of the amphitheatre. That the people both in the theatres and amphitheatres were placed in wedge-like diviſions, we learn from various paſſages in ancient authors. Apuleius ſays, ſuch ſpectators as could not get places on the marble benches, but ſtood in the paſſages or on the ſtairs, were "unwedged;" and Tacitus informs us, that when Nero placed ſoldiers in the amphitheatre to applaud his performances, they were diſtributed through all the "wedges," that every part might ring with applauſe.

With regard to the laws by which the people were arranged in amphitheatres, our information is very imperfect; but we may preſume the ſame regulations applied to amphitheatres and theatres, as far as the forms of the edifices coincided. We know that perſons of the higheſt dignity had their places on the podium, and in the middle of one ſide of it was the emperor's PAVILION, called the SUGGESTUM. Several of the wedges were aſſigned to the ſenatorial order, as the podium was not ſufficiently ſpacious to contain all the ſenators and other dignified perſons. Other *Cunei* were allotted to the Equeſtrian order, with whom the Tribunes, both civil and military, took their ſeats, of which the number was very great, as every man who had once filled the office retained the rank. The *Liberti* were cautiouſly excluded from theſe orders, and even the *Legati* were prohibited by Auguſtus from ſitting among the ſenators, becauſe ſome Liberti had been ſent in that character. The married men had places diſtinct from the unmarried. The young men had their appropriate ſeats, and their tutors ſat in other ſeats near them, that they might obſerve their behaviour. The attendants and official ſervants of dignified perſons had ſeats conſtructed of wood in the higher parts of the building. The places for the veſtals were on the podium, and the princeſſes and ladies of high diſtinction frequently ſat with them; but the front of the gallery, which roſe above the gradations of benches, was eſpecially appropriated to the women, where they ſat on chairs, and the loweſt order of the Plebeians ſtood behind them. Theſe were the leading diſtinctions of rank and claſſes; but for popular accommodation different wedges were, in all probability, allotted to different tribes. The Cunei were all numbered as before mentioned; but it is a miſtake to imagine that every man had his particular ſeat numbered and ticketed, for ſometimes all the Cunei were filled, and the precinctions, and ſtairs ſo crowded, that many perſons who were entitled to places within certain precincts, were obliged to aſcend to the gallery, and mingle with the plebeians behind the women. By ſuch arrangements as we have ſpecified, which relate chiefly to the Roman amphitheatre, and which undoubtedly were varied in the provinces, as the ranks and claſſes of people differed from thoſe of Rome, all confuſion and diſorder were avoided. The general care of the amphitheatre was given to an officer named the VILLICUS AMPHITHEATRI, and the Cunei were under the direction of other officers, called LOCARII. The ſtricteſt attention was exerted to prevent any one from occupying a place to which he was not entitled; and if a man was wrongfully compelled to quit a ſeat he had taken, he conſidered himſelf as degraded and injured. See *Plate* VII. of *Architecture*.

The front of the podium, next the arena, was defended by ſtrong netting and rails of iron, armed with ſpikes, and alſo with ſtrong rollers of timber which turned vertically, to prevent the hunted animals from leaping over. The emperor's pavilion was lined with ſilk, and otherwiſe highly embelliſhed. The ſeats of the principal perſons were covered with cuſhions, the marble benches in general with boards, and over all an awning of woollen of different colours, called the VELUM, was occaſionally ſtretched to protect the ſpectators from the ſun and rain, which, by means of pullies and cords, could be let down and drawn up at pleaſure. Theſe articles, which may be denominated the furniture, were almoſt the only combuſtible parts of the fabric, and in the Flavian amphitheatre they were, at different times, deſtroyed by lightning, and particularly in the reign of Macrinus, when ſo much damage was done to that building, that the public games were performed in the circus for ſeveral years after.

It has been aſſerted that amphitheatres had an underground ſtory, conſiſting of numerous dens and cells, in which the beaſts were kept for the games; but whoever conſiders the ſpace which, on the ground ſtory, was neceſſary for the ingreſs and egreſs of the people, and the difficulty of getting light, however ſmall the quantity requiſite, and of gaining convenient entrances to theſe ſubterraneous places, to ſay nothing of the inſufferable ſtench that the food and ordure ſuch numbers of animals would occaſion, will at leaſt acknowledge this to be improbable. As the coliſeum has not been examined to the foundations, we can ſay nothing with certainty with regard to the ſubterraneous parts of that fabric; but the amphitheatre of Verona was cleared in many places by Maffei, and nothing found but drains (ſee *Plate* VIII. of *Architecture*), which received the rain and other waters conveyed from above by channels in the ſtaircaſes. Among the paſſages, and under the ſtairs on the ground ſtory, are many cells and rooms that were probably priſons for criminals condemned to fight, or be devoured, in which the beaſts might occaſionally be ſtabled; but there is nothing to juſtify a conjecture that animals were conſtantly kept there. On the contrary, we learn from a paſſage in St. Chryſoſtom, that the beaſts intended for the public games were kept in the environs of cities, and Procopius makes particular mention of a ſpacious place in Rome called the VIVARIUM, appropriated to that uſe. It appears, that Lipſius and others were led to conjecture that animals were kept under the amphitheatre, by ſome paſſages in ancient authors, which deſcribe them as coming from ſubterraneous places into the arena. But it was ſometimes the practice to give novelty to the games, by erecting pieces of machinery on the arena, repreſenting mountains, on which real trees were planted, and under them hidden caves were formed, from whence the animals ruſhed out to encounter the combatants, or to devour their victims. It was probably to theſe caverns that ſuch ancient authors alluded, and not to any permanent caverns conſtructed under the amphitheatre.

Of the amphitheatres which merit particular notice, the coliſeum ſtands foremoſt in order of time and in magnitude. It was an ellipſis, whoſe longeſt diameter was about 615 Engliſh feet ſix inches, and the ſhorter 510 feet. The longer diameter of the arena was about 281 feet and the ſhorter 176 feet, leaving a circuit for the ſeats and galleries of about 157 feet in breadth. The external circumference, when complete, was about 1770 feet, covering a ſuperficies of about 246,651 feet, or ſomething more than five acres and a half, and could barely be included in a parallelogram of ſeven acres. Theſe dimenſions are taken from Deſgodetz, who appears to have examined the remains of this edifice with great care, and to have corrected many miſtakes of Serlio and Fontana.

The external elevation of the coliſeum conſiſted of three ſtories of arcades reſpectively embelliſhed with columns of the Doric, Ionic, and Corinthian orders; and an incloſed

PILASTRADE of the Corinthian order that aſcended to the uppermoſt cornice. The firſt ſtory of arcades was raiſed four ſteps, or about three feet ſix inches, above the ground, and the baſes of the columns ſtood on the pavement. In the two ſuperior ſtories the PIERS and columns were elevated on ſtylobatae or continued PEDESTALS, which ſerved as PARAPETS to the corridors. The pilaſtrade was alſo elevated on a STYLOBATA, in which were the windows of an intermediate gallery, and in every ſecond INTERPILASTER was another window that lighted the higheſt gallery. The building was crowned by a CANTALIVER CORNICE perforated with ſquare holes, three in each inter-pilaſter, through which the upright pieces of timber that ſupported the awning were paſſed to a range of CORBELS about the middle of the pilaſtrade. Theſe ſeveral ſtories of columns and pilaſters appear to have been continued, without break or interruption, round the whole external circuit; although on ſome medals, engraved by Maffei, there is a repreſentation of a PORTICO on one ſide, as if intended for the principal entrance. Whether this was ever executed, and in what manner, cannot now be determined, as there are no veſtiges of ſuch an additional ſtructure, unleſs the mutilations over the central arch, on the ſide next the Imperial palace, may be conſidered in that light. Piranezi ſays, that in this place there was a bridge which communicated with the portico of Claudius. The height of the firſt ſtory from the pavement to the top of the cornice is about 33 feet 6 inches, the ſecond about 39 feet, and of the third about 38 feet, of the pilaſtrade about 46 feet, and the whole height, including the ſteps and BLOCKING COURSE, about 164 feet. See *Plate* IV. of *Architecture*.

On the ground plan the exterior circuit of the ellipſis conſiſted of eighty open arches; the piers of which were about ſeven Engliſh feet, one inch broad, having three-quarter-columns in front of about two feet ten inches diameter; ſeventy-ſix of the arches were each about 13 feet 8 inches wide, and the four which anſwered to the four ſemi-diameters, about 14 feet two inches. Theſe arches opened into a ſpacious double corridor, that encompaſſed the whole, from thence radiated eighty paſſages and ſtaircaſes, which either led to two interior corridors and the arena, or aſcended to the galleries and vomitories above. This double corridor is a grand and diſtinguiſhing feature in the plan of the coliſeum. The firſt interior corridor was lighted by ſquare apertures in the floor of the precinction over it, and the corridor adjoining to the wall of the podium was probably lighted in the ſame manner. The ſecond ſtory had a double corridor over that on the ground ſtory, connected by paſſages on the ſame level, with an interior corridor from whence ſtairs, on one hand, aſcended to the ſecond range of vomitories, and on the other to an intermediate corridor, which formed an ENTRESOL or MEZZANINE-floor, over the interior circuit of the double corridor. In this mezzanine gallery, which was lighted by ſquare apertures in the floor of the gallery over it, the ſtairs commenced that roſe to the next ſtory. The third ſtory conſiſted of a double corridor, and muſt have contained the ſtairs that communicated with the galleries above, but it is too much in ruin to be accurately traced. In the interior wall are ſome windows, and the doorways or vomitories that opened on the uppermoſt cunei of benches. The fourth ſtory, in all likelihood, was that appointed for the women, and on the exterior wall there are veſtiges of ſtairs that led to the fifth gallery, which we conjecture was that allotted to ſervants, and furniſhed with benches of timber. This gallery contained four ſtaircaſes that led to a ſixth floor, which was, perhaps, appropriated to thoſe who managed the velum and had no other covering, and from this floor the four ſtaircaſes continued to the parapet or blocking courſe, which crowned the exterior wall. Theſe three upper floors were all comprehended externally in the pilaſtrade, but how their interior fronts were finiſhed we know not: we may, however, preſume, that they were ſo conſtructed, probably of timber, as to give the leaſt poſſible obſtruction to the proſpect, and perhaps nearly in the manner we have repreſented them in the perſpective ſection, *Plate* V. of *Architecture*, which with the plans in *Plate* III., and the ſections in *Plate* IV. will ſufficiently explain the conſtruction of this edifice.

The exterior circuit of the coliſeum is built of Travertine-ſtone, cramped together with iron without cement. The piers of the double corridor, the VOUSSOIRS of the arches, the heads of the partition walls and ſome BONDING COURSES are of the ſame kind of ſtone. The reſt is of brick. The OFFSETS of the front walls are all made on the outſide, ſo that its interior face is nearly perpendicular. Some of the internal walls have remains of ornaments in plaſter, and in others they are lined with marble. The floors of the corridors are paved with ſmall flat bricks and covered with a hard incruſtation of STUCCO. The columns in the three ſtories and the pilaſters are all of one diameter. The diminution of the columns commences from the third part of their height. In the firſt and ſecond orders they are three-quarter columns; in the third order ſemi-columns. The VOLUTES of the Ionic capitals, and the foliage and other embelliſhments of the Corinthian capitals, are only rough-hewn or BOSTED. All the mouldings except the IMPOSTS of the arches have the SOFFITS of their projections ſloping upwards or higher in front than rear, and in the ſame degree in the mouldings of the firſt order as in thoſe at the top of the edifice. This was frequently practiſed by the architects of antiquity, for the purpoſe, as many have conjectured, of giving the mouldings a greater apparent projection; but, as Deſgodetz juſtly obſerves, if the mouldings have in reality their due projection, to make them appear larger is to make them appear falſe, and as the ancients in all ſituations gave them the ſame degree of elevation, he thinks they had ſome other beſides optical reaſons for the practice. This edifice is not every where executed with exactneſs, many of the parts being out of level and larger in ſome places than others, perhaps the unavoidable conſequences of an immenſe number of perſons working upon ſuch an extenſive building at the ſame time, and the unequal ſettling of ſo many piers, placed upon a foundation of ſeventeen hundred feet.

This amphitheatre, according to Juſtus Lipſius, was capable of containing 87,000 ſpectators on the benches, to which number Fontana added 22,000 for the galleries, ſtaircaſes, and paſſages. But it will be found, that allowing two feet two inches to each ſeat, and 21 inches for each perſon, not quite ſo many as 50 thouſand could be contained on the benches, with the addition of one floor of the gallery, and ſuppoſing all the precincts and ſtaircaſes to be filled. If the higher galleries were completely crowded, perhaps about 30,000 more might be added, in all about 80,000; a number ſufficiently large without exaggeration.

A ſtructure of ſuch dimenſions, and of ſuch contrivance and ingenuity as that we have been deſcribing, throws into obſcurity the moſt magnificent works of the Greeks, and even when compared with the pyramids of Egypt, is more entitled to our praiſe, though leſs the object of vulgar admiration,

ration. The pyramids, if they be considered as buildings, are the works of barbarous grandeur, performed by ignorant labour, with little invention or ingenuity. The colifeum could not have been constructed till the art of building had arrived at its highest perfection, and probably would never have been constructed if the arch had not been invented, and its powers determined both experimentally and mathematically fome short space of time preceding. This, however, is conjecture. When this edifice was complete, its external afpect muft have been ftrikingly grand, from its magnitude, its loftinefs, and fimplicity of form; and the immenfity of its interior concavity, efpecially when crowded with [illegible] perfons, muft have been in the higheft degree impofing. Even now, when its benches and galleries are in ruins, and the arena filled with the accumulated rubbifh of twelve centuries, its remains are contemplated with aftonifhment. Yet this magnificent edifice, if it was completed by Titus, was erected in two years and nine months, a wonderful example of the energy of the Romans! However, there is a tradition in Rome, that 15,000 men were employed upon it for ten years, which, if true, will place the time of its being completed far in the reign of Domitian, though it was certainly dedicated, and the firft games exhibited within it, before the death of his brother. The colifeum has been pillaged greatly at various times, but moft by Michael Angelo, who carried away near one-half of the outward wall to build the Palazzo Farnefe. Pope Benedict XIV. to ftop thefe depredations, confecrated the ruins, and erected feveral altars, which on Fridays and Sundays were, before the French revolution, much frequented by devotees. A fmall building near the centre was furnifhed with accommodations for a hermit, who conftantly refided there to guard the facred relicts from the rude hands of ignorance and impiety, an office which we hope is ftill continued.

Of the amphitheatre of Verona only four arches of the external circuit were remaining at the beginning of the 18th century. They confift of three ftories of *unwrought* RUSTIC arcades, of which the two lower ftories were embellifhed with rufticated pilafters and entablatures, affignable to no legitimate order. In the third ftory, there were no pilafters, but capitals are executed under the architrave, as if pilafters had been originally intended. On the top of the higheft cornice there are two mutilated courfes of ruftic work, like the reft of the front, and the beginning of two plain pillars which has been fuppofed the commencement of a fourth ftory. The height of the three exifting ftories is about 90 Englifh feet. The whole of the edifice was erected without any cement, the ftones being nicely joined and fecured by iron cramps, covered with lead. The longer diameter of the ellipfis was 500 Englifh feet. The fhorter 405 feet. The arena was about 247 feet by 145. The exterior circuit was 1451 feet. The fuperficies 204.930 feet, or four acres and nearly one third of an acre.

The exterior circuit was divided into 72 arches, opening into a fingle corridor, furrounding the whole fabric, from whence radiated 72 paffages and ftaircafes, interfected by two other furrounding corridors. The greateft part of thefe exift, and by confulting the plans and fection in *Plates* VI. and VII. of *Architecture,* a clear idea may be obtained of their conftruction. The two grand entrances at the ends of the ellipfis were confiderably wider than the other paffages, and nearly of an uniform width from one end to the other. The GROOVES in the jambs of the remaining external piers fhew that the arches have been inclofed by gates; but whether this was the cafe at Rome and other places we know not. By the plan of the fecond ftory we find that the outward corridor was croffed by eight ftaircafes, which, rifing over the circuitous paffage-way, conducted the fpectators to the third corridor, and the uppermoft vomitories. The benches of this amphitheatre, 45 in number, remain, but not in their original places, having been moved and altered according to Maffei in the repairs, which the citizens of Verona, much to their honour, have from time to time made to this edifice. By contriving to make it occafionally ufeful as a place for public diverfions, they have preferved it from entire deftruction. As we drew our general defcription of the precinctions and cunei, as well as many other particulars, from this amphitheatre, it is unneceffary to repeat them here.

In *Plate* VIII. of *Architecture,* we have reprefented the fewers made for the purpofe of carrying off the water of the building. In the centre a well is obfervable that has no connection with the fewers, the ufe of which it is not eafy to conjecture, unlefs it was intended to receive fome maft or pole, erected for the purpofe of fupporting and working the velum. It is fix feet wide and very deep. The time of building this edifice is unknown, fome afcribe it to Auguftus, and others to the emperor Maximilian, but Maffei fuppofes it to have been conftructed by the citizens of Verona, during the reigns of Domitian and Nerva. The younger Pliny mentions a magnificent exhibition of gladiatory combats at Verona, which gives probability to the conjecture of Maffei. About 30,000 fpectators might have been crowded into this amphitheatre if the precinctions and ftaircafes, as well as the benches and gallery, were filled.

The elevation of the amphitheatre at Nimes confifted of two ftories of open arcades and an ATTIC. The lower ftory is very lofty, the arches tall and narrow, EXTRADOSSED, and feparated by buttreffes of two projections in the Gothic form, crowned by a Tufcan capital. A regular entablature encircles the building, and breaks in projection over every BUTTRESS. The fecond ftory is embellifhed with columns of the Tufcan order, feven diameters in height, over each of which the entablature breaks as in the order below. The arches on this ftory were originally defended by a parapet that rofe about three feet fix inches above the floor of the corridor, formed of one large flat ftone, with a funk PANNEL, on which various defigns were carved in bas-relief. On one which remains perfect, there is the reprefentation of a combat between two gladiators. The reft have been removed and their place fupplied by others of modern building. On the crown of the attic, directly over every pier, are two CONSOLES, projecting 20 inches before the face of the wall, pierced with a hole about eleven inches diameter. Through this hole the pole which fupported the velum was paffed to the cornice, where it refted in a focket of the fame dimenfions and about fix inches deep. Other holes are found in the benches at correfponding intervals, in which other poles were fixed, and the *velum* extended by pullies from one pole to another, as reprefented in *Plate* II. of *Architecture.* This method of fupporting the velum is more fimple than Fontana's, but it fhades only the upper ranges of benches, and leaves thofe where the perfons of higheft rank were feated, expofed to the weather; yet if we conjecture rightly as to the ufe of the well in the Veronian arena, the velum might have been further extended by other cords attached to a maft in the centre. See *Plates* II. and IX. of *Architecture.*

The exterior circuit confifts of 60 open arches, of which four at the extremities of the diameters " are ornamented with

with pediments, and formed the grand entrances." The other 56 led to the paſſages and ſtaircaſes, interſected by two corridors which encompaſſed the whole; one in the exterior of the building, and one near the wall of the podium which received light by iron grates from the arena. Another interior corridor or gallery, ſituated near the middle of the building, and nearly at equal diſtances of height between the two exterior ſtories, forms the common landing of the ſtaircaſes, and communicates both with the exterior gallery on the ſecond ſtory and the benches. The ſpectators aſcended by 20 ſteps, each nine inches high and twelve broad, into the intermediate gallery, and by 20 more into the exterior one on the ſecond ſtory. There is a fifth gallery in the attic, which was approached by narrow ſtairs, wrought in the body of the wall, and probably intended for the *velarii* or ſervants who managed the *velum*. This amphitheatre had no covered gallery ſurmounting the benches and looking upon the arena, like thoſe of Rome and Verona. All the radiating paſſages, as well as the four grand entrances, regularly decreaſed in height and width from the exterior corridor to the wall of the podium. It was the ſame in the amphitheatre at Arles, as may be ſeen in the only paſſage remaining.

The longeſt diameter of this edifice, extending from eaſt to weſt, is, according to Beaumont, corrected by another account, about 430 Engliſh feet, the ſhorter diameter 338 feet, and the whole height 76 feet ſix inches. The ſuperficies 126,273 feet, or ſomething leſs than three acres. The benches were originally 32 in number, from 18 to 24 inches high and from 18 to 24 in breadth. They were approached by three rows of vomitories, and were capable of containing about 17,000 ſpectators. The ſtones with which this fabric is conſtructed are of very large dimenſions; ſometimes cemented and ſometimes fixed with iron cramps and lead. In ſeveral places the impoſt of the piers is a ſingle ſtone, nine feet long, ſeven feet broad, and between two and three feet thick, and many of the ſtones, which form the benches, are eighteen feet long, two feet broad, and one foot eight inches high.

The viciſſitudes of the amphitheatre of Nimes upon record, are ſo numerous that it is wonderful it ſhould have been preſerved ſo well as it now appears. In the year 472 it fell under the dominion of the Viſigoths, who ſurrounded it with a ditch, built a caſtle within it, and converted it into a citadel. Part of the towers of the caſtle ſtill remains; but the ditch was filled up in the 13th century. In 720 it was taken by the Saracens, who were driven from it in 737 by Charles Martel. After that time it was occupied as a fortreſs by the counts of Provence, who ſuſtained a number of attacks in it, and built a church and a palace on the arena. The ſteeple of the church is ſtill in exiſtence. In 1226 the knights, who then guarded the citadel, yielded it to Lewis the VIII., and in 1391 it ceaſed to be a fortreſs and was evacuated, though the houſes continued. In 1533, that poliſhed monarch Francis the Firſt directed it to be cleared, which his ſubſequent misfortunes prevented from being done, and ſimilar orders were given by the late unfortunate Lewis the XVI., but the work has not yet been compleated.

Governor Pownall, who viſited Nimes in 1785, ſays, that the amphitheatre was filled with houſes arranged in ſtreets, and looked like a little walled town. The galleries on the ground ſtory and the intermediate gallery were converted into numberleſs miſerable habitations, but the exterior gallery of the ſecond ſtory and that in the attic were perfectly unencumbered as in their original ſtate. The date of this building is uncertain: but Monſ. Menard conjectures it was erected by Antonine, which places it between the years 138 and 161.

What remains of the amphitheatre at Pola, in Iſtria, is a ſingle elliptical wall of 72 arches, built on the declivity of a hill, having on the weſtern ſide, which looked towards the ſea, two ruſtic arcade ſtories with ruſtic Tuſcan pilaſters and entablatures, and on the oppoſite ſide only one arcade ſtory, the firſt being gradually loſt in the ſlope of the hill. Above the arcades is an attic ſtory of ruſtic wall, with 72 windows, which ſurrounds the whole, and in it are grooves and corbels for the poles that ſupported the velum. At the haunches of the ellipſis are four projecting buildings or towers, of two arches in width, having windows curiouſly filled with reticulated ſtone work in the attic, and doors and windows on every ſtory towards the arena. The ſecond ſtory of exterior arches in theſe projecting buildings are cloſed up as high as the impoſts, and the ſemicircle is filled with upright MULLIONS of ſtone like the loopholes of an Engliſh barn. Theſe towers have been called COUNTERFORTS by Serlio and others, but in all likelihood they were made for another purpoſe, as will be mentioned hereafter.

The whole of the exterior circuit of this edifice, excepting a very few yards of the parapet, was remaining when it was viſited by Maffei, and appeared with extraordinary beauty when viewed from the ſea. It was built with ſtones cramped together without cement. All the benches and other interior parts which were originally conſtructed of timber had long been deſtroyed. The longer diameter of the ellipſis is about 416 Engliſh feet, the ſhorter diameter about 337 feet. The circuit about 1182 feet, the ſuperficies 123012 feet, or about two acres and ſeven-eighths of an acre.

The Marquis Scipio Maffei, whoſe attachment to Verona made him unwilling to believe that amphitheatres exiſted in other places, inſpected this incloſure, and pronounced it to have been a theatre only, aſſigning the ſlope of the hill to the benches for the ſpectators, and the oppoſite ſide which is nearly level, to the orcheſtra and ſtage. The two towers on the weſtern ſide he ſuppoſed to have been conſtructed to repreſent the houſes in the ancient ſcene, and the other two on the eaſtern ſide to have been built for the ſake of uniformity only. All this appears highly improbable. The erecting of ſuch an extent of elliptical arcades as half this incloſure, for the actors, would have been a waſte of labour and expence to produce a work but ill adapted to its uſe, and if the towers had been intended to repreſent the fronts of houſes, they would not have had doors and windows on both the upper ſtories, as well as the arches which gave entrance on the ground ſtory; nor would ſuch appendages have been erected on the oppoſite ſide for the ſake of uniformity, when, in no point of view, they could be ſeen together. It is much more likely that the architect took advantage of the ſlope of the hill to place his benches on one ſide, and conſtructed them of timber on the other, and made the ſtaircaſes to the higher ranges in the four towers, which conjecture renders them uſeful as well as uniform, on every ſide. It is ſaid that veſtiges of ſuch ſtaircaſes actually exiſt, but if they did not, the diſpoſition of the apertures would juſtify the concluſion. There can be no doubt but the interior of this amphitheatre was filled with benches as high as the ſecond ſtory of arcades, and had a covered gallery on the attic ſtory. If this be not admitted we may aſk, why was there a range of windows in the attic ſtory? and for what uſe was the cornice or coping of the wall formed

to mad into a gutter, made to receive rain water from a roof?

The amphitheatre of Pœſtum is one of thoſe which had the arena and part of the benches ſunk below the ſurface of the earth and the excavation, encompaſſed by other benches and an arched ſtructure of ſtone. Neither Major's work on the ruins of Pœſtum, nor the Italian work on the ſame ſubject, publiſhed at Rome in 1784, by the Rev. Father Paul Antonio Paoli, enable us to form a clear idea of its conſtruction, or even the exact ſtate of its remains, and it would not have merited particular attention if it had not been made the baſis of an hypotheſis reſpecting the origin and progreſs of theſe edifices, which, however ſimple and pleaſing, does not appear to be true. The reverend father conjectures that the firſt public ſpectacles were given in ſmall vallies, and that the ſpectators beheld them from the declivities of ſurrounding hills. That afterwards, when they were exhibited in cities, excavations were made in the earth, and encompaſſed with benches of turf, upon which the people enjoyed their diverſions without incommoding one another. That the greater the number to be accommodated the more they ſunk the arena, and increaſed the ſurrounding ſlope; and finally, that they inclo ed it with walls of maſonry, and added other benches of ſtone till it was capacious enough to contain a vaſt multitude of ſpectators. This, he thinks, was the firſt method of forming amphitheatres, which the Romans improved into the magnificent ſtructures we have been deſcribing. The amphitheatre of Pœſtum he conſiders as an example of this ancient method, and ſuppoſing the excavated part to be of great antiquity aſcends to the time of the Etrurians, and adopts the opinions which we have briefly controverted in the beginning of this article. But, however plauſible this theory may be, if it depends on the antiquity of the Pœſtum amphitheatre, its probability will decreaſe in proportion as that antiquity becomes doubtful. The remains of this amphitheatre are indeed ſituated among temples, which are believed, though perhaps erroneouſly, to be very ancient; but it is difficult to believe that a city, which could erect ſuch temples, would be content with a ſimple excavation for the place of its public amuſements. As to the part which was built of ſtone, the arches at either end of the elliptical incloſure, prove it to be the work of a much later period; and if our conjecture be well founded that the invention of the arch and the firſt conſtruction of ſtone amphitheatres were nearly coeval, if not reciprocally the cauſes of each other, the date of that part will be fixed in the reigns of the firſt emperors, when the fame of the coliſeum and the paſſion for public ſpectacles ſpread through all the Roman provinces and tributary nations, and every country endeavoured to imitate in the manner beſt ſuited to its population and riches the amphitheatre of Rome. But in whatever age the amphitheatre of Pœſtum was made, its form alone is no proof of its antiquity, as the amphitheatre of Caerleon was formed in the ſame manner, and Britain might with equal reaſon produce it as an example of the earlieſt mode of forming amphitheatres, and from ſuch evidence contend with Lucania or Etruria for the honour of the invention. The length of the Pœſtum amphitheatre was about 211 feet, its width 151 feet, the ſuperficies 31861 feet, or about three quarters of an acre.

In the five different amphitheatres which we have deſcribed, will be found the principal varieties of theſe edifices in a gradation that may be amuſing to thoſe who will take the trouble to compare them. The dimenſions have been collected from the beſt authorities; and the calculations made and examined with care; but ſuch is the difference among authors in this reſpect, that the more we have conſulted the greater has been our uncertainty. Thus Beaumont gives the dimenſions of the amphitheatre of Nimes as 438 by 338 feet, while Governor Pownall ſtates them to be 400 by 300, and the difference between Fontana and Deſgodetz, with regard to the coliſeum, is not leſs conſiderable. Who can wonder that the dimenſions of the pyramids ſhould have remained doubtful from the days of Herodotus to the preſent, when we are uncertain as to the exact ſizes of objects in a manner under our eyes.

The writers on amphitheatres, moſt worthy of regard are the learned Juſtus Lipſius and the celebrated marquis Scipio Maffei. To the latter we have been greatly indebted, though we have not always adopted his opinions. Serlio, who deſcribed the ancient buildings of Italy, about the middle of the 16th century, deſerves more attention than he has received. His prints of the coliſeum, though rudely executed, and in places, incorrect, preſerve ſome particulars which later authors have omitted. The ſplendid work of Fontana on the ſame ſubject is very ingenious, but inaccurate, and full of improbable conjectures; we have, therefore, followed Deſgodetz in preference, who has trodden in the ſteps of Serlio, corrected his errors, and ſupplied his deficiencies; but even the plates of Deſgodetz are in a few inſtances incorrect and inconſiſtent with one another. Governor Pownall's "Antiquities of the Provincia Romana of Gaul," and Auguſtus Beaumont's "Select Views of Antiquities in the South of France," furniſh much information relative to the amphitheatre of Nimes and amphitheatres in general. "The Ruine della Citta di Peſto," by Father Paoli, contains ſome amuſing ſpeculations which are rendered doubtful by the amphitheatre of Caerleon, as deſcribed by Giraldus Cambrenſis, and that intelligent traveller Mr. Cox, in his "Tour in Monmouthſhire." Numberleſs other notices may be found in writers on local antiquities that illuſtrate this ſubject; a ſubject equally intereſting to the architect and the antiquary.

Amphitheatre is uſed by the French for the ſeats at the lower end of a theatre which riſe above the parterre, oppoſite to the ſtage, and occupy the ſpace of the front boxes and a part of the pit of an Engliſh theatre. They alſo give this name to an apartment appropriated to public ſcientific lectures and diſcourſes, filled with ſeats, riſing one above another, either in a ſemicircular form, or encompaſſing the whole room like the ſeats of an ancient amphitheatre. In the former caſe the ſcholars are in front of the lecturer; in the latter, he is placed in the central area, and ſurrounded by his ſcholars. Such ſchools in England are denominated theatres, as the theatre of the Univerſity of Oxford, the anatomical theatre at Surgeon's Hall, and the theatre of the Royal Inſtitute, in London.

Amphitheatre, in *Gardening*, is a lofty terrace, aſcended by flights of ſteps either ſtraight or circular, ſupported by banks and ſlopes of turf in various forms, and uſed to terminate the view from an alley or an opening in a thicket. This mode of decoration is alſo employed to give regularity to the ſide of a hill, and to gain an eaſy aſcent by means of ſlopes and platforms of turf to the ſummit. The banks and ſlopes are frequently embelliſhed with ſtatues, fountains, vaſes of flowers, clipt-yews, ſhrubs, and dwarf-trees, and ſometimes behind theſe are planted trees of nobler ſize, ſuch as pines and cedars. A taſte for gardening more conſonant to the beauties of natural landſcape, has nearly baniſhed this kind of amphitheatre from England; but it is not uncommon in gardens on the continent.

AMPHI-

AMPHITHURA, in *Eccleſiaſtical Antiquity*, a name given to the veil, or curtain, which divided the chancel from the reſt of the church.

The word is αμφιθυρα, thus called, on account of its opening in the middle, after the manner of folding doors.

AMPHITRION, in *Entomology*, a ſpecies of PAPILIO. Wings indented, above black, with an unequal yellow band; beneath, on the poſterior pair, a ſtripe of yellow dots, and blue lunulated marks. Linnæus. This is the Papilio Cambriſius of Cramer. The body is large, and without ſpots, general colour black, with an unequal row of yellow ſpots near the anal angle of the poſterior, but not connected with it. Under ſide of the poſterior wings black, with a ſtripe of ſeven large orbicular ſpots, and a ſtreak of blue lunulated marks, terminating at the anal angle in a yellow dot; the margin ſinuous with yellow. A native of America. Fabricius.

AMPHITRITE, Αμφιτριτη, from αμφι, and τριζω, *ſono*, in the *Heathen Mythology*, the wife of Neptune, daughter of Oceanus and Thetis, and goddeſs of the ſea, ſometimes taken for the ſea.

There was a ſtatue of Amphitrite in the temple of Neptune at Corinth, and another in the iſle of Tenos. Spanheim ſays, that ſhe is often repreſented like a Syren, with the upper part of the body to the waiſt like a female, and the lower part with the tail of a fiſh inſtead of limbs. Amphitrite was the mother of Triton. Two Nereids were alſo called by this name.

AMPHITRITE, in *Natural Hiſtory*, a genus of the MOLLUSCA order in the claſs of VERMES. The body is protruded from a tube, and is annulated; peduncle warted; feelers acuminated, approximated and feathered; and it is deſtitute of eyes. Linnæus. The ſpecies of this genus are Reniformis, Pencillus, Ventilabrum, Auricoma, Criſtata, Chryſocephala, and Plumoſa, which ſee.

AMPHITRYON, in *Mythological Hiſtory*, the huſband of Alcmena, was the ſon of Alcæus, and the father of Hercules; but leſs diſtinguiſhed by his own exploits than by thoſe of Alcmena, which it is of no great importance to recite.

AMPHODONTA, compounded of αμφι, and οδους, *tooth*, in *Zoology*, a deſignation given to animals which have teeth in both jaws, the upper as well as under.

AMPHORA, in *Antiquity*, an earthen veſſel, which ſerved as a kind of liquid meaſure among the ancient Greeks and Romans.

It is called in Homer αμφιφορευς, from αμφι and φερω, and by *ſyncope*, αμφορευς, on account of its two *anſæ*, or *handles* for carriage. It is the ſame with the quadrantale. But we meet with two kinds of *amphoræ* in ancient writers, the Italic and Attic.

AMPHORA, *Italic*, was that uſed by the Romans, and which is, therefore, ſometimes called the Roman amphora. The Italian amphora was alſo called *quadrantale*, and ſometimes *cadus*. It contained 72 pounds of wine or water, 80 of oil, and 180 of honey.

The amphora was equal to 2 *urnæ*, or 3 *modii*, 6 *ſemodii*, 8 *congii*, 48 *ſextaries*, 96 *heminæ*, 192 *quartarii*, or 570 *cyathi*, amounting to about 7 gallons one pint, Engliſh wine meaſure. Arbuthnot.

The ancient amphoræ were either *ſeſſile*, *i. e.* ſuch as would ſtand, or *non ſeſſile*, terminating in a ſharp bottom. Of both which kinds, we meet with figures on ancient medals.

The *amphora capitolina* was the ſtandard of this meaſure, which was kept in the capitol, to adjuſt others by.

Suetonius tells us of a man, who ſtood for the quæſtorſhip, and who drank an amphora of wine at one meal with the emperor Tiberius. Suppoſing the amphora to have been a cube of four feet each ſide, as Politian aſſerts it to have been, we may venture to ſay, that ten of the greateſt drinkers on earth could not have emptied it. Buddæus's computation is much more reaſonable; he makes the amphora of wine amount to about $4\frac{1}{4}$ gallons Paris meaſure.

AMPHORA, *Attic*, was that uſed by the Greeks, and therefore ſometimes alſo called the Grecian amphora.

The Attic amphora was one-third part bigger than the Italic; ſo that as the latter contained 2 *urnæ*, or 48 *ſextaries*, the former contained 3 *urnæ*, or 72 *ſextaries*, amounting to about ten gallons $5\frac{1}{2}$ pints Engliſh wine meaſure. This was called αμφορευς, ſometimes alſo κεραμιον, and, by way of diſtinction from the Roman kind, μετρητης.

AMPHORA was ſometimes alſo uſed as a dry meaſure, containing three buſhels; the ſtandard whereof was kept at Rome in the capitol, to prevent falſe meaſures.

AMPHORA is alſo uſed to denote the largeſt liquid meaſure in uſe among the Venetians. The amphora contains four *bigots*, ſeventy-ſix *muſtachi*, or two boats, or *muids*.

AMPHORA, in *Aſtronomy*, a name given to the ſign more uſually called AQUARIUS.

AMPHORARIUM *vinum*, in *Antiquity*, denotes that which is drawn or poured into *amphoræ* or pitchers, by way of diſtinction from *vinum doliare*, or caſk wine.

The Romans had a method of keeping wine in amphoræ for many years, to ripen, by faſtening the lids tight down with pitch or gypſum, and placing them either in a place where the ſmoke came, or under ground. Colum. Re Ruſt. lib. i. cap. 6. Plin. Nat. Hiſt. tom. ii. lib 2.3. cap. 1.

AMPHORITES, a kind of poetical conteſt, which obtained in the iſland of Ægina; in which an ox was given to the perſon who produced the beſt dithyrambic verſes in honour of Bacchus.

AMPHOTEROPLON, among *Civilians*, denotes a kind of naval inſurance, where the inſurers run the riſque both in the going out and return of a veſſel.

In this ſenſe the word ſtands oppoſed to *heteroplon*, where only the voyage outwards is inſured.

AMPHOTIDES, in *Antiquity*, a kind of defence, or armour for the ears, worn by the ancient Pugiles, to prevent giving their adverſaries a handle by that part.

Authors have not been well acquainted with the nature and office of the amphotides. Some explain them as a ſort of helmet for covering the noſe and ears.

Fabretti firſt aſcertained their real uſe, from the figure of a Pugil, which had amphotides over its ears joined by a piece coming over the forehead, and tied with ſtrings under the chin.

AMPHRYSUS, in *Ancient Geography*, a town of Phocis, called AMBRYSUS.

AMPHRYSUS, or AMPHRYSSUS, is alſo the name of a river of Phthiotis in Theſſaly, which ran by the foot of Mount Othrys. Virgil, in ſpeaking of this river, alludes to the time when Apollo, being a ſhepherd, guarded the herds of king Admetus, whence he is called "paſtor ab Amphryſo," Georg. lib. iii. v. 2. This river is alſo mentioned by Callimachus, Apollonius, Ovid, and Lucan. Another Amphryſus in Phrygia is mentioned by Pliny, to which was aſcribed the property of rendering women barren.

AMPLA, in *Conchology*, a ſpecies of VOLUTA. Shell elongated, aperture large, lip acute, wreaths of the ſpire ſcarcely viſible. Linnæus.

AMPLEPIUS, in *Geography*, a town of France, in the department of the Rhone and Loire, and chief place of a canton,

canton, in the district of Ville Franche, four leagues east-south-east of Roanne, and five west of Ville Franche.

AMPLEXICAULE, in *Botany*, denotes embracing the stalk, and is applied to a leaf whose base embraces the stalk sideways. See LEAF.

AMPLIATION, in a general sense, is used by some writers for the act of enlarging the compass or extent of a thing.

On a medal of the emperor Antoninus Pius we find the title *ampliator civium* given him, on account of his having extended the *jus civitatis*, or right of citizenship, to many states and people, before excluded from that privilege. In effect, this prince is generally supposed to have made the famous constitution, whereby all the subjects of the empire were made citizens of Rome. M. Spanheim refutes this notion, and makes the emperor Caracalla to have been the author of that constitution.

AMPLIATION, in the Roman *Law*, denotes the act of deferring a judicial sentence, either because the cause was not clear, or in favour of him against whom it is to pass.

Ampliation differed from *comperendination*, as the former was granted on the mere motion or pleasure of the judge, the latter at the petition of one or both the parties. Besides, the former was not limited to any certain time, whereas the latter could not be extended beyond the third day. Besides, ampliation might be repealed, which comperendination might not.

The first introduction of ampliation was in favour of the *rei*, or persons accused. But it was afterwards used on other occasions; *e. gr.* when certain witnesses were wanting, or the crime or the fact had not been sufficiently proved for a final decision, or the kind or measure of punishment was not agreed on, &c.

In these cases the prætor signified his intention, by pronouncing the word *amplius*, or the letters *N. L.* for *non liquet*, by which he denoted that the cause was not clear, but that the second action must be brought.

The person whose sentence, whether of condemnation or absolution, was thus deferred, was said to be *ampliatus*.

Hence the phrases, *bis ampliatus, tertio absolutus est reus.* Liv. xliii. 2.

AMPLIATION is also used, among *Schoolmen*, to denote the acceptation of a term for a different time from that signified by the verb in the proposition, e. gr. *justus peccavit*, i. e. *before he sinned he was just.*

AMPLIFICATION, in *Rhetoric*, part of a discourse or speech wherein a crime is aggravated, a phrase or commendation heightened, or a narration enlarged, by an enumeration of circumstances, so as to excite the proper emotions in the souls of the auditors.

Such is the passage in Virgil, where instead of saying merely that Turnus died, he amplifies the circumstances of his death.

> ——*Ast illi solvuntur frigore membra,*
> *Vitaque cum gemitu fugit indignata sub umbras.*

The masters of eloquence make amplification to be the soul of discourse. Longinus speaks of it as one of the principal means which contribute to the sublime: but he censures those who define it a discourse which magnifies things; this equally agreeing to the sublime, the pathetic, &c. The same author distinguishes amplification from the sublime by this, that the latter consists wholly in the elevation of words and sentiments, whereas the former consists also in their multitude: the sublime is sometimes found in a single thought; but amplification cannot subsist, excepting in abundance.

There is likewise a difference between the amplification and the proof; because the one serves to clear the point, and the other to heighten and exaggerate it; and therefore it requires a florid and beautiful style, consisting of strong and emphatical words, flowing periods, harmonious numbers, lively tropes, and bright figures.

There are two general kinds of amplification; the one of *things*, the other of *words*. The first is produced in divers manners; as, 1. By a multitude of definitions: thus it is Cicero amplifies on history: *Historia est testis temporum, lux veritatis, vita memoriæ, magistra vitæ, nuntia vetustati* 2. By a multitude of adjuncts; of which we have a fine instance in Virgil's lamentation for Cæsar's death, by enumerating the many prodigies and monsters that either preceded or succeeded it. *Vox quoque per lucos vulgo exaudita silentes ingens, & simulacra modis pallentia miris visa sub obscurum noctis; pecudesque locutæ, infandum! sistunt amnes terræque dehiscunt; et mœstum illacrymat templis ebur, æraque sudant.* 3. By a detail of causes and effects. 4. By an enumeration of consequences. 5. By comparisons, similitudes, and examples, &c. 6. By the contrast of antithets, and by rational inference.

Amplification by words is effected six ways. 1. By using metaphors. 2. By hyperboles. 3. By *synonima*. 4. By splendid and magnificent terms; as that of Horace, *Scandit æratas vitiosa naves cura, nec turmas equitum relinquit, ocyor cervis, & agente nimbos ocyor euro.* 5. By *periphrases*, or circumlocutions. 6. By repetition. To which may be added, by gradation.

AMPLITUDE *of the range of a projectile*, in *Gunnery*, denotes the horizontal line subtending the curvilineal path in which it moved. See PROJECTILE.

AMPLITUDE, in *Astronomy*, is an arch of the horizon, intercepted between the true east or west point, and the centre of the sun, or a star, at its rising or setting, so that the amplitude is of two kinds; *ortive*, or eastern, and *occiduous*, or western. These are also called northern or southern, as they fall in the northern and southern quarters of horizon; and the complement of the amplitude, or the distance of the point of rising or setting, from the north or south point of the horizon, is called the AZIMUTH.

To find the sun's or star's amplitude, either rising or setting, by the globe, see GLOBE.

To find the sun's amplitude trigonometrically; having the latitude and the sun's declination given. Say, as the cosine of the latitude is to the radius, so is the sine of the sun's or star's declination to the sine of the amplitude. Suppose, *e. gr.* the latitude to be that of London, *viz.* 51° 32′, and the declination 23° 28′; then cosine 51° 32′, or 9.7938317: rad. or 10.0000000 :: sine of declination 23° 28′ or 9.6001181 : 10.0000000 + 9.6001181 — 9.7938317 = 9.8062864, or sine of the amplitude, or 39° 48′; and this is of the same name with the given declination, *viz.* north, when the declination is north, and south, when the declination is south.

AMPLITUDE, *magnetical*, is an arch of the horizon, contained between the sun or star at its rising or setting, and the magnetical east or west point of the horizon, indicated by the magnetical compass, or the amplitude or azimuth compass; or it is the difference of the rising or setting of the sun, from the east or west points of the compass. For this purpose place the compass on a steady place, from which the horizon may be clearly seen, and looking through the sight-vanes of the compass, turn the instrument round, till the centre of the sun, or other celestial object, may be seen through the narrow slit which is in one of the sight-vanes, exactly in the thread which bisects the aperture in the other sight-

ſight-vane; and when the centre of the celeſtial object, whether riſing or ſetting, is juſt in the horizon, puſh the ſtop, in the ſide of the box, ſo as to ſtop the card, and then read the degree of the card which ſtands juſt againſt the ſiducial line in the box; and this gives the amplitude required. In this operation allowance muſt be made for the height of the obſerver's eye above the level of the ſea. The difference between the magnetical amplitude, thus obſerved, and the true amplitude, obtained by the laſt article, is the variation of the compaſs. E. G. If the magnetical amplitude be obſerved by the compaſs to be

61° 47′, at the time when it is computed to be - - 39° 47′;

then the difference - 22° 0′ is the variation weſt.

AMPLUSTRA, in *Conchology*, a ſpecies of Bulla. Shell roundiſh; ſpire elevated, obtuſe, banded with fleſh colour. Inhabits Aſia. Linnæus.

AMPOSTA, in *Geography*, a town of Spain in Catalonia, ſituate on the Ebro, three leagues from its mouth, ſeven miles ſouth of Tortoſa.

AMPOTIS, ἀμποτις, ſignifies properly the receſs or ebb of the tide. But Hippocrates, who was of Cos, one of the Grecian iſles, and muſt have had many opportunities of obſerving the tides, very elegantly applies this word to the receſs of humours from the circumference of the body to the internal parts.

AMPRÆ, in *Ancient Geography*, a people whom Pliny places in Arabia Felix.

AMPRELITÆ, a people of Colchis, according to Pliny.

AMPSAGA, a river of Africa, on the eaſtern part of Mauritania Cæſarienſis, ſeparating it from Numidia Propria, riſes on Mount Auras, in the confines of the Atlas, and falls into the Mediterranean, ten leagues eaſt of Jijel, or Igilgili. One branch of it, called Rummel, waters Cirta. According to Dr. Shaw, the Ampſaga is now called Wed el Kibbeer, *i. e.* the Great River, which correſponds with the ſignification of ampſaga; *ampſaga*, in Arabic, denoting ample, or large.

AMPSALES, a town of Aſiatic Sarmatia, according to Ptolemy.

AMPSANCTI *Vallis*, or *Lacus*. See Moffetta.

AMPSANI, a people of Germany, conquered by Germanicus, according to Strabo.

AMPT, in *Geography*, the name given in Denmark to a leſſer juriſdiction or diſtrict. The country is divided into ſeveral larger diſtricts, called ſtifts-ampts, of which there are ſeven; four in Jutland, and three in the iſlands. Every ſtifts-ampt is ſubdivided into leſſer diſtricts called ampts. A perſon of quality is generally choſen ſtifts-amptſman, a poſt reſembling that of lord-lieutenant in England. The amptſman, or under governor of an ampt, is generally a perſon of inferior rank, who reſides in the principal town of his diſtrict, and is intruſted with the conduct of all public concerns. The poſt is generally given for life, as a recompence to thoſe who have faithfully ſerved the court. The ſalary of the amptſman is uſually 400 crowns, and that of the ſtifts-amptſman a thouſand crowns; beſides various exemptions and privileges.

AMPTHILL, a town of England, in the county of Bedford, pleaſantly ſituate, near the centre of the county, between two hills. It has been of late years much improved, particularly by the erection of a handſome market-houſe. The principal ſtreets are neat and regular, croſſing each other at right angles. Near the middle of the town is an obeliſk of Portland ſtone in which is a pump, built for the uſe of the inhabitants by the Earl of Upper Oſſory; and weſt of the town is Ampthill park, his lordſhip's ſeat, which is a ſuperb edifice, containing a valuable collection of paintings, by ſeveral ancient and modern maſters. The town has an almshouſe and a charity-ſchool. Its market is on Thurſday; and its diſtance from Dunſtable 12 miles, and from London $25\frac{3}{4}$.

AMSONIA, in *Botany*. See Tabernæmontana. Gmelin has made Amſonia a diſtinct genus, including two ſpecies, *viz.* 1. *A. Tabernæmontana*, and 2. *A. Ciliata*. But Mr. Dryander obſerves, that the *A. Tabernæmontana* of Walter, to which Gmelin refers, is certainly meant for Tabernæmontana *Amſonia* of Linnæus, as the trivial name is printed in Roman character; and he thinks it highly probable that Gmelin's A. Ciliata is the ſame as Tabernæmontana *Anguſtifolia* of Hort. Kew. Linnæan Tranſ. vol. ii. p. 228.

AMPTRUARE, in *Antiquity*, denotes a kind of dancing performed by the chief of the *ſalii*, and anſwered with a correſpondent motion by others in the *chorus*.

This is ſometimes alſo called *ambarvare*; the anſwer of the *chorus* was particularly called *redamtruare*.

AMPUDIA, in *Geography*, a ſmall place of Spain, in the country of Leon. In the time of the Goths it was a conſiderable city and biſhop's ſee; 10 miles north of Valladolid.

AMPUGNANI, a town of the department of Golo (iſland of Corſica) the canton of which contains 4,143 inhabitants.

AMPULLA, in *Antiquity*, an oil-vial or jug, with a large belly, uſed for unctions at the baths.

The word ampulla was alſo uſed for a drinking veſſel uſed at table.

Ampulla, among *Eccleſiaſtical Writers*, denotes one of the ſacred veſſels uſed at the altars.

The word is ſometimes alſo written in Engliſh *ampul*.

Ampullæ were alſo uſed for holding the oil uſed in chriſmation, conſecration, coronation, &c.

Among the ornaments of the churches we find frequent mention made of ampuls, or vials. In the inventory of the cathedral of Lincoln, we meet with ampuls of cryſtal, variouſly enriched with ſilver feet and covers: one containing a tooth of St. Chriſtopher, another a tooth of St. Cecily, another a bone of the head of St. John Baptiſt. Dugdale. Mon. tom. iii. p. 272.

Ampulla, *Knights of St. Ampulla*, belong to an order inſtituted by Clovis I. king of France; at the coronation they bear up the canopy, under which the ampulla is carried in proceſſion. This ampulla, or ſacred vial, with which the kings of France were anointed at their coronation, is ſaid to have been brought from heaven by a dove, for the baptiſmal unction of Clovis I. the firſt Chriſtian king of France, A. D. 496, and dropped into the hands of St. Remigius, then biſhop of Rheims, where it has been preſerved ever ſince for the purpoſe of anointing all ſucceeding kings; and its divine deſcent is ſaid to be confirmed by this miracle; that as ſoon as the coronation is over, the oil in the vial begins to waſte and vaniſh, but is conſtantly renewed of itſelf, for the ſervice of each new coronation. The Abbé de Vertot vindicates the truth of this miracle, in a diſſertation written for this purpoſe; and Baronius ſays, that it was a miracle worthy of the apoſtolical times. Archbiſhop Hincmar, in the year 869, is the firſt voucher for the truth of this legendary tale. Jortin's Rem. on Eccl. Hiſt. vol. v. p. 320. Middleton's Works, vol. i. p. 184.

Ampulla, in *Conchology*, a ſpecies of Bulla. Shell roundiſh, opaque crown umbilicated. Linnæus.—A moſt common ſpecies in the Indian, Ethiopic, and American ſeas; about three inches in length; colour white, variegated with cinereous, black, brown, red, and bluiſh in ſpots and clouds. There are two, if not more, diſtinct varieties of this ſpecies;

β the firſt, very oblong, opaque, dark, and ſcarcely an inch and an half in length; γ the ſecond, tranſverſely ſtreaked, grey and black.

AMPULLA, in *Entomology*, a ſpecies of gammarus, having hand claws without fangs: fourteen legs: hind thighs compreſſed and dilated. Fabricius. This is a CANCER of Linnæus. Inhabits the northern ocean. Body almoſt white; proboſcis incurvated and ſharp-pointed. Tail of ſix leaves, laſt joint bifid.

AMPULLACEÆ CONCHÆ, in *Natural Hiſtory*, a name by which ſome authors have called a tribe of ſhells, which, in the Linnæan arrangement, belong generally to the genus VOLUTA, or BUCCINUM: it is ſynonymous with *concha globoſa*, *dolium*, and *tonnes*. See DOLIUM.

AMPURA, in *Geography*, the name of a province in the kingdom of Peru, before its conqueſt by the Spaniards. The inhabitants are ſaid to have worſhipped two high mountains, becauſe they furniſhed ſtreams which fertilized the land. It is ſaid to have been conquered by Virachoca, the eighth inca.

AMPURIAS, anciently *Emporia*, a ſea-port town of Spain, and the capital of a diſtrict called Ampurdam, in Catalonia, ſituate at the mouth of the Fluvia. It was once conſiderable, and a biſhop's ſee, but is now a mean place; 15 miles eaſt of Gerona, and 58 north eaſt of Barcelona. N. lat. 42° 10′. E. long. 3°.

AMPURIAS, *Caſtello d'*, a little town of Catalonia, ſeated in a bay.

AMPUTATION, in *Surgery*, is that operation by which a member is ſeparated from the body. It differs from EXCISION, in that the latter is cutting *out* a part of the body; whereas, the former is cutting it *off*.

Amputation is one of the moſt formidable and important operations in the whole art of ſurgery: although it is by no means the moſt difficult to perform. The ſkill of a ſurgeon is often much more clearly evinced, by ſaving a condemned limb, than by dexterouſly removing it: ſo that "the moſt expert operator," as Mr. O'Halloran obſerves, "may not always be the beſt ſurgeon." Nay, "to do juſtice to the ſick and to ourſelves, we muſt, in many caſes, rather avoid than perform capital operations." See Mr. O'Halloran's Treatiſe on Gangrene and Sphacelus; pref. p. 3—7. *et ſeq.* "As to amputation itſelf, that its indiſcriminate uſe, or indeed, rather abuſe, has been of infinitely greater detriment to mankind than ſervice, muſt be admitted. We daily hear of *ſudden* accidents that require amputation; and nothing is more common than to be informed, that the patient died in two or three hours after the operation. In ſea engagements, where a limb is torn and ſhattered, death very ſoon follows mutilation; and after battles the recoveries bear no proportion to the deaths on this account.

"It was this great propenſity to lopping off limbs," continues our author, "that cauſed a complaint to be exhibited to Louis the XIVth, that his ſurgeons eſtimated the importance of their ſervice by the number of mutilations only; and they were obliged to defend themſelves from this aſperſion before a prince, who wiſely rated the lives of his ſubjects too high to ſuffer characters to be gained at their expence. In fact, it is not enough for a ſurgeon to know HOW to operate; he muſt alſo know WHEN to do it." Mr. O'Halloran computes, that ninety-five patients out of an hundred ought to recover, where amputation is performed at a PROPER TIME, as well as in a proper manner; an acquiſition highly honourable to ſurgery, and acceptable to humanity."

Hiſtorical Sketch of Amputation.

Although, from the earlieſt period of human exiſtence, there muſt have been occaſion for performing this operation, we have no deciſive proofs from hiſtory that it was ever done by the father of medicine, Hippocrates. A. C. Celſus, who lived in the reign of Tiberius, and whoſe book De Re Medica ſhould be read by every ſurgeon, has left us a ſhort deſcription of the mode of amputating gangrenous limbs. It has been often remarked, that Celſus has left no inſtructions for ſecuring the divided blood veſſels; but it has not been commonly noticed, that in his chapter on wounds, he directs us to ſtop hæmorrhages by taking hold of the veſſels, then tying them in two places, and dividing the intermediate portion. If this meaſure cannot be adopted, he adviſes the uſe of a cauterizing iron. Several hints are to be met with in the writings of Celſus, from which it may be inferred, that the ligature of bleeding veſſels was ſometimes practiſed in that early age; and this ſuppoſition is ſtrengthened by a fragment of Archigenes, preſerved by Cochius on the ſubject of amputation, where he ſpeaks of tying or ſewing the blood-veſſels. We are not, however, in poſſeſſion of all the writings of medical authors prior to the time of Galen, and muſt therefore remain in doubt upon this point.

Celſus recommends amputation to be performed between the ſound and corrupted part of the member. The firſt inciſion was made with a knife down to the bone, but not over a joint; and ſome of the ſound fleſh was to be cut off, rather than leave any of the gangrenous part. The muſcles were then to be retracted, and cut cloſe around the bone, to lay it bare: then we were to ſaw off the projecting bone cloſe to the fleſh which ſtill adheres; afterwards the rough edges of the bone were to be made ſmooth, and the integuments brought over it as much as poſſible. It is ſomewhat extraordinary that Galen has neither mentioned this important operation, nor ſo much as once quoted the name of Celſus, who flouriſhed about a century before him at Rome. If amputation proved often fatal in the days of Celſus, "ſæpe in ipſo opere," as he tells us, it was owing to the want of ſome efficacious method of compreſſing the blood-veſſels during the operation itſelf; for, although the ligature might, perhaps, be employed, they knew not the uſe of a tourniquet. See TOURNIQUET, LIGATURE, CAUTERY, and HÆMORRHAGE.

The conciſeneſs of the account left by Celſus renders it uncertain whether the edges of the ſkin were confined or not, ſo as to leſſen the ſuppurating ſurface of the ſtump; but he evidently intended to preſerve a large cuſhion of ſkin and muſcle, in order to facilitate the cure. And as to the wound, ſo far as it remains expoſed, he directs it to be covered with lint, and then bound over with a ſponge dipt in vinegar. From the whole, then, it appears that the ancient Romans had tolerably correct notions of the art of healing. Paulus Ægineta, about eight centuries afterwards, ſuggeſts no improvement, except a broad fillet of cloth to retract the divided muſcles during the time of ſawing the bone: he recommends the application of hot irons, to ſear the orifices of the bleeding arteries; and indeed, the early Greek practitioners were more diſpoſed to uſe the actual cautery than the Romans.

The Arabian ſurgeons, who chiefly copied from the Greeks, made no material alteration in the mode of amputating; and were ſtrangely inattentive to the advantages of the needle and ligature, *which they well knew how to apply on other occaſions*. Perhaps this laſt aſſertion will be controverted; as a ſurgeon in Edinburgh has preſumed to tell the world, in two of his late publications, that the Arabians were ignorant of the needle and ligature for tying blood-veſſels, "and never uſed them otherwiſe, than by ſewing a wound juſt ſo much the cloſer and tighter in proportion to

the

the bleeding." He ſays, "burning irons were uſed by the ancients, merely becauſe they knew of *no other* means of ſuppreſſing the bleeding." Again, "In the times before Paré, not being able to take up an artery," &c.

We ſhall elſewhere have opportunity to treat of the LIGATURE of bleeding veſſels; and therefore can only obſerve, by way of anticipation, that thoſe who (with Mr. John Bell) impute the firſt diſcovery of this practice to Ambroſe Paré, are greatly miſtaken, and not ſufficiently familiar with the writings of the old ſurgeons, whether Greeks, Romans, or Arabians. "It is not only entertaining but uſeful," ſays the late Dr. Hunter in his Commentaries, p. 62. "to ſee by what purſuits and ſteps an improvement was made; it gives clear ideas of the ſubject, makes a ſtronger impreſſion upon the memory, ſhews the moſt probable road to improvement in ſimilar inquiries, and raiſes emulation." But, ſays he, "if a man writes freely upon any ſubject, without knowing what has been ſaid by others, he riſques being made the object of ridicule or cenſure." Ibid. p. 60.

Guido de Cauliaco, who revived the languiſhing ſtate of ſurgery in Europe during the 14th century, agrees with Avicenna and Albucaſis, that it is better to cut off a mortified extremity than to let the whole body periſh. He adviſes, when the gangrene is near a joint, to ſeparate the articulation. In other caſes he directs us to apply a tight ligature on the edge of the healthy part as well as on the gangrenous part; cutting between them down to the bone, and then ſawing through, with a retractor interpoſed. But ſometimes Guido would wrap up a mortified limb, and allow it to fall off of itſelf; by which means he avoided the odium of amputating members that his patients might have thought capable of preſervation. After the example of his predeceſſors, he had recourſe to hot irons, boiling oils, and aſtringent powders, to ſtop the hæmorrhage; although he diſapproves the practice of Theodoric and others, who gave narcotic remedies to prevent or mitigate the ſuffering of their patients.

Methods of amputating, ſomewhat like that of Guido, were uſed by Bartholomew Maggius, Veſalius, and moſt ſurgeons in the 15th and 16th centuries: till Botallus and Regius propoſed to lop off the limb by a ſort of GUILLOTINE, at one ſtroke, after the manner in which criminals, formerly of Scotland, and lately of France, were decapitated. This ſummary treatment, however, cauſed ſo much contuſion and ſplintering, that it was very ſoon oppoſed as unſcientific and butcherly. The moſt important innovations made, about this time in amputating, were introduced by the celebrated Ambroſe Paré, a French ſurgeon; to whoſe induſtry, good ſenſe, and ſkill, we are chiefly indebted for the abolition of cauteriſing inſtruments, and the general uſe of a needle and ligature to ſuppreſs the bleeding, after this operation.

Paré recommended to cut off the whole of the gangrenous part, if the limb be mortified; but to encroach as little as poſſible on the living fleſh. At the ſame time he laid it down as a rule, not to leave a very long ſtump to an amputated leg; becauſe the patient could more conveniently, he ſays, make uſe of a wooden leg, having the ſtump only five fingers long below the knee, than if much more of the fleſh were to be preſerved. In the arm, however, he left the whole of the living and healthy portion of the member, only ſeparating the diſeaſed part from the ſound.

In preparing for amputation, he directs the ſkin and muſcles to be drawn upwards, and bound tight with a broad bandage, a little above the part where the inciſion is to be made. This fillet was intended to anſwer a threefold purpoſe: 1ſt, To afford a quantity of fleſh for covering the bone and facilitating the cure; 2dly, To cloſe the extremities of the divided blood-veſſels; 3dly, To dull the patient's feelings, by preſſure on the ſubjacent nerves. When this firm ligature has been applied, Paré directs an inciſion to be made down to the bone, either with a common large ſcalpel, or a curved knife: then, by a ſmaller curved knife, we are carefully to divide the muſcle or ligament remaining between the bones of the fore-arm or leg; after which we may proceed to ſaw off the bone, as high as poſſible, and to remove the aſperities occaſioned by the ſaw.

With the aſſiſtance of a curved pair of forceps, he drew out the extremities of the bleeding arteries, either by themſelves alone, or with ſome portion of the ſurrounding fleſh, to be firmly tied with a ſtrong double thread. He now looſened his bandage, brought together the lips of the wound over the face of the ſtump, and kept them as cloſe as he could, without actual ſtretching, by means of four ſtiches or ſutures. If the larger tied veſſels ſhould accidentally become looſe, he deſires the ligature or bandage to be again paſſed around the limb; or elſe, which is better, to let an aſſiſtant gripe the limb firm with both hands, and preſs with his fingers over the courſe of the bleeding veſſel, ſo as to ſtop the hæmorrhage; then, with a ſquare-edged needle about four inches long, and a thread four times doubled, the ſurgeon muſt ſecure the artery in the following manner: Thruſt the armed needle into the outſide of the fleſh, half a finger's breadth from the veſſel which bleeds, and bring it out at the ſame diſtance from the bleeding orifice; then ſurround the veſſel with the ligature, paſs it back again to within one finger's breadth of the place where it firſt entered, and tie a faſt knot upon a folded ſlip of linen rag, to prevent its hurting the fleſh. Paré, by this means, ſays, the orifice of the artery will be agglutinated to the adjoining fleſh ſo firmly, as not to yield one drop of blood: but, if the hæmorrhage were not conſiderable, he contented himſelf with the application of aſtringent powders.

The limb was afterwards treated according to the old plan, with "defenſatives, repurcuſſives, and agglutinatives." The firſt dreſſing was not removed for three or four days; but, when a ſuppuration came on, the "digeſtive, deterſive, and mundificative remedies" were employed, until the ligatures might be ſafely removed, and exfoliation of the bone took place. As the ſurgeon ſaw proper, it was alſo recommended by Paré to haſten the exfoliation by the actual cautery applied to the extremity of the bone only; and to keep down fungous fleſh by the uſe of burnt alum, blue vitriol, or red nitrated mercury.

Thus did this famous ſurgeon endeavour, by his ſingle example and precepts, to exclude the barbarous uſe of hot irons in amputation. He ſays, he knew not of any ſuch practice among the old ſurgeons; except that Galen recommended us to tie bleeding veſſels, towards their origin, in accidental wounds, and he thought proper to do the ſame in caſes of amputation: but in an apology at the end of his book, Paré has quoted, in his own defence, a dozen authors, who employed or recommended the ligature before him; and he might have cited many more.

From the ſtatement we have here given, it may be ſeen how far our beſt writers, of every country almoſt, have erred in aſcribing the original invention of tying arteries to Amb. Paré. Great merit, indeed, was due to him for the part he took in extending, and even reviving this incomparable practice; nay, it is not certain whether any one before him had ever applied the needle and ligature in ſimilar caſes, *i. e.* after amputation: but how very wide of the truth Mr. John Bell's recent account of this matter is, will appear to every perſon who will enquire into the facts themſelves; for not only were needles and ligatures in uſe among the ancients,

ients, but likewiſe the TENACULUM or hook to lay hold of the bleeding veſſels when they had buried themſelves in the muſcles. We refer our inquiſitive readers to Avicenna, Ætius, Albucaſis, Brunus, Theodoric, Guido de Cauliaco, John de Vigo, Bertapalia, Tagaultius, Petrus Argillata, Andreas a Cruce, &c. &c. where they will find enough to ſatisfy them on this head.

From the time of Paré to the commencement of the ſeventeenth century, a variety of petty reformations and alterations were propoſed in amputating; but the ſurgeons were backward to adopt the needle and ligature in ordinary practice, chooſing rather to apply aſtringent, vegetable, and mineral ſubſtances to the bleeding veſſels, or to cauterize them with burning irons. One ſurgeon of note (John Woodall, who was many years ſurgeon-general to the Eaſt India Company, and ſurgeon of St. Bartholomew's Hoſpital in London) ventured to deviate from the common rule of diſmembering in the ſound part of a gangrenous limb. He publiſhed a treatiſe in 1639, chiefly to recommend "the amputating of any member in the mortified part;" and declared that this had been his cuſtom ſince the year 1617, having amputated in that manner above a hundred limbs, "of which not one died in the cure." He uſed to wait till either the mortification had ceaſed, or till a circular line of ſeparation appeared between the gangrenous and the ſound part; then he would cut through the limb about one inch below the line, and gently remove the mortified portions of fleſh. To facilitate the exfoliation of the bone, it was burnt with the actual cautery, as had formerly been practiſed by Veſalius and other of his predeceſſors. The limb was afterwards fomented, and warm dreſſings applied to encourage the ſuppuration.

Woodall relates, that it was at this time no uncommon thing for criminals, who, in the Eaſt Indies, had their feet chopped off at the ancles, to get ſo well cured as to run on errands for their livelihood, after having put their ſtumps into large bamboo canes or reeds ſtuffed with cotton, &c.

Numerous applications, mechanical, chemical, and pharmaceutical, having been thought of to prevent bad and fatal hæmorrhages after bleeding, it occurred to our countryman, James Young, that a more ſecure way of compreſſing the artery during amputation would be as follows: He placed a hard wadd or bolſter of linen cloth upon the inſide of the arm or thigh, exactly in the courſe of the main artery; then, paſſing a towel or bandage around the member, he tied the ends together, and twiſted them ſo very tight with a ſtick or battoon, as to ſtop the circulation through the blood-veſſels. When the limb was amputated, he ſays, there was ſcarcely any bleeding, and the pain was greatly diminiſhed by the compreſs. Before the dreſſings were applied, he adviſes to looſen the tourniquet a little, in order to obſerve where our care and aſtringents are moſt wanted. This propoſal is deſcribed in a curious and ſcarce book, publiſhed at London, A. D. 1679, entitled, "Currus Triumphalis è Terebinthô:" where may be likewiſe ſeen the firſt hint of the method of amputating with a flap, ſince claimed as a diſcovery by two continental ſurgeons, Verduin and Sabourin; but whether or not theſe writers borrowed the ſuggeſtion from Mr. Young, is uncertain. As this mode of amputating is ſtill very frequently practiſed, and in many caſes is unparalleled for its ſimplicity and advantages, we extract part of the author's original account, where he thus addreſſes his friend:

"Sir, I find by yours, that you are ſurprized with the intimation I gave you, of a way of amputating large members, ſo as to be able to cure them per ſymphyſin in *three weeks*, and without fouling and ſcaling the bone.—I ſhall now entertain you with an account of the manner of this operation I would recommend to you, after I have told you that it was from a very ingenious brother of ours, Mr. C. Lowdham, of Exeter, that I had the firſt hints thereof. The ligatures and gripe being made after the common manner, you are with your catling, or ſome long inciſion-knife, to raiſe (ſuppoſe it the leg) a flap of the membranous fleſh covering the muſcles of the calf, beginning below the place where you intend to make exciſion, and raiſing it thitherward of length enough to cover the ſtump: having ſo done, turn it back under the hand of him that gripes, and as ſoon as you have ſevered the member, bring this flap of cutaneous fleſh over the ſtump, and faſten it to the edges thereof by four or five ſtrong ſtitches: having ſo done, clap a doſſil into the inferior part, that one paſſage may be open, for any blood or matter that may lodge between; but of that there ſeldom occurreth any: then lay on a common defenſative, *ex.* bole. fang. dracon. maſtich, terræ ſigil. cum alb. ovor. & aceto, and thereto girt it cloſe with your croſs bandage, and other compreſſes, after the uſual manner; the former, *viz.* the defenſative, not only defends from accidents, as heat, pain, fluxion, &c. but gently conſtipateth the veſſels, thereby contributing to the ſecuring the hæmorrhage, and very conſiderably aſſiſts to the agglutination: the latter, *ſcil.* the compreſs ligature, keeps the fleſh ſnug and cloſe to the ends of the divided veſſels, confirms the conſolidation, keeps the parts from cavity, and the blood from extravaſation, and hinders that deflux of humours which would otherwiſe deſtroy the intention of cure.

"In this ſort of amputation, that manner of compreſſing the thigh by ligature, or the arm near the ſhoulder, which I have recommended in the foregoing diſcourſe, is of excellent uſe; becauſe thereby you may retain the deſcent of the blood, till by your dreſs and bandage you have ſo far ſecured the part as that it can receive no damage thereby.

"In this way of cure, phlebotomy, juleps, ligature of the extreme parts, if need be, with what elſe may contemporate the blood, hinder defluxion and maturation, and promote conſolidation, though declaimed againſt in that diſcourſe, is in this caſe very uſeful and neceſſary.

"In the ſucceeding dreſſings, medicines healing per ſymphyſin are to be uſed: and amongſt them, perhaps, there are none better than that already mentioned, adding ſome powder of the roots of great comphrey thereto; the doſſil, if you uſe any, may be left out the next dreſſing, or that following it.

"That this method hath cured ſuch a ſtump in *three weeks*, is a truth I can vouch by ſufficient teſtimony; and I believe you will not much doubt it when you have peruſed this, and conſidered how eaſy and ſoon ſuch large conſolidation hath been made.

"I muſt not forget to intimate to you that this manner of diſmembering, &c. is not to be made uſe of where the part hath been much inflamed, tumefied from fluxion, or otherwiſe vexed therewith, nor in members amputated for chronic cauſes; as cancers, fiſtulas, &c. or where the body is pockt, or very cachectic, becauſe in ſuch digeſtion (which would deſtroy the unition) is neceſſary to rectify and ſweeten the maſs, which it doth by draining off the miaſma of the diſeaſe more than ten fontanels can do. It is alſo no leſs unavoidable; for the courſe of matter that hath that way diſcharged itſelf ſo long (as in a fiſtula), cannot of a ſudden be obſtructed, without hazard of a miſchievous apoſtumation: moreover, in ſuch ill habits as thoſe caſes either cauſe or reſult

ſult from, conſolidation is difficult, if not impoſſible to be ſo ſuddenly performed, as this manner of cure requireth; the dyſcraſis of the blood having deſtroyed or weakened its balſam that it cannot expedite the work, which, if not ſpeedily done, cannot be performed ſecurely and firm; and in parts inflamed and tumefied by fluxion, or by congeſtion, it is eaſy to imagine there muſt be a diſcharge of that concrete matter, which cannot be, and yet the wound cured by ſympathy.

"But in moſt of the amputations made at ſea in fight, or on land in battles, or whereſoever acute accidents, ſuch as wounds, recent lacerations require it, it may be done, and that with thoſe advantages of the other way it rivals."

The author next enumerates eight very ſingular advantages with which this *new* method is attended, and then concludes his letter as follows:

"Theſe are all the conſiderable advantages manifeſtly acquired by this *new way*: without doubt uſe and trial will diſcover more, equal to them, and an abundance of leſſer conveniences, which at preſent occur not to my conſideration: theſe are enough to ſhew the novelty to be conſiderable and worthy of imitation: let them have with you this acceſſional manifeſtation, that I am very ready to obey and ſerve you.

"*Plymouth, Aug.* 3, 1678. "JAMES YOUNG."

We thus have demonſtrated, though it is not commonly believed, that what the French call "OPERATION A LAMBEAU," claimed as the invention either of Verduin or Sabourin, was put in practice by ſurgeons of Exeter and Plymouth before the year 1678. The different improvements and ſuggeſtions of more modern authors, will be noticed in our account of the amputation of particular members.

Of the Cauſes which may render Amputation adviſeable.

Previous to the time in which the needle and ligature were generally had recourſe to, for ſecuring the divided arteries after amputation, this formidable operation was but rarely ventured upon, by even the moſt enterprizing ſurgeons; ſo that, we ſeldom read among the older authors of a limb having been amputated, from any other cauſe than a complete mortification. About the middle of the laſt century, however, the practice of inconſiderately taking off diſeaſed members was ſo common, that ſeveral eminent ſurgeons attempted to prove it was never, or ſcarcely ever, abſolutely needful. This opinion, although it originated from the beſt motive, was certainly untenable; ſince caſes daily occur, in which, for want of amputation, patients muſt either inevitably die, or would only preſerve their limbs at the hazard of dragging out a miſerable exiſtence, perhaps worſe than death itſelf. Two general cauſes, at leaſt, will therefore juſtify the performance of amputation: *Firſt*, when the life of the patient is conſiderably endangered, by keeping his limb; *ſecondly*, when its preſervation does not ſecure a more uſeful member than an artificial one.

The ſurgeon muſt know well how to diſtinguiſh the circumſtances in which the amputation of a limb is neceſſary, or may even be conſidered as a benefit; and in which, ſhould it be delayed, or conceived to be unneceſſary, the patient would run the riſk of loſing his limb or his life. To form a determination is no eaſy matter, and in many caſes extremely difficult; eſpecially as, in forming it, we have alſo to conſider whether, by means of the operation, the patient's life or limb can really be ſaved. For in the cure of limbs that have been materially wounded, the event often depends upon the conſtitution of the patient, his age, and the air in which he lives; and it is rarely poſſible to form a ſure prognoſtic at firſt, as the ſymptoms, from which it can be drawn, generally do not make their appearance till during the progreſs of the cure. Now, though it cannot be denied, that amputation has in many inſtances been performed when there was no neceſſity for it, it would be folly to imagine that it may in all caſes be avoided. For there certainly are numerous diſeaſes incident to the extremities, in which this operation is the only means of alleviating the ſufferings of the patient, and even of ſaving his life.

1. A CARIES OF THE BONES, whatever be its degree and magnitude, is not a ſufficient reaſon for amputation in a young ſubject, at leaſt not till every poſſible means have been tried for the preſervation of the limb: but when the diſeaſe has ſpread very far, ſo that no benefit can be expected from the common milder remedies; and when the caries is moreover advancing, and combined with deep ſpreading ulcers in the ſurrounding ſoft part, we have certainly no other remedy left but the operation. However, even in this caſe, it would be neceſſary previouſly to examine, whether benefit were really to be expected from the operation; that is, whether the caries were confined entirely to the part, or, whether it had not ſpread itſelf already too far to admit of a cure.

2. When the bones of a limb have been entirely ſhattered by a GUN-SHOT WOUND, and all the muſcles, ligaments, veſſels, and nerves have been ſo lacerated by it, as to render the circulation of the blood into the fore-part of the limb altogether impoſſible, and that its death is altogether inevitable; farther, when a whole limb, or a part of one has been torn off by a cannon-ball, or by any other means, in ſuch a manner that the bones are broken off into uneven ſplinters, and remain uncovered, and the muſcles and tendons likewiſe are of unequal lengths, and at the ſame time very much torn and bruiſed; in both theſe caſes the neceſſity of the operation is evident.

3. When a large ANEURISM of long ſtanding has deſtroyed the texture of the ſurrounding parts, and has produced a high degree of ſuppuration, eſpecially if it be in a joint, amputation is neceſſary, on account of the diſeaſed ſtate of the ſurrounding parts; for, on account of the aneuriſm alone, it would never be adviſeable. But it alſo becomes neceſſary when, after the operation for an aneuriſm has been performed, the limb does not acquire again its warmth and ſenſibility, but dies away. See the article ANEURISM.

4. In COMPOUND FRACTURES, let them have ever ſo unfavourable an appearance, amputation is never allowed, provided we are able immediately to procure for the patient all the requiſite medicines, reſt, attendance, pure and wholeſome air, and proper nouriſhment; for even in the moſt deſperate ſeeming caſes a cure has ſometimes been effected. But when, for example, in armies and fleets, every thing requiſite for the cure of the wound is wanting, we are obliged to proceed to amputation; which muſt either be performed very ſoon after the injury has been inflicted (eſpecially if the bones be ſhattered near a joint), or delayed until its moſt immediate effects and conſequences, namely, the ſwelling, inflammation, and fever, have made their appearance.

5. In LARGE WOUNDS, combined with much LACERATION and contuſion, it is extremely difficult to determine the neceſſity of the operation, which, conſequently, ought never to be performed immediately after the wound has been inflicted; but it is at moſt admiſſible afterwards, when the wounds ſuppurate ſo profuſely as to exhauſt the ſtrength of the patient, or when they become gangrenous, or when a

hæmorrhage

hæmorrhage is produced that can be ſtopped by no other means.

6. In WHITE SWELLINGS, when the bones have become carious, the operation is always indicated; but good effects can only be expected from it when the diſeaſe is ſtill merely or chiefly local. When it has already become general, or when it is the conſequence of a ſcrofulous habit of the body, it is in the firſt caſe always, and in the ſecond generally, unſucceſsful.

7. In large SWELLINGS of the BONES, that either endanger the life of the patient, or on account of their ſize, or from ſome other cauſe, become unbearable, the amputation of the limb is the only remedy that remains; provided there be no cauſe preſent that renders it inadmiſſible.

8. CANCEROUS SORES, which, in ſome rare caſes, attack the extremities, may indeed now and then be extirpated without amputating the limb; however, when the diſeaſe has already ſpread itſelf far among the ſurrounding parts, and has attacked the bones and ligaments, the amputation of the limb, above the diſeaſe itſelf, may be of ſome benefit.

9. In other extenſive and malignant ULCERS, that do not ariſe from any internal and general cauſe, and which materially vitiate the whole maſs of fluids, injuring the health, and, inſtead of yielding to the remedies that are employed, ſpread farther and farther, and become more and more obſtinate, we are obliged to adviſe amputation, as the patient's life is actually in danger.

10. INCYSTED TUMOURS are ſometimes very deep ſeated, or are even produced within the bone or upon the periofteum, and increaſe to a conſiderable ſize; ſo as by the preſſure they occaſion, to injure the texture of the ſurrounding parts, and not only to render the bones carious, but entirely to diſſolve them. In ſuch caſes the operation may, under certain circumſtances, be rendered neceſſary.

11. The extremities, and, according to Dr. Richter, moſt frequently the feet, are ſometimes affected with a ſingular kind of tumour, the peculiar character of which has not as yet been accurately defined, but for which no remedy has hitherto been diſcovered, except amputation. The reader will find it deſcribed under the head of OEDEMA.

12. Sometimes alſo the DISTORTION of a limb may be ſo conſiderable, and cauſe ſuch great inconvenience, on account of its ſtiffneſs, that the patient will rather loſe the limb than remain longer in that condition. If we are not able to cure or relieve the diſtortion by any milder means, we may with propriety comply with the deſire of the patient.

13. Finally, a GANGRENE may render the operation neceſſary; but that this is adviſeable in only a few caſes, the reader will find maintained under the head of GANGRENE.

When, therefore, it appears, upon due conſideration of every circumſtance, that the diſeaſed limb cannot be preſerved, and that the life of the patient can only be ſaved by immediately amputating it, the operation muſt be undertaken without arther delay. Conſidered of itelf, it is not ſo dreadful an operation by far as it formerly was, nor are its conſequences ſo precarious and troubleſome; and the cure is effected much more ſpeedily, provided that, in performing it, all the rules preſcribed by the preſent improved ſtate of ſurgery are obſerved.

For performing the operation moſt of the following inſtruments are requiſite:

1. Two ſtraight knives, the blade of one to be from ſix to ſeven, and that of the other from five to ſix inches in length. The firſt of theſe is uſed in amputating the thigh, and the ſecond for the reſt of the limbs.

2. A ſmall, narrow, ſtraight knife, or catlin, edged half way down the back, three inches and a half long, half an inch broad. This is uſed for cutting through the fleſh between the two bones, in the fore-arm and leg, and for dividing the perioſteum.

3. A fine ſharp ſaw, for ſawing through the bone. The blade may either be made of a ſteel ſpring, about ten inches long and half an inch broad; or of a wide ſteel blade, ſtrengthened by a firm back, as repreſented in the plate of amputating inſtruments. The handle ſhould be of a ſize proportioned to that of the blade; it alſo ſhould be ſmooth, and without much ornament.

4. A ſmaller ſaw, made of a watch-ſpring, for ſeparating ſplinters, and dividing the bones of the fingers, &c. The blade of this ſaw muſt be provided with a ſcrew, by which it may be turned in either direction.

5. A ſmall ſtraight ſaw without a frame, for ſeparating ſplinters in parts where the firſt ſaw cannot conveniently be applied.

6. A ſmall pair of ſciſſars, with long handles, for dividing membranes, ligaments, and tendons.

7. A pair of forceps, with a ſliding button, for laying hold of the arteries; or, which will anſwer the purpoſe better, a tenaculum, with a light handle.

8. A tourniquet. (See the deſcription of this inſtrument.)

9. A ſlip of parchment, eighteen inches long, and from four to five broad; it ought to have a ſlit as far as the middle, terminating in a circular hole. (See RETRACTOR.) Its uſe is to draw back the muſcles. We may alſo uſe inſtead of it, a broad leathern ſtrap, or a fillet of linen of the ſame ſhape.

10 Two tapes, half an inch broad, for tying round the limb, one above the other, under the place where we intend to make the inciſion. Still more uſeful for this purpoſe, eſpecially when the limb is fat and flabby, are narrrow leathern ſtraps with buckles, which hold the fleſh firmer than the others. But many ſurgeous uſe neither of them.

11. A quantity of adheſive plaiſter cut into ſlips.

12. Two ſingle headed bandages, the many tailed bandage, or a woollen cap.

13. A number of pledgets and compreſſes.

14. Lint, needles, and waxed thread.

General Rules of Practice.

In performing this operation the ſurgeon muſt be particularly attentive to the choice of the place where he ſhould amputate; to the prevention of any violent hæmorrhage during the operation; in cutting through the ſkin and muſcles, to the ſaving of as much of theſe parts as is neceſſary for entirely covering the ſtump; in tying up the arteries, he muſt be careful to ſpare the neighbouring nerves and other parts as much as poſſible; he muſt be attentive to the ſupport of the external integuments, that they may not ſhrink back again after the operation; and, finally, to the ſubſequent treatment of the patient, till he is completely cured. In general, a ſucceſsful event depends upon the ſurgeon promoting, by every means in his power, a ſpeedy union of the parts, or the healing of the wound without ſuppuration; the chief method by which this important point may be obtained, is by preventing all expoſure of the wounded ſurface, and retaining the integuments in cloſe contact with the ſubjacent bone, &c.

Ordinary Steps of the Operation.

Having determined on the propriety of amputating, and fixed the time in which it ſhould be performed, we ſhould prepare and arrange the neceſſary apparatus. Previouſly to commencing

commencing the operation, the ſurgeon will not fail to ſee every thing in the apartment that may be wanting, either for his own uſe or the patient's comfort. When the aſſiſtants have been properly inſtructed, a tourniquet is firſt to be placed over the main artery of the limb to be amputated, ſo as to ſtop the circulation entirely. On ſome occaſions a tourniquet cannot be applied, and in ſuch caſes a careful perſon is to be appointed to the office of preventing the hæmorrhage by other means. The limb being firmly ſecured, an inciſion is then to be made through the ſkin and cellular membrane, down to the muſcles, by one circular ſtroke, except when the *flap operation* has been reſolved on. The integuments are next to be raiſed, and turned back or drawn up from the muſcles, more or leſs, according to the circumſtances of the caſe, for the purpoſe of afterwards furniſhing a covering to the face of the ſtump: in thus ſeparating the integuments, we muſt have particular regard to the ſize of the limb. At the lower edge of the reflected ſkin and fat, the operator begins his ſecond inciſion, carrying it through to the bone, in an oblique direction upwards, by holding his knife a little ſlanting. The retractor, if one be wanting, is now to be applied; and, by means of the double-edged catlin, the fleſh, &c. is to be divided between the bones (in the fore-arm and leg). A ſmall line of ſeparation muſt alſo be made through the perioſteum, but it is not to be ſcraped, for the entrance of the ſaw; after which the bone or bones will be divided, by ſlowly repeated long ſtrokes with the ſaw, taking care not to make ſplinters. Having next ſecured the bleeding veſſels, by ligature alone, and wiped away the coagulated blood, after ſlackening the tourniquet entirely, we finiſh, by bringing the lips of the wound neatly in contact, retaining them by croſs ſlips of good adheſive plaſter, laying ſoft lint, &c. over the outſide, in the direction of the edges of the wound, and bandaging the ſtump, with the ligatures hanging out at one corner. Thus may we frequently effect a cure in twenty or thirty days, by healing without ſuppuration, and without danger, after taking off the largeſt extremities; eſpecially in quiet, airy ſituations, and with healthy young patients.

Amputation of the Thigh.

In this operation, the patient is to be reclined upon a table of the ordinary height. A common tourniquet muſt be applied as near as poſſible to the upper part of the thigh, immediately under Poupart's ligament, in ſuch a manner, that the compreſs comes to lie ſtraight upon the femoral artery: the fillet laid over it is to be ſcrewed or twiſted, by means of a ſhort ſtick, over a piece of horn or leather placed on the oppoſite ſide, ſo tight, that not only no blood can flow through the large artery, but ſo as alſo to ſqueeze together all the muſcular parts as cloſely as poſſible. A tourniquet of this kind (ſee the PLATE *of Surgery*) prevents a hæmorrhage, not only from the principal trunk of the artery, but alſo from all the lateral branches, and is therefore preferable in ſuch caſes to the ſcrew tourniquet. Some ſurgeons, during the operation, never make uſe of a tourniquet, but have the artery ſtrongly compreſſed by an aſſiſtant with his fingers and a cuſhion.

It is a general rule, that we ought never to amputate more of the thigh than the diſeaſe abſolutely requires; for the more of it we ſuffer to remain, the more uſeful the ſtump will be. Where the injury done to the limb is ſuch, that only the leg is damaged up the knee, we amputate the thigh about a hand's breadth over the knee, in order to gain a quantity of ſkin ſufficient for properly uniting the parts. The inciſion through the ſkin muſt be made at leaſt three fingers breadth lower than the ſecond cut, by which the muſcles are divided. In order to hit upon the right meaſure, we muſt principally attend to the thickneſs of the thigh, for the thicker it is the more ſkin we muſt endeavour to gain; but it is in general better to ſave too much, than too little, of the integuments.

Two aſſiſtants, who ſtand at the head of the patient, hold faſt his arms, and a third ſecures the ſound leg. The diſeaſed limb is held by two aſſiſtants in a horizontal poſition, with the knee moderately bent. One of theſe holds the limb, with both his hands under the knee, firm and immoveable; the other ſupports the thigh in the middle, holds it faſt, and at the ſame time draws the ſkin tightly upwards. The operator now applies one of the ſmall fillets to the place where he intends to make the firſt cut; namely, when the whole thigh is ſound cloſe over the patella, and draws it very tight in an exact circle round the limb. With the aſſiſtance of this fillet the cut may be made more even and circular; and the fleſhy parts, particularly the integuments, are prevented from ſhrinking and impeding the operation, being held faſt and tenſe at every point. This fillet, therefore, is of great and eſſential uſe in the operation, and ought certainly to be retained, though ſome may be inclined to reject it as ſuperfluous. But to apply a ſecond fillet above the cut, as ſome do, is unneceſſary. The operator, who ſtands on the outſide of the limb, now cuts through the ſkin and cellular texture, with a ſtraight, ſtrong, and ſharp knife, cloſe over the upper margin of the fillet, in an exact circle, without cutting into the muſcles. In performing this part of the operation, great attention is neceſſary, in order that the inciſion may not be made too ſuperficial, or too deep, or even crooked. When the operator has divided the ſkin all round, but not the faſcia lata, by this firſt cut, he next divides the faſcia cautiouſly, by repeated cuts, without penetrating into the muſcles; after which the ſkin may be more eaſily drawn back as far as he thinks proper. The ſkin is now to be retracted in an uniform manner, in order that the ſecond cut may alſo be made exactly circular; the firſt aſſiſtant muſt, therefore, be well acquainted with the method of performing this operation.

When the ſkin has been drawn back full three fingers breadth (too much is always better than too little), the operator, uſing the ſame knife as before, cuts the muſcles through down to the bone, cloſe to the margin of the retracted ſkin, with a perpendicular, even, and circular inciſion. Some ſurgeons, however, cut through *obliquely*, by ſlanting the edge of the knife upwards. If the operator has acquired ſufficient dexterity by practice, he will always be able to make this inciſion without carrying the knife twice round the limb.

"As it frequently happens, in amputating the thigh," ſays Profeſſor Murſinna (Neue Med. u. Chirurg. Beobachtungen. Berlin, 1796. 8. pag. 515), "after the circular inciſion through the muſcles, though theſe are divided three fingers breadths higher than the ſkin, that the flexor-muſcles of the leg contract more than the extenſors, and thus, at times, produce a deformity of the ſtump, which occaſions ſome inconvenience in wearing a wooden leg; this accident might be prevented, by keeping the patient's knee moderately bent, whilſt cutting through the extenſors, and extended whilſt making the inciſion through the flexors. The inciſion will, nevertheleſs, be even and circular; and when performed in the above mentioned poſitions of the limb, will prevent any deformity of the ſtump; for the flexors of the leg contract with much more force, after the inciſion, than the extenſors; in order to avoid which, the former muſt be cut through at their greateſt elongation, conſequently when extended, and the latter when contracted. By this practice

no time is loſt, nor any additional pain given to the patient; and both the cure is more ſpeedily effected, and the ſtump acquires a better form."

"Generally (ſays Dr. Richter in Medicin. u. Chirurg. Bemerk. &c. B. I. Gottingen, 1793. 8. pag. 232.) the flexor muſcles contract with much greater force than the extenſors after amputation of the thigh. They do the ſame during the progreſs of the cure alſo, and conſequently, even in the moſt rapid cure, attended with no ſuppuration, the ſtump generally grows uneven at the bottom, which cauſes inconveniences in the application of a wooden leg." He accedes therefore to Prof. Murſinna's opinion, that the extenſors ſhould be divided higher and the flexors lower, conſequently the firſt with the knee moderately bent, the ſecond with the knee extended. This practice deſerves, therefore, to be generally recommended.

According to Mr. Alanſon's method, the knife ought to be conducted in a ſlanting direction, with the edge directed upwards, in order to form a hollow cone; but few ſurgeons have any opportunity of acquiring the dexterity requiſite for performing the operation in this manner, by practiſing it upon dead bodies; and it is not done by ſome of the moſt noted ſurgeons on the continent. Profeſſor Calliſen (Tode Medicin. Journal, B. I. Copenhagen, 1793, p. 106.) does not make his inciſion in the form of a cone, but cuts through the ſkin at the requiſite diſtance from the place where the bone is to be ſawed through. He next ſeparates the ſkin from the muſcles, as far as is neceſſary, in order to turn it back like the cuff of a coat. He next cuts through the fleſh, ſaws off the bone, binds up the veſſels; and, laſtly, draws down the retracted ſkin over the ſtump, and folds it together in ſuch a manner as to make it form an oblong ſlit from above to below, out of which the ligatures of the veſſels hang.

"To hold the knife obliquely (ſays Prof. Murſinna in Neue Med. u. chirurg. Beobachtungen, p. 165.), with the edge turned upwards, in cutting through the muſcles, ſo as to form a conical inciſion, is a refinement upon the operation, which it is equally difficult and unneceſſary to practiſe."

"I am ſtill of opinion," Dr. Richter remarks (Med. und Chirurg. Bemerk. B. I. p. 232), "that the operation by means of which Mr. Alanſon endeavours to make the ſtump itſelf hollow, is very difficult, if not entirely impracticable." He performed the amputation in the following manner: the inciſion was made three fingers breadth above the knee. An aſſiſtant laid hold of the limb, with both hands, above the place of the inciſion, and ſecured the ſkin. By the firſt circular inciſion, the operator divided not only the ſkin, but alſo the cellular texture, as far as the external ſurface of the muſcle; this muſt neceſſarily be done, if we wiſh to be able to draw the ſkin much upwards. When the cellular texture has not been completely divided, we ſhall generally find that it becomes tenſe, whilſt we are drawing the ſkin upwards, and thus prevents its being retracted ſo far as it otherwiſe might. Whilſt, therefore, the aſſiſtant drew up the ſkin as much as poſſible, the operator made a ſecond circular inciſion, cloſe to the margin of the retracted ſkin, with which he again divided the cellular texture as deep as to the ſurface of the muſcles, whereby the aſſiſtant was enabled to draw up the ſkin ſtill much higher; ſo that now the upper margin of the ſkin was at leaſt three full fingers breadths diſtant from the lower. The ſeparating and turning back of the ſkin, according to Mr. Alanſon's method, he conſiders as a very tedious and difficult operation. With the third circular inciſion he cut into the muſcles along the margin of the retracted ſkin, not ſo deep as down to the bone, however, but only about half way through. He now directed this divided external layer of fleſh to be drawn upwards, as much as poſſible, with the ſlit compreſs; and with a fourth circular inciſion along the margin of the retracted ſkin, he cut through the remaining fleſh to the bone. The whole of the fleſh was now drawn back with the ſlit compreſs ſo ſtrongly, that the bone was laid bare the length of at leaſt two fingers breadths, and could be ſawed off to that height. When the ſkin and muſcles were drawn down, the ſtump formed a conically excavated ſurface, at the upper point of which the bone lay ſo deep within the fleſh, that it could not be ſeen. After the veſſels had been tied up, the ſtump was preſſed together on both ſides, ſo that the wound formed a ſlit in a ſtraight direction from before to behind. The edges of the ſkin were ſo cloſe to each other, that the wound reſembled a very narrow fiſſure. The ſkin was faſtened together with adheſive plaſter, and the fleſh and the ſtump were preſſed together by pads of lint applied to both ſides, and then confined by a bandage. The ends of the ligatures hung out at the loweſt and poſterior angle of the wound. Even on the fifth day, three quarters of the wound, from the top, adhered together, and were quite dry; the loweſt quarter, out of which the ligatures hung, was ſtill moiſt, but diſcharged only a very few drops of pus during the whole courſe of the caſe. On the eleventh day the ligatures were ſeparated, and the remaining ſmall orifice cloſed in the ſpace of a few days more.

When all the muſcles have been cut through to the bone (whether we have recourſe to Richter's or Alanſon's mode), the ſlit compreſs is applied; by means of which the remaining muſcular parts are covered, and theſe are, at the ſame time, ſomewhat drawn back by the hands of the aſſiſtant, in order that the operator may be able to uſe the ſaw with more freedom, and ſaw off the bones higher up. When this has been done, the perioſteum is divided circularly, as high as poſſible, with a ſhort, ſtrong knife, and peeled downwards. The ſaw is now applied horizontally, and the bone ſawed through. The operator ſaws ſlowly at firſt, but when the ſaw has laid proper hold of the bone, he moves it ſomewhat quicker; and, at the ſame time, the aſſiſtants hold the limb rather high at the ſuperior part, and low at the inferior, ſo as to bend it ſomewhat aſunder, in order that the ſaw may not get wedged in during the operation. When the bone is nearly ſawed through, the ſaw is again moved ſlowly and with ſhort ſtrokes, in order that the ſtump may become as ſmooth and even as poſſible. Should there ſtill remain any ſmall projection on the bone, this muſt immediately be removed.

As ſoon as this has been performed, the veſſels are to be ſecured by ligatures. The principal trunk is firſt tied up, and if it be at the diviſion of the artery, both branches are included in one ligature. For this operation a triple thread is uſed, which is faſtened together with wax, ſo as to form a flat ligature, in order that the artery may be tied faſt with it, without danger of its cutting through. This thread is inſerted into a crooked needle; the artery is laid hold of, at its orifice, with a tenaculum, or crooked ſharp hook; it is then drawn forwards, and the needle being introduced under the veſſel, in ſuch a manner as at the ſame time to perforate the cellular texture on both ſides, it is pulled through. The aſſiſtant now holds the hook, whilſt the operator takes hold of the ligature inſerted under the artery, and ties it faſt with a double knot, over which ſome ſurgeons make another ſingle one, about two lines above the extremity of the veſſel. The ligature is generally left of ſuch a length, that it can be conveniently faſtened upon the ſkin on the outſide of the wound. Should we find it difficult to diſcover the trunk of the ar-

tery in proper time, the tourniquet muſt be looſened, upon which the ſpouting of the blood immediately diſcovers its orifice. In order to diſcover the orifice of the lateral veſſels, the tourniquet muſt always be quite looſened, that they may alſo be bound up in the manner already deſcribed.

As the adheſion of the parts, and the healing of the wound depend upon the blood being entirely ſtopped, it is neceſſary that all the lateral veſſels which diſcharge any ſhould be tied up; for which purpoſe the ſurgeon, when he has looſened the tourniquet entirely, wipes the ſtump with a wet ſponge, examines whether any of the branches diſcharge blood, and ties up thoſe which do, be they never ſo ſmall. When no more blood is diſcharged, the ſtump is once more wiped with the ſponge, entirely cleanſed from the blood, and the lips of the wound are brought together.

The ends of the ligatures, if there be many, ought to be diſtributed between both angles of the wound, that they may not form a thick bunch, and occaſion inconvenience by their preſſure. When every part of the operation has been performed in manner above directed, the adheſion will take place eaſily; but if the directions are not obſerved, it will ſometimes not take place without much difficulty and pain.

The lips of the wound may be brought together in two different ways. Some preſs them together, on both ſides, ſo that the wound forms a perpendicular ſlit, which runs in a ſtraight line from the fore to the back part of the thigh, and let the threads of the ligatures hang out of the lowermoſt and poſterior angle of the wound. Others preſs them together, ſo as to form a horizontal fiſſure: in this manner the ſtump can lie conveniently, and the fluids may ſtill be diſcharged by the two lateral orifices of the wound, out of which the threads hang. By this method the ſtump alſo acquires a better form than when the fold is made perpendicularly.

When the lips of the wound are brought together in either of the abovementioned ways, they muſt be made to apply neatly to each other, and all the points of the ſides of the wound brought into cloſe contact. Whilſt the ſurgeon holds them together in this manner, an aſſiſtant applies from four to ſix ſlips of adheſive plaſters; then lays over the edges of the wound ſome looſe dry lint, and covers this with a quantity of the ſame ſubſtance, ſpread with a mild, healing ointment. The whole is finally ſecured with a long bandage, which is applied at the upper part of the thigh, and carried down in ſpiral folds round the limb to the bottom, where it is doubled round, and carried up again to the upper part; it is then doubled round, and brought over the fore ſide upon the wound from behind upwards; and theſe folds are repeated over both ſides of the thigh and over the wound, in ſuch a manner, that one fold always half covers the other. The whole thigh is thus ſurrounded with the bandage. Theſe folds are then ſecured by circular folds from below upwards, without croſſing the bandage over the ſtump, as that would be an impediment to the adheſion of the wound; but by this method of bandaging, the retraction of the ſkin is prevented, and the adheſion promoted.

After the bandaging has been completed, the patient is placed in a convenient poſture, and the thigh is laid upon a bolſter, gently bent; for if laid horizontally, or even lower than the horizontal line, it not only cauſes pain to the patient, but the flexor muſcles of the thigh conſtantly tend to bend it and bring it to the abovementioned poſition. If we attempt to counteract this tendency, by applying force to the limb, it becomes convulſed, and the adheſion is fruſtrated.

If no particular ſymptoms forbid it, the firſt dreſſings are ſuffered to remain on till the fourth, fifth, or ſixth day; and when all this is ſtill properly united, the adheſive plaſters are nevertheleſs left in their places, the wound is cleanſed from the impurites that have been diſcharged, and the limb is bandaged in the manner above deſcribed. If any of the plaſters have broken looſe, or the lips of the wound have ſeparated at any part, the plaſter is cut through over the wound, without pulling it off, and a new one, or if it be neceſſary, ſeveral are applied, in order to bring the ſeparated lips of the wound into proper contact

Inſtead of the circular bandage above deſcribed, ſome adviſe the limb to be rolled with Loder's twenty-ſeven-tailed bandage, (D. Juſt. Chr. Loder, Chirurg. Medicin. Beobachtungen, &c. lib. i. Weimar, 1794, p. 14. Tab. I. fig. 4, 5.) in which caſe a circular bandage is firſt applied to the upper part of the thigh, and carried down to the bottom in ſpiral folds, ſo cloſe to each other, as to prevent the retraction of the ſkin and muſcles, but not to excite pain, or obſtruct the circulation. The bandage is faſtened with a pin at the lower part of the ſtump, leaving for future uſe a piece large enough for folding two or three times round the limb. After the whole of the bandaging has been performed as above deſcribed, the remaining part of the fillet is folded twice or thrice round the limb, ſo that the preſſure can be increaſed or diminiſhed at pleaſure, and finally the twenty-ſeven-tailed bandage is applied.

While we apply the circular bandage, the tourniquet muſt be removed, but it muſt be again applied as ſoon as we have finiſhed the bandaging of the limb, in order that we may be able immediately to ſtop any hæmorrhage that may come on; for which purpoſe it muſt likewiſe be kept applied for ſeveral days after amputation has been performed.

When the patient has been put to bed, and a hooped frame laid over the ſtump, he ſhould immediately receive an opiate, in order to prevent involuntary ſpaſmodic motions of the ſtump. During the firſt days after amputation, an aſſiſtant ought frequently to examine the thigh with great care, in order that if he ſhould find blood to flow from any of the veſſels, he may draw the tourniquet as tight as is neceſſary to prevent any material hæmorrhage, till proper aſſiſtance can be obtained. If there exude only a ſmall quantity of blood from the ſurface of the ſtump, it is unneceſſary, on that account, to remove the bandages; but when the hæmorrhage is conſiderable, it can only be ſtopped by the application of ligatures; for were it even poſſible to ſtop it by compreſſion, this would fruſtrate our principal aim, namely, the ſpeedy union of the parts without ſuppuration. After we have ſtopped the bleeding, we muſt apply the bandages as before directed.

When every thing goes on according to our wiſh, the bandages are only renewed every two or three days, in order that we may not impede the uniting of the parts; but oftener, if the ſuppuration becomes more copious, or a new pain is perceived in the wound. Commonly about the 10th or 11th day, ſometimes later, the threads of the ligatures may be drawn out by gently pulling them; frequently they grow looſe and fall out of themſelves. When the threads have been detached, the open angles of the wound are to be united nearly in the ſame manner as before; after which the complete cicatrization of the wound takes place in a longer or ſhorter time, but commonly in a week or a fortnight more.

To prevent inflammation, the patient ſhould be ſtrictly treated during the firſt days after the operation, according to the antiphlogiſtic regimen; though this muſt be uſed with great caution in exhauſted and debilitated conſtitutions, leſt by too ſtrict a regimen we might impair the ſtrength of the body. When the pyrexia has abated, and the patient is in a

ſtate of debility, we give him Peruvian bark, preſcribe proper diet, and, at the ſame time, take care to keep his bowels open. As ſoon as the patient feels himſelf well, it is beſt to give him no medicines at all, but merely to enjoin attention to a proper diet.

It ſometimes happens, that in applying the dreſſings we find the parts red, tenſe, and painful to the touch, and the deges of the ſkin at a little diſtance from each other. As long as theſe circumſtances continue, we muſt omit the application of the adheſive plaſters, and cover the ſurface of the ſtump with a pledgit of ſoft lint ſpread with cerate, as in the firſt dreſſing; over this we are to apply a cuſhion of lint, which is to be ſecured with ſlips of adheſive plaſter, or croſs pieces of linen; and the whole of theſe dreſſings are to be confined with the circular bandage, the preſſure of which ought to be not ſtronger than is neceſſary for ſecuring the dreſſings. When the bandage is ſoiled, with the pus collected upon it, it ſhould be changed for another; otherwiſe it may be left in its ſituation. In general, we ought not entirely to lay aſide the bandages till the third or fourth week after the operation; but at that period we ſhould do it leſt the ſtump grow thinner than the other thigh. As ſoon as the wound is perfectly clean, and the pain and ſenſe of tenſion removed, the edges of the wound may again be drawn cloſely together with adheſive plaſter.

The amputation of the thigh has been performed only at its lower part, namely, at the adopted diſtance of three or four fingers breadths from the knee, for fear of a too copious hæmorrhage; but experience has ſhewn, that in caſes of neceſſity the operation may be ſafely performed very high upon the limb. Only in ſuch caſes the tourniquet muſt be ſecured with great care, that it may not ſlip off in conſequence of the retraction of the muſcles. For this purpoſe we may, according to Mr. Schmuker's method, (Vermiſche Chirurgiſche Schriften, lib. i. Berlin a Stettin, 1776, c. 8. p. 43.) lay under the tourniquet four pieces of tape about an inch broad, and two feet in length; directing two aſſiſtants to lay hold of theſe like handles, and draw them tight, two of them on the inner, and two on the outer ſide of the limb, whereby all ſuch diſagreeable conſequences will be prevented.

Amputation of the Leg.

It is adopted by many as a general rule, that the amputation of the leg ſhould never be performed juſt above the ankle, even though the diſeaſe be ſeated near the bottom of the limb; but always three or four finger-breadths under the knee: repeated experiments, however, have ſhewn, that amputation may be ſucceſsfully performed juſt above the ankles, and as near to them as the diſeaſe permits. The advantage of being able to uſe the knee-joint in walking is ſo great, that the ſurgeon ſhould not deprive the patient of it. (See our account of the *Flap Operation.*) The objection, that a long ſtump is an incumbrance, may be removed by the uſe of an artificial foot. In order to promote the cure of thoſe wounds, the projecting tendinous parts muſt be ſeparated with the ſciſſars. Mr. B. Bell conceives it to be better in every inſtance, where the circumſtances admit of it, to amputate a little above the ankle than at the upper part of the leg: amputation immediately under the knee he rejects entirely, as the cure of the ſtump is always tedious in this ſituation, the bones thick, and the ſoft parts deficient. In ſuch caſes he prefers amputating above the knee, though his opinion cannot be unconditionally adopted.

When we are to amputate immediately below the knee, the patient is placed upon a table, and ſecured in the ſame manner as in the amputation of the thigh. Some are of opinion that the tourniquet ſhould be applied a little above the knee, with the cuſhion upon the artery in the ham; but others apply it alſo in this operation immediately under Poupart's ligament, or in the middle of the thigh, which is the preferable method. The foot and leg are ſecured by an aſſiſtant, who ſits before the patient. A ſecond aſſiſtant draws up the integuments towards the knee. The ſurgeon ſtands on the inſide of the limb, and with his knife makes firſt a circular cut through the ſkin and cellular ſubſtance down to the muſcles; ſo that after as much of the integuments as will afterwards be neceſſary for covering the ſtump, has been ſeparated in this manner from the parts beneath, the muſcles and bones may be divided immediately below the part where the tendons and flexor muſcles of the leg are inſerted. When this has been done, the ſoft parts between the two bones muſt be divided with a two-edged knife (named a CATLIN), and the periоſteum ſeparated downwards. The ſkin and other ſoft parts muſt then be held faſt to protect them againſt the ſaw, which is to be applied ſo as to cut through both of the bones together. When this has been done, and the veſſels tied, the external integuments are drawn over the ſtump, and retained with adheſive plaſters. During the courſe of the cure the practice is the ſame as after amputation of the thigh.

In ſeparating the ſkin we muſt be very careful to ſeparate it from the ſubjacent parts in ſuch a manner as to have as much as poſſible, if not the whole, of the cellular ſubſtance attached to it. The more we deprive the ſkin of its cellular texture, the more lifeleſs it becomes, and the leſs fit for adhering ſpeedily to the ſtump. As the ſkin alſo on the fore part of the leg cannot be retracted with near the ſame facility as in other parts, for example, the thigh, where it lies upon muſcles, whilſt on the fore part of the leg; on the contrary, it is connected by a very denſe cellular ſubſtance immediately to the periоſteum, the aſſiſtant is always obliged to fold back as much of it as has been ſeparated, before the diviſion of the muſcles can be attempted, in order that the ſurgeon may be able to ſeparate them from the bone, and ſave as much of them as is requiſite for covering the ſtump.

The reaſon why the ſurgeon is directed to ſtand on the inſide of the leg in this operation is, that when the knee and foot are turned inwards, and the fibula raiſed, he may be able to ſaw through both bones of the leg together, which he cannot do when he ſtands on the outſide. Finally, he muſt take care not to ſuffer the bone to break off, or ſhould ſuch an accident happen, he muſt remove the inequalities that may be produced by it. Many have adviſed, in amputating the leg, after the muſcles have been cut through, to apply a ligature round both bones, in order to hold them faſt, and the ſame has alſo been adviſed in the amputation of the fore-arm; but this can be of no advantage, for it will be better to hold both the bones faſt with the hand, and inſert the forefinger between them, nearly under the ſpot where the ſaw is to go through, in order to prevent their coming into contact with each other.

When the leg is amputated immediately above the ankle, an artificial foot cannot eaſily be applied and ſecured upon the ſtump; the machine muſt be made heavier and thicker at the ankle, nor can the leg be made ſo equal in length and thickneſs as the other, as would otherwiſe be poſſible. When the ſtump is about nine inches in length from the knee, its dimenſions are reckoned to be in every reſpect the moſt convenient.

Of amputating with a Flap.

In the old method of performing amputation, the cures were very tedious, and the health of the patients much impaired;

paired; and as the ſtumps became ſo pyramidal and ſcantily covered with ſoft parts, an attempt was made to perform the operation in ſuch a manner as to ſave a quantity of fleſh and ſkin for the purpoſe of covering the ſtump. This operation we have ſhewn to have been firſt invented by Mr. Lowdham, of Exeter, and afterwards practiſed by Mr. Young, of Plymouth; though ſince their time Verduin, of Amſterdam, and ſtill later, Sabourin, of Geneva, have claimed the merit of this invention. In France this method met with many advocates, but it was never approved of in Germany. In England it had been wholly neglected for a long time, when it was anew propoſed by O'Halloran, with ſome alterations and ſuppoſed improvements of his own. (See his Treatiſe on Gangrene, 8vo. London, 1765.)

As it is very difficult to reſtrain the hæmorrhagy which may accidentally happen to ſupervene, after the flap has been applied in Mr. Young's manner, it being neceſſary for that purpoſe to undo the whole of the bandages, and ſeparate the flap from the ſurface of the wound; moreover, as the flap does not always adhere uniformly over the whole ſurface of the ſtump, and the pain, inflammation, and tenſion which ſupervene, are ſometimes much more violent than after the ordinary method of amputating, Mr. O'Halloran propoſed to dreſs the ſtump and flap as two ſeparate wounds for the firſt twelve or fourteen days; but afterwards, when the danger of a bleeding is over, the ſymptoms ſubſided, and ſuppuration eſtabliſhed, to turn the flap back over the ſurface of the ſtump, and ſecure it by adheſive plaſters, compreſſes, and bandages, till a complete adheſion has taken place. It ſeems that one grand cauſe of failure in the ſucceſs of the flap operation, as it was performed in France about a century ago, was "the monſtrous hæmorrhagy," as Mr. O'Halloran expreſſes himſelf; and, according to *their* uncouth mode of conducting the operation, we almoſt agree with the laſt named writer, that "it was abſolutely impoſſible for it to ſucceed." But we are ſurpriſed that Mr. Benjamin Bell, of Edinburgh, even in the new edition of his Surgery, ſhould miſrepreſent the ſucceſs of the *preſent mode*, ſo much as to deny its having cured "before the fourth week." Syſtem of Surgery, vol. vii. p. 330. 7th edition: this is certainly an unfair and imperfect ſtatement of Mr. B. Bell.

By Mr. O'Halloran's improvement the flap operation was rendered more ſafe and certain, but has not come into general uſe, as that which Mr. Alanſon invented in the mean time deſerves, in moſt caſes, the preference. The flap may, under various circumſtances, be employed with advantage. Where it is impracticable in the common way to cover the divided parts ſufficiently, we ought always to cut out a flap of muſcle or ſkin for that purpoſe: it is beſt, for example, when we amputate the arm at the ſhoulder joint, or a finger, or toe. It has alſo been preferred by ſome ſurgeons when the leg is to be amputated immediately under the knee, as the integuments are very thin at that part, and there is reaſon to ſuppoſe that the ſtump cannot be ſufficiently covered by any other means.

It has not been the common practice to make a double flap, although this is at preſent done with very great advantage by the ſurgeons of the Liverpool Infirmary. Their method is (excepting for diſeaſes of the feet) to take the flap from each ſide of the limb, in preference to above and below, as it affords a better outlet for any pus that may collect in the ſtump. Upon an average, we find, on making recent inquiry, the ſtumps are healed in about "*eighteen days*;" which is more than can be ſaid in favour of any other mode of amputating. The double flap likewiſe is free from the puckered appearance which remains after the ſingle flap; and in a few weeks, we are informed, "the cicatrix can hardly be perceived." Our own experience with the flap operation, even in the metropolis, is much in its favour; ſo that whatever objections have been raiſed againſt it (when properly performed), we are ſtrongly inclined to think they have been chiefly theoretical, and not founded on actual obſervation.

Amputation with a Flap immediately above the Knee.

This operation may be performed either with one or two flaps; but if it be done with only one, it ſucceeds beſt on the fore part of the thigh, as there is here a ſufficiency of ſoft parts for forming the flap and covering the bone; and as the matter thus paſſes off more readily when the flap is applied, and the patient laid down upon his back.

The patient being placed upon a table, and the tourniquet applied to the femoral artery below Poupart's ligament, an aſſiſtant draws the ſkin firmly up, and retains it in that ſituation. Whilſt this is doing, we ought to mark, with ink upon the ſkin, the circumference of the intended flap. The extreme angle of the flap ſhould reach to the bottom of the thigh unleſs the ſkin be much diſeaſed, in which caſe the flap muſt terminate where the diſeaſe of the integuments commences. The baſe of the flap muſt be at the place where we intend to ſaw through the bone. Its breadth muſt be proportionate to the dimenſions of the limb. If, for example, the diameter of a ſtump be twelve inches, a flap four inches and a quarter in length will be fully ſufficient to cover it. But as ſome allowance muſt alſo be made for the quantity of ſkin and muſcles that may be ſaved on the oppoſite ſide of the limb, by drawing them up before ſawing the bone, a thigh twelve inches thick will not require a flap more than three inches and a quarter long, and ſo in proportion to the ſize of the limb. The flap ſhould be as broad at the baſe as the breadth of the limb will permit; and it ſhould be continued nearly, though not entirely of the ſame breadth, till within a little of its termination, where it ſhould be cut circular, ſo as to correſpond, as accurately as may be, with the back part of the circumference of the wound.

When now the ſurgeon has marked out the circumference of the flap, he muſt place himſelf on the outſide of the thigh, apply the point of a ſtraight double-edged knife to the outer ſide of the baſe of the intended flap, and puſh it in to the depth of the bone; then, carrying the point cloſe to the bone, puſh it through the integuments on the oppoſite ſide of the mark. He muſt now carry the edge of the knife downwards in ſuch a direction as to cut out the flap according to the figure marked out; but towards the end he ſhould raiſe the edge ſomewhat from the bone, ſo as to make the lower part of the flap ſomewhat thinner than the baſe, whereby it will apply more accurately to the ſurface of the ſore. The flap muſt be held by an aſſiſtant, but the ſkin and muſcles on the back part of the limb muſt, with one ſtroke of the knife, be cut down to the bone, about an inch lower down than where the bone is to be ſawed. The muſcles are then to be ſeparated to this height from the bone, with the point of the knife, and all the ſoft parts muſt be drawn back with the ſlit compreſs, till the bone is ſawed. Any ſplinters that may have been left are then to be ſeparated, the arteries tied up, and the ligatures left hanging out at the edge of the flap.

The muſcles and integuments muſt now be drawn down, and ſecured with a roller, as has been directed above, in treating of the amputation of the thigh with the circular inciſion. The flap may now be laid down over the ſurface of the wound, the coagulated blood having firſt been carefully wiped off with a ſponge, and the flap may then be moderately ſecured to the ſtump with adheſive plaſters and ſutures. The under part of the ſtump ſhould be covered with a large

a large pledgit ſpread with cerate, and a cuſhion of lint or tow laid over it. The whole ſhould then be ſecured with croſs ſtraps of linen, and ſeveral turns of the circular roller. After the ſpace of three or four days, or even longer, the dreſſings may be renewed. As ſoon as all the ligatures are removed, and the tenſion and pain have abated, the ſkin may be drawn over every part of the wound which before was not covered, and ſecured with adheſive plaſters.

The method now deſcribed is generally to be preferred; but if, inſtead of effecting the cure by promoting a ſpeedy adheſion of the parts, the ſurgeon deems it adviſeable, he will treat the flap as a ſeparate wound according to O'Halloran's method; in which caſe, his eaſieſt mode of proceeding is as follows: The muſcles and ſkin being brought down and ſecured with the roller, the whole ſurface of the ſtump is covered with a ſoft pledgit ſpread on both ſides with an emollient ointment. Upon this the flap is laid down, and another pledgit of the ſame kind being laid over the flap, a cuſhion of lint or ſoft tow, and a compreſs of ſoft linen are applied, and the whole is ſecured with croſs ſtraps of linen and a circular roller; but with no more preſſure than is requiſite for the ſecurity of the dreſſings. At the end of three or four days the dreſſings may be renewed in the ſame manner; and about the tenth or twelfth day, or whenever the tenſion and inflammation are removed, the ligatures may be taken out.

When now a proper ſuppuration is eſtabliſhed, the flap may be applied to the ſtump. But previouſly, the matter muſt be wiped off from the ſurfaces of both ſores, with a ſoft ſponge, and theſe being brought into contact with the greateſt exactneſs poſſible, they may be ſecured either with adheſive plaſters or two or three ſutures.

Mr. Benjamin Bell, who prefers the latter method, aſſures us, that when, with a view to immediate adheſion, the flap is laid down directly after the operation, the pain, tenſion, and inflammation, which enſue, run often ſo high as to compel the ſurgeon to remove the dreſſings: whereas, when O'Halloran's method is adopted, the inflammation which enſues is very trifling, and the cure is accompliſhed even more quickly, than when the operation has been done according to the former method. We are, however, very much diſpoſed to think the inflammation, &c. is too often produced by tight bandaging or ſutures, in the caſes where it fails of ſucceſs.

The operation with *two flaps*, according to Ravaton's method, is performed in the following manner: When the tourniquet has been applied, an aſſiſtant draws up the ſkin tight, and makes a circular inciſion through the ſkin and muſcles at the lowermoſt part of the limb, with the edge of the knife turned obliquely upwards. A ſharp-pointed knife is now puſhed in on one ſide of the limb down to the bone, at the part where the bone is to be ſawed, and the under edge of the knife being turned obliquely outwards, the muſcles are divided down to the circular inciſion. The ſkin and muſcles on the oppoſite ſide of the limb are now divided by a ſimilar inciſion, and with theſe the intermediate ſoft parts that may have been left are likewiſe cut through. When now the bone has been ſawed, and the veſſels tied up, the ſurgeon muſt either lay both flaps together immediately (as we recommend), or keep them ſeparate for the firſt twelve or fourteen days, after which he may treat them in the manner above directed.

Of the Flap-Operation below the Knee.

This operation is performed nearly in the ſame manner as that above the knee; and the flap may be applied either immediately, or after the pain, tenſion, and inflammation are gone. Only we cannot here, as on the thigh, ſo commodiouſly cut out the flap on the fore part of the limb, as the leg has no muſcles there. On that account all writers direct the flap to be cut out at the back part: though this is attended with a very conſiderable inconvenience. For when the flap has been cut out of the calf of the leg, it is ſcarcely poſſible, after it has been applied to the ſtump, to prevent the accumulation and retenſion of the pus, as it does not find a free vent below, and we dare not apply more than a very moderate degree of preſſure to the ſtump.

Inſtead therefore of cutting the flap out of the back part of the leg, Mr. B. Bell adviſes us to do it from the outſide of the limb, where there is a ſufficient quantity of muſcles for the purpoſe, and where the flap can be no impediment to the diſcharge of the pus. He therefore performs the operation according to the following method: Let the point of the knife be entered on the outſide of the ridge of the tibia, at the place where the bone is to be ſawn, and after carrying it backward, in a direct line, to the oppoſite ſide of the baſe of the flap, let the edge be carried down the line previouſly marked with ink as a direction for the form and length of it.

When we amputate immediately above the ankle, we muſt cut out the flap behind, as there is not a ſufficient quantity of ſoft parts behind; but it is here to be repeated, what has already been obſerved, that the leg ought never to be amputated ſo immediately above the ankle, as to have the ſtump too long for an artificial leg and foot being conveniently adapted to it. In an adult we ought therefore to form the flap about nine inches under the knee, if we wiſh to perform the operation in this manner.

Amputation of the Foot, Toes, and Fingers.

When the whole foot is diſeaſed, we muſt perform the amputation in the manner above mentioned, above the ankle. This ſhould alſo be done even where the joint itſelf is ſound, but all the reſt of the foot diſeaſed. Some, indeed, have adviſed to take off the foot at the ankle joint; but as, when this is done, an artificial foot cannot well be applied, nor the ſtump covered with fleſhy ſubſtance, the amputation above the ankle is evidently to be preferred.

But when a conſiderable part of the foot is ſtill ſound, we ought to endeavour to preſerve it, and merely to remove what is diſeaſed; and this ſhould be our practice even where two of the metatarſal bones only remain ſound; for the patient may ſtill make great uſe even of a ſmall part of the foot in walking, provided he wears a ſhoe well made, properly ſtuffed out, and with a ſtrong unyielding ſole. This may be done, eſpecially when the bones on the inſide of the foot, or thoſe correſponding to the great toe, and thoſe next it, are left. Very remarkable, therefore, is the caſe of Mr. Turner's amputating the foot at the middle. The operation was performed on account of a painful tumour, which extended as far as the middle of the metatarſus; and it was thought unneceſſary to amputate above the ankle. A double inciſion was therefore made, and in order to preſerve as much as poſſible of the integuments, a ſmall part of them ſituated above the tumour, was included in the firſt inciſion. As the integuments could not be drawn back to any conſiderable length, it was impoſſible to preſerve ſo much of them as might have been wiſhed. The foot was ſawed through at the upper part of the metatarſus, the hæmorrhage was eaſily ſtopped, and in the courſe of ten weeks it was completely healed, without any violent ſymptom having ſupervened.

When only ſingle bones of the tarſus are diſeaſed, theſe bones alone are to be taken out. When only one part of a bone

bone is diſeaſed, this muſt be removed with the ſaw, chiſel, or trephine, but not the whole bone taken away.

In every amputation as much ſkin as is ſufficient for covering the wound muſt be ſaved; but this is particularly neceſſary in amputating any part of the foot, where bad effects are to be apprehended from friction in walking. As the ſkin of the ſole of the foot is commonly very thick, the flap which is to cover the ſore ought, if poſſible, to be taken from that part; for this will prevent the bad effects of friction upon the part, much more than could be done by the ſkin of the upper part of the foot which is thinner, and unaccuſtomed to friction or preſſure.

In performing this operation, the patient is placed on a table, and the tourniquet applied either below Poupart's ligament, near the upper part of the thigh, or over the knee, with a compreſs in the ham. The limb is ſecured by an aſſiſtant, and in ſawing through the diſeaſed bone, a piece of paſteboard, or a thin ſplint of wood, ſhould be inſerted between it and the contiguous ſound bone, in order to protect the latter from the ſaw. When the diſeaſed bone has thus been removed, and the arteries tied, the flap that has been ſaved is laid, with as much exactneſs as poſſible, on the ſore, and ſecured with ſlips of adheſive plaſter, and a roller. If ſutures are employed, they ought to be inſerted in ſuch a manner as not to injure the tendons of the flexor and extenſor muſcles of the foot and toes.

In amputating the fingers and toes, we proceed in the ſame manner as with the larger extremities, and the ſtump muſt here alſo be covered with a flap. The ſkin is drawn back as much as poſſible, after which the ſkin and fleſh are cut through with a ſtraight biſtoury, between the contiguous ſound fingers and the diſeaſed one, in a ſtraight line backwards, till ſomewhat above the joint, on both ſides; the ſkin and fleſh are alſo cut through above, round the joint; the finger is then bent towards the palm of the hand, and cut off from the out to the inſide; the inciſion terminating at the fore part in ſuch a manner, that ſtill ſome part of the fleſh is preſerved for the purpoſe of being afterwards applied over the wound to facilitate the cure. When we only leave a ſingle flap of integument on the finger, it has been recommended to let it be taken from below in labouring people, to afford a ſuitable ſtump for preſſure; but, where beauty is more an object than uſe, we may take the flap of ſkin from above, as it will then ſcarcely occaſion a viſible ſcar after the cure.

In as much as we here ſpeak of the caſe, in which the whole finger or toe is amputated from the contiguous metacarpi or metatarſi, we muſt alſo proceed in a ſimilar manner when amputating only one or two joints; and if we find it neceſſary to tie an artery, we ſhould do it by means of the tenaculum. The flap muſt be laid over the wound, and ſecured as accurately as poſſible with adheſive plaſters, and moderate preſſure with a roller. The objection which has been made that the union of the ſoft parts with the cartilage is precarious, is not founded in truth; for the ſkin unites with the cartilage, which covers the bone at the joint almoſt as readily as with other parts. It is therefore unneceſſary that we ſhould ſeparate the cartilaginous ſurface of the joint with a ſmall ſaw, as was formerly the general practice.

Amputation of the Arm and Fore-Arm.

This is performed in every reſpect in the ſame manner as has formerly been directed for the amputation of the thigh and leg. It ſhould be remembered, however, that a long ſtump will be more uſeful in the arm than a ſhort one. When we are to amputate at any other part than the joint, we may do it without cutting out a flap to cover the wound; for in theſe parts there is a ſufficient quantity of muſcles, cellular texture and ſkin, for covering the ſtump, if we draw back the ſkin, according to the directions formerly given, and firſt divide that, and afterwards the muſcles. Should this not be practicable in certain caſes, it would then undoubtedly be better to perform the operation with a flap.

Amputations in the Joint.

Theſe operations have been recommended on the authority of a number of caſes in which they have been performed. In ſuch an operation we are directed to cut firſt through the ſkin, nearly over the joint, with a ſtraight knife upon the upper or foremoſt ſide, making a ſemicircular inciſion; we then open the capſule of the joint on both ſides, and in doing this, we bend the limb (ſuppoſe it be the hand) in order to obtain room for cutting through the capſule all round, that we may the better be able to ſpare the cartilage of the ſound member. The reſt of the operation and cure is conducted in the uſual manner.

But though amputation at the joint is preferable to amputation above the joint, with the fingers and toes, and perhaps alſo with the hand, the application of the ſame practice to other joints, ſuch as the elbow, knee, and ankle joint, muſt be attended with very great difficulties. For, in the firſt place, this method of amputating is in fact more tedious than the operation above the joint. It is alſo equally painful, and the hæmorrhage equally dangerous; and as the ſoft parts in theſe joints are moſtly aponeurotic and tendinous, a favourable inflammation and ſuppuration are not ſo likely to enſue. Beſides it is very difficult at the elbow and ankle-joint to ſave ſo much muſcular ſubſtance and ſkin as are requiſite for covering the bone at the ſurface of the articulation, on which account a tedious ſuppuration and exfoliation generally take place; and there is reaſon to apprehend, that we may afterwards be ſtill compelled to amputate again above the joint, and ſaw through the bone.

We ſhall deſcribe the operation, as it has been done at the hip and ſhoulder-joint by eminent ſurgeons.

Amputation of the Arm at the Shoulder Joint.

Though this operation ought never to be performed when we can accompliſh our purpoſe by amputating below the ſhoulder-joint, it being always a hazardous operation, yet we ought not to heſitate to undertake it, when abſceſſes in the joint, caries of the humerus extending to the ſhoulder, complicated fractures reaching as far as the head of the bone, bad gun-ſhot wounds, or a ſphacelus render it neceſſary. Mr. Bromfeild has given the following directions for performing it; and he did it ſeveral times with ſucceſs. See his Chirurgical Obſervations, vol. i. p. 247, *et ſeq.*

When the apparatus is ready, place the patient upon his ſound ſide upon a table, and in a ſomewhat oblique poſture, that the ſurgeon may have room to move freely. Let an aſſiſtant then compreſs the ſubclavian artery at the place where it paſſes through the ſcalenus muſcle, in ſuch a manner that, by the reſiſtance of the firſt rib, the paſſage of the blood through the artery may be entirely prevented. In order to know whether the preſſure be ſufficient for this purpoſe, we have only to examine the pulſe at the wriſt.

The patient being properly ſecured by the aſſiſtants, and preſſure made firmly on the artery, the ſurgeon begins his inciſion on the inner ſide of the arm, at the edge of the deltoid muſcle, namely, at the place where the great pectoral muſcle paſſes over the axilla, to be inſerted into the os humeri. He cuts through the ſkin and muſcles, carrying his inciſion downwards, and rather obliquely outwards, till he arrives a little

little below the termination of the deltoid. He then continues his incision across to the outer side of the arm, but so as to make this cross incision semicircular, and continues it on the outer side of the arm as far as the fold of integuments in the axilla. By means of this semicircular incision, we obtain, provided the skin and muscles have been drawn upwards from the bone, a flap of the form of a crescent, with which we may fill up the axilla after the operation.

A second incision must now be made, commencing at the processus acromion, to be continued quite through the deltoid muscle in a longitudinal direction, and as far as the place where this muscle is inserted into the os humeri, terminating in the first semicircular incision. This incision, however, must not divide the flap into two equal parts, but it must be carried somewhat more inwards, so as to make the outer division of the flap the largest. The operator then passes his knife under the outer edge of the inner division of this flap, and separates it from the bone as high up as he is able. By these means, the tendon of the pectoralis major is laid bare. He now introduces under the tendon the fore-finger of his left hand, which serves as a conductor to a crooked knife provided with a guard at the point, with which he cuts through this tendon, near to the place where it is attached to the os humeri. If by these means the vessels have not yet been laid sufficiently bare to be easily taken up, he divides also the outermost head of the biceps muscle.

The vessels being now sufficiently in view, the surgeon first ties the artery with a strong ligature about eight inches in length. For this purpose he makes use of a peculiar kind of instrument, which is fixed to a flat handle, like a scalpel, and towards the point resembles a blunt crooked needle, having a transverse eye at its anterior extremity. When he has introduced the ligature under the artery, by means of this instrument, he directs his assistant to lay hold of the ligature, with a small tenaculum, on the other side, near to the eye of the needle; which being done, he draws back the needle. He now cuts through the ligature, at the tenaculum, by which means he obtains two ligatures. The one of these he lays hold of, and draws it a little forwards, in order to find its other end; after which he ties the artery with a surgeon's knot, about two inches below the head of the os humeri. The other ligature is applied about half an inch lower down, and the artery is then divided a little below the second ligature. The great brachial vein must also be tied with the same care, without, however, including the nerve, and then cut through in the same manner as the artery. He then delivers the ends of the ligatures to an assistant, who holds them up with one hand, towards the upper part of the thorax, and with the fingers of the other compresses the vessels at the axilla.

The surgeon then divides the nerve as high as possible, and much higher than the artery. He now separates the outer part of the flap also, as high up as sufficiently to expose the capsule of the joint; he then cuts through the muscles and the capsule at the superior and lateral part, and presses the arm a little backwards, upon which the head of the bone is immediately dislodged from the socket of the joint, after which the remaining part of the capsule is easily divided. He now completes the operation with the third grand incision, which he commences at the inside of the shoulder, where the vessels must be protected by the fingers of the assistant from the knife; and continues it in a semicircular direction through the fleshy parts, which cover the inner side of the joint, till this incision terminates in the first incision on the outside of the arm. Should any of the vessels still throw out much blood, it must be drawn out with the tenaculum and tied, taking care not to include the nerve in the ligature. The ends of the ligatures are then drawn to the outside of the arm, and the inner part of the flap let fall down in such a manner, as to fit into the semicircular incision. The surgeon then passes a large crooked needle with a thread through the inner flap, about an inch and a half under the upper and inner part of the wound, and carries the point of it through the skin of the wound in the same line, forming the interrupted suture in the usual manner, in order to promote the speedy union of the parts. The same operation he repeats twice with the outer flap, then draws out the ends of the threads through the middle incision in the deltoid muscle, and lets them hang out till they come away spontaneously, which may be in about eight or ten days.

When the socket of the joint is not carious, the operator, before drawing out the ends of the vessels, is recommended (but, we think, very improperly) to separate the cartilaginous substance which lines its socket with a scalpel, and to cover the bone with dry lint, which is to remain there till it comes away of itself. He also makes use of dry lint when the socket of the joint and the adjacent bones are carious. Every long sinus that does not proceed perpendicularly upwards must likewise be laid open by an incision.

After the operation he covers the stump with a double piece of flannel, which he draws together with a needle and thread, in such a manner as to make it lie close upon the upper part of the shoulder, so that it cannot fall down. This he further secures with other stripes of flannel, from three to four fingers-breadth broad, and from six to nine feet in length, according as the strength of the patient requires, sewing such a stripe of flannel on each side to the upper edge of the bandage; the foremost of which he carries behind over the back of the patient, and the hindmost forwards over his breast, so that they cross each other over the shoulder, and again on the opposite side at the axilla, after which their ends are brought back to the stump, and there secured with pins. Two other stripes of flannel are fixed on the inner and outer side, to the inferior margin of the flannel bandage on the stump, one of which is carried across the back, and the other across the breast at the lower part of the sternum; they are then made to cross each other at the axilla of the sound arm, then brought round to the shoulder, and crossed again; after which the end that was brought out under the axilla, and carried to the shoulder, is now passed along the lower part of the neck to the bottom of the stump. The other end is brought forwards, and secured to the bottom of the stump with pins.

Mr. Benjamin Bell advises us to perform this operation, after a method somewhat different from that of Bromfeild; although he seems not to have done it himself. He directs us to place the patient upon a table of a convenient height, covered with a mattress and a blanket. Let him be laid upon his back, as near as possible to the edge of the table, and properly secured by assistants. Hæmorrhagy is guarded against by an assistant compressing firmly with his finger and a cushion on the subclavian artery, as it passes over the first rib directly above the clavicle. The diseased shoulder is then made to project somewhat over the side of the table, and the arm is stretched out at nearly a right angle with the body, and supported by an assistant.

The incision is made exactly at the insertion of the deltoid muscle into the humerus, in a circular form through the skin and cellular substance; the integuments are retracted about half an inch, and along their margin all the muscles are divided with a perpendicular cut down to the bone. All this is performed with the common amputating knife; the rest of the operation is performed with a strong round-edged scalpel. With this instrument a perpendicular incision is made

made down to the bone, commencing at the acromion, and terminating in the former circular inciſion, ſo as to paſs ſtraight between the centre of the deltoid muſcle and its outer edge, and end about an inch above, or rather on the outſide of the brachial artery. A ſimilar inciſion is made on the back part of the arm, commencing alſo at the acromion, and terminating in the circular inciſion. This ſhould be at ſuch a diſtance from the firſt perpendicular inciſion, that the two flaps formed between them may be both nearly of equal breadth. The brachial artery muſt be tied, as ſoon as it has been divided by the circular inciſion through the muſcles; and any other anaſtomoſing branches of arteries that may have been cut muſt likewiſe be tied in a ſimilar manner. The two flaps muſt now be ſeparated from the bone, care being taken not to injure the great brachial artery, in ſeparating that part of the flap near which it lies. An aſſiſtant muſt then preſs both the flaps aſunder, ſo as to bring the capſular ligament of the joint into view. Into this ligament an opening is now made, and the bone diſlocated, by dreſſing the arm backward. The operation is then finiſhed by dividing the remaining part of the ligament.

Any arteries that may have been cut about the joint muſt be tied, and the ligature ſuffered to hang out at the moſt depending part of the wound. When the parts have been cleared of all the coagulated blood, the two flaps are laid together, in ſuch a manner as to cover the joint as exactly as poſſible, and retained in this ſituation by one or two more ſutures. A pledgit ſpread with emollient ointment is laid upon the joint, and over this a cuſhion of lint with a ſoft compreſs of linen. All this is ſecured by a flannel roller, applied ſo as to make only a moderate preſſure, by which the flaps will be kept in contact with the parts beneath. The patient muſt, in other reſpects, be treated according to the directions formerly given. In the courſe of eight or ten days, Mr. Bell ſays, the ligatures will eaſily come away; but to avoid any riſk from ſudden hæmorrhage, he adviſes an aſſiſtant to watch the patient for the firſt few days after the operation.

This method is undoubtedly more eaſy and ſimple than that of Bromfeild: for the muſcles are divided at once, down to the bone, with a circular inciſion; and not, as in Mr. Bromfeild's method, firſt one muſcle cut and then another. As the attachments of all the muſcles to the humerus are removed by the arm being taken away, it is not neceſſary we ſhould divide them with ſuch ſlowneſs and caution; one ligature alſo upon the brachial artery is ſufficient, if applied with the requiſite care and attention by means of the tenaculum. Neither is it neceſſary to ſcrape off the cartilage from the acetabulum of the joint; for, as has been already obſerved, the ſoft parts will adhere to cartilage as readily as to bone.

Another method of amputating the arm at the joint was employed by Mr. Deſault, of Paris, which ſeems not only to be far more expeditious, but alſo leſs painful to the patient, and eaſier to execute than any other. The manner in which it is performed is as follows:

The patient being placed upon a chair, and the ſubclavian artery compreſſed by the finger of an aſſiſtant at the place where it paſſes through the ſcalenus muſcle, the arm is raiſed in ſuch a manner as to form nearly a right angle with the trunk of the body. A two-edged ſcalpel, having a ſtraight blade ſix inches in length, and half an inch in breadth, is thruſt into the joint at the place where the long head of the biceps muſcle enters it, and brought out again an inch below the axilla; in this manner the capſule of the joint is cut through forwards; and, at the ſame time, the knife is carried round the head of the os humeri on the ſame ſide of the arm, care being taken to keep it always quite cloſe to the bone. By cutting downwards in this manner, all the fleſhy ſubſtance is at once ſeparated three finger-breadths below the joint, ſo as to form a triangular flap, in which the axillary artery and vein are contained. This flap is immediately laid hold of by an aſſiſtant, who holds it off from the bone, and compreſſes the veſſels with his fingers. The arm is then bent a little backwards, the knife introduced again into the joint, the remainder of the capſule and ligaments cut through, and, by carrying the inſtrument downwards from the back part next the bone, and at the ſame diſtance from the joint as before, another triangular flap is formed ſimilar to the former in ſhape and ſize. The arm being entirely cut out in this manner, the axillary artery and vein are tied as high up as poſſible.

When the acetabulum of the joint is quite free from diſeaſe, the cure is endeavoured to be effected by reunion, for which purpoſe Mr. Deſault alſo conceived it to be unneceſſary to ſcrape away the cartilage. The two flaps are now laid together, ſo as to fill up the ſocket of the joint, and the lips united by means of the interrupted ſuture. Over the fleſhy parts dry lint is applied, and over that a compreſs, in the form of a croſs of Malta, ſpread with ointment; then again a round compreſs and two longuettes, which are all finally ſecured with a flannel roller. Under the axilla an oval piece of linen is applied, partly in order to reſiſt the impetus of the blood in the axillary artery, and partly to preſs the fleſhy parts more cloſely to the hollow of the ſcapula, with a view to facilitate the healing of the wound. The whole of theſe dreſſings are likewiſe ſecured with a roller.

The knife uſed in this operation muſt be ſharp, and ſomewhat ground off on both ſides, like a pair of ſciſſars. The blade ſhould not be made of too hard ſteel, leſt it break during the operation; on the contrary it ſhould be rather flexible, but at the ſame time tough, in order that when it is carried round under the head of the os humeri, it may apply the more aptly to the bone.

Amputation of the Thigh at the Hip Joint.

The propoſal of this operation muſt at firſt ſtrike a feeling mind with horror; and, indeed, it is ſo terrible as well as difficult to perform, that many eminent men have thought it impracticable to be done with ſucceſs. This opinion has even been advanced by Schmucker, in his Vermiſche Chirurgiſche Schriften, &c. B. i. p. 48. Berlin, 1776; where the author ſays, "he is perſuaded that no patient on whom it may be performed can ever ſurvive." He very properly diſſuades us from relying on experiments which have been made on dogs, and from thence inferring, that ſimilar trials will ſucceed equally well on the human ſubject; but Schmucker ought certainly to have ſpoken with ſome degree of diffidence, after the publication of facts which ſeem to eſtabliſh an oppoſite opinion to his own. That a perſon may actually *ſurvive* this dreadful operation, will appear from what we ſhall preſently ſtate for the reader's information.

The poſſibility of performing amputation at the hip-joint with ſucceſs, was diſcuſſed ſo early as the year 1739; and was maintained in a public theſis, at one of the medical ſchools at Paris, A. D. 1748. The members of the Royal Academy of Surgery at Paris, likewiſe believing that it was practicable, gave out the following prize queſtion in 1756: "*Dans le cas où l'Amputation de la Cuiſſe dans l'Article paroîtroit l'unique Reſſource pour ſauver la vie à un Malade, déterminer ſi l'on doit pratiquer cette Opération, et quelle ſeroit la Methode la plus advantageuſe de la faire;*" but not being ſatisfied with the anſwer it met with, they again propoſed the ſame ſubject for the year 1759. On the former occaſion, twelve memoirs were received by the Royal Academy; on the

the latter, thirty-four. Diſput. Chirurg. Halleri, tom. v.—Opuſcules de Chirurgie par M. Morand.—Prix de l'Académie, tom. iv.—Journal de Médecine en 1759.

Who would have imagined, à priori, that a patient could ſurvive the complete dilaceration of an arm, with the ſcapula, and all the muſcles attached to it? Yet this is a fact that cannot be controverted. The thigh of a young lad, at the Hotel Dieu d'Orleans, was ſpontaneouſly ſeparated at the hip-joint, except the round ligament and ſciatic nerve: the other thigh, which was much ſphacelated likewiſe, was preſently afterwards cut off by his ſurgeon; and the ſore on both ſides went on well till the fifteenth day from the firſt operation, when a fever ſupervened and deſtroyed the patient. Another inſtance of an amputation of the limb at the hip-joint is recorded by M. Sabatier, (De la Méd. Opér. tom. iii. p. 330.) which had been performed in conſequence of a violent contuſion, followed by gangrene: the cure was effected in eighteen months, and remained permanent; ſo that this man was afterwards married, and had a fine child. Laſtly, we beg leave to copy an intereſting account of a caſe publiſhed by Mr. William Kerr, of Northampton, in vol. vi. p. 377, of Dr. Duncan's Medical Commentaries; from which we may farther preſume on the reaſonableneſs of this operation, under certain circumſtances of extreme danger.

"A girl, between eleven and twelve years of age, was brought into the hoſpital, from Kettering, in December laſt. She had a tumour on the outſide of her right thigh, extending from the middle to near the great trochanter; ſhe was very much emaciated, had a conſtant cough, night ſweats, and many more hectic ſymptoms. She told us that ſhe had been ailing upwards of two years, during which period ſhe had frequently had fevers, and that her lameneſs had been gradually increaſing from her firſt illneſs. That at firſt ſhe had little pain, but a few months before ſhe came into the houſe, it became very acute from the groin all round the hip, and till then ſhe never obſerved the tumour before mentioned.

"She ſuffered great pain upon the leaſt motion of the joint, and upon every ſuch attempt there was a very perceptible grating to be felt. Being engaged myſelf," ſays the author, "I directed Mr. Warden, houſe-ſurgeon, to open the tumour the day after ſhe came into the hoſpital; there was diſcharged about half a pint of ill-conditioned matter, and we had the ſame kind of diſcharge, in a very great quantity, at every dreſſing, from that time till the operation, which was performed the Saturday following.

"Flattering myſelf that the hectic ſymptoms might be the effects of abſorption, convinced that the joint was diſeaſed, and concluding, therefore, that there was no other method of cure but by amputating the limb at the articulation, I ſet about it in the following manner:

"Having laid the patient upon the ſound ſide, upon a table of a common height, and putting the diſeaſed thigh at right angles with the trunk, I began my inciſion immediately behind the top of the great trochanter, carrying it obliquely, backwards and downwards, to the inſide of the thigh, and from thence obliquely upwards to within two inches of the crural artery.

"I then began a ſecond inciſion at the ſame place with the former, carrying it in an oppoſite direction over the upper extremity of the trochanter, and from thence obliquely forwards and downwards to within the ſame diſtance of the veſſel as in the former.

"Theſe inciſions were made only through the ſkin and fat, which being well drawn back by my two aſſiſtants, I cut down into the joint, and from thence carried two other inciſions through the muſcles in the ſame order and direction, and to the ſame extent as thoſe which were made through the outer teguments.

"I then turned the head of the femur out of the acetabulum, that I might with more eaſe and ſecurity accompliſh the moſt important part of the operation, namely, the taking up the artery. From the foregoing deſcription you will eaſily conceive that a flap about four inches in breadth, conſiſting of all the integuments with the artery included, was ſtill undivided. This flap I graſped firmly betwixt the fingers and thumb of my left hand, (my fingers on the ſkin ſide of it, and my thumb on the muſcular) and cut it through immediately below my hand, and between three and four inches from the paſſage of the artery under the ligamentum fallopii.

"The inciſion here was made from above downwards, firſt through the muſcular part of the flap, and then through the fat, veſſels, and ſkin. It was done in this manner that the ſkin might correſpond with that which was divided by the firſt inciſions, and that the edges of the wound, we cannot ſay ſtump, might thereby be kept neat and uniform.

"The next ſtep was to ſecure the artery, which I effected by paſſing a ſtrong ligature round it with a needle, and getting one of my aſſiſtants to tie it up; ſuch a compreſſion being all the while made upon it by my left hand in the manner related above, as to prevent the loſs of a ſingle drop of blood, and the hæmorrhage from the other arteries was full as inconſiderable as in any other amputation of the thigh. By ſaving a good portion of ſkin the wound was much more decent and ſeemly than you can well imagine; but, to my great mortification, I found not only the acetabulum carious, but alſo the adjacent parts of the oſſa innominata, to a very conſiderable extent. From her almoſt conſtant cough, I was under the greateſt apprehenſion that the artery would be forced open; yet no miſchief enſued, and the ligature fell off at the fourth or fifth dreſſing: the aſpect of the ſore, in the mean while, giving us the moſt ſanguine hopes of her recovery. But about the tenth or eleventh day her reſpiration became more difficult, expectoration ceaſed, her mouth and tongue were covered with aphthæ, and ſhe died on the 18th day from the operation. The appearance of the ſore, even to the laſt, was ſuch as to afford good reaſon to ſuppoſe that the immediate cauſe of death was the daily increaſe of the hectic ſymptoms, and that without theſe the operation would have ſucceeded; I therefore had her opened, and our ſuppoſition was, I think, pretty ſtrongly confirmed by the following phenomena. The lungs were almoſt totally reduced to matter, eſpecially on the right ſide, in which there was ſcarcely a veſtige of pulmonary ſubſtance remaining. The left lobe alſo was full of abſceſſes, and reduced to leſs than half the natural ſize. An abſceſs (commonly called the pſoas abſceſs) was likewiſe found on the right ſide, in the abdomen, which communicated, by a corroded opening with the acetabulum, with the joint.

"I have given you an exact narrative of the circumſtances of the caſe, the operation, and the event of it; at leaſt, I do not recollect any other of conſequence. I ſhall not comment farther upon it than juſt to obſerve, that the total deſtruction of the ligamentum rotundum by the ſuppuration within the joint, contributed greatly to the facility with which the operation was accompliſhed; for I imagine, if that ligament had been entire, the diviſion of it would have been attended with perhaps conſiderable embarraſſment; I think, however, it might be effected in a ſound joint.

"With regard to the expediency of the operation, I am ſo much convinced of it in certain caſes, that in ſuch I ſhall not, for the future, heſitate to perform it when they occur."

Concluding Obſervations.

It ſtill remains for us to notice two propoſals, one of which is directed to the prevention, the other to the improvement, of the operation of amputation. In caſes of ſcrofulous tumours, or, as they are termed, white ſwellings of the joints; of collections of matter in the cavities of joints, which often ſupervene upon ſimple inflammation; of gunſhot wounds and compound fractures of the joints; often alſo of the moſt ſimple, but, at the ſame time, penetrating wounds, a variety of morbid ſymptoms take place, which render timely amputation of the limb the only means by which the unfortunate patient's life can be ſaved. In theſe diſeaſes, when they affect the knee and elbow-joint, Mr. Park has propoſed, inſtead of amputating the whole limb, as is generally practiſed, another remedy, which conſiſts in the complete extirpation of the joint, or rather, in the amputation of the extremities of the bones which form the joint, together with the whole, or at leaſt the greater part of the capſular ligament, the cure is afterwards effected by means of callus, which occupies the place of the bones that have been ſawn off, or the femur is attached to the tibia by a ſynoſtoſis. But in the elbow, the humerus ſynoſtoſes with the radius and ulna, without the joint retaining any perceptible power of motion. With this view he made the following experiment:

Two inches above the upper end of the patella he made an inciſion, and carried it down to its lower extremity; he then placed the leg in an extended poſture, and made a croſs inciſion immediately above the patella, through the tendons of the extenſor muſcles, down to the bone, and nearly half round the limb, ſo as to form a right angle with the former inciſion. The lower angles which were formed by this inciſion, he widened ſo as to lay bare the capſular ligament, and took out the patella. The upper angles he likewiſe widened, ſo as to lay bare the head of the femur, and to enable him to paſs a ſmall knife acroſs the poſterior flat part of the bone immediately above the condyles, taking care to keep one of the flat ſides of the point of the inſtrument cloſe to the bone all the way. He then withdrew the knife, and introduced an elaſtic ſpatula in its place, to guard the ſoft parts during the ſawing through of the femur. He then carefully diſſected out the head of the femur that had been ſawn off. The head of the tibia was then eaſily turned out; this he ſawed off, and cut away as much as poſſible of the capſular ligament, leaving only the poſterior part to cover the veſſels, which he found, upon examination, to be not only unhurt, but alſo that they were ſufficiently covered with the remaining part of the ligament, and that, during the whole of the operation, they had been ſufficiently far from the courſe of the knife. Although the wound had a formidable appearance, he ſaw no reaſon to doubt that nature would be able to repair the breach; as the limb below would not be deprived of its nouriſhment, and every healthy freſh-inciſed ſurface, both of bone and of ſoft parts, has a natural tendency to granulate.

The next operation he performed upon the elbow-joint. He made an inciſion, commencing two inches above the tip of the olecranon, and terminating at the ſame diſtance below it; he then raiſed the integuments, and endeavoured to ſeparate the lateral ligaments from each other, in order that he might be enabled to draw the bones aſunder. But as he found this to be difficult, he firſt ſawed off the olecranon, whereby he looſened the joint to that degree, that he could very eaſily draw it aſunder, without being under the neceſſity of making a croſs inciſion. He then turned out the lower end of the humerus, and ſawed it off, and afterwards the heads of the radius and ulna. He does not, however, flatter himſelf that this method will prove equally ſucceſsful in all caſes; as, in ſome, amputation is indiſpenſably neceſſary; for example, when the diſeaſe has ſpread too far, when the ſoft parts are too much injured, and the caries too extenſive. In general, he thinks the operation is more to be recommended in caſes of external injury than in ſcrofulous affections.

The other propoſal, which has Mr. Wrabetz for its author, refers to the amputating of limbs without the knife, by means of ligatures. Mr. Plouequet (Von der unblutigen Abnehmung der Glieder. Tuebingen, 1786, 8vo.) deſcribes it as follows: Take a flaxen, or rather a cotton cord, of thickneſs and ſtrength proportionate to the ſize of the limb; lay it in ſpirit of turpentine, mixed with fine powder of tobacco-leaves, the ſeeds of the ruta, cantharides, and camphor; and after it has lain in this liquid for the ſpace of twelve hours, apply it to the limb in the following manner. Draw back the ſkin as much as poſſible towards the ſound part of the limb, and apply it above the diſeaſed part round ſome perfectly ſound part of the limb; draw it tight with a turn-ſtick, and ſecure the latter. About two inches above the cord rub a quantity of the above-mentioned mixture, till ſmall bliſters are raiſed, which muſt be opened and dreſſed with a drawing plaſter. By this application and by poultices the requiſite degree of inflammation is promoted. As long as the cantharides are employed, the uſe of which is very beneficial to debilitated habits, the patient muſt drink mucilaginous liquids, with which cordials are to be combined, ſuch as camphor, Peruvian bark, arnica, &c. and, at the ſame time, blood-letting and refrigerant remedies, eſpecially nitre, are to be adminiſtered. As the cord ſinks into the fleſh, and grows looſer, it muſt be tightened; and the crevice which it leaves above it muſt be filled up with a fine powder of Peruvian bark, camphor, and alum, in equal parts. This powder may alſo be made into a liniment with ol. hypericon. and rubbed into the above-mentioned crevice. That part of the limb which we wiſh to ſeparate ſhould be ſwathed in a cloth ſoaked in a mixture of a ſolution of alum, lime-water, and ſome aromatic ſpirit. Mr. Wrabetz has in one caſe ſucceeded in amputating the humerus according to this method, and aſſures us, that he has often ſeparated ſmall limbs by means of ligatures: it is, however, a practice that cannot be recommended for imitation, although Mr. Mariguet has endeavoured to demonſtrate the advantages of this operation; for, on the one hand, his obſervations are too defective to prove any thing, and on the other, the operation ſhould only be attempted in a perfectly ſimilar caſe.

For an account of the means of ſupplying defective members, *ſee* LIMBS, *artificial*.

AMPUZITZA, in *Geography*, a town of Beſſarabia, 26 miles weſt-north-weſt of Iſmael.

AMPYX, in *Antiquity*, a kind of golden chain, which ſerved to bind the hair of the horſes on the forehead. Homer deſcribes by this ornament the ſteeds of the god of war, calling them χρυσαμπυκες. The term was afterwards uſed more generally to denote a band or fillet, which formed a part of the dreſs, and which encompaſſed the hair. It was ſometimes encircled with gold and precious ſtones.

AMRAM, in *Scripture Biography*, was the ſon of Koath, of the tribe of Levi, and married Jochebed, by whom he had Aaron, Miriam, and Moſes. He died in Egypt, aged 137. Exod. vi. 20.

AMRAN, in *Geography*, a town of Arabia, 20 miles north-weſt of Sana.

AMRAPHEL, in *Scripture Hiſtory*, was king of Shinar, and confederate with Chedorlaomer, king of Elam, and two

other kings, in making war againſt the kings of Sodom, Gomorrah, and the three neighbouring cities. The kings, who were in league with him, plundered theſe cities, and carried off many captives, among whom was Lot, Abraham's nephew; but Abraham purſued them, retook Lot, and recovered the ſpoil. A. M. 2092, B. C. 1912.

AMRAS, in *Geography*, a caſtle or palace of Germany, in the county of Tyrol, called by ſome writers *Arx Ambroſiana*, and alſo *Ombraſs*, and ſituate at the foot of a mountain, two miles ſouth eaſt of Inſpruck. In the heat of Summer it is a place of retirement for the archdukes. It is famous for its collection of antiquities, gold medals, cameos and intaglios, moſt of which were ſent to it by Charles V. On the walls and ceilings are many curious paintings, and one, in particular, of Noah's ark by Baſſano, for which the grand duke of Tuſcany is ſaid to have offered 100,000 crowns. Here are alſo a library, a gallery full of buſts, and many pictures of great value. N. lat. 47°. E. long. 11° 40′.

AMRU, or Amrou, Ebn-Al-As, in *Biography* and *Hiſtory*, a famous Saracen commander, was the dubious progeny of Aaſi, of the tribe of Koreiſh, by a notorious proſtitute. In his youth he was impelled by the paſſions and prejudices of his kindred: his poetic genius was exerciſed in ſatirical verſes againſt the perſon and doctrine of Mahomet; and his dexterity was employed by the reigning faction, to purſue the religious exiles who had taken refuge in the court of the Ethiopian king. From this embaſſy he returned a ſecret proſelyte, having renounced the worſhip of idols; and making his eſcape from Mecca with his friend Caled, he joined the fugitive prophet at Medina. His impatience to lead the armies of the faithful was checked by the reproof of Omar, who adviſed him "not to ſeek power and dominion, ſince he who is a ſubject to-day may be a prince to morrow." Amru, having acquired a high degree of military reputation, was the chief in Irak, when Caled ſummoned all the Arabian generals to his aſſiſtance, in the ſiege of Damaſcus. In Paleſtine, he ſerved during the Caliphate of Omar, under Abu Obeidah, who was the commander in chief. On his arrival in this country he was informed, that Conſtantine, the ſon of the emperor Heraclius, lay encamped with a body of troops near Cæſarea. As he was advancing towards the ſiege of this city, this prince deputed ſome Chriſtian Arabs to reconnoitre the Moſlem camp; when one of them was diſcovered, and cut to pieces. Amru was much offended, and iſſued orders that all ſpies ſhould be brought to him for examination, before they were thus puniſhed; alleging, that ſuch ſpies might probably, in caſe of conviction, rather embrace Iſlamiſm than ſuffer death. About this time Conſtantine expreſſed a deſire to have a conference with Amru. When the Arabian chief was introduced to the prince, he declined making uſe of a ſeat that was offered him, and took his place croſs-legged on the ground, after the Arabian manner, with his ſword upon his thigh, and his lance laid acroſs before him. Conſtantine made overtures for a pacification, but they were rejected with great inſolence by Amru, who inſiſted upon his paying tribute or embracing the religion of Mahomet. This conference cloſed with a declaration on the part of Amru, "that the Arabians were tired of living in their ſcorching deſerts, and were reſolved to re-enter into the poſſeſſion of the delightful country, which was the inheritance of their progenitors." Accordingly both parties prepared for action; which terminated in the capture of Cæſarea by Amru, and the ſubjugation of all the maritime towns of Syria, A. D. 638. Upon the death of Obeidah, Amru aſſumed the chief command in Syria, in which, notwithſtanding the oppoſition of Othman, he was confirmed by Omar. Determining to proceed to Egypt, he left his ſtation at Gaza, and advanced forward at the head of only 4000 Arabs; but in his progreſs he was overtaken by a meſſenger from Omar, with inſtructions contained in a letter which he did not open, becauſe he entertained ſome ſuſpicion of its contents, till his tents were pitched within the territory of Egypt. "If you are ſtill in Syria," ſaid the ambiguous mandate, "retreat without delay; but if, at the receipt of this epiſtle, you have already reached the frontiers of Egypt, advance with confidence, and depend on the ſuccour of God and of your brethren." After peruſing this letter in the preſence of his officers, he declared his ready obedience to the commands of the Caliph. After a ſiege of 30 days, he took poſſeſſion of Farmah or Peluſium, and this key of Egypt, as it has been juſtly called, unlocked the entrance of the country, as far as the ruins of Heliopolis, and the neighbourhood of the modern Cairo. From Peluſium, he marched to the ancient Memphis, or Miſrah, the ſiege of which was protracted to ſeven months: and as the invaders were, by this delay, threatened with the inundation of the Nile, they ſtormed the place and drove the remnant of the Greeks to their boats and the iſle of Rouda. On this ſpot, the eaſtern bank of the Nile, recommended to the conqueror by its eaſy communication with the gulf and the peninſula of Arabia, he built a city called Foſtat; and the contiguous quarters of Babylon and Foſtat are confounded in their preſent decay, by the appellation of old Miſrah or Cairo, of which they form an extenſive ſuburb. After this conqueſt, the Coptic Chriſtians, or Jacobites, negociated, by means of their governor, Mokawkas, a treaty of peace and amity with Amru; agreed to pay a ſtipulated tribute; ſwore allegiance to the Caliph, and promiſed an hoſpitable entertainment of three days to every Muſſulman, who ſhould travel through their country. Their patriarch Benjamin, at the earneſt requeſt of Amru, emerged from his deſert; and, after the firſt interview, the courteous Arab affected to declare, that he had never converſed with a Chriſtian prieſt of more innocent manners and a more venerable aſpect. In the march from Memphis to Alexandria, the lieutenant of Omar entruſted his ſafety to the zeal and gratitude of the Egyptians; and in every ſtep of his progreſs, he could depend on a conſtant ſupply of proviſions and intelligence. The fugitive Greeks were purſued to Alexandria, and the road thither was laborioufly cleared by the victorious Saracens, in 22 days of general or partial combat. After a ſiege of 14 months, and the loſs of 23,000 men, the city was taken A. D. 640. See Alexandria. During the progreſs of this memorable ſiege, Amru "was betrayed by his imprudent valour; his followers, who had entered the citadel, were driven back; and the general, with a friend and a ſlave, remained a priſoner in the hands of the Chriſtians. When Amru was conducted before the præfect, he remembered his dignity and forgot his ſituation; a lofty demeanour, and reſolute language, revealed the lieutenant of the Caliph, and the battle-axe of a ſoldier was already raiſed to ſtrike off the head of the audacious captive. His life was ſaved by the readineſs of his ſlave, who inſtantly gave his maſter a blow on the face, and commanded him, with an angry tone, to be ſilent in the preſence of his ſuperiors. The credulous Greek was deceived; he liſtened to the offer of a treaty, and his priſoners were diſmiſſed in the hope of a more reſpectable embaſſy, till the joyful acclamations of the camp announced the return of their general, and inſulted the folly

of the infidels." After the capture of Alexandria, the whole of Egypt ſoon ſubmitted to the arms of the conqueror; and in the adminiſtration of it he balanced the demands of juſtice and policy. In the management of the revenue he diſapproved the ſimple, but oppreſſive mode of a capitation, and preferred with reaſon a proportion of taxes, deducted on every branch, from the clear profits of agriculture and commerce. A third part of the tribute was appropriated to the annual repairs of the dykes and canals ſo eſſential to the public welfare. Under his adminiſtration the fertility of Egypt ſupplied the dearth of Arabia; and a ſtring of camels, laden with corn and proviſions, covered almoſt without an interval the long road from Memphis to Medina. The genius of Amru opened the maritime communication which had been attempted or achieved by the Pharaohs, the Ptolemies, or the Cæſars; and a canal, at leaſt 80 miles in length, was opened from the Nile to the Red Sea. From Egypt, Amru extended his conqueſts to the neighbouring parts of Africa; but on the acceſſion of Othman, he was ſuperſeded in his government of Egypt by Abdallah-ebn-Said. The diſmiſſion of Amru was conſidered as a public loſs, and even diſpoſed the Egyptians to revolt. This change in the ſentiments of the people induced Conſtantine, the Greek emperor, to meditate the reduction of Alexandria, and he eaſily effected his purpoſe. Upon this loſs Amru was reſtored to his former dignity; and employed in the recapture of the city. After a vigorous reſiſtance, on the part of the beſieged, and great ſlaughter, he took it by ſtorm; and though by his authoritative interpoſition he reſtrained the maſſacre of the inhabitants, he diſmantled it, and utterly demoliſhed all the walls and fortifications. After this exploit, he was again diſplaced by Abdallah, and recalled to Medina; but Othman found it neceſſary to avail himſelf of his influence in quelling a ſedition, which he was unable to effect.

Upon the acceſſion of Ali, Amru joined the mal-contents, and quitting his command in Paleſtine, arrived at Damaſcus, which was then the reſidence of Moawiyah, the competitor of Ali, and ſwore allegiance to him. When it was propoſed to decide the difference between theſe two rivals, by ſingle combat, Amru perſuaded Moawiyah to accept the challenge; but he declined it, and aſcribed Amru's recommendation of it to ſelfiſh motives, and to his deſire of obtaining the caliphate for himſelf. Notwithſtanding this unjuſt ſuſpicion, Amru maintained his attachment to Moawiyah, and ſerved him in the buſineſs of the arbitration between theſe two competitors. See Ali. He alſo took poſſeſſion of Egypt in Moawiyah's name, after having defeated Mahomet-ebn Abubeker, Ali's governor, whom he took priſoner, and put to death in a barbarous manner. Amru was now conſidered of ſuch importance, that he was one of the three conſpirators, whom the ſect of the Kharijites determined to aſſaſſinate, with a view of reſtoring peace to the Saracen empire. Amru fortunately eſcaped; being prevented, by a fit of the colic, from attending in the moſque on the day when one of the conſpirators went to kill him, but Kharijah, a friend whom he appointed to perform the office of Imam, as his ſubſtitute, was ſtruck by the conſpirator, who miſtook him for Amru, and fell down dead with the blow. In the year of the Hegira 43, A.D. 663, during the caliphate of Moawiyah, Amru ended his days in the palace and city, which he had founded on the banks of the Nile. Of him Mahomet is reported to have ſaid, that there was not a Moſlem more ſincere and ſtedfaſt in the faith than Amru. He was juſtly eſteemed one of the greateſt men amongſt the Arabs of the age in which he lived; diſtinguiſhed by his quick apprehenſion, ſolid judgment, undaunted courage, and ſingular reſolution, as well as his profound ſagacity and penetration; always excellent in his advice, firm in his purpoſe and ſpeedy in its execution. The two firſt ſucceſſors of Mahomet were not inſenſible of his merit. To his arms they were indebted for the conqueſt of Paleſtine; and in all the battles and ſieges of Syria, he united with the temper of a chief, the valour of an adventurous ſoldier. In a viſit to Medina, the caliph wiſhed to ſurvey the ſword which had cut down ſo many Chriſtian warriors; Amru unſheathed a ſhort and ordinary ſcymetar; and as he perceived the ſurpriſe of Omar, "Alas!" ſaid the modeſt Saracen, "the ſword itſelf, without the arm of its maſter, is neither ſharper nor more weighty than the ſword of Pharezdak the poet." This ſaying is preſerved by Pocock, and juſtly applauded by Mr. Harris, in his Philoſophical Arrangements, p. 350. After the conqueſt of Egypt, Amru was recalled by the jealouſy of the caliph Othman; but in the ſubſequent troubles, the ambition of a ſoldier, a ſtateſman, and an orator, emerged from a private ſtation. His powerful ſupport, both in council and in the field, eſtabliſhed the throne of the Ommiades; the adminiſtration and revenue of Egypt were reſtored by the gratitude of Moawiyah to a faithful friend, who had raiſed himſelf above the rank of a ſubject; and in the poſſeſſion of this lucrative dignity his life terminated. His dying ſpeech to his children, in which he deplored the errors of his youth, and particularly his offence in ſatirizing Mahomet, is celebrated by the Arabians as a model of eloquence and wiſdom. Ockley's Hiſt. of the Saracens, vol. i. and ii. Mod. Un. Hiſt. vol. i. p. 315, &c. Gibbon's Hiſt. vol. ix. p. 425, &c.

AMSBEG, in *Geography*, a town of Swifferland, in the canton of Uri, ſeven miles ſouth of Altorff.

AMSDORF, Nicholas, in *Biography*, a Lutheran divine, was born at Meiſſen, in 1483. After ſtudying at Wittemberg, he became a diſciple of Luther, who appointed him miniſter of Magdeburg, and afterwards of Naumberg. He was diſtinguiſhed by his oppoſition to the Roman Catholics, and by his controverſy with Melancthon and his adherents, on the ſubject of good works; in the heat of which he extravagantly maintained, "that good works were an impediment to ſalvation." From this imprudent and unwarrantable expreſſion, the flame of controverſy received new fuel, and broke forth with redoubled fury. The ſentiments of Melancthon in oppoſition to thoſe of Luther and his partizans, were ably defended by George Major, an eminent teacher of theology at Wittemberg; who, in 1552, maintained the "neceſſity of good works," againſt the extravagant aſſertions of Amſdorff; who died at Magdeburg in 1541.

AMSDORFIANS, in *Church Hiſtory*, a ſect of Proteſtants, in the 16th century; were ſo denominated from their leader *Amſdorf*. They maintained, that good works were not only unprofitable, but even oppoſite and pernicious to ſalvation. Moſheim's Eccl. Hiſt. vol. iv. p. 328.

AMSEGETES, in *Antiquity*, thoſe whoſe grounds abutted on the highway. Vide Feſt. de Verb. Signif. in voc.

The laws of the Twelve Tables decree, *amſegetes viam muniunto.*

AMSOMOE, in *Geography*, an iſland in the German Ocean, near the weſt coaſt of Denmark. N. lat. 54° 40'. E. long. 8° 25'.

AMSTEL, a river of Holland, which paſſes by Amſterdam, and joins the Y or Wye.

AMSTELLAND, a ſmall diſtrict of South Holland, takes

takes its name from the river Amſtel, which runs through it. Thoſe parts of this diſtrict, which are not healthy, afford good paſturage. It contains ſeveral villages; ſuch as Ouderkirk, or Gudekerk, called alſo Altenkirchen, which is the burial-place of the Portugueſe Jews of Amſterdam; Diemen ſituate between this city and Munden, Amſtelveen belonging to Amſterdam, &c. The lakes of Diemer and Beilmer are drained and made arable.

AMSTERDAM, or AMSTELDAM, formerly called *Amſtelredam*, *i. e.* the dam or dyke of the Amſtel, the capital of Holland and of the United Provinces, is ſituated at the influx of the river Amſtel, from which it derives its name, into the arm of the ſea, called Y or Wye, and which forms a port, capable of receiving a thouſand large veſſels, about two leagues from the Zuyder ſea. Although the Pampus, which is the only channel leading to it from the ſea, is ſhallow, and ſhips of conſiderable burden are lightened before they can paſs through it; and they are afterwards under a neceſſity of waiting for an eaſterly or north-eaſt wind, in order to proceed through the Marſdiep into the North ſea; yet upon the whole its commercial ſituation is advantageous, on account of its eaſy connection with the other towns of the province, and its ſmall diſtance from all the ports of North-Holland, Frieſland, Overyſſel, and Guelderland. The ſoil, on which this city is ſeated, is marſhy, and therefore its buildings are founded on oaken piles, which gave occaſion to the witticiſm of Eraſmus, "that in his country vaſt multitudes of people lived on the tops of trees." This circumſtance reſtricted the uſe of coaches to great men and phyſicians, who paid a tax for this privilege; and goods are conveyed from one part of the town to another on ſledges. In the beginning of the 13th century Amſterdam was a very inconſiderable fiſhing town, containing a few huts that were the reſidence of perſons engaged in this occupation; but its inhabitants were gradually multiplied, and the earls of Holland gave it the title and privileges of a city; nevertheleſs, till the year 1490, it was ſurrounded merely by a weak palliſado. At this time it was encompaſſed by a wall of brick, conſtructed by order of Mary of Burgundy, in order to defend it from the incurſions of the inhabitants of Utrecht, who were frequently quarrelling with the Hollanders; but it was ſoon afterwards reduced to aſhes. The people of Guelderland beſieged it in 1512; but not ſucceeding in their attempts to take it, they ſet fire to the ſhips in the harbour. In 1525, the town-houſe of Amſterdam was attacked by a party of wild enthuſiaſts, under an anabaptiſt leader; but they were defeated by the citizens, and moſt of them were cut to pieces. Tumults of a ſimilar kind were renewed by perſons of the ſame deſcription in 1535, (ſee ANABAPTISTS,) and theſe were followed by a regular and deep-laid conſpiracy againſt the magiſtrates of Amſterdam, with a deſign to wreſt the government of the city out of their hands. Van Geelen, the head of theſe inſurgents, marched his fanatical troop to the town-houſe, on the day appointed, with drums beating and colours flying, and fixed there his head-quarters. He was attacked by the burghers, aſſiſted by regular troops, and headed by ſeveral of the burgomaſters of the city; and after an obſtinate reſiſtance, he was ſurrounded, with his whole troop, and they were put to death, in the ſevereſt and moſt dreadful manner. In 1578, Amſterdam was beſieged by the Hollanders, and after a reſiſtance of ten months, capitulated; on this condition, among others, that the Roman Catholics ſhould be allowed the free exerciſe of their religion. The condition, however, was not obſerved by the Proteſtants; for they drove the eccleſiaſtics, monks, and nuns, out of the city, broke the images, and demoliſhed the altars. From this time Amſterdam became the general rendezvous of perſons of all ſects and nations; and by them it was raiſed to that degree of opulence and ſplendour to which it afterwards attained, and which it long continued to enjoy. The city has been frequently enlarged to accommodate its new acceſſion of inhabitants; particularly in 1585, 1593, 1612, and 1658; and in 1675 it was extended to its preſent ſize, ſurrounded by a wall and a large ditch, 80 feet wide, and full of running water, and fortified on the land ſide with ramparts and 20 baſtions, on each of which was afterwards placed a windmill. It has alſo eight gates towards the land, and one towards the water. The land ſide of the town may be eaſily inundated. Amſterdam is interſected by ſeveral navigable canals, which divide the town into a number of iſlands, joined to each other by wooden and ſtone bridges, and which are connected with the Wye and the Amſtel. Theſe canals, on the ſide of which are generally planted rows of trees, ſerve the convenience of trade, and contribute to render the ſtreets through which they paſs clean and pleaſant; though in hot and calm weather they occaſionally emit fœtid effluvia. Of theſe canals the principal is that called the Ammarack, formed by the waters of the Amſtel, which admits the influx of the tide, and it has on its ſide two large quays. It has alſo ſeveral bridges; the chief of which, next the ſea, is called Pont Neuf, or the New Bridge; it is 600 feet long and 70 broad, with iron balluſtrades on each ſide; it has 36 arches, 11 of which are very lofty, and eight are ſhut up to incloſe the yachts. This bridge affords a fine proſpect of the city, port, and ſea. The port is a mile and a half in length, and above 1020 paces in breadth; and it is filled with a multitude of veſſels, the maſts of which appear like a foreſt, and forming a kind of floating city. Towards the ſide of the Wye, or of the haven, the city is incloſed by double rows of piles, driven into the ground, and connected by large horizontal beams. Between theſe piles are openings, through which the ſhips paſs in and out, and which are ſhut every evening at the ringing of a bell. The ſtreets are generally narrow, but well paved, and the houſes, which are built of brick or ſtone, have the air of neatneſs, peculiar to thoſe of the Dutch. In the interior of the city there are agreeable walks, but the communication with the environs is chiefly by water; though there is a pleaſant road to Oudekirk, through gardens and groves. The population of Amſterdam is eſtimated at 212,000 perſons; and its commercial connections ſupply a very conſiderable, but fluctuating, acceſſion of foreigners, who reſort to this city from all nations, and are tolerated in their religious worſhip; though the government is reſtricted to perſons of the reformed or Calviniſtic profeſſion. For perſons of this profeſſion, which is the eſtabliſhed religion of the country, there are eleven churches, whoſe miniſters are maintained by the ſtate, and which are allowed the uſe of bells. The Engliſh have alſo had three churches; one for the Preſbyterians, whoſe miniſters have been paid by the magiſtracy; a ſecond for the church of England, provided for by his Britannic majeſty; and a third for the Browniſts, who maintain their own miniſters. Theſe churches or congregations were formerly eſtimated to comprehend about a third part of the inhabitants. The Roman Catholics, who had about 27 places of worſhip appropriated to their uſe, amounted to another third part of the population; and the other third part included Jews, Lutherans, Arminians, Anabaptiſts, &c. The Jews had two ſynagogues, one of which, *viz.* the Portugueſe, is the largeſt in Europe; and annexed to it are

ſeveral

ſeveral ſchool-rooms, in which children are taught the Hebrew language, and inſtructed in the Jewiſh religion. The moſt remarkable of the churches at Amſterdam is that called the New Church, and dedicated to St. Catherine. It is ſaid to have been begun in 1408, or 1414, and not to have been finiſhed for 100 years. The ſteeple, intended to be conſtructed before this church, and ſtanding upon a great number of piles, is not yet completed. The pulpit is a curious ſtructure, and is adorned with various kinds of ſculpture, particularly that of the four evangeliſts. The paintings in the glaſs windows exhibit, amongſt other figures, the emperor Maximilian preſenting an imperial crown to the burgomaſters of Amſterdam, for the creſt of the arms of the city. The organ has been much admired and extolled, on account of its ſize, and its powers of execution. It has a ſet of pipes that counterfeit a chorus of voices, and has 52 whole ſtops, beſides half ſtops, with two rows of keys for the feet, and three rows for the hands. Its ſound, when it plays, ſeems to reſemble that of the human voice. The grate, by which the chancel is ſeparated from the body of the church, is conſtructed of Corinthian braſs. The branches of the candleſticks are the richeſt in the ſeven provinces. In the church is alſo a marble monument, erected to admiral Ruyter, who was killed at Meſſina.

The largeſt and moſt ſtately edifice, not only of Amſterdam, but of all the United Provinces, is the Stadthouſe, founded in 1648 on 13,659 piles, and comprehending in breadth 282 feet, in depth 235, and in height 116 feet. On the front is a marble pediment, on which is a female figure in relievo, holding the arms of the city, ſeated in a chair, which is ſupported by two lions, and bearing an olive branch in the right hand: on each ſide are four Naiads, preſenting her with a crown of palm and laurel, and two other marine goddeſſes, offering her different ſorts of fruit; there is alſo Neptune with his trident, accompanied with Tritons, a ſea-unicorn and a ſea-horſe. Above are placed three ſtatues in bronze, repreſenting juſtice, ſtrength, and plenty; and on the top of the ſtructure is a round tower, 50 feet above the roof, adorned with ſtatues, and an harmonious chime of bells, the biggeſt of which weighs about 7000 pounds; and they are made to play different tunes every month. The entrance into this edifice is by ſeven doors, intended to repreſent the ſeven Provinces. In the great hall are two globes, celeſtial and terreſtrial, made of black and white marble, and inlaid with jaſper and copper, 22 feet in diameter, and 69 in circumference. All the chambers are enriched with paintings, carvings, and gildings. Under the ſtadthouſe is the treaſury of the bank of Amſterdam, which is ſtrongly ſecured, and entruſted to the care and inſpection of the burgomaſters, and opened only in the preſence of one of them. In other vaults are the priſons for debtors and criminals, and alſo the guard-room for the citizens, in which the keys of the city are depoſited every night. At the end of the great hall is the chamber of the ſchoppen or aldermen, where civil cauſes are tried; and there are alſo other apartments and offices of various kinds. In the ſecond ſtory is a large magazine of arms; and in the top of the building are ſix large ciſterns of water, as a ſupply in caſe of fire, for the prevention of which the chimnies are lined with copper.

Another public building that deſerves notice is the bourſe or exchange, conſtructed of free-ſtone, and ſtanding upon 2000 wooden piles. Its length is about 250 feet, and its breadth 140. The galleries are ſupported by 26 marble columns, upon each of which are the names of the people that are to meet there. They are all numbered; and there is a place fixed for every merchandiſe, under ſome one of theſe numbers. A ſuperb ſtaircaſe on the right hand of the gate leads to the galleries; on one ſide are ſeveral ſhops, and on the other a place in which cloths are ſold. This exchange reſembles that of London. The admiralty-office is in a houſe which formerly belonged to the princes of Orange. The arſenal for their men of war, 200 feet long and 22 feet broad, is in the harbour; and contains, on the ground floor, bullets, on the ſecond the arms and cordage, and on the third, ſails, pulleys, flags, &c. and many curioſities. The conſervatory of water on the top of the building holds 1600 tons of water, which, in caſe of fire, may be diſtributed into 16 different parts, by leaden pipes. Near this edifice is the dock or yard, in which the men of war are built, and which is 508 feet long. The Eaſt India company occupy a large building, divided into ſeveral offices or apartments, which ſerve as magazines or warehouſes for goods of various kinds. They have alſo a kind of arſenal, of conſiderable extent. The academy, called "the illuſtrious ſchool," is alſo a good building; it was formerly a convent belonging to the nuns of St. Agnes; it is now devoted to inſtruction in Latin, the oriental languages, theology, philoſophy, hiſtory, &c. The lawyers and phyſicians have likewiſe their ſchools. Beſides theſe, there are ſeveral hoſpitals, or houſes for the accommodation and relief of the aged, of orphans, of ſick perſons, of perſons infected with the plague, and of lunatics, &c. The principal houſes of correction are the raſp-houſe and ſpin-houſe. In the former offenders are employed in ſawing and raſping Brazil wood; and thoſe who will not perform their taſk are placed in a cellar, into which the water runs, ſo that if they neglect to work the pump, they are expoſed to the danger of being drowned. The ſpin-houſe is appropriated to debauched women; in this they are employed in ſpinning wool, flax and hemp, and other work. The hoſpitals are maintained partly by voluntary contributions, for receiving which the poor's boxes are fixed in different parts of the city, and partly by taxing all public diverſions. Thoſe who have the management of theſe public charities, are called, "deacons." The governors are ſelected from the moſt conſiderable perſons in the city, and are nominated by the magiſtrates. The places of diverſion appropriated to the lower claſſes are called, "ſpiel houſes," in which the amuſements are muſic and dancing. To this city belong two ſuburbs, one at the gate of the regulars, and the other extending as far as Overtoon, a village at a ſmall diſtance, where boats that come from Leyden are forwarded over land upon wooden rollers.

Amſterdam is governed by a ſenate or council, called Vroedſchap, and compoſed of 36 perſons, who repreſent the whole body of the people, and are inveſted with the ſupreme power. Their office is for life, and the ſurvivors ſupply vacancies occaſioned by death. This ſenate elects deputies to be ſent to the ſtates of Holland, and appoints the chief magiſtrates, called "burgomaſters," or "echevins," reſembling our aldermen. Their number is 12, and four of theſe are annually choſen to execute the office, and are denominated "burgomaſters regent." Three are diſcharged every year, and three new ones ſupply their places. During the term of the office of each, which is three months, they may be compared to the lord mayor of the city of London. To them it belongs to diſpoſe of all offices, that become vacant during their regency. They have likewiſe the direction of all public works, which concern the ſafety, peace, and embelliſhment of the city. The keys of the bank of the city are in the cuſtody of theſe magiſtrates.

The college conſiſts of new burgomaſters, who are judges

in

in all criminal affairs, without appeal; but in civil cauſes they may appeal to the council of the province. There are two treaſurers, a bailiff, and a penſionary. The bailiff continues in office three years, and it is his buſineſs to ſearch after criminals, to take care of their proſecution, and to ſuperintend the execution of ſentence. The penſionary is the miniſter of the magiſtracy, and is ſuppoſed to be well verſed in the laws; and it is his province to defend the intereſts of the city. Amſterdam has in former times contributed to the public income tax above 50,000 livres per day, beſides the exciſe of beer, fleſh, and corn, which amounts to above 1,600,000l. a year; and this ſum is more than the amount of the payments of all the other provinces; and yet Amſterdam bears only the fifth rank in the aſſembly of the ſtates of Holland, with this diſtinction, that as the other cities ſend two members, this ſends four.

The militia of Amſterdam is conſiderable, and has uſually conſiſted of 60 companies, each of which has from 200 to 300 men. From this ſervice the Jews and Anabaptiſts are excluded, as they are not allowed to bear arms; but they are obliged to contribute to the maintenance of the city-guard, which is compoſed of 1400 ſoldiers, and to the night-watch, who patrole about the ſtreets, and proclaim the hour. Beſides theſe, there are trumpeters on every church ſteeple, who ſound every half hour; and if a fire happens, they ring the fire bells, and announce where it is. The trade of Amſterdam, before the late war, and the revolutions and changes that have attended it, was very great; and it was juſtly regarded as the magazine or ſtore-houſe of Europe. What alterations may take place in its internal government or foreign relations, in conſequence of the peace that has been lately eſtabliſhed, cannot now be aſcertained. Amſterdam is diſtant 44 leagues from Bruſſels, 49 from Liege, and 112 from Paris. N. lat. 52° 22′ 45″. E. long. 4° 45′ 30″.

Amsterdam, now called Tongataboo, an iſland in the South Pacific ocean, ſaid to have been diſcovered by Taſman, a Dutch navigator, in 1643. It was viſited by Captain Cook, and other later navigators. Its extent is about 16 miles in length, and its greateſt breadth about eight. It is about ſix leagues weſt of Middleburgh. S. lat. 21° 9′. W. long. 174° 46′.

The ſhore of this iſland is ſurrounded by a coral rock, and its moſt elevated parts are not above ſix or eight yards above the level of the ſea. Its interior parts are highly and univerſally cultivated, the whole iſland conſiſting of incloſures, with reed fences, about ſix feet high, interſected with innumerable roads; and its plantations ſupply ſome of the richeſt productions of nature. It abounds with bread-fruit, cocoa-nut trees, plantains, bananas, ſhaddocks, yams, ſugar-canes, and a fruit like a nectarine, called by the natives "fig-hega." Caſuarinas, pandangs, and wild ſago palms appear here with their various tints of green, and barringtoniæ of the ſize of the largeſt oaks. As the coral rock, which forms the baſis of this ſpot, is but thinly covered with mould, the bread-fruit does not thrive with the ſame luxuriance as at the Society iſlands; neither does this iſland afford an equal ſupply of water, though the ſhips were furniſhed with as much as they wanted from a pool to which they were directed by the chief.

The men and women are of the common European ſize; their colour is that of light copper; and they are well ſhaped, have regular features, and are lively and active. They have fine eyes, and in general good teeth even to advanced age. The women are merry and talkative; many of them are modeſt, and others of a different character. They ſwarm about the ſhips, without any covering, like amphibious creatures; and were eaſily perſuaded to come on board; though they would not ſtay after ſun-ſet, but returned to paſs the night on ſhore with the other inhabitants, under the ſhade of the wood that lined the coaſt, where they had large fires, and were heard converſing together almoſt during the whole night. Their hair is black, and worn ſhort, excepting a lock on the top of the head, and a ſmall quantity on each ſide. The men ſhave their beards cloſe by means of two ſhells; and the hair of many was obſerved to be burnt at the ends, and ſtrewed with white powder, which was found to be lime made of ſhell or coral, which had ſinged the hair; ſome uſed blue powder, and others an orange-coloured powder, made of turmeric. The dreſs of both ſexes conſiſted of a piece of cloth or matting, wrapped round the waiſt, and hanging below the knees. From the waiſt upwards they were generally naked; and it ſeemed to be a cuſtom with them to anoint thoſe parts of the body every morning. The practice of tattowing, or puncturing the ſkin, prevailed amongſt them; the men performed this operation from the middle of the thigh to the part above the hips; the women performed it ſlightly and only on their arms and fingers. The ornaments worn by men as well as women, were amulets, necklaces, and bracelets, the bone, ſhells, and beads of mother-of-pearl, tortoiſe-ſhell, &c. The women alſo wear on their fingers neat rings, made of tortoiſe-ſhell, and occaſionally pieces in their ears, about the ſize of a ſmall quill. They have alſo a curious apron, made of the cocoa-nut ſhell, and compoſed of a number of ſmall pieces, ſo diſpoſed as to form ſtars, half-moons, little ſquares, &c. and ſtudded with beads and ſhells, and covered with red feathers, ſo as to produce an agreeable effect. They have cloth ſimilar to that of Otaheite, but not ſo fine; and they have a method of glazing it, which renders it more durable, and capable, for ſome time, of reſiſting rain. Their colours, which they procure from vegetables, are black, brown, yellow, purple, and red. Of matting they have different ſorts, uſed for cloathing, for bedding, and for ſails to their canoes; they have alſo ſeveral kinds of baſkets made of the ſame materials with their mats, or of the twiſted fibres of the cocoa-nut, which they form of different colours, and ſtud with beads made of ſhell or bones. They appear to be ingenious in deſigning and executing various articles of this kind. Their fiſhing implements are much the ſame with thoſe of the other iſlands; their nets are formed of ſtrong though ſlender threads. Although their diſpoſition is friendly, they poſſeſs very formidable weapons; ſome of their ſpears being furniſhed with many barbs. This iſland is often ſtained with the blood of human victims; nor do the ideas of property, which prevail among the inhabitants, prevent their ſtealing from ſtrangers. The Miſſionaries, in their voyage, ſome of whom were left on this iſland, imparted uſeful arts to the natives; but the rats were found very deſtructive to the European plants. Theſe, with hogs, dogs, and guanos, were the only quadrupeds in the iſlands, till cats were left there in 1797. The morais are here called fiatookas; and are conſtructed in the form of terraces, with high ſteps, and the material of which they are formed is coral. In the miſſionary voyage of 1797 there is an intereſting map of this iſland.

Amsterdam, an uninhabited iſland in the Frozen Sea, near the weſt coaſt of Spitzbergen. This is alſo the name of an iſland in the Indian Sea. S. lat. 38° 42′. E. long. 76° 54′. (for an account of which, ſee St. Paul); and of another in the Chineſe Sea, between Japan and the iſland of Formoſa.

Amsterdam, New, a name originally given by the Dutch to the city of New York, in America. Amſterdam

is alſo the name of a new townſhip in Montgomery county, New York; containing 235 inhabitants, who are electors.

AMSTOTTEN, a town of Germany, in the archduchy of Auſtria, eight miles ſouth-weſt of Ips.

AMTITZ, a ſeignory of the circle of Guben, in Luſatia, containing the market town of Amtitz, with a citadel, and ſeveral villages.

AMTRUSTIO, in *Ancient Charters*, denotes a ſworn or liege tenant, or vaſſal, of the ancient French or German kings.

The word is alſo written *antruſtio*. Spelman derives it from the German *ampt*, *office*, *buſineſs*, and the Engliſh *truſtee*.

AMTSZELL, in *Geography*, a town of Germany, in the circle of Swabia, eight miles eaſt of Ravenſburg.

AMU, or AMOL, or AMU-DARIA, called alſo GIHON, and ſaid to be the *Oxus* and *Bactrus* of the ancients, a river of Independent Tartary, in Bucharia, which formerly diſcharged itſelf by two channels or mouths into the Caſpian ſea; but theſe are become dry, and the ſtream has been diverted by art into the ſea or lake of Aral. In the reign of Cyrus it was the boundary of the Perſian monarchy, and ſome authors have ſuppoſed it to be the Araxis of the ancients. Its ſource is in the mountains of Paropamiſſus.

AMU. See AMOL.

AMUDA, in *Ancient Geography*, a town of Syria, diſtinguiſhed in the Notitia Imperii from *Amida;* but its ſituation is not known.

AMUDARSA, a town of Africa Propria, in the territory of Bizacium, mentioned by Antonine, and placed by M. d'Anville north of Septimunicia. It was an epiſcopal ſee.

AMULET, AMULETUM, formed from *amoliri, to remove*, a kind of external medicament, to be worn about the neck, or other part of the body, for preventing or removing diſeaſes. Such are quills of quickſilver, or arſenic, which ſome hang on the neck, or wear under the ſhirt, againſt the plague, and other contagious diſeaſes; as alſo the bloodſtones worn by others againſt hæmorrhages; and that worn by the women of the Eaſt Indies to bring the *menſes*.

Amulets are alſo frequently no other than a ſort of ſpells, or charms; conſiſting of quaint words and characters, ſuppoſed to have the virtue of warding off miſchief, witchcraft, and diſeaſe, and to which credulity and ſuperſtition have annexed wonderful properties. Pliny makes frequent mention of them.

Perſons of all ages and nations have uſed them. The materials of which they were formed, the characters inſcribed upon them, and the ſuperſtitious ceremonies with which they were prepared, were very various. Amongſt the ancient Egyptians they were very common, and thoſe denominated abraxas were peculiarly diſtinguiſhed. The Perſians, having obſerved in Egypt the practice of ſuſpending to the neck ſmall cylinders, adorned with figures and hieroglyphics, adopted a ſimilar cuſtom, and inſtead of the Egyptian deities, they ſubſtituted repreſentations of ſubjects deduced from their hiſtory and theology, and annexed to them hieroglyphical characters, diſpoſed in the form of a prayer, which, in their opinion, gave a ſecret virtue to theſe amulets. A ſimilar practice prevailed alſo among the Etruſcans. The Jews confided in their efficacy for driving away diſeaſes, and they are prohibited by the Miſchna, unleſs they had been effectual in the cure at leaſt of three perſons. Chriſtians alſo in former ages had recourſe to amulets, made of the wood of the croſs, or ribbands with texts of ſcripture written on them, as preſervatives againſt diſeaſes.

The Greeks called this kind of remedies φυλακτηρια, *phylacteries*; περιαπτα, [illegible] βρεττια, and τυχολπια. The Latins call them *amuleta*, *appenſa*, *pentacula*, &c.

Some think this word derived from *amula*, a ſmall veſſel with luſtral water in it, anciently carried in the pocket by the Romans, for the ſake of purification and expiation. This laſt opinion appears the more probable, in that ſome amulets were made in the ſhape of little veſſels, as appears from the teſtimony of Pliny, who obſerves, that pieces of amber, cut in form of little veſſels, were hung about children's necks for amulets.

Amulets are by ſome conſidered as a natural ſpecies of *taliſmans*. Others rather make taliſmans a ſpecies of amulets. The *bulla*, worn by the ancients; the *abraxas* of the Baſilidians, &c. were alſo amulets. See ABRAXAS, ABRACADABRA, and TALISMAN.

The ancients made great uſe of gems for amulets; the whole Eaſt, according to Chifflet, wore a kind of jaſper for this purpoſe.

That ſpecies of amulets compounded of poiſons, uſed as preſervatives from the plague, are more particularly denominated *zenechta*.

Under amulets, ſome alſo include medical or other ſubſtances fixed to brutes, or even plants, to preſerve them from certain diſeaſes and dangers.

Charms, words, ſcrolls, magic figures and numbers, make a large claſs of amulets, to which the Turks are ſtill greatly devoted. Their amulets, called *chaimaili*, are little bits of paper of two or three fingers breadth, rolled up in pieces of ſilk, containing ſhort prayers or ſentences cut out of the Alcoran, with circles and other figures, in which they inſcribe the name of Jeſus, the figure of the croſs, &c. They hang them about their necks, or place them under their arm-pits, or in their boſom near their hearts, and eſpecially when they go to war, as a preſervative againſt the dangers of it.

The pope is ſuppoſed to have the virtue of making amulets, which he exerciſes in the conſecration of *Agnus Dei's*.

Amulets are now much fallen from the repute they were anciently in; yet the great Mr. Boyle alleges them as an inſtance of the ingreſs of external effluvia into the habit; in order to ſhew the great poroſity of the human body.—He adds, that he is perſuaded ſome of theſe external medicines do anſwer: for that he himſelf, having once been ſubject to bleed at the noſe, and reduced to uſe ſeveral remedies to check it, found the moſs of a dead man's ſkull, though only applied ſo as to touch the ſkin till the moſs was warm thereby, the moſt effectual of any. The ſame Mr. Boyle ſhews how the effluvia, even of cold amulets, may, in tract of time, pervade the pores of a living animal; by ſuppoſing an agreement between the pores of the ſkin, and the figure of the corpuſcles. Bellini has demonſtrated the poſſibility of the thing in his laſt propoſitions, De Febribus; and the like is done by Dr. Wainwright, Dr. Keill, &c. However, theſe are principally uſed at preſent by empirics, women, and credulous ſuperſtitious perſons.

AMULET, in a more particular ſenſe, is reſtrained to ſuch medicines as do not operate by any phyſical virtue, or to thoſe wherein there is no proportion between the cauſe and effect.

In this ſenſe medicines, which operate by effluvia, odours, and the like, do not belong to the claſs of amulets.

In this ſenſe alſo thoſe eſſence-veſſels worn by hyſterical women on their breaſts, called by the Greeks καρδιοφυλακια,

and by the Latins *domus pectoris*, were not properly amulets.

Amulet is ſometimes alſo applied, in a more extenſive ſenſe, to all medicines, whether internal or external, whoſe virtue or manner of operation is *occult*.

Amulet, in *Cookery*. See Omelet.

Amuletics, in *Medicine*, is uſed by ſome writers for what is more frequently called an *amulet*.

Amuletics amount to the ſame with what are otherwiſe called *ſympathetics*, and have been chiefly uſed in late times to ſtop bleeding; ſuch are the *perſicaria*, *lapis hæmatites*, dried toads, &c. alſo againſt warts, *ſarcomas*, &c.

Sir Kenelm Digby's ſympathetic powder is one of the principal amuletics in caſes of hæmorrhages; and with many the *ancora ſacra*.

AMUNCLA, in *Ancient Geography*, a town of Africa Propria, ſituate between the two Syrtes.

AMUND, in *Ancient Writers*, denotes a perſon free or diſcharged from tuition or wardſhip. The word is alſo written *aamund*, *amod*, and *amont*; and is compounded of the privative *a*, and the Saxon *mund*, *defence*, *tuition*.

AMUR, or Amoor, in *Geography*, a river of Aſiatic Ruſſia, or rather of Chineſe Tartary, is formed of two rivers, Argoon and Shilka, and firſt takes this name on their conjunction in the Chineſe territory, E. long. 121° 14′, and diſcharges itſelf into the Pacific ocean, oppoſite to the iſland of Sakkhalen, E. long. 142° 14′. N. lat. 53°. The Shilka riſes in the Yablonnoy mountains, E. long. 109° 14′. N. lat. 49°, being formed of the tributary ſtreams, called Ingoda, Onona, and Nertcha, paſſes by Nertchinſk, through the Nertchinſkoi diſtrict, and joins the Argoon. The Argoon has its ſource in a lake upon the frontier that parts Ruſſia from China, and forms the border all the way to its exit, in the Shilka. By the treaty of 1727 the Amoor belongs entirely to China; otherwiſe, the ſhip-building on the ſea of Okhotſk would be much facilitated to the Ruſſians, as great part of their materials might then be brought by water, which are now conveyed by land at a great expence.

AMULO, in *Biography*, was born in France, and after having been deacon of the church of Lyons, under Agobard, was on his death raiſed to the archbiſhoprick of that ſee in 841. He condemned the veneration that was paid to relics as an occaſion of error and ſuperſtition; he alſo wrote a letter againſt Goteſchalcus, and ſome other pieces upon Grace, Predeſtination, and Free-will; and "a book againſt the Jews," addreſſed to king Charles, the brother of the emperor Lotharius. Amulo, conſidering the time in which he lived, and his high rank in the church, was a man of diſtinguiſhed liberality and moderation; he was much eſteemed on account of his talents and eloquence; and ſhared in an eminent degree the favour of Charles the Bald. He preſided in the council of Lyons in 845. His book againſt the Jews was publiſhed in 1656 by Father Chifflet, under the name of Rabanus Maurus. All his works, except this, were publiſhed by Baluze, with notes, at the end of his edition of Agobard, whence they were transferred to the Bibliotheca Patrum. Trithemius ſays, that Amulo was well ſkilled in the ſcriptures and ancient writers, very converſant in ſecular learning, famous for his knowledge of the Hebrew as well as Latin tongue, and of a quick and lively genius. Cave, H. L. tom. ii. p. 29. Moſheim, vol. ii. p. 332.

AMURACORY, in ſome *Writers of the Middle Age*, denotes a kind of Turkiſh ſoldiery belonging to the corps or order of janizaries.

They ſeem to be the ſame with thoſe otherwiſe called *Seraptarii* and *Pociliatores*.

AMURATH, or Morad, I., in *Biography* and *Hiſtory*, Sultan of the Turks, was the ſon of Orchan, and the brother of Solyman, and ſucceeded his father, A. D. 1360. In purſuing the conqueſts of the Greek empire, he ſubdued without reſiſtance the whole province of Romania or Thrace, from the Helleſpont to mount Hæmus, and the verge of the capital, and made choice of Adrianople for the royal ſeat of his government and religion in Europe. He afterwards marched againſt the Sclavonian nations, between the Danube and the Adriatic, *viz.* the Bulgarians, Servians, Boſnians, and Albanians, and having vanquiſhed theſe hardy and warlike tribes, he converted them by a prudent inſtitution into the firmeſt and moſt faithful ſupporters of the Ottoman greatneſs. Being reminded by his vizir, that, according to the Mahometan law, he was intitled to a fifth part of the ſpoil and captives, and that the duty might be eaſily levied, by ſtationing vigilant officers at Gallipoli to watch the paſſage, he ſelected for his uſe the ſtouteſt and moſt beautiful of the Chriſtian youth, and educated many thouſands of the European captives in religion and arms. This new militia was conſecrated and named by a celebrated derviſh, who, ſtanding in the front of their ranks, ſtretched the ſleeve of his gown over the head of the foremoſt ſoldier, and pronounced his bleſſing in theſe words: "Let them be called Janizaries, (*yenghi cheri*, or new ſoldiers); may their countenance be ever bright! their hand victorious! their ſword keen! may their ſpear always hang over the heads of their enemies! and whereſoever they go, may they return with a white face!" Such was the origin of the Janizaries. By the aſſiſtance of theſe troops, Amurath extended his conqueſts in Europe and Aſia; and he ſuccoured the emperor, John Palæologus, againſt the Bulgarians. When a rebellion was concerted by the eldeſt ſons of theſe two ſovereigns againſt their fathers, Amurath puniſhed his own ſon by depriving him of his ſight, and inſiſted on the ſame penalty being inflicted on the ſon of the emperor. After a prolonged courſe of ſucceſs, Amurath was oppoſed by a formidable league of the Walachians, Hungarians, Dalmatians, Triballians, and Arnauts, under the command of Lazarus, prince of Servia. By the battle of Coſſova, Lazarus was defeated and taken priſoner, and the league and independence of the Sclavonian tribes were finally cruſhed. But as the victor walked over the field, viewing the ſlain, and triumphing in his ſucceſs, a Servian ſoldier ſtarted from the crowd of dead bodies, and pierced Amurath, at the moment of his exultation, in the belly with a mortal wound. Others have attributed his death to a Croat, who is ſaid to have ſtabbed him in his tent; and this accident was alleged as an excuſe for the unworthy precaution of pinioning, as it were between two attendants, an ambaſſador's arms, when he was introduced to the royal preſence. Amurath died in the 71ſt year of his age, and 30th of his reign, A. D. 1389. His character has been highly extolled by the Turks, and he has been repreſented as mild in his temper, modeſt in his apparel, temperate in his mode of living, and a lover of learning and virtue; he was reproached, however, by the Moſlems for his abſence from public worſhip, and he was corrected for his negligence by the firmneſs of the mufti, who refuſed to admit his teſtimony in a civil cauſe. The ſultan, it is ſaid, profited by the reproof, and atoned for his fault by erecting a magnificent moſque at Adrianople. Gen. Dict. Gibbon's Hiſt. vol. xi. p. 444, &c.

Amurath, or Morad, II., ſucceeded his father Mahomet I., in 1422, at the age of 18 years. His reign commenced

menced with the capture and death of an impoſtor, who pretended to be Muſtapha, the ſon of Bajazet, and who was ſupported by the Greek emperor. He then inveſted Conſtantinople; but his attention was diverted by the rebellion of Muſtapha, his younger brother, who was impriſoned and ſtrangled in his preſence. In 1424 he reſtored the diſcipline of the Janizaries, and reformed the abuſes of the Spahis; and in 1426 he laid waſte the iſle of Zante, belonging to the Venetians. In the next year he invaded and ſubdued the Morea, and obliged the Grecian emperor to pay him tribute; and having taken Theſſalonica, or Saloniki, he compelled the Venetians to make peace. In 1434 he ſuppreſſed the rebellion of Karaman-Ogli; and when a war broke out between the Ottoman empire and the king of Hungary, in which the famous Hungarian general, John Huniades, gained ſeveral victories, Amurath croſſed the Danube, and laid ſiege to Belgrade, but Huniades obliged him to raiſe it. He alſo invaded and ſubdued Servia, which was reſtored in the peace between Hungary and Poland; and on this occaſion it was ſtipulated, that neither party ſhould croſs the Danube in a hoſtile manner into the dominions of the other. Amurath, having awed Karaman-Ogli, who was renewing his attacks, into ſubmiſſion, and granted him peace in compliance with the intreaties of his wife, found his dominions in a ſtate of tranquillity; and formed a reſolution of abdicating the Turkiſh throne. Accordingly, in 1443, at the age of 40 years, perceiving the vanity of human greatneſs, he reſigned the empire to his ſon, Mahomet, and retired to Magneſia, where he joined the ſociety of derviſes and hermits, and adopted all their auſterities and fanatic rites. If his motives in this extraordinary proceeding had not been debaſed by an alloy of ſuperſtition, we might have extolled his magnanimity. From this dream of enthuſiaſm, as it may be juſtly called, he was ſoon rouſed by the Hungarian invaſion. Ladiſlaus, the king of Hungary, and his auxiliaries, inſtigated by Karaman-Ogli, the inveterate foe of the Turkiſh empire, penetrated into the Muſſulman territories, and Amurath, urged by the earneſt intreaty of his ſon, and the wiſhes of the people, conſented to take the command of the army. Advancing by haſty marches from Adrianople, at the head of 60,000 men, he met the Chriſtians at Warna; and on the firſt onſet the Turkiſh wings were broken; and Amurath perceiving the flight of his ſquadrons, deſpaired of his fortune, and that of the empire. During the heat of the engagement, a copy of the treaty of peace between himſelf and the Hungarian king, was diſplayed in the front of the ranks, and it is ſaid, that the ſultan in his diſtreſs, lifting his eyes and hands to heaven, implored the protection of the God of truth, and called on the prophet Jeſus himſelf to avenge the impious mockery of his name and religion. Whilſt the battle was in ſuſpenſe, the young king of Hungary ruſhed forward in the confidence of victory, till his career was ſtopped by the impenetrable phalanx of the Janizaries. If we may credit the Ottoman annals, his horſe was pierced by the javelin of Amurath; he fell among the ſpears of the infantry; and a Turkiſh ſoldier proclaimed, with a loud voice, "Hungarians, behold the head of your king!" The death of Ladiſlaus was the ſignal of a total defeat. Ten thouſand Chriſtians were ſlain in the diſaſtrous battle of Warna; and of the number was cardinal Julian Cæſarini, diſtinguiſhed by his talents and learning, and by a volatile genius, equally adapted to the ſchool, the camp, and the court. The circumſtances of his death are variouſly related; but it is believed, that a weighty incumbrance of gold impeded his flight, and tempted the cruel avarice of ſome Chriſtian fugitives. However, it is allowed, that he fell a juſt victim to that pernicious caſuiſtry by which he quieted the mind of Ladiſlaus in the violation of his oath, and abſolved him in the pope's name from the guilt of perjury. The loſs of the Turks, more conſiderable in numbers than that of the Chriſtians, bore a ſmaller proportion to their total ſtrength, and yet Amurath himſelf was not aſhamed to confeſs, that his ruin muſt be the conſequence of a ſecond and ſimilar victory. This battle happened on the 10th of November, A. D. 1444; and was followed by the retirement of Amurath a ſecond time to the ſtillneſs and devotion of private life. In 1446 he was again called forth to public ſervice by an inſurrection of the Janizaries, who filled Adrianople with rapine and ſlaughter. Having quelled this tumult, he turned his arms againſt the famous Scanderbeg, prince of Epirus, who had revolted; and followed him to Albania, at the head of 60,000 horſe and 40,000 Janizaries. The conqueſts of the ſultan were confined to the petty fortreſs of Sfetigrade; and he retired with ſhame and loſs from the walls of Croya, the caſtle and reſidence of the Caſtriots. Amurath, by the alternative of death or the Koran, converted all the Epirots to his own faith. The Hungarians renewed their invaſion of the territories near the Danube; and Amurath fell in with them near Coſſova, the place where Amurath I. had been victorious. The reſult of many partial but bloody actions was the route of the Chriſtian forces, and the capture and impriſonment of Huniades, the ſupreme captain and governor of Hungary, in his retreat. Amurath returned to Adrianople; and having given up all thoughts of reſignation, he married his ſon Mahomet to the daughter of the prince of Elbiſtan, and appointed him to the government of Aſia Minor. By his diſappointment at Croya, and the fatigues of his retreat, his laſt days were not only embittered, but probably ſhortened; for on his arrival at Adrianople he was ſeized with a diſorder in his head, which terminated his life in the 47th year of his age, and the 29th of his reign. According to Cantemir, the hiſtorian of the Othman empire, he lived 49, and reigned 30 years, ſix months, and eight days. According to this hiſtorian, "he was a juſt and valiant prince, of a great ſoul, patient of labours, learned, merciful, religious and charitable; a lover and encourager of the ſtudious, and of all who excelled in any art or ſcience; a good emperor, and a great general. No man obtained more or greater victories than Amurath: Belgrade alone withſtood his attacks. Under his reign, the ſoldier was ever victorious; the citizen rich and ſecure. If he ſubdued any country, his firſt care was to build moſques and caravanſeras, hoſpitals, and colleges. Every year he gave a thouſand pieces of gold to the ſons of the prophet, and ſent 2500 to the religious perſons of Mecca, Medina, and Jeruſalem." It ſhould be conſidered, however, that cruelty and violence have been ſanctioned by zeal in propagating the Mahometan faith; and that, in the hands of the Turks, the ſcymetar was the only inſtrument of converſion; after all the abatements that ought to be made in the preceding panegyric, it is generally allowed that the moderation and juſtice of Amurath have been atteſted by his conduct. In the vigour of his age and military power, he ſeldom engaged in war till he was juſtified by a previous and adequate provocation; when victorious, he was diſarmed by ſubmiſſion; and in the obſervance of treaties, his word was ſacred and inviolate. Mod. Univ. Hiſt. Gibbon's Hiſt. vol. xii. p. 150, &c.

AMURCA, in *Pharmacy*, a medicine made of the refuſe or recrement of expreſſed olives.

Amurca, being boiled in a copper veſſel to the conſiſtence

of honey, becomes a drug of ſome uſe in medicine, being reputed an aſtringent and drier; and as ſuch ſometimes preſcribed in ulcers, as well as againſt diſeaſes of the teeth, eyes, &c.

Hippocrates applies the term amurca to a crude, immature, putrid ſtate of the liver.

Some authors have alſo given the name amurca to the juice or fluid found in the RENES *ſuccenturiati*.

AMUSKEAG FALLS, in *Geography*, are on Merrimack river, in New Hampſhire, America, 16 miles below Concord, and ſeven below Hookſet falls. There are three of them, one below the other, ſo that the water falls about 80 feet in the courſe of half a mile. In the middle of the upper part of the ſecond fall is a rocky iſland, in which are found ſeveral excavations or pits, by the circular motion of ſmall ſtones, impelled by the force of the deſcending water, which are capable of holding ſeveral tons of water. A little below the falls is a bridge 556 feet in length, and 20 in breadth, conſiſting of 2000 tons of timber. N. lat. 42° 59′.

AMUTRIUM, in *Ancient Geography*, a town of Dacia, according to Ptolemy.

AMUY, in *Geography*, a town of India, beyond the Ganges, near the weſtern bank of the lake Chamai, on the confines of the kingdom of Kanduana.

AMWELL, a village of England in the county of Herts, 21 miles north of London, and one ſouth-weſt of Ware, in which is the ſpring of the New River, that ſupplies a conſiderable part of London with water. This river or canal was projected by Sir Hugh Middleton, in 1606.

AMY, N. in *Biography*, advocate in the parliament of Aix, in France, died in 1760, and is known by ſome valuable works, in natural ſcience, *viz.* "Experimental Obſervations on the Waters of the Seine, Marne, &c." 12mo. 1749; "New Filtrating Fountains." 12mo. 1757. "Reflections on Copper, Lead, and Tin Veſſels," 12mo. 1757.

AMY, in *Law*, the perſon next of kin to an orphan, or infant, who is to be intruſted for him; properly called PROCHEIN *amy*.

The word in French literally ſignifies *friend*.

AMY, *alien*, is a foreigner here, ſubject to ſome prince, in friendſhip with us.

AMYBUS, in *Ancient Geography*, an iſland of the Red Sea, ſuppoſed to be the ſame with AMICUS, or *Amici Inſula*.

AMYCI CAMPUS, a name given by Polybius to a plain in the midſt of which runs the river Orontes, between Libanus and Antilibanus.

AMYCI PORTUS, was ſituated on the Thracian Boſphorus, north of Nicopolis, and ſouth of Fanum Jovis. It derived its name from Amycus, an ancient king of the Rebrices, who was killed in a combat with Pollux, and on whoſe tomb was planted a laurel, Gr. *Daphne*, whence the port was called *Daphnis portus*.

AMYCLÆ, a city of Peloponneſus, in Laconia, ſituate ſouth-weſt of Sparta, and near it. Although ſmall, it was famous for its fruit-trees, ſo that it was called by Statius (Theb. ix. v. 769.) "virides Amyclæ." According to Polybius, the temple of Apollo in this place was the moſt celebrated in Laconia, whence it was denominated by Statius, "Apollineæ Amyclæ;" and it was pretended that Leda, the mother of Caſtor and Pollux, reſided in this place, whence Silius Italicus, (lib. xi. v. 434.), deſcribes it thus:

"Ledæis veniens victor Xanthippus Amyclis.

Venus had alſo a ſtatue in this place, executed by Gitiades. When this part of Laconia was attacked by the Romans, Q. Flammius encamped near Amyclæ, and ravaged its territory; and the city was afterwards deſtroyed. In the time of Pauſanias, there were ſome remains of its ancient magnificence.

AMYCLÆ was alſo a town of Italy, in Upper Calabria, ſaid to have been peopled by a colony from Amyclæ, in Laconia, but its ſituation has not been aſcertained; though it is ſuppoſed to have been between Cajeta to the ſouth-eaſt, and Terracina to the north-weſt. Pliny and Solinus ſay, that the inhabitants were ſo infeſted with ſerpents, as to be under a neceſſity of abandoning their dwellings. The Amyclæ were diſtinguiſhed among the ancient poets by the epithet, "taciti," or ſilent, as ſome ſay, becauſe it was built by the Lacedæmonians, who, having adopted the ſyſtem of Pythagoras, recommended ſilence; or, according to others, becauſe a law was enacted in this place, for the purpoſe of preventing falſe rumours, by which the people were alarmed, which prohibited any perſon from reporting the approach of an enemy; but this law was in the end the cauſe of the ruin of the city; for the Dorians arrived unexpectedly at the walls, and took the city. To this circumſtance Silius refers, lib. viii. v. 530:

"—Quaſque evertere ſilentia, Amyclæ."

AMYCLÆI, a people of Africa, who, according to Dionyſius Periegetes, inhabited Cyrenaica.

AMYCLÆUM, a town and port of the iſland of Crete, according to Euſtathius.

AMYDON, a town of Macedonia, upon the Axius, in Pæonia, mentioned by Steph. Byz.

AMYGDALA, in *Natural Hiſtory*, a ſpecies of ECHINUS, in the claſs molluſca of worms, ſo called, becauſe in ſhape it reſembles an almond.

AMYGDALÆ, in *Surgery*, denotes ſuperfluous fleſh growing at the root of the tongue.

AMYGDALÆ, in *Anatomy*. See ALMONDS.

AMYGDALATE, an artificial milk, or emulſion, made of blanched almonds, &c.

AMYGDALE. See ALMOND.

AMYGDALIS SIMILIS, in *Botany*. See THEOBROMA.

AMYGDALOID, in *Natural Hiſtory*. See TOAD-STONE.

AMYGDALUS, in *Botany*, a genus of the *icoſandria monogynia* (*polyandria monogynia*, Gmelin,) claſs and order, of the natural order of *pomaceæ* and *roſaceæ* of Juſſieu; its characters are, that the *calyx* is a perianthium, one-leafed, tubulous, inferior, quinquefid, deciduous, diviſions ſpreading and obtuſe; the *corolla* of five petals, oblong-ovate, obtuſe, concave, inſerted into the calyx; the *ſtamina* have filaments about 30, filiform erect, ſhorter by half than the corolla, inſerted into the calyx, anthers ſimple; the *piſtillum* has a roundiſh, villoſe germ, ſimple ſtyle, of the length of the ſtamens, and headed ſtigma; the *pericarpium* is a roundiſh, villoſe, large drupe, with a longitudinal furrow; the *ſeed* is a nut, ovate, compreſſed, acute, with prominent ſutures on each ſide, reticulated with furrows, and dotted with ſmall holes. Obſ. the nut of the almond is covered with a dry ſkin; that of the peach with a ſmall pulp. There are ſeven ſpecies. 1. A. *perſica*, with all the ſerratures of the leaves acute, and the flowers ſeſſile and ſolitary. There are two varieties, *viz.* the *peach-tree*, with downy fruit, and the *nectarine*,

nectarine, with ſmooth fruit. For a particular account of both theſe, their varieties, and different qualities, and the method of their culture and propagation, See AMYGDALUS, in *Gardening*, *infra*. 2. A. *communis*, the almond tree, with the lower ſerratures of the leaves glandulous, and the flowers ſeſſile and in couplets. Some reckon three varieties, *viz.* α. A. *ſylveſtris*, the common or wild almond; β. *ſativa*, ſweet or Jordan almond; and γ. A. *amara*, bitter almond. Miller makes three ſpecies of the almond, *viz.* 1. A. *communis*, or common A. cultivated more for the beauty of its flowers, than for its fruit; of which there are two varieties, one with ſweet, the other with bitter kernels, which often ariſe from the fruit of the ſame tree. 2. A. *dulcis* or Jordan A. the nuts of which are frequently brought to England; theſe have a tender ſhell, and a large ſweet kernel. The leaves are broader, ſhorter, and grow much cloſer than thoſe of the common ſort, and their edges are crenate. The flowers are very ſmall and of a pale colour, inclining to white. Theſe trees have been often raiſed from the almonds which came from abroad, and the plants have been found to maintain their difference from the common almond. 3. A. *ſativa*, with narrow ſharp pointed leaves, flowers much ſmaller than thoſe of the common almond, and white; the ſhoots of the tree ſmaller and joints cloſer than thoſe of the common ſort; and the tree is leſs hardy, and ſhould therefore have the advantage of a warm ſituation, otherwiſe it will not thrive. This ſort flowers in the Spring, and rarely produces fruit in England. From an old tree, placed againſt a wall, with a ſouth aſpect, the fruits have ſome years been ripe, and well flavoured, but their kernels have been ſmall.

Duhamel gives ſeven ſpecies and varieties of the almonds, *viz.* 1. Common A. with a ſmall fruit. 2. Sweet A. with a tender ſhell. 3. Bitter A. with a tender ſhell; a variety of the preceding. 4. A. with a ſmall fruit, and a tender kernel: Amande-ſultane,—and, with a ſtill ſmaller fruit, amande-piſtache. 5. Sweet A. with a large fruit. 6. Bitter A. with a large fruit, a variety of the preceding. 7. Bitter A. probably a variety of the firſt. He alſo mentions another, which he calls amandier-pecher, and ſuppoſes to have been produced from the impregnation of the almond, by the farina of the peach.

The *common almond* has leaves which reſemble thoſe of the peach, but the lower ſerratures are glandular; they proceed from buds both above and below the flowers, and not as in the peach, from the ends of the ſhoots above and not below the flowers. The form of the flowers is not very different, but they uſually come out in pairs, and vary more in their colour from the fine bluſh of the apple-bloſſom to a ſnowy whiteneſs. The chief obvious diſtinction is in the fruit, which is flatter, with a coriaceous covering, inſtead of the rich pulp of the peach and nectarine, opening ſpontaneouſly when the kernel is ripe. The ſhell is not ſo hard as in the firſt ſpecies, and is ſometimes tender and very brittle; it is flatter, ſmoother, and the furrows or holes are more ſuperficial. This tree is a great object in ſome parts of Italy, and in the ſouth of France, and there are large plantations of it in Provence and Dauphiné. It is common in China, and moſt of the Eaſtern countries; and alſo in Barbary, where it is a native. In the time of Cato it ſeems not to have been cultivated in Italy; for he calls the fruit *nuces græcæ*, or Greek nuts. With us it is valuable as an ornamental tree in clumps, ſhrubberies, &c. within view of the manſion; for it diſplays its delicate red-purple bloom in the mouth of March, when few other trees have either leaves or flowers. An almond-tree, covered with its beautiful bloſſoms, is one of the moſt elegant objects in nature. In a forward Spring, they often appear in February; but in this caſe, the froſt generally deſtroys them, and they bear little or no fruit; but when they flower in March, they ſeldom fail to bear plenty of fruit, very ſweet, and fit for the table when green, but they will not keep long.

3. A. *pumila*, perſica africana nana, &c. of Herm. lugdb. A. perſica nana, &c. of Pluk. phyt. perſica amygdalus of Miller, double-flowered dwarf-almond, with leaves veined-wrinkled, or leaves lanceolated and double ſerrated, Willd. The braches are ſmooth, two or three feet high, and dark-purple; the flowers are generally two in a bud and ſeſſile; the calyx reddiſh; the petals emarginate (acuminate, Reichard), red, longer than the tube of the calyx; filaments paler; germ and ſtyle pubeſcent at bottom; ſtipules linear and very deeply ſerrate; varies with double flowers; and its native country is Africa. Theſe ſhrubs make an agreeable variety amongſt low flowering trees, in ſmall wilderneſs quarters; the ſingle ſort flowering in the beginning of April, and the double commonly three weeks later. It was cultivated by Miller in 1731. 4. A. *nana*, A. indica nana of Pluk. and Miller, prunus inermis, &c. of Gmelin, Sibir, armeniaca perſicæ foliis, &c. of Amm. Ruth. common dwarf almond, with leaves attenuated at the baſe. The leaves are lanceolated, ſubpetiolated, ſcattered, ſomewhat rigid, ſmooth, the ſerratures very ſharp and ſomewhat ſpinoſe; the ſtipules linear, long and deciduous; the flowers very abundant on the twigs, appearing with the firſt leaves from all the buds; the calyx ſubſeſſile and reddiſh; ſegments acute, green, and very finely ſerrulate; petals of a fine roſe-colour: ſtamens about 20, the inner ones gradually ſhorter; piſtil very villoſe; fruit uſually ſolitary, ſeſſile, ſomewhat compreſſed, very hirſute, with a harſh yelloviſh wool, the ſize of a hazel nut, which is of a ſharp ovate form, yelloviſh-grey colour, and grooved at the ſutures; the kernel reſembles that of the peach and colour in taſte; the wood hard, of a yelloviſh cheſnut colour, and veined, but the trunk ſeldom an inch in thickneſs. It varies much in ſize; on the banks of the Volga, it is annually ſet on fire, and never riſes to any height, but is low and ſhrubby, creeping very much at the root, and obſtructing the plough. In Cherſon it ſcarcely attains a ſpan in height, but in the Ukraine it grows a fathom high, as it does in gardens, where the leaves are broader, and ſometimes five inches long. It blooms in April, when all the young ſhoots are covered with flowers of a peach-bloſſom colour, and makes a fine appearance among ſhrubs of the ſame growth. It is a native of the northern parts of Aſia, abounds in Calmuc Tartary, and is very common on the banks of the Volga; cultivated in Kew garden by Mr. Sutherland, in 1683. See AMYGDALUS *infra*. 5. A *incana*, hoary dwarf A. with leaves lanceolate, ſerrate, wrinkled, ſubſeſſile, white tomentoſe beneath. It may be doubted whether this be not a variety of the preceding ſpecies. 6. A. *orientalis*, A. argentea of La Marck, ſilvery-leaved A. with leaves lanceolate, quite entire, ſilvery, perennial, and petiole ſhorter. The flowers are ſmall, and are not ſucceeded by fruit in England. It was found growing near Aleppo, whence the fruit was ſent to the duke d'Ayen, in France, who raiſed ſeveral plants in his garden at St. Germain's, and ſent ſome to Mr. Miller, who cultivated them at Chelſea, in 1759. It is a native of the Levant. 7. A. *cochinchinenſis*, with leaves ovate, quite entire, and racemes, ſmall, and ſubterminal. This is a large tree, with ſpreading branches, acuminate, waved, ſhining, and alternate leaves, white corolla, drupe about half an inch in diameter, and kernel like the common almond, in

form

[illegible] and ſmall; a native of the vaſt woods of Cochinchina. For the culture and propagation of almonds, ſee AMYGDALUS *Communis*.

For the nature and medicinal properties and uſes of Almonds, ſee ALMOND.

AMYGDALUS *Æthiopica*. See BRABEIUM.

AMYGDALUS *Indica*. See TERMINALIA.

AMYGDALUS, in *Gardening*, is applied to the *almond*, *peach*, and *nectarine trees*; the claſs, order, and genuine characters, as well as the different ſpecies of which, have been given above. In order to render their culture and modes of propagation as clear and intelligible as poſſible, it may be proper to conſider each of them ſeparately.

1ſt. *Amygdalus, almond-tree*. This ſort of tree is cultivated both for the advantage of the fruit, and as being highly ornamental in ſhrubberies, plantations, and other deſcriptions of pleaſure ground, from its coming into bloom early in the Spring. It is, however, leſs important in the former than the latter point of view, as the fruit is often liable to miſcarry in this climate. All the ſpecies and varieties of this tree are deciduous, and of a hardy nature, thriving well in moſt common garden ſoils. Thoſe of the tree kind frequently riſe to fifteen or twenty feet in height, dividing in many ſpreading branches, which ultimately form beautiful heads, that are generally well adorned in the beginning of March with innumerable flowers, which continue in full bloom for a fortnight or three weeks, and are followed by the leaves, which are long and narrow, and the fruit takes its growth. This is downy, rather large, and of an oval form, conſiſting of a thick, tough, leathery ſubſtance that embraces an oblong nut or ſtone, in which the kernel or almond is incloſed, which is the only part of the fruit that is capable of being made uſe of.

The dwarf ſhrubby ſorts of this tree do not, however, in general, exceed three or four feet in height, having ſlender ſtems, which ſend forth a great number of ſmall branches near to the ground; and in the ſingle-flowered kind various ſuckers are frequently ſent up from the root. And in both the double and ſingle flowered almond tree, all the young branches are thickly beſet with flowers in the Spring, which, from their having a fine pale red colour, and continuing ſome time in blow, are highly ornamental. The ſingle ſort have their flowers coming out about the end of March, and the double kind in the beginning of April, each remaining about a fortnight in blow.

The ſorts chiefly cultivated for uſe in this country, are, according to Mr. Forſyth, the *tender-ſhelled almond*, the *ſweet almond*, the *common* or *bitter almond*, the *ſweet Jordan almond*, and the *hard ſhelled almond*. Thoſe propagated only for ornament are the *dwarf* and the *double-flowering almonds*.

Methods of Propagation, &c.—Theſe are either by budding them upon plum, almond, or peach ſtocks, or by ſowing the ſtones of the fruit. It is obſerved in the "Univerſal Gardener," that in the firſt way they much ſooner form full and regular heads, and attain the ſtate of flowering and producing fruit; and that if it be intended to continue the *ſweet-kernelled*, or any other particular ſort, it can only be effected with certainty by inoculation, as when raiſed from ſeed they are apt to vary, all the varieties often proceeding from the fruit of the ſame tree. This operation is generally performed about July or Auguſt, and may be done either for dwarfs, half, or full ſtandards. Mr. Forſyth remarks, that the Spring after being budded they may be trained for ſtandards, or let grow for half-ſtandards; but that the moſt common method is to bud them at ſuch a height as the ſtem is deſigned to be; and the ſecond year afterwards to plant them out for good. If they are to be tranſplanted into a dry ſoil, it is recommended to be done in October, when the leaves begin to decay; but if into wet ground, in the month of February. Such as are budded on plum ſtocks are found to grow the beſt in wet ſoils, and thoſe on almond and peach ſtocks in dry ones.

In raiſing trees of this kind from the ſtones, it is beſt to plant them in the early Autumn or Spring months, as October and November, or February and March, being careful to chuſe thoſe of the laſt Summer's growth, drilling them in, in a bed of good light ground, two or three inches in depth. The plants appear in the Spring, and in the Autumn or Spring following, may be tranſplanted into the nurſery, and put in rows for the purpoſe of being trained for ſtandards, half-ſtandards, or dwarfs, according to the intention of the planter.

When it is intended to bud any of them with peaches or almonds, they will ſome of them be in a proper ſtate for the operation; for dwarfs the firſt, and all of them the ſecond Summer after tranſplanting; but for ſtandards, in order to be trained with proper ſtems, they ſhould conſtantly have three years growth.

The dwarf ſorts, beſides being propagated by budding upon plum or almond ſtocks, may be eaſily raiſed by ſuckers from the roots, and by layers. The common method in pruning trees of this ſort is, in the Spring, to ſhorten the firſt ſhoot from the bud to four or five eyes, in order that the trees may put forth lateral ſhoots in proper quantity, ſo as to form regular full heads. But it is adviſed by Mr. Forſyth, that when the young trees are brought from the nurſery, they ſhould never be cut till the young ſhoots begin to break. And, that, as after wet Autumns, when the wood is not well ripened, hard Winters are apt to kill the ſhoots, they ſhould in ſuch caſes be cut down to the ſound wood, care being taken to prune out all ſuch croſs ſhoots as rub againſt others, leaving the tree open in the middle, cutting the ſhoots about the ſame length as for apricots, and in proportion to their ſtrength. The cankery parts and decayed wood muſt always be wholly cut out and removed.

Whether made uſe of as ſtandards or half-ſtandards, it is recommended that they be planted in ſheltered ſituations, which have a ſouthern aſpect. In ſome caſes it may be neceſſary to protect them by ſome ſort of light covering, againſt the injury that may be expected from the froſts in February and March. Trees of this ſort are alſo ſometimes planted againſt walls and on eſpaliers.

The fruit of the almond-tree, after being properly dried, may be preſerved in either bran or ſand.

2d. *Amygdalus-Perſica*, or *peach-tree*. Its native country is not known. It came to the Romans from Perſia, as its Latin name, *Malus Perſica*, indicates; and it has been cultivated from time immemorial in moſt parts of Aſia; it has been adoped by almoſt every nation of Europe, and now flouriſhes abundantly in America, where it has been introduced by the Europeans. Of this tree we have only one diſtinct ſpecies, but there are a great many varieties, and by producing them from the ſeed or kernel, they may be almoſt indefinitely increaſed. But though they are capable of being greatly augmented in this manner, it is probable that but very few poſſeſs the neceſſary qualities, as nurſerymen ſeldom cultivate more than twenty or thirty ſorts. As in the cultivation of this ſort of tree much expence is conſtantly required in walls or other ſuitable buildings, none but ſuch as produce fine fruit ſhould be attended to.

This ſort of trees will grow to a conſiderable height as ſtandards, but in order to produce and ripen fruit, requires the ſhelter of warm walls. They flower early in the Spring in

in common, the flowers appearing before the leaves, moſtly on the ſhoots of the preceding year, and either ſingly or in pairs along their ſides. They are formed each of five ſmall petals, with many ſtamina in the middle, and a ſmall round germen that becomes the peach.

The fruit is diſtinguiſhed into two ſorts, the *peach* and *pavie*, from the circumſtances of the fleſh or pulp quitting or adhering to the ſtone, as in the former it eaſily ſeparates, while in the latter it adheres firmly.

There are various ſorts of peaches that may be cultivated, but for ſmall gardens Mr. Forſyth recommends the following as the moſt ſuitable; the *early avant*, *ſmall mignonne*, the *Anne peach*, *royal George*, *royal Kenſington*, *nobleſſe*, *early Newington*, *Galland*, *early purple*, *chancellor*, *nivette*, the *Catharine*, the *late Newington*.

Againſt north and eaſt walls he thinks the *early avant*, *early Anne*, *early Mignonne*, *royal George*, *red Magdalen*, *royal Kenſington*, *nobleſſe*, *groſs mignonne*, and *Millet's mignonne* are by much the beſt. In this method a regular ſucceſſion of fine peaches, may, it is conceived, be procured until the late ſorts againſt the ſouth and weſt walls come in. But late ſorts ſhould never be planted on a north or eaſt wall.

Methods of Culture and Propagation.—It is obſerved by Mr. Forſyth, that peaches require a lighter ſoil than either pears or plums, and that a light, mellow loam is the moſt proper for them. Where the natural ſoil is a ſtrong brick mould, inclining to clay, it will be neceſſary to take ſome of it away in firſt preparing the borders for the trees, in order to be mixed with ſome light mould, ſand, or old lime rubbiſh. And in making them up, where the trees are to be planted, the earth ſhould be taken out to the depth of three feet, and the breadth of four, and the reſt worked well together with rotten leaves or ſtreet dung, and the above mixture, throwing them up as ſoon as convenient into rough ridges, to be expoſed to the action of the froſt, and the influence of the atmoſphere.

The borders, when it is intended to plant theſe trees againſt walls, ſhould never be narrower than three or four feet, and when made ſix or ſeven feet, they are more proper. The moſt advantageous aſpects for trees of this deſcription, are thoſe which have the moſt command of the ſouth ſun, but on an eaſtern or weſtern aſpect, they ſometimes anſwer tolerably well.

Where the ſoil is wet, drains laid deep are recommended by Mr. Forſyth to be made acroſs the borders, to draw the water from the roots of the trees. Theſe may be filled with old bricks or ſtones at bottom, and above with gravel, having the depth of two feet of good mould upon the latter. And when water is retained after rains from the ſtiffneſs of the ground, the borders ſhould be formed with ſuitable ſlopes for the ſame purpoſe.

If the ſoil be a ſour, moiſt clay, he adviſes brick-bats to be thrown into the bottoms of the borders, and to be covered with lime rubbiſh, or the core from the ſcreenings of lime; which ſhould be then watered, and, when nearly dry, well rammed to form a ſolid ſurface, and prevent the roots of the trees from penetrating the wet earth below, as well as to aſſiſt in taking off the water.

When water is permitted to ſtagnate near the roots of tender trees, in ſtrong land, it is remarked, that it is certain to bring on the mildew, and thereby totally ſpoil them. They may, however, in ſome inſtances, he thinks, be recovered by moving them to another aſpect. All the French peaches, it is obſerved, are extremely liable to this diſeaſe on lands of the ſtrong adheſive kind.

The propagation of peach-trees is accompliſhed either by ſetting the ſeed, or by budding upon plum-ſtocks. The fine varieties of this fruit have been moſtly obtained in the firſt method, though it is tedious, and often attended with but little ſucceſs, from the great tendency to deviate from the nature of the variety from which the ſeed was taken.

The manner of proceeding in this way is to ſow or ſet the ſeeds, in beds of good mould, in ſmall drills two or three inches deep, about October or November; or where this cannot be done, to preſerve them in ſand till February. They will be up in the Spring following; and after one or two Summers' growth, according to circumſtances, they will be fit to be tranſplanted into the nurſery, which ſhould be done in rows, either in the Autumn or Spring months. After having remained about twelve months in this ſituation, ſome of them may be taken out, and planted againſt a paling or other proper fence, in order to be trained.

But the moſt certain method of propagation for preſerving the variety, according to the authors of the "Univerſal Gardener," is that of budding, as by this means peach-trees are produced that afford fruit in ſize, colour, and taſte, exactly ſimilar to that of the tree from which the bud was taken. Beſide, in this way, the trees become much ſooner in a bearing ſtate. Though peaches may be budded on different ſorts of ſtocks as thoſe of their own kind, the almond, the apricot, and the plum, yet the plum is always to be preferred for the purpoſe, as being more hardy and ſuitable for continuing the trees in a proſperous and full bearing condition. It is alſo more adapted to grow well in different kinds of ſoil. The muſcle plum-ſtock is by much the beſt, where it can be procured.

Stocks for this uſe may be raiſed from the different varieties of plums, as well as from peaches, almonds, and apricots, by ſowing the ſeed or ſtones in the manner that has been already deſcribed. The true muſcle-plum cannot, however, be produced with certainty in this way, as it is liable to great variety when raiſed by ſeed. The only mode of procuring it with certainty is by layers in the Autumn, or ſuckers from peach or other trees that are known to have been worked upon that ſort of plum-ſtock. Theſe are to be collected in October or November, or in the early Spring months, ſuch being choſen as are about the ſize of the little finger; the knots of old wood adhering to the roots, and the ſide branches being then trimmed off, they are to be planted in rows two feet and a half diſtant, and the following Summer ſome of them will be ready to bud for dwarfs. For forming dwarfs, the moſt proper ſized ſtocks for budding upon are thoſe from half an inch to an inch in thickneſs; but for half or full ſtandards the ſtocks ſhould be allowed to ſtand till the ſtems are an inch thick at the bottom, and four or five feet in height. See Stock.

The beſt ſeaſon for budding them is Auguſt, though ſome gardeners perform the operation in June or July; but when budded too early the buds are liable to ſhoot weakly the ſame ſeaſon, and to be ſo greatly injured by the Winter, as to make but little progreſs. See Budding and Inoculation.

As it is moſtly neceſſary that trees of this kind are trained againſt ſome ſort of fence, they ſhould be principally budded ſo as to form dwarfs, that their branches may come out low. Where the fences are high, they may, however, be budded for half or full-ſtandards, and trained accordingly. In performing this buſineſs, care ſhould conſtantly be taken that only one bud be inſerted into each ſtock, the head of which ſhould remain perfect until the Spring; when about March the whole of the heads ſhould be cut over, in a ſloping direction, juſt above the places where the buds were inſerted. Shortly after this the buds moſtly ſhoot out, producing each a ſtrong

ereſt ſhoot, which by Autumn has generally attained a conſiderable height, and the trees have obtained their firſt ſtate of formation. They ſhould, therefore, in the early Autumn or Spring months, as October and November, or February and March, be tranſplanted either againſt ſuitable walls, where they may remain, or againſt ſome fence, merely with the view of being properly trained before they are finally planted out into their intended ſituations; but in either caſe, in the Spring, they muſt have the firſt ſhoot from budding headed down to a few buds or eyes, in order that a proper ſupply of lateral ſhoots may be produced below. In two or three years they are generally in a ſtate to bear fruit. See HEADING DOWN TREES.

Planting the Trees.—In chuſing this ſort of tree, Mr. Forſyth well obſerves, that ſuch plants ſhould be preferred as have the ſtrongeſt and cleaneſt ſtems; and if ſuch as have been headed down, and are of two or three years growth, they will bear and fill the walls much ſooner than thoſe that have not been managed in this way. Where they have only one ſtem they are better than with two, as, in the latter caſe, one of them muſt be cut off; for, if planted with both, the middle of the tree would be left naked, and a large portion of the wall remain uncovered. He is aware that it is frequently the practice to chuſe the trees with the ſmalleſt ſtems; but, he thinks, they always afford weaker ſhoots than the others.

The ſeaſons of planting are either the Autumn or the Spring. In dry, warm ſoils, October or November, as ſoon as the leaves begin to fall, may be the beſt periods for this buſineſs; but in very moiſt or wet ſoils the Spring months, as February and March, are to be preferred.

In whatever ſeaſon the work is done, if the borders be new, the ground ſhould be well trenched before the trees are planted; and where they are to ſupply the places of ſuch as have been removed, or where the trees have died, the whole of the old roots ſhould be carefully removed, and freſh mould put into the place where the old tree was removed from; the new earth being raiſed ſufficiently above the old, as where this is not the caſe, the trees are frequently injured by being planted too deep. Where they are not kept at firſt above the level of the old ground, Mr. Forſyth ſays, they ſeldom thrive well. After the trees have been planted, the roots ſhould be well watered in order to ſettle the mould round them, letting it remain in that ſtate for ſeveral days till the whole of the water has been taken up. The earth is then to be well trodden round them, and the holes filled up to the top. The freſh planted trees ſhould remain without being pruned until the Spring when planted in the Autumn. The authors of the "Univerſal Gardener," however, adviſe, that trees of this ſort, as well as moſt others that are deſigned for walls, be planted out into their permanent ſituations, when they are only of one year's growth from the bud, and with their heads entire, as in this way they may be more perfectly pruned and trained the two firſt years, which are the chief points in forming good wall-trees. Where walls are to be immediately covered, trained trees from the nurſery muſt, however, be procured, and of ſuch ſizes as may be the moſt ſuitable to the views of the planter. The proper diſtance of planting peach trees is about fifteen feet from each other. Where the walls are high, half or full ſtandards may ſometimes be planted between the dwarfs to fill up the upper parts, until the dwarfs grow up ſo as to cover them. The general rule is, where the walls are not more than ſix or eight feet high, to plant none but dwarf trees at the diſtance mentioned above; but when they are nine feet in height, half ſtandards of three or four feet ſtem may be put betwixt; and when the walls are ten or twelve, full-ſtandards of five or ſix feet ſtem may be had recourſe to, in order to cover the top parts; the lower branches of the ſtandard trees being annually removed, as the branches of the dwarf trees advance, and the trees themſelves at laſt wholly taken away, to admit the dwarfs to ſpread over the whole ſpace.

In removing the trees from the nurſery great care ſhould always be taken to preſerve their roots as much as poſſible, and that ſuch parts as are bruiſed be cut away. The long ſmall roots may alſo be a little ſhortened. The trees are then to be planted three or four inches from the wall, with the buds outwards, and the heads inclining to the fence, to which they ſhould be immediately tacked, in order to prevent the winds from injuring them. When the enſuing Spring proves dry, they ſhould be moderately watered once or twice a week, according to circumſtances. See PLANTING OF FRUIT-TREES.

When planted with their heads entire, they ſhould be headed down about March, when they juſt begin to bud. This is done by ſhortening the firſt main ſhoot within a few eyes of the bud, in a ſloping direction next the wall, as before directed. This muſt be done to all the trees that are to be planted againſt fences, whether dwarfs, half, or full-ſtandards; as by ſtopping their upward direction, it induces them to ſend out lateral ſhoots near the parts where they are budded from, which, by proper training, are formed into good trees. Where this operation is then omitted they run up, leaving the ſtem naked to ſome height. The next thing is to attend to the ſhoots that are made from the few eyes that were left, rubbing ſuch off cloſe, as come out *fore-right*, either from the front or back of the branches, only retaining thoſe that are ſent off laterally, which, about June, when of ſufficient length to be laid in, ought to be nailed well to the fence, keeping them to it, without being ſhortened during the Summer.

About November, when the leaves have fallen, or in the March following, they ſhould have their firſt Winter pruning. This is to be performed according to the number of ſhoots that have been produced from the heading down. If there ſhould be two ſhoots, one on each ſide, both of them may be retained, being ſhortened to eight, ten, or more inches, in proportion to their ſtrength, to promote a further ſupply of wood, nailing them horizontally to the fence. When there are three ſhoots, the middle one, if not regularly placed, or of too ſtrong growth, ſhould be cut out cloſe to its origin, the others being ſhortened and nailed as above; but when of a moderate growth, and regularly placed, it ſhould be ſhortened and nailed in an upright direction. When there are four ſhoots, they muſt be ſhortened as above, and trained regularly two on each ſide; the principle to be chiefly attended to at this period of their growth, being that of keeping the ſhoots of as equal a ſtrength as poſſible, and of equal number and regularity on each ſide; which is beſt accompliſhed by leaving only two or four good branches, to be trained with exactneſs both to the right and left, as theſe will ſupply others to cover the fence in an upward direction. See WALL-TREES.

In the ſecond year's pruning, during the Summer, all the ſhoots that proceed from the upper or under ſides of the horizontal branches of the former year, are to be retained entire and trained, the whole of the *fore-right* ſhoots ariſing from both the front and backs being carefully rubbed off as uſeleſs, reſerving all ſuch as are regular to be trained in at full length, as in Summer the ſhoots ſhould, but in few inſtances, be ſhortened.

The ſecond Winter pruning may be performed about the ſame periods as the firſt, in which the branches are to be ſhortened as directed above, and kept in as much regularity and uniformity as poſſible, both in number and ſize, by removing ſuch ſhoots as are weak. By conſtantly keeping the loweſt branches the moſt extended, where there are five, ſix, or eight branches on a ſide, and theſe trained at the diſtance of four, five, or ſix inches from each other, very handſome trees will be formed, from which ſome fruit may be expected in the ſummer following.

The trees being by theſe means brought to the proper form for bearing, they are to be preſerved and kept in order by proper Summer and Winter pruning. It may be obſerved, that both the peach and nectarine trees conſtantly produce their fruit on the former year's ſhoots, or the ſhoots that are formed each Summer bear fruit the next; and that the ſame ſhoots ſeldom bear more than once, except ſometimes, on very ſhort caſual lateral ſpurs; nor farther do the ſame ſhoots, after the firſt year, furniſh a regular ſupply of ſucceſſional bearing wood; it is moſt generally afforded by the year old ſhoots. Hence the great object in pruning is to procure an annual ſucceſſion of young wood, in every part of the tree. This is principally effected by the ſhortening of each year's branches in the Winter prunings, as by this means they are made to afford both a ſupply of bearing wood and a crop of fruit.

The manner of pruning and training, ſo as to render theſe trees regular and uniform in their ſhape and appearance at firſt, has been already explained.

But the general Summer prunings chiefly conſiſt in reforming the irregularity of the numerous ſhoots then produced, and training, to the wall at full length, in every part, an abundant ſupply of all the regularly placed ones as ſucceſſion wood for the next year's bearing; and the general Winter prunings are intended to reform generally the branches and ſhoots of all ages, ſizes, and ſituations, ſo as to render the trees healthy, beautiful, and productive. The times of performing theſe different prunings have been mentioned above. See PRUNING of FRUIT-TREES.

After the trees have been pruned they ſhould be immediately nailed to the fences, and the beſt method is to nail them as the pruning advances, that is, as ſoon as a tree is pruned to ſecure the branches by nails, before another is begun. In performing the operation care is to be taken that the branches be laid with order and regularity in a horizontal direction, having their extremities but very little higher than their bottoms, where there is ſufficient room between the trees. And in other caſes the degrees of obliquity ſhould be as little as the nature of the ſituations will admit. Where more wood has been left than can be laid in, it muſt either be cut out altogether or down to an eye, for the purpoſe of a ſhoot the next year. See NAILING of FRUIT-TREES.

Peach trees are very liable to be affected with the blight, a diſeaſe in which the leaves are ſhrivelled, or curled up, and conſiderably thickened. This ariſes from inſects and other cauſes, and is to be remedied by removing the leaves that are moſt diſeaſed, and waſhing the trees in hot weather well with water, by means of a garden engine, afterwards letting them be well fumigated with tobacco ſmoke, or ſprinkled over with the powder of it. See FUMIGATION, and DISEASES of FRUIT-TREES.

As theſe trees come into bloſſom early, it frequently becomes neceſſary to protect them from the effects of the froſts, in order to ſecure the fruit. For this purpoſe various means have been attempted, but thoſe that ſeem the moſt effectual are either thin light mats nailed over them, or a ſtrong open canvaſs. Theſe ſhould be nailed up in the evenings, and removed during the ſunny part of the day. Or in ſevere weather they may be kept on the whole day.

From the fruit of theſe trees ſetting too thick, or in cluſters, it often becomes neceſſary to thin them, which ſhould always be done according to the vigour and ſtrength of the tree, and the ſize of the fruit. Where the trees are ſtrong, and the fruit ſmall, they may be left thicker than where they are weak and the fruit large. In each caſe the largeſt, faireſt, and thoſe that are beſt placed ſhould be left; and where the leaves cover the fruit too much, they ſhould alſo be thinned away, by being pinched off. Trees of this kind, from the period of their being headed down, to their ſixth or ſeventh year, may be conſidered in the ſtate of training, though in their ſecond or third they will generally begin to bear fruit. When properly managed they are alſo much more durable than is commonly ſuppoſed, as they will continue thirty or forty years. It is likewiſe of much utility in the culture of peach trees, to dig a little dung occaſionally into the borders in which they are ſituated, and to permit none but the ſmaller kind of garden plants to be grown about them.

Peach and nectarine trees are often cultivated in *houſes*, *frames*, and *hot walls*, in order to obtain their fruit early. For theſe purpoſes the early ſorts ſhould always be procured. See PEACH HOUSE, FORCING FRAMES, and HOT WALLS.

The *double bloſſomed* and *dwarf peach trees* are moſtly planted out in ſhrubberies and pleaſure grounds, as beautiful or ornamental trees; the latter ſometimes in pots, as being curious.

3. *Amygdalus Nuciperſica*, or *the Nectarine Tree.* This is now generally conſidered as a variety of the peach, but the two trees cannot by any circumſtances in their growth, wood, leaves, or flowers, be diſtinguiſhed from each other with any degree of certainty. The fruits are, however, readily diſcriminated in all their different ſtages of growth, that of the nectarine having a ſmooth, firm cuticle, or rind, while in the peach it is covered with a ſoft downy ſubſtance. Beſides, the pulp or fleſh of the former is much more firm than that of the latter.

There are many varieties of the nectarine that may be cultivated; but thoſe that chiefly deſerve attention are the *Fairchild's*, the *violet*, the *Elrouge*, the *Newington*, the *Roman*, the *Temple*, and the *Virmaſh*. The white nectarine may alſo be cultivated both for the goodneſs of its fruit, and as being a curious variety.

The culture and management of this tree is, in every circumſtance, the ſame as that of the peach. It alſo requires the ſame ſort of ſoil and ſituation. See AMYGDALUS *Perſica*.

AMYLACEOUS, formed from "Amylum, ſtarch;" a term applied to the fine flower of farinaceous ſeeds, in which conſiſts their nutritive part.

AMYLON, in *Ancient Writers*, a kind of aliment anſwering, as ſome apprehend, to our furmity.

The word is Greek, αμυλον, thus called, becauſe made *fine mola*.

AMYLUM. See STARCH.

AMYNTA, in *Literary Hiſtory*, a beautiful paſtoral comedy, compoſed by Taſſo; the model of all dramatic pieces, wherein ſhepherds are actors. The *Paſtor Fido*, and *Filli di Sciro*, are only copies of this excellent piece.

AMYNTÆ, in *Ancient Geography*, a people of Theſpotis. Steph. Byz.

AMYNTAS, in *Entomology*, a ſpecies of HESPERIA in the Fabrician ſyſtem, with tailed wings: above blue, margin black; beneath cinereous with black points. Two ferruginous ſpots at the anal angle of the poſterior wings. This is a ſmall

a ſmall inſect, and inhabits Auſtria. Fabricius.—This is the Papilio Tiresias of Eſper.

AMYNTICA *emplaſtra*, in *Pharmacy*, defenſative, or ſtrengthening plaiſters.

AMYNTOR, properly denotes a perſon who defends or vindicates a cauſe. The word is αμυντης, formed of the verb αμυνω, *I defend* or *avenge*.

In this ſenſe Mr. Toland entitles his defence of Milton's life, *Amyntor*, as being a vindication of that work againſt Mr. Blackhall, and others, who had charged him with queſtioning the authority of ſome of the books of the New Teſtament, and declaring his doubts that ſeveral pieces under the name of Chriſt and his Apoſtles, received now by the whole Chriſtian church, were ſuppoſititious.

Amyntor, in *Entomology*, a ſpecies of Hesperia. Wings indented, tailed, black: a fulvous ſpot at the baſe, and yellow ſtripe at the tip. The wings are entirely black above, except the fulvous ſpots and yellow ſtripes: beneath yellow, with an arched black band; poſterior end of the lower wings black with white dots. A native of India. Fabricius.

AMYOT, James, in *Biography*, was born at Melun in 1514, and roſe from an obſcure original to the high ſtation of biſhop of Auxerre, and great almoner of France. At the age of ten years he fled, for fear of chaſtiſement, from the houſe of his father, who, as ſome ſay, was a currier; but according to Thuanus and others, a butcher; and being taken ill on the road, he was removed to the hoſpital at Orleans, where he was not only reſtored to health but charitably furniſhed with 16*d.* for defraying the expence of his journey home. This relief was requited, on his ſubſequent proſperity, by a legacy of 1200 crowns to the hoſpital. He was afterwards a diligent ſtudent in the univerſity of Paris, where he was maintained either by the induſtry of his parents or the charity of a lady, whoſe ſons he attended at college; and at the age of 19 he attained the degree of Maſter of Arts. In 1537 he left Paris and accompanied the abbot of St. Ambroſe to Bourges; and being recommended as preceptor to the children of William Bouchetel, ſecretary of ſtate, he was thus introduced to the patronage of the princeſs Margaret, ſiſter of Francis I. who obtained for him the chair of public lecturer in Greek and Latin at the univerſity of Bourges, where, for ten years, he read two lectures a day, one in Greek and the other in Latin. Here he tranſlated the ancient Greek romance of Heliodorus, intitled, his "Ethiopic Hiſtory, or the Loves of Theagenes and Charicles," which performance was much admired, and procured for him the abbey of Belloſana. At Venice, whither Amyot went in purſuit of preferment, after the death of Francis I. he was employed on a commiſſion to the council of Trent, and having executed it with honour, he ſpent two years at Rome, proſecuting his ſtudies, and ingratiating himſelf with thoſe who were likely to ſerve him. By Cardinal de Tournon he was recommended to the king of France, and undertook the charge of educating his two ſons in 1558. When the eldeſt of theſe pupils ſucceeded his father, under the name of Charles IX. in 1560, he immediately upon his acceſſion to the throne, advanced Amyot to the dignity of great almoner, appointed him curator of the univerſity of Paris, and conferred on him the honours and emoluments of the abbey of St. Corneille, and the biſhopric of Auxerre. When the younger of his pupils, Henry III. came to the crown, Amyot was continued in his other offices, and in 1578 appointed maſter of the order of the Holy Ghoſt, then inſtituted. During the commotions and civil war which enſued, he remained in his dioceſe, and cloſed his life in 1593, in the 79th year of his age. In proof of the avarice, with which Amyot has been accuſed, and which enabled him to amaſs 200,000 crowns, it is alleged, that, when he was ſoliciting from Charles IX. another benefice, in addition to the lucrative dignities which he poſſeſſed, the king ſaid to him. "How now, maſter? you told me, if you had 1000 crowns a year, you would be ſatisfied: I believe you have that and more."—"True, ſire," replied the biſhop; "but appetite comes by eating." Of the learning of Amyot we have ample evidence in his tranſlation of Heliodorus, and alſo of Plutarch's Lives, which is ſtill held in high eſtimation in France; the beſt edition is that of Vacoſſan, printed in 1567 and 1574, in 13 volumes, 8vo.; and Racine ſays of it, that this old tranſlation poſſeſſes a grace not to be equalled in modern language. As an apology for not complying with the requeſt of thoſe who wiſhed him to write a hiſtory of France, he humorouſly urged, "that he loved his maſters too well to write their lives." Amyot tranſlated ſeven books of Diodorus Siculus, ſome Greek tragedies, and the paſtoral of Daphnis, of which a beautiful edition, with plates, in 8vo. was publiſhed in 1718. His miſcellaneous works were printed in 8vo. at Lyons, in 1611. Gen. Dict.

AMYRALDISM, in *Eccleſiaſtical Hiſtory*, a name given by ſome writers to the doctrine of univerſal grace, as explained and aſſerted by Amyraldus, or Moſes Amyraut, and his followers, among the reformed in France, towards the middle of the ſeventeeth century.

This doctrine principally conſiſted of the following particulars, *viz.* that God *deſires* the happineſs of all men, and none are excluded by a divine decree; that none can obtain ſalvation without faith in Chriſt; that God refuſes to none the *power* of *believing*, though he does not grant to *all* his aſſiſtance, that they may improve this power to ſaving purpoſes; and that many periſh through their own fault. Thoſe who embraced this doctrine were called universalists, though, it is evident, they rendered grace univerſal in words, but *partial* in reality, and are chargeable with greater inconſiſtencies than the supralapsarians.

Amyraldiſm is ſaid to have been a ſyſtem formed with a view of producing a reconciliation with the Lutherans.

AMYRAUT, Moses, in *Biography*, an eminent proteſtant divine, was born of a good family at Bourgueil in Touraine in 1596. He was deſigned by his father for the profeſſion of the civil law, which he aſſiduouſly ſtudied in the college of Poitiers; but preferring that of a divine, he applied himſelf to theology at Saumur in 1626, and obtained the profeſſorſhip of divinity in the univerſity of this place. With his two colleagues in office he lived in perfect harmony; and the three profeſſors cordially concurred in their exertions for the credit of the ſeminary in which they preſided. In 1631 he was deputed by the proteſtant ſynod at Charenton to preſent to the king their complaints concerning the violation of the edicts which had been paſſed in their favour; and being inſtructed not to deliver his addreſs on his knees, which had been the uſual mode, he was allowed to decline it; and the ability and addreſs with which he conducted this buſineſs were admired by Cardinal Richelieu. His treatiſe "On Grace and Predeſtination," written at the requeſt of a Roman catholic of rank, who was favourably diſpoſed towards the proteſtants, excited much attention. This attempt, on the part of Amyraut, for reconciling the doctrine of predeſtination with that of univerſal grace, was violently oppoſed by the Calviniſtic divines, and particularly by Du Moulin. Although Amyraut was enjoined ſilence with regard to theſe ſubjects of debate by the ſynod of Alençon, he perſevered in the conteſt; and ſuch was, ultimately, his ſucceſs, that the ſentiments which he inculcated, and which

which nearly coincided with thoſe of the Pelagians and Arminians, were received in all the univerſities of the Hugonots in France, and diſſeminated by the French proteſtants, who fled from the rage of perſecution, through all the reformed churches of Europe. The talents, learning, and moderation of this able polemic, were much reſpected by the clergy and laity of all profeſſions. His political opinions, which were favourable to the high pretenſions of abſolute monarchy, and which militated againſt thoſe which were generally avowed by the Hugonots, and the advocates of religious liberty, ſerved to recommend him to the particular notice and eſteem of Cardinal Mazarine. In his Apology for the Proteſtants of France, publiſhed in 1647, he declares, that he will not pretend to juſtify the taking up arms againſt one's prince on any occaſion whatever; and that he always believed it to be much more agreeable to the nature of the goſpel and the practice of the ancient church, to have recourſe to no other arms than patience, tears, and prayers. In his book "On the Sovereignty of Kings," publiſhed in 1650, on occaſion of the tragical death of Charles I. he expreſſes, in the ſtrongeſt terms, his approbation of the doctrine of paſſive obedience. He excepted, however, thoſe caſes of conſcience, in which he regarded the authority of God as ſuperior to that of man: and he ſo ſtrenuouſly reſiſted an order of the council of ſtate, which required all the proteſtants to put out hangings before their houſes on Corpus Chriſti day, that the order was ſoon revoked.

The principal works of Amyraut, beſides thoſe that have been already mentioned, are, "A Treatiſe on Religions," publiſhed in 1631; "On the Nature and Extent of the Goſpel," 1636; "The Elevation of Faith, and Abaſement of Reaſon," 1641; "A Defence of Calvin in relation to the Doctrine of Abſolute Reprobation," in Latin and French, 1644; "Paraphraſes on the Scriptures;" "An Apology for the Proteſtants;" "A Treatiſe on Free-will;" "On Separation from the Church of Rome," in Latin, in 1647; "Irenicon," for promoting a reunion of the Lutherans and Calviniſts," in 1648; "Of the calling of Paſtors," 1649; "Chriſtian Morality," in 6 vols. 8vo. 1652; "A Treatiſe on Dreams;" "A Treatiſe on the Millennium;" "The Life of La Noue;" and a poem intitled, "St. Stephen's Apology to his Judges;" theſe pieces are written in French; thoſe excepted which are mentioned to be in Latin.

Amyraut was eminently diſtinguiſhed both by his writings and character. His moderation and candour ſecured the reſpect of perſons of different ſects; and his liberality to the poor comprehended alike the catholics and reformed, and it was ſo extenſive, that he diſtributed in charity the whole ſalary of his miniſtry during the laſt ten years of his life. He died, much reſpected and regretted, in 1664, bearing teſtimony, in his laſt moments, to the truth and importance of thoſe religious principles, by which the courſe of his life had been uniformly regulated. Gen. Dict. Moſheim's Eccl. Hiſt. vol. v. p. 364, &c.

AMYRBERIS, in *Botany*, a name uſed by ſome authors to expreſs the *Barberry-tree*.

AMYRIS, a genus of the *octandria monogynia* claſs and order, and of the natural order of *terebintaceæ*, Juſſieu. Its characters are, that the *calyx* is a perianthium, one-leafed, four-toothed, acute, erect, ſmall, and permanent; the *corolla* conſiſts of four, oblong, concave, and ſpreading petals; the *ſtamina* have awl-ſhaped, erect filaments, anthers oblong, erect, of the length of the corolla; the *piſtillum* has a germ, ſuperior ovate, ſtyle thickiſh, of the length of the ſtamens, and ſtigma four-cornered; the *pericarpium* is a drupaceous and roundiſh berry; and the *ſeed* is a round, ſhining nut. Martyn, in his edition of Miller, enumerates 9, and Gmelin, in his Linnæus, 13 ſpecies. 1. A. *elemifera*, cornus of Plum. icicariba of Maregr. frutex trifolius of Cateſby, with leaves ternate and pinnate, with five lobes, downy underneath. The height of this tree is about ſix feet; the leaflets pointed, ſtiff, and ſhining; and leaves oppoſite on peduncles two inches long; at the ends of the branches grow four or five ſlender ſtalks, ſet with many very ſmall white flowers, in a little corymb; the petals are inflex at the tip. It has a ſmall trunk, covered with a ſmooth, grey bark, and grows almoſt in the manner of a beech-tree. The fruit is of the ſize and figure of an olive, and the colour of a pomegranate, having within it an odoriferous pulp. A native of Carolina and Brazil. The reſin of this tree is the *Gum* Elemi. 2. A. *ſylvatica*, with leaves ternate, crenate, and acute. This is an erect, leafy ſhrub, from 2 to 15 feet high, according to the ſoil and ſituation, abounding with a turpentine of a ſtrong diſagreeable ſmell: it is found plentifully about Carthagena in woods near the ſea, and flowers in Auguſt. 3. A. *maritima*, ſmall, ſhrubby ſweet-wood, with leaves ternate, crenulate, and obtuſe. This is a dwarf ſhrub, yielding a juice like that of the former, but more agreeable, and ſmelling like rue: the berry is of the ſize of black pepper, black when ripe, incloſing a globular, brittle nut, in which is a white kernel. Swartz doubts whether the preceding be a diſtinct ſpecies from this. It grows in very barren coppices, in a calcareous rocky ſoil, both near the ſea, and on the interior mountains of Jamaica, Hiſpaniola and Cuba; and flowers from June to September. 4. A. *Gileadenſis*, balſam of Gilead-tree, with leaves ternate, quite entire, and peduncles one-flowered, and lateral. This ſpecies is a ſhrub with purpliſh branches, having protuberant buds loaded with balſamic reſin: the flowers proceed from the ſame buds by threes; the bracte minute and ſlightly bifid. It is doubted whether this be diſtinct from the next ſpecies. See Balsam of *Gilead*. 5. A. *Opobalſamum*, balſam of Mecca tree, balſamum of Bellon. and Alpin, opobalſamum, or balſamum Judaicum of Geoffroy, has pinnate leaves, and ſeſſile leaflets. See Balsam of *Mecca*, and Opobalsamum. 6. A. *toxifera*, poiſon aſh, elemifera of Linn. Hort. Cliff. toxicodendron of Cateſby and Miller, with leaves pinnate, and leaflets petiolate and plane. Cateſby deſcribes his poiſon-wood as a ſmall tree, with a light-coloured, ſmooth bark, the mid-rib of the leaf, as ſeven or eight inches long, and the pedicles as an inch in length; the fruit as hanging in bunches, ſhaped like a pear, of a purple colour, covering an oblong hard ſtone; from the trunk diſtils a liquor as black as ink, which the inhabitants ſay is poiſon: birds feed on the fruit. It is a native of America. 7. A. *protium*, protium Javanicum of Burm. tingulong of Rumph. with leaves pinnate, and leaflets petiolate and waved. It is perennial, and a native of the Eaſt Indies. 8. A. *ambroſiaca*, icica heptaphylla of Aubl. Guian. with leaves pinnate and petiolate, and panicles crowded and axillary. This is a tree, with a trunk 30 feet high, branching at the top, with branchlets leafy and flowery: leaves alternate, with two or three oppoſite, ovate leaflets on each ſide, ending in long points, ſmooth, entire, on ſhort-petioles, gibbous at the baſe; flowers yelloviſh white, axillary, and corymbed; perianth very ſmall and four-toothed; petals lanceolate, ſpreading at the tip; filaments filiform, half as long as the calyx, inſerted into the tube; germ, ſuperior, ſubgloboſe, ſtyle cylindrical; ſtigma capitated, depreſſed and four-cornered; fruit ovate, oblique, four-celled, reſembling that of the laurel; the nucleus involved in a brittle covering, four-celled, with four ſtones wrapped up in a viſcid red pulp, having a balſamic ſmell and taſte, hardening into a grey reſin, and uſed for burning as a perfume. The whole tree is very

ſweet-ſcented, and yields a very odoriferous balſam from the wounded trunk or branches, which is uſed in the dyſentery; the doſe is one dram in red wine; it is alſo uſed in houſes and churches for burning as a perfume. It grows in the woods of Guiana, and by the ſea-ſhore, flowering and fruiting in September. The Caribbee name is arouaou, and the French arbre de l'Encens. 9. A. *balſamifera*, lucinium of Plak. Sweet amyris, white candle-wood, or roſewood, with leaves two-paired. This grows to a conſiderable ſize, and is one of the moſt valuable trees in the iſland of Jamaica; the wood is white, and of a curled grain when young, but grows of a dirty, clouded aſh colour with age, bearing a fine poliſh, and having a pleaſant ſmell; it is heavy, and much eſteemed among cabinet-makers. All the parts of this tree are full of warm aromatic particles, and may be uſed in baths and fomentations; the berries are oblong, and have the taſte of the balſam Copaiba. An infuſion of the leaves has a pleaſant flavour, is highly cephalic, ſtrengthens the nerves, and is particularly reſtorative to weak eyes. In Jamaica there are ſeveral ſpecies of *amyris*, the leaves and bark of which yield a fine balſamic juice; and if the body were tapped at the proper ſeaſon, a thick liquor would tranſude, reſembling that of the Gilead balſam, to which the taſte of the bark and wood of the ſmaller branches bears a very exact relation. Dr. Wright apprehends that this wood, by diſtillation, would yield a perfume equal to the oleum rhodii. 10. A. *kataf*, with leaves ternate, ſerrate at the tip, and dichotomous peduncles. Forſk. Fl. Æg. Arab. 11. A. *balſamea*, with leaves ternate, and pinnate, with five lobes, and flowers faſcicled and pentapetalous. Gleditch. Schr. Berl. Naturf. 12. A. *Zeylanica*, with leaves pinnate, petiolated and ſmooth, racemes interrupted and axillary, and flowers involucred and hexandrous. Koenig apud Retz Obſ. Bot. 13. A. *Guianenſis*, with leaves pinnate, the pinnæ two-paired, and ovate-oblong, and racemoſe berries. Sloan. Hiſt. Jam. Gmelin's Linnæus, and Martyn's Miller.

AMYRIS. See XIMENIA.

AMYRUS, in *Ancient Geography*, a town of Greece in Theſſaly; its preciſe ſituation is not known. There was alſo a river of the ſame name.

AMYSTIS, a river of India, ſo called by Arrian.

AMYTHAONIA, a diſtrict of Elis, ſo called from Amythaon. Steph. Byz.

AMYTON, a town of Caria, according to Ptolemy.

AMYTRON, a town of Thrace, according to Heſychius.

AMYZON, a town of Aſia Minor, in Caria, according to Strabo.

AMZEL, in *Ornithology*, the name of a bird found in the northern parts of Great Britain; but which is better known by the name of ring-ouzel. This is the TURDUS TORQUATUS of Linnæus. See TORQUATUS.

ANA, in *Commerce*, the name of an Indian coin, in value ſomewhat more than one penny ſterling.

ANA, ANAH, or ANNA, in *Geography*, a town of Aſia, in Arabia Deſerta, ſituate on the Euphrates, in a pleaſant and fertile country, which produces plenty of corn, olives, dates, oranges, lemons, pomegranates, figs, &c. It is under the government of an emir, tributary to the grand ſignior. It is the general reſort of the robbers, who plunder the caravans that paſs to and from Bagdad, Aleppo, Damaſcus, &c. 260 miles eaſt of Damaſcus, and 300 ſouth-eaſt of Aleppo. N. lat. 33° 35'. E. long. 42° 4'.

ANA, āā, in *Medicine*, denotes an equal quantity of any things, whether in liquid, or in dry meaſure.

Hence *anatica proportio* is uſed by ſome writers to ſignify the *ratio*, or *proportion of equality*.

ANA, in *Matters of Literature*, a Latin termination, adopted into the titles of ſeveral books in other languages. *Anas*, or *books in ana*, are collections of the memorable ſayings of perſons of learning and wit; much the ſame with what we otherwiſe call TABLE-*talk*.

Wolfius has given the hiſtory of books in ana in the preface to the Caſauboniana. He there obſerves, that though ſuch titles be new, the thing itſelf is very old; that Xenophon's books of the deeds and ſayings of Socrates, as well as the dialogues of Plato, are *Socratiana*; that the apophthegms of the philoſophers collected by Diogenes Laertius; the ſentences of Pythagoras, and thoſe of Epictetus; the works of Athenæus, Stobæus, and divers others, are ſo many anas. Even the *Gemara* of the Jews, with ſeveral other oriental writings, according to Wolfius, properly belong to the ſame claſs. To this head of ana may likewiſe be referred the *Orphica*, the *Pythagoræa*, *Æſopica*, *Pyrrhonea*, &c.

Scaligerana was the firſt piece that appeared with a title in ana. It was compoſed by Iſan de Vaſſan, a young Champanois, recommended to Joſ. Scaliger, by Caſaubon. Being much with Scaliger, who was daily viſited by the men of learning at Leyden, De Vaſſan wrote down whatever things of any moment he heard Scaliger ſay. And thus aroſe the Scaligerana, which was not printed till many years after, at Geneva, in 1666. Patin. Let. 431. Soon after came the Perroniana, Thuana, Naudæana, Patineana, Sorberiana, Menagiana, Anti-Menagiana, Furetiana, Chevræana, Leibnitziana, Arlequiniana, Poggiana, &c.

Ana is uſed among ſome occult philoſophers to denote the human mind. Hence, according to ſome, is derived the word *anaſapta*, a dæmon invoked to the aſſiſtance of a ſick perſon.

ANAB, in *Scripture Geography*, a town of Paleſtine, ſituate in the mountainous parts of the tribe of Judah. Joſh. xi. 21. xv. 50.

ANABAGATAS, in *Ancient Geography*, a city of Aſia, and the ſee of an archbiſhop under the patriarch of Antioch.

ANABAO, in *Geography*, one of the Molucca iſles ſouth weſt of Timor, from which it is ſeparated by a canal capable of receiving veſſels of any burden. At the extremity of this canal are two points; the ſouthern, called *Gupang*, belongs to Timor; and that on the northern ſide to Anabao.

ANABAPTISM, ſee ANABAPTISTS, *infra*.

ANABAPTISTON. See ABAPTISTON.

ANABAPTISTS, in *Eccleſiaſtical Hiſtory*, a name given to Chriſtians who maintained that baptiſm ought always to be performed by immerſion; that it ought not to be adminiſtered to children before the age of diſcretion, or that at this age it ought to be re-adminiſtered to thoſe who have been baptized in their infancy, becauſe they ſay the adminiſtration of this ſacrament is neither valid nor uſeful, if it be done by ſprinkling only, and not by immerſion; or if the perſons who receive it be not in a condition to give the reaſons of their belief.

The word *Anabaptiſt* is compounded of ἀνα, *new*, and βαπτιστης, *a baptiſt*, and this general denomination has been indiſcriminately applied to people of very different principles and practices; though many of them object to the name, becauſe the baptiſm of infants by ſprinkling, is, in their opinion, no baptiſm; and they hold nothing in common excepting ſome one or other of the above mentioned opinions concerning BAPTISM.

The NOVATIANS, the CATAPHRYGIANS, and the DONATISTS, may be conſidered as a kind of Anabaptiſts in the earlier ages, though not then denoted by this name; for they contended that thoſe Chriſtians of the catholic church, who joined themſelves to their reſpective parties, ſhould be rebaptized.

rebaptized. But we muſt not claſs under the ſame denomination thoſe biſhops of Aſia and Africa, who, in the third century, maintained, that baptiſm, adminiſtered by thoſe whom they called heretics, was not valid; and therefore that ſuch of them as returned into their churches ought to be rebaptized. Nor does it appear that there is ſufficient authority to affirm, that the *Vaudois* and the *Albigenſes* were predeceſſors of the modern *Anabaptiſts*; though ſome of them adopted the practice of adult baptiſm.

It was not till a little after the time when the Lutherans ſeparated from communion with the Romiſh church, that the Anabaptiſts began to make a noiſe in Germany. Storck, Stubner, and Munzer, were the firſt diſciples of Luther, who, about the year 1521, were ſtyled Anabaptiſts. But well knowing that their opinions were very different from Luther's doctrine, they availed themſelves of his abſence to diſſeminate them in Wittemburgh, and had the addreſs to over-reach the piety of Melancthon. Their principal purpoſe was to gain over the populace, and to form a conſiderable party. To effect this, ſays Bayle, they were induſtrious and active, each in his own way. Storck, wanting knowledge, boaſted of inſpiration; and Stubner, who had both genius and erudition, laboured at commodious explications of Scripture. Not contented with diſcrediting the court of Rome, and decrying the authority of conſiſtories, they taught, that men being entitled under the Goſpel to equal liberty, could not be juſtly ſubjected to any civil power, nor erect ſuperiorities over each other; that, as all magiſtracy was an uſurpation on Chriſtian freedom, no true Chriſtian could be either magiſtrate or ſubject, nor conſequently pay any impoſt, give any oath, or bear arms; that violence and arms ought never to be made uſe of, excepting againſt princes, and people in power, from whom they were permitted to revolt, as from ſo many uſurpers, who were to be pulled down, in order to erect the kingdom of God. They pretended that Chriſtians, being all free, equal, and independent, there ought to be no tribunal among them, nor laws, nor any diſtinction of property, but that every thing ſhould be in common, nor any reſtraints with regard to the number of wives whom they might marry. In other reſpects they affected ſingular auſterity, recommending macerations, faſtings, and the utmoſt ſimplicity of apparel. Their ſermons were, for the moſt part, declamations againſt the communion of the reformed; and they were inceſſantly exhorting every body to join with them, who, as they ſaid, were ſent of God, to re-eſtabliſh the kingdom of his Son. They made high promiſes to all who would unite with them to exterminate the impious, if this maſſacre proved the epocha for the commencement of Chriſt's reign upon earth, when the juſt, meaning themſelves, were to reign alſo, inſtead of the unrighteous uſurpers of authority. They moreover affected to ſpeak with a kind of contempt concerning external worſhip, the ſacraments, the miniſtry, and even the word of God, with a view to enhance the merit of the extaſies, viſions, and inſpiration, to which they pretended, and on which they valued themſelves. They dealt much in predictions, eſpecially concerning the nearneſs of the laſt judgment; and, finally, to give a greater eclat to their party, they rebaptized all thoſe who joined them; and to make their practice ſucceed, they taught that baptiſm adminiſtered to infants was void.

Munzer took the lead of this party; and, in 1525, aſſembled a numerous army of aſſociates; but this inſurrection was ſoon ſuppreſſed, and Munzer put to an ignominious death. Many of his followers, however, ſurvived, and propagated their opinions through Germany, Swiſſerland, and Holland. In the year 1533 they formed a new community at Munſter, under the direction of two Anabaptiſt prophets, John Matthias, a baker of Haerlem, and John Blockholdt, a journeyman tailor of Leyden. Having made themſelves maſters of the city, they depoſed the magiſtrates, confiſcated the eſtates of ſuch as had eſcaped, and depoſited the wealth they amaſſed together in a public treaſury for common uſe. They made preparations of every kind for the defence of the city, and ſent out emiſſaries to the Anabaptiſts in the Low Countries, inviting them to aſſemble at Munſter, which was now dignified with the name of Mount Sion, that from hence they might be deputed to reduce all the nations of the earth under their dominion. Matthias, who was the firſt in command, was ſoon cut off in an act of phrenſy by the biſhop of Munſter's army; and was ſucceeded by Blockholdt, who was proclaimed, by a ſpecial deſignation of heaven, as he pretended, king of Sion, and inveſted with legiſlative powers, like thoſe of Moſes. The extravagancies of Blockholdt were too numerous to be recited: it will be ſufficient to add, that the city of Munſter was taken after a long ſiege and an obſtinate reſiſtance; and Blockholdt, the mock monarch, was puniſhed with a moſt painful and ignominious death. The *Baptiſts* in England and Holland, or, as they are there called, the *Mennonites*, are very different from thoſe who firſt gave riſe and name to the ſect.

It muſt be acknowledged, that the firſt inſurgents in Germany had been grievouſly oppreſſed; and that they took up arms principally in defence of their civil liberties; nor ſhould ſubſequent extravagancies of violence be attributed to their religious principles, much leſs charged on their ſucceſſors.

The ſequel of their hiſtory, and diſtinguiſhing tenets, may be ſeen under the article ANTI-PÆDO-BAPTISTS, BAPTISTS, MENNONITES, WATERLANDIANS, &c.

ANABASII, in *Antiquity*, the couriers who travelled on horſeback, or in chariots, for the greater expedition.

The word comes from the Greek ἀναβασις, *mounting*.

ANABASIS, in *Botany*, a genus of the *pentandria digynia* claſs and order, of the natural order of *holoraceæ* and *atriplices* of Juſſieu: its characters are, that the *calyx* is a three-leaved perianthium, the leaflets roundiſh, concave, obtuſe, and ſpreading; the *corolla* five-petalled, petals ovate, equal, leſs than the calyx, and permanent; the *ſtamina* have filaments filiform, longer than the corolla, and anthers roundiſh; the *piſtillum* has a germ roundiſh, acuminate, ending in two ſtyles, and obtuſe ſtigmas; the *pericarpium* is a berry, roundiſh, ſurrounded by the calyx and dilated: the *ſeed* is ſingle and ſcrew-ſhaped. There are four ſpecies. 1. A. *aphylla*, leafleſs A. ſalſola baccifera of Gmel. Siber. kali bacciferum of Buxb. without leaves, and the joints emarginate. This is a perennial plant, and has been found wild on the ſhores of the Caſpian. The berry, in a ſtate of maturity, is large; it is red, the pulp is watery, and it dyes a yellow colour. Gmelin makes the anabaſis cretacea of Pallas and Gærtner a variety of this ſpecies. 2. A. *folioſa*, leafy A. ſalſol. foliis incraſſatis, &c. of Gmel. and Pallas, kali bacc. fol. clavatis of Buxbaum, with leaves ſubclavate. It is ſeldom more than half a foot high; annual; found wild on the ſhores of the Caſpian. 3. A. *tamariſcifolia*, tamariſk-leaved A. with awl-ſhaped leaves and juiceleſs pericarpia. This is a ſhrub with white branches, very ſmooth; a native of Spain. 4. A. *ſpinoſiſſima*, thorny A. ſhrubby, branches without leaves, but full of ſpines: the native place of growth is unknown.

ANABASIS, in *Medicine*, the ſtate of a diſeaſe *in* its growth.

ANABASIUS, a name given by Pliny to a plant, which he calls alſo *ephedra*, and deſcribes as hanging down from

from the branches of large trees, in form of tufts of hair. The plant described by Pliny, and others of the ancients, under this name is the USNEA, or long hairy tree moss.

ANABATA, in *Ancient Cuſtoms*, a cope, or ſacerdotal veſt, to cover the back and ſhoulders of the prieſt.

It is otherwiſe called *anabolaſium*, formed of ἀναβάλλεσθαι, *to caſt on*, or *cover*.

The word *anabala* ſeems to be uſed in the ſame ſenſe.

ANABATHRA, from ἀναβαίνω, *I aſcend*, in *Ancient Writers*, denote a kind of ſteps or ladder, whereby to aſcend ſome eminence. In this ſenſe we read of the anabathra of theatres, pulpits, &c. Anabathra appears to have been ſometimes alſo applied to ranges of ſeats riſing gradually over each other.

ANABATHRA is more particularly applied to a kind of ſtone-blocks raiſed by the highway ſides, to aſſiſt travellers in mounting or alighting, before the uſe of ſtirrups was invented. The firſt author of this contrivance, among the Romans, was C. Gracchus, brother of Tiberius.

ANABIBAZON, in *Aſtronomy*, the DRAGON's *tail*.

ANABIS, in *Ancient Geography*, a town of Spain, in the territory of the Lacetani, according to Ptolemy. Euſebius mentions a village of Egypt under this name, in which a man was the object of worſhip.

ANABLATA, a town of Paleſtine, near Bethel.

ANABLATUM, in *Botany*, a name uſed by ſome authors for the *ſquammaria*, or tooth-wort, called *dentaria* by others.

ANABLEPS, in *Ichthyology*, a ſpecies of COBITIS, having a depreſſed head, prominent eyes, and two beards; one at each angle of the mouth. Linn. This fiſh inhabits the ſea ſhore of Surinam, and is deſcribed by Seba and Gronovius. It has ſix rays in the gill membrane, ſeven in the dorſal fin, twenty in the pectoral fin, ſeven in the ventral fin, and nine in the anal fin.

In the ſyſtem of Fiſhes of Artedi, ANABLEPS is a genus of the malacopterigious kind.

ANABOA, in *Geography*, a ſmall iſland ſituate near the coaſt of Loango in Africa, in S. lat. 1°. and E. long. 8° 30'. This iſland has ſeveral fertile vallies, in which are produced bananas, oranges, lemons, pine-apples, citrons, cocoa-nuts, &c. and abundance of cotton. It has two high mountains, almoſt always covered with clouds, which occaſion frequent rains.

ANABOLEUM, in *Antiquity*, denotes any kind of upper garment worn over the coat or tunic.

This is otherwiſe called *anabole*, from ἀνὰ and βάλλω.

ANABOLEUS, among the *Ancients*, a ſervant whoſe office was to aſſiſt in mounting on horſeback. Theſe were in uſe before the invention of ſtirrups, or of thoſe ſtones called *anabathra*.

ANABOLEUS is alſo uſed by Euſtathius, to denote a ſmall piece of iron, whereon the foot was ſet, in order to mount; from which Buddæus infers, that the ancients had ſtirrups or foot-boards; to which Lipſius objects, that it does not appear this anaboleus was any pendant part fixed to the ſaddle, after the manner of our ſtirrups, but rather a portable engine brought by a ſervant, and placed by the horſe's ſide.

ANABROCHISMUS, from ἀνὰ, *upwards*, and βρόχος, a *loop*, in the *Ancient Phyſic*, the operation of taking away offenſive hairs in the eye lids.

The manner of performing the anabrochiſmus is deſcribed by Gorræus.

ANABROSIS, ἀναβρωσις, q. d. *eroſio*, in *Medicine*, otherwiſe called *diabroſis*, the iſſuing of blood at a hole worn in a vein by corroſion.

ANABUCIS, in *Ancient Geography*, a place of Africa, ſituate, according to Antonine, in the route from Carthage to Alexandria. As it lay to the eaſt of Macomades, it muſt have been in the Cyrenaic territory.

ANABUM, a town of Germany, ſituate, according to Ptolemy, in an iſland of the Danube.

ANABURA, a town of Phrygia in Aſia Minor, probably the ſame which ſome authors have placed in Piſidia.

ANACA, in *Ornithology*, the name of a ſpecies of PSITTACUS, or parrot, that inhabits Brazil and Guiana, and is called at the latter place the common parrot, being the moſt frequent ſpecies of that genus. It is green, beneath ferruginous-brown, crown of the head cheſnut, ſpot on the back, and tail pale brown, margins of the wings red. Linnæus, Gmel.

This is ANACA BRASILIENSIBUS of Ray and Willoughby; ANACA of Buffon, and cheſnut-crowned parraket of Latham. It is likewiſe *la petite perruche brune du Breſil*, of Briſſon. It is the ſize of a lark. Bill and orbits brown; crown of the head cheſnut, throat cinereous: hind part of the neck, back, rump, ſides, thighs, ſcapulars, upper wing and tail coverts, green: breaſt, belly, and under tail coverts, rufous brown: legs and claws blackiſh.

In the Britiſh Muſeum there is a ſpecimen, which varies in having the ſpot on the back of a deep cheſnut; no red on the edge of the wings: tail green, the upper tail coverts brown, and the under tail coverts of a brown ſtill paler. Vide Dr. Latham Gen. Syn.

ANACALYPTERIA, in *Antiquity*, feaſts celebrated among the Heathens on the day that the bride was permitted to lay aſide her veil, and to be ſeen in public.

They were thus called from ἀνακαλύπτειν, *to uncover*.

According to Suidas, it alſo means the preſents which were made to the bride by her huſband's relations and friends on that day.

ANACAMPSEROS, in *Botany*. See CLAYTONIA, PORTULACA, and SEDUM.

ANACAMPTERIA, in *Eccleſiaſtical Antiquity*, denote little hoſpitals, or inns, for the entertainment of the poor and ſtrangers, built adjoining to the ancient churches.

ANACAMPTIC, from ἀνὰ and κάμπτω, *flecto*, *I bend*, ſignifies as much as *reflecting*; and is frequently uſed in reference to echoes, which are ſaid to be ſounds produced *anacamptically*, or by reflection.

Hence, alſo anacamptics is uſed by ſome for the ſcience of reflecting rays; otherwiſe called CATOPTRICS.

ANACANDAIA, in *Zoology*, the name of a ſpecies of ſerpent found in the iſland of Ceylon, and very miſchievous among the cattle, whence it is called BUBALINUS.

ANACARDII, in *Entomology*, a ſpecies of PAPILIO of the tribe *Parnaſſius*. The wings are tranſparent, or glaſſy and greeniſh. Poſterior pair brown at the tips, with two eye ſhaped ſpots. Inhabits South America. Linn. and Fabric.

ANACARDIUM, formed of ἀνὰ, *without*, and, καρδία, *heart*, becauſe the pulp of the fruit, inſtead of having the ſeed incloſed, as is uſually the caſe, has the nut growing out at the end of it, in *Botany*, *acajou* of Tournefort, *acajuba* of Gærtner, a genus of the *polygamia monoecia* claſs and order, (*enneandria monogynia* of Gmelin and Willdenow,) of the natural order of *holoraceæ*, and *terebinthaceæ* of Juſſieu; its characters are, that it has hermaphrodite flowers and male flowers, either mixed with the hermaphrodites, or on a diſtinct tree. The *calyx* of the former is a perianthium five leaved, leaflets ovate, concave, coloured, erect, and deciduous; the *corolla* has five petals, lanceolate, acute, three times as long as the calyx, upright at bottom, reflex at the end; the *ſtamina* have ten filaments, united at the baſe and upright, nine of them capillary, ſhorter than the calyx,

calyx, one thicker, double the length of the others, lying on the germ in front, anthers roundiſh, in the longer filament large and fertile, in the reſt ſmall; the *piſtillum* has a germ kidney-ſhaped, obliquely emarginate in front, ſtyle ſubulate, bent in, the length of the corolla; ſtigma ſmall, roundiſh, depreſſed, and concave; no *pericarpium*; receptacle fleſhy, very large and obovate; the *ſeed* a nut kidney-ſhaped, large, at the top of the receptacle, with a thick ſhell, cellular within, and abounding in oil. The *calyx*, *corolla*, and *ſtamina* of the male flowers as in the hermaphrodites; the *piſtillum* has either no germ, or one that is abortive. There is one ſpecies, *viz.* A. *occidentale*, acajuba occidentalis of Gærtner, acajou of Piſo, acajaiba of Marcgrave, caſſuvium of Rumphius, caſchou of Merian, kapa-mava of Rheed, anacardium fructu obverse ovato nuce reniformi, racemis terminalibus of Browne, Jamaic. Caſhew-nut, caſſu or acajou. The caſhew is an elegant tree, 12 or 16 feet high, ſpreading much as it riſes, and beginning to branch at the height of five feet, according to Browne; but Long affirms, that in good ſoils it ſpreads to the ſize of a walnut tree, which it reſembles in the ſhape and ſmell of the leaves: the trunk ſeldom exceeds half a foot in diameter; the leaves are coriaceous, ſubovate, ſhining, entire, petioled, and ſcattered alternately; the panicles corymbed, diffuſed, and terminating, containing many ſmall, ſweet-ſmelling flowers, on an oblong receptacle, ſcarcely diſtinguiſhable from the peduncle; the corolla red, with commonly 10 ſtamens, one of which has no anther, but it has frequently eight or only ſeven all fertile; and there are ſometimes female flowers entirely deſtitute of ſtamens. The fruit has an agreeable ſubacid flavour, in ſome degree reſtringent; in ſome of a yellow, and in others of a red colour, which difference may be probably owing to the ſoil or culture. The juice of the fruit, fermented, affords a pleaſant wine, and diſtilled, yields a ſpirit exceeding arrack or rum, and ſerves to make punch, and alſo to promote urine. The ripe fruit is ſometimes roaſted, and ſliced, and thus uſed for giving an agreeable flavour to punch. The reſtringency of the juice has recommended it as a remedy in dropſical habits. From one end of the apple proceeds the nut, which is kidney-ſhaped, incloſed in two ſhells, the outer of an aſh-colour, and ſmooth, and the inner covers the kernel. Between theſe ſhells is lodged a thick, inflammable, and very cauſtic oil, which, incautiouſly applied to the lips and mouth, inflames and excoriates them. This oil has been ſucceſsfully uſed for eating off ring-worms, cancerous ulcers, and corns; but it ſhould be very cautiouſly applied. Some of the females have uſed this oil as a coſmetic, in order to remove the freckles and tan occaſioned by the ſcorching rays of the ſun, but it proves ſo corroſive as to peel off the ſkin, and cauſe the face to inflame and ſwell; but after enduring the pain of this operation for about a fortnight, their new ſkin, as it may be called, appears fair like that of a new-born infant. This oil alſo tinges linen of a ruſty iron colour, that can hardly be got out; and when ſmeared on wood, it prevents decay, and might therefore ſerve for preſerving houſe timber and ſhips' bottoms. The freſh kernel has a delicious taſte, and abounds with a ſweet milky juice; it is an ingredient in puddings, &c. and is eaten raw, roaſted, and pickled. The negroes of Brazil, who are compelled by their maſters, the Portugueſe, to eat this nut, for want of other ſuſtenance, obtain relief from this involuntary uſe of it in various diſorders of the ſtomach. When the kernel is ground with cacao, it improves the chocolate; but if it be kept too long it becomes ſhrivelled, and loſes its flavour and beſt qualities. The milky juice of the tree, obtained by tapping or inciſion, will ſtain linen of a deep black, which cannot be waſhed out; but whether this has the ſame property with that of the eaſtern anacardium, has not yet been fully aſcertained; for the inſpiſſated juice of that tree is the beſt ſort of lac which is uſed for ſtaining black in China or Japan. Phil. Tranſ. vol. xlix. part ii. p. 872. Lewis Comm. Phil. Techn. p. 329, &c. This tree annually tranſudes from five to ten or twelve pounds weight of a fine ſemi-tranſparent gum, reſembling gum-arabic, and not inferior to it in virtue or quality, except that it has a ſlight aſtringency, which may probably, in ſome reſpects, render it more valuable. It is a native of both Indies, *e. g.* Malabar, Ceylon, Brazil, Guiana, Jamaica, and the Caribbee iſlands; and was cultivated in Kew Garden in 1699, by the ducheſs of Beaufort.

Culture.—The caſhew tree is eaſily raiſed in its native country from the nut; and it is of quick growth, bearing fruit in two years after it has been planted. But in England the plants are preſerved with difficulty. They are eaſily raiſed from the nut ſupplied from America; and they ſhould be planted in ſmall pots filled with light ſandy earth, and plunged into a hot-bed of tanner's bark, which ſhould be preſerved from moiſture. Freſh nuts will yield plants in about a month, and in two months theſe will be four or five inches high, with large leaves, but they ſeldom advance much farther in the ſame year. The plants muſt be conſtantly kept in the ſtove, as they are too tender to live abroad in England, even in the warmeſt ſeaſons. They ſhould have little water in Summer, and in Winter, water once in a fortnight will be ſufficient. When they are tranſplanted, the pots ſhould be broken, that the earth which cleaves to their roots may not be diſturbed; and they ſhould then be put into larger pots, filled with light ſandy earth, and plunged into the hot-bed. They muſt not be removed oftener than once a year, and the pots ſhould not be too large, for unleſs their roots are confined they will not thrive. With this management they may be kept ſeveral years, but they ſeldom exceed two feet and a half in height, and are ſeldom half as high. Martyn's Miller. Murray's Mat. Med. vol. iv. p. 413.

ANACARDIUM *Orientale*. See AVICENNIA.

ANACARDIUM *Officinarum*. See SEMECARPUS.

ANACATHARSIS, in *Medicine*, properly denotes a purgation by ſpitting; in which ſenſe it ſtands contradiſtinguiſhed from *catharſis*, or evacuation downward.

In this ſenſe is the word uſed by Hippocrates and Galen; agreeably to this Blaſius reſtrains *anacatharſis* to expectoration. Only Blancard, on what authority does not appear, extends *anacathartic* medicines to all thoſe which work upwards, by the glands of the head, whether vomitories, ſternutatories, or maſticatories.

ANACATHARSIS is alſo a name given by *civil lawyers* to the *Baſilicon repetitæ Prelectionis*, made by order of the emperor Conſtantine Porphyrogenitus.

It was thus called, as being a review or correction of the Baſilicon.

ANACATHARSIS, among *Divines*, denotes the clearing up ſome obſcure paſſage, by a ſpiritual or anagogical interpretation.

ANACATHARTIC, from ανα, *upwards*, and καθαιρω, *I purge*, is uſually underſtood of a vomit, or a purging medicine that works upwards.

ANACEIA, an Athenian feſtival in honour of the Dioſcuri. It took its name from thoſe deities, who were alſo called Ανακες, and honoured with a temple called Ανακειον, *Anaceum*. The Anaces, Anactes, or Dioſcuri have been thought by ſome writers to be the ſame with the Cabiri of the ancient Carthaginians, but others are of a different opinion. However this may be, they were undoubtedly deſcended from the Anakims of Moſes; and Inachus was alſo

of

of this race, as his name imports. Some have ſuppoſed, that the appellation Anactes was given to thoſe princes of the line of Inachus, who had diſtinguiſhed themſelves by their heroic actions.

The ſacrifices offered at that time were named Ξενικα, becauſe thoſe deities were ξενοι, or *ſtrangers*; and conſiſted of three offerings, which were called Τριτται. Athenæus mentions plays acted in honour of theſe deities.

ANACEPHALÆOSIS, formed of ανα, which in compoſition ſignifies *again*, and κεφαλη, *head*, in *Rhetoric*, a recapitulation, or a ſhort and ſummary repetition of the heads of a diſcourſe.

ANACHARSIS, in *Biography*, a Scythian philoſopher, was the ſon of a Scythian chief by a native of Greece, and flouriſhed about 600 years before Chriſt. Having acquired an early acquaintance with the Greek language, he was entruſted by his ſovereign with an embaſſy to Athens; and in the firſt year of the 47th Olympiad, *i. e.* 592 B. C. he was conducted by Toxaris, one of his countrymen, to the houſe of Solon. Anacharſis availed himſelf of the opportunities which free and familiar intercourſe with Solon afforded him for gaining wiſdom: he was introduced to the ſociety of the principal perſons at Athens, and he was the firſt ſtranger upon whom the Athenians conferred the honour of citizenſhip. After the death of Solon, and probably not before, Anacharſis left Athens, and travelled into other countries; and at laſt returned to Scythia, with a deſign of communicating to his countrymen the knowledge he had acquired, and of eſtabliſhing among them the deities and the worſhip of Greece. But his attempts were ineffectual. Whilſt he was performing ſacred rites to Cybele, in fulfilment of a vow which he had made upon his way home, he was killed by an arrow levelled againſt him, as report ſays, by the king's own hand; ſo that he fell a ſacrifice to the envy and folly of his countrymen, who would not condeſcend to be inſtructed by Grecian wiſdom. The phraſe, "Scythian eloquence," was derived from the manly and nervous kind of language for which he was diſtinguiſhed. He is ſaid to have been the inventor of the anchor and potter's wheel, but theſe inſtruments were known before his time; however, he might have introduced the uſe of them among the Scythians. Of his ingenious ſayings that are recorded, the following deſerve to be mentioned: "The beſt method of teaching a youth ſobriety is to ſet before his eyes a drunken man." "The vine bears three ſorts of fruit: the firſt, pleaſure; the ſecond, intoxication; the third remorſe." "An ape is by nature ridiculous; man, by art and ſtudy." To an Athenian of infamous character, who reproached him for being a Scythian, he ſaid, "My country may be a diſgrace to me; but you are a diſgrace to your country." As he was one day conſidering the thickneſs of the planks of a ſhip, he cried out, "Alas! thoſe who go to ſea are but four inches diſtant from death." Being aſked what was the moſt ſecure ſhip, he replied, "That which is arrived in the port." He often repeated, "That every man ſhould be particularly careful to make himſelf maſter of his tongue and his belly." Being aſked what was the beſt and what the worſt part of a man, he anſwered, "The tongue." "It is much better," ſaid he, "to have but one friend, if he be faithful to us, than a great number of thoſe who are always ready to follow the change of fortune." He uſed to compare laws to ſpiderwebs; and to ridicule Solon, who pretended to reſtrain the paſſions of mankind by pieces of writing. He obſerved, "That the prince who is wiſe is happy; and that that city is beſt wherein all things elſe being equal, virtue hath the better condition, vice the worſe." The epiſtles that bear his name are probably ſpurious. Herodotus, lib. iv. Plut. Vit. Solon, apud Opera, tom. i. p. 80. Diog. Laertius, lib. i. tom. i. p. 64. Strabo, lib. vii. tom. i. p. 461. Brucker's Hiſt. of Philoſ. by Enfield, vol. i. p. 104. The Travels of Anacharſis the Younger in Greece, by the Abbé Barthelemi, compriſed in ſeven volumes, 8vo. with a volume of maps, &c. in 4to. is a work in high eſtimation.

ANACHIMOUSSI, in *Geography*, a province of the iſland of Madagaſcar, having on the eaſt the river Jonghainon, which runs through it, the country of Manamboule on the ſouth, on the weſt large and lofty mountains, and on the north the river Mangharac and the country of Eringdrana. This province produces great quantities of rice and yams, with plenty of cattle, and other neceſſaries of life, and is extremely populous.

ANACHIS, in *Mythology*, one of the four deities, to whom the Egyptians imagined the peculiar care of each perſon was committed at his birth: the other three were *Dymon*, *Tyche*, and *Heros*. They were alſo called *Dynamis*, *Tyche*, *Eros*, and *Ananche*; i. e. Power, Fortune, Charity, and Neceſſity.

ANACHORESIS, denotes a withdrawing from ſociety, or retiring into ſolitude. The anachoreſis was not allowed to perſons before they had ſpent thirty years in the community.

ANACHORET, from ανα χωρεω, *I retire into a ſolitary place*, a hermit or devout perſon, living alone in ſome deſert, to be farther out of the reach of the temptations of the world, and more at leiſure for meditation. Such were St. Anthony, St. Hilarion, &c. Paul the Hermit was the firſt of the tribe of anachorets.

When many of the habitations of anachorets were placed together in the ſame wilderneſs, at ſome diſtance from one another, they were all called by one common name *laura*, which, as Evragius informs us, differed from a *cænobium*, or *convent*, in that a *laura* conſiſted of many cells divided from each other, where every monk provided for himſelf; but a *cænobium* was one habitation, where the monks lived in ſociety, and had all things in common. Anachorets, popularly anchorets, were very numerous among the Greeks, conſiſting principally of monks; who not caring for the fatigues and offices of the monaſtery, purchaſed a little ſpot of ground, with a cell, whither they retreated, and never appeared in the monaſtery again excepting on ſolemn days. Theſe are ſometimes alſo called *aſcetæ* and *ſolitaries*.

They had their chapel, and after prayers applied themſelves to the culture of their vineyards, olives, fig-trees, and the like, which afforded them proviſion for the year.

Theſe anchorets only differed from the conventual monks, in that they had leſs intercourſe with the world, and lived but in ſmall bodies.

The anchorets of Syria and Paleſtine retired into the moſt obſcure and unfrequented places; hiding themſelves under rocks and mountains, without either tents or cottages, repoſing wherever the approach of night happened to find them, and living on the ſpontaneous productions of the earth. This courſe of life they purſued, that they might avoid the view and the ſociety of mortals.

There have alſo been anchorets in the Weſt. Peter Damain, who was of the order of hermits, frequently ſpeaks of them with great praiſe. He repreſents them as by far the moſt perfect ſort of monks; holding them in much higher opinion and veneration than the *cænobites*, or monks reſiding in monaſteries.

Many of theſe retire, with the leave of their abbots, and have an allowance from the monaſtery. The people, on account of their piety, preſent them with good ſums of money, which they carefully hoard up, and at their death bequeath to the monaſtery they had belonged to.

ANACHORETA, in *Entomology*, a ſpecies of PHALÆNA, of the *bombyx* tribe, which, till lately, was confounded with

with phalæna curtula, from which it chiefly differs in having a white ſtreak acroſs the brown ſpot at the tip of the anterior wings. Its ſpecific character is, wings grey, with white ſtreaks; at the tip a ferruginous-brown ſpot, marked with a waved ſtreak of white. Fabricius. Feeds on the willow and poplar in the larva ſtate. The larva is hairy, brown with a fleſh-coloured ſtripe along the back; two elevated warts, and lateral dots of rufous colour. Inhabits Auſtria.

ANACHORITA, in *Eccleſiaſtical Writers*, a name ſometimes given to the cells of recluſes.

By the ancient canons, no anachorita could be erected without conſent of the biſhop.

ANACHRONISM, compounded of ανα, *higher*, and χρονος, *time*, in *Chronology*, an error in computation of time; whereby an event is placed earlier than it really happened.

Such is that of Virgil, who placed Dido in Africa at the time of Æneas; though, in reality, ſhe did not come there till 300 years after the taking of Troy. An error on the other ſide, whereby a fact is placed later or lower than it ſhould be, is called a *parachroniſm*; though this diſtinction is not commonly obſerved.

ANACHYTIS, in *Natural Hiſtory*, a ſpecies of Echinus, of the ſecond order of Vermes, *Molluſca*; it is heart-ſhaped, rather oblong, and ſomewhat conic, baſe flattiſh. Spaces and diviſions ten; mouth ſubrotund, ſurrounded with an elevated margin; vent oval, notched below. Klein and Linn. Found in a foſſil ſtate.

ANACIUM, in *Ancient Geography*, a mountain of Attica, on which was a temple of Caſtor and Pollux.

ANACLASTIC *glaſſes*, *vitra anaclaſtica*, a kind of ſonorous phials or glaſſes, chiefly made in Germany, which have the property of being flexible, and emitting a vehement noiſe by the human breath. They are alſo called vexing glaſſes, by the Germans *vexier glaſer*, on account of the fright and diſturbance they occaſion by their reſilition.

The anaclaſtic glaſſes are a low kind of phials with flat bellies reſembling inverted funnels; whoſe bottoms are very thin, ſcarce ſurpaſſing the thickneſs of an onion-peel: the bottom is not quite flat, but a little convex. But upon applying the mouth to the orifice, and gently inſpiring, or as it were ſucking out the air, the bottom gives way with a horrible crack; and from being convex becomes concave. On the contrary, upon expiring or breathing gently into the orifice of the ſame glaſs, the bottom with no leſs noiſe bounds back on its former place and becomes gibbous as before.

The anaclaſtic glaſſes firſt taken notice of were in the caſtle of Goldbach; where one of the academiſts *Naturæ Curioſorum*, having ſeen and made experiments on them, publiſhed a piece expreſsly on their hiſtory and *phænomena*. Roſini Lentilii Oribaſii Sched. de Vitris Anaclaſticis. Vid. Ephem. Acad. N. C. Dec. 2. Ann. 3. p. 489, ſeq. Their figure may be ſeen in the book above cited.

They are all made of a fine white glaſs. It is to be obſerved in theſe, 1. That if the bottom be concave at the time of inſpiration, it will burſt, and the like will happen if it be convex at the time of expiration. 2. A ſtrong breath will have the ſame effect even under the contrary circumſtances.

ANACLATICS, or Anaclastics, derived from ανα, and κλαω, *I break*; that part of optics which conſiders refracted light, and is the ſame with what we more uſually call dioptrics.

ANACLETERIA, formed of ανα, and καλεω, *I call*, in *Antiquity*, ſolemn feaſts celebrated in honour of kings and princes when they came of age, and took upon them the adminiſtration of the ſtate, and made a ſolemn declaration thereof to the people.

ANACLETICUM, in the *Ancient Art of War*, a particular blaſt of the trumpet, whereby the fearful and flying ſoldiers were rallied, and recalled to the combat.

ANACLETUS, or Cletus, or Anencletus, *i. e. irreprehenſible*, in *Biography*, a pope, reckoned by Roman Catholics the third; ſucceeded Linus as biſhop of the church of the Romans; and, according to Euſebius, (Hiſt. Eccl. lib. iii. c. 13. 15.) in the ſecond year of the reign of Titus, or in 79, A. D. and governed that church 12 years. This biſhop has been enrolled among the ſaints and martyrs, though there is no ſatisfactory evidence of his martyrdom. Dupin. Bower's lives of the Popes, vol. i. p. 13.

Anacletus was alſo the name of a competitor for the popedom againſt Innocent II. He was the grandſon of a circumciſed Jew, named Peter of Leon. When Innocent II. was acknowledged as ſucceſſor to the papal chair by the emperor Lotharius II. upon the death of Honorius II. in 1130, Roger, King of Sicily, did homage to Anacletus, who was for ſome time maſter of Rome. After the defeat of Roger, upon whom he had conferred the title of king of Naples and Sicily, he was obliged to yield to his more fortunate competitor. He died in 1138, and his memory has been reproached with ſcandalous vices. Dupin.

ANACLINOPALE, from, ανα, κλινω, *I recline*, and οπλον, *arms*, in *Antiquity*, a kind of wreſtling, wherein the champions threw themſelves voluntarily on the ground, and continued the combat by pinching, biting, ſcratching, and other methods of offence.

The anaclinopale ſtood contradiſtinguiſhed from the *orthopale*, wherein the champions were erect. In the anaclinopale, the weaker combatant ſometimes gained the victory.

ANACLITES, the denomination of thoſe Britons, who are placed by moſt of our antiquaries in that diſtrict of Berkſhire which is adjacent to Henley.

ANACLINTERIA, in *Antiquity*, a kind of pillows on the dining-bed, whereon the gueſts uſed to lean.

The ancient triclinary beds had four στιβαδες, one at the head, another at the feet, a third at the back, and a fourth at the breaſt. That on which the head lay was properly called by the Greeks, ανακλιντηρον, or ανακλιντρον; by the Romans *fulcrum*, ſometimes *pluteus*.

According to other writers, anaclinteria is more properly underſtood of the backs of chairs whereon we lean.

ANACOINOSIS, from ανα and κοινοω, *I communicate*, *communicatio*, a figure in *Rhetoric*, when we conſult the adverſary, or appeal to the judges what ought, or could have been done on ſuch an occaſion.

Such is that of Cicero, *Quæro, ſi te hodie domum tuam redeuntem, coacti homines et armati, non modo limine tecloque ædium tuarum, ſed primo aditu veſtibuloque prohibuerint, quid acturus fis?* Cicero pro Cecin.

ANACOLLEMA, formed of ανακολλαω, *conglutino*, in *Phyſic*, denotes a liniment or other medicine applied to the forehead, to ſtop or prevent defluxions of the eyes.

Anacollemata make a ſpecies of medicines called *frontalia*.

The qualities required are, to be drying, cooling, thickening, aſtringent, conglutinant, &c.

To the claſs of anacollema belong bran, manna, myrrh, *terra ſamia*, *acacia*, &c.

Junker deſcribes an *anacollema frontale* for ſtopping hæmorrhages at the noſe.

ANACOLUTHON, from ανακολουθος, *incoherent*, among *Ancient Grammarians*, denotes an incoherence, or a conſtruction which does not accord. This is uſually ſignified by the

the appellation of a figure which ought rather to be denominated an inaccuracy.

ANACONDA, in *Zoology*, a name given in the iſle of Ceylon (and adopted by ſome naturaliſts) to a very large and terrible ſnake, which, it is ſaid, often devours the unfortunate traveller alive, and is itſelf accounted excellent and delicious fare. This creature is deſcribed as a ſpecies of rattle-ſnake, but it is far more probable that it is not of that genus. It is generally believed that rattle-ſnakes are altogether peculiar to the American continent; nor is there any known ſpecies of rattle-ſnake that correſponds with the deſcription of this tremendous creature; the largeſt kinds ſcarcely exceeding four, five, or at moſt ſix feet in length.

Perhaps the ſnake in queſtion may be *boa conſtrictor* of Linnæus, which it is known ſometimes grows to the length of twenty or thirty feet, and is of ſuch prodigious ſtrength, that it is able to deſtroy almoſt any other animal. It is a ſpecies found in the Indian iſlands, and is eaten by the inhabitants.

ANACOPIA. See ABKHAS.

ANACREON, in *Biography*, a Greek lyric poet, was born at Teos, a ſea-port of Ionia, and flouriſhed during the reign of Polycrates, tyrant of Samos, at whoſe court he reſided, in the ſixth century before Chriſt. His fame was ſuch, that Hipparchus, the ſon of Piſiſtratus, as we are informed by Plato, (in Hipparcho) ſent a veſſel of 50 oars to bring him to Athens. After the death of Hipparchus he returned to Teos, and afterwards removed to Abdera, the place of his youthful reſidence, where he died at the age of 85 years. Report ſays, that his death was occaſioned by a grape-ſtone, which choaked him whilſt he was drinking new wine. He was a profeſſed voluptuary, and habituated to the unreſtrained gratifications of wine and love. He is cenſured even by Ovid for devoting his chief attention to Bacchus and Venus—

> "Quid, niſi cum multo Venerem confundere vino
> Præcipit lyrici Teia muſa Senis?"

His attachment to Cleobulus is recorded by Maximus Tyrius, (Orat. ii.) and the ardour of his paſſion for Bathyllus is mentioned by Horace. Epod. xiv. v. 9.

> "Non aliter Samio dicunt arſiſſe Bathyllo
> Anacreonta Teium,
> Qui perſæpe cava teſtudine flevit amorem."

Ælian (in his Var. Hiſt. lib. ix. c. 4.) has endeavoured to vindicate his character; but the charges againſt him are too well founded to admit of refutation. During his reſidence at Samos, Polycrates made him a preſent of 5 talents, equal to about 562*l.* ſterling. Unaccuſtomed to the poſſeſſion of ſuch a ſum, he could not enjoy his uſual repoſe, and he therefore haſtened to reſtore it to the generous donor, alleging, that while he had ſo great a charge in his cuſtody, he ſhould never be able to write or ſing again. The poems of Anacreon, that are extant, conſiſt chiefly of Bacchanalian ſongs, and love-ſonnets. They are moſtly compoſed in verſes of ſeven ſyllables, or rather of three and a half feet; ſpondees and iambics, and ſometimes anapeſts; and hence verſes in that meaſure are ſometimes called *Anacreontics*, or *Anacreontic verſes*. The odes of Anacreon abound in ſuavity, ſprightlineſs, and elegant fancy; they are ſweeter, ſays Scaliger, than Indian ſugar; and, according to Mad. Dacier, the chief beauty and excellence of Anacreon conſiſted in his imitations of nature, and in his following reaſon; ſo that he preſented to the mind no images that were not noble or natural. The odes of Anacreon, ſays Rapin, are flowers, beauties, and perpetual graces; it is familiar to him to write what is natural and to the life; and he poſſeſſed an air ſo delicate, eaſy, and graceful, that, among all the ancients, there is nothing comparable to his method, nor to the kind of writing which he purſued. He flows, adds this writer, ſoft and eaſy, diffuſing the joy and indolence of his mind through his verſe, and tuning his harp to the ſmooth and pleaſant temper of his ſoul. The character of his writings is juſtly given by the God of Love, directed to ſpeak by Mr. Cowley:

> "All thy verſe is ſofter far
> Than the downy feathers are,
> Of my wings, or of my arrows,
> Of my mother's doves and ſparrows;
> Graceful, cleanly, ſmooth, and round,
> All with Venus' girdle bound."

The authenticity of ſome of thoſe poems, which have been diſtinguiſhed by his name, has been ſuſpected, but they have been acknowledged by ancient writers; nor is it probable that imitations, compoſed at different times by different authors, ſhould invariably retain the ſame ſtyle and dialect. Of theſe odes we have had tranſlations and imitations in various languages. Of the original the beſt editions are thoſe of Barnes and Pauw; and the free verſions of Cowley are the moſt approved Engliſh imitations. The odes of Anacreon have been lately, in 1801, tranſlated into Engliſh verſe, with notes, by Thomas Moore, Eſq. 4to. Gen. Dict.

ANACRISIS, from ἀνὰ and κρίνω, *I judge*, among the *Ancient Greeks*, is uſed for a kind of trial or examination, which the archons, or chief magiſtrates of Athens, were to undergo before their admiſſion into that office. The anacriſis ſtands diſtinguiſhed from the *docimaſia*, which was a ſecond examination in the forum. The anacriſis was performed in the ſenate-houſe. The queſtions here propoſed to them were concerning their family, kindred, behaviour, eſtate, &c. Some maintain that all magiſtrates underwent the anacriſis.

ANACRISIS, in the *Civil Law*, denotes a ſearch or inquiry into the truth by examination of witneſſes.

ANACROSIS, in *Antiquity*, denotes a part of the Pythian ſong, wherein the combat of Apollo and Python is deſcribed.

The anacroſis was the firſt part, and contained the preparation to the fight.

ANACTON *pædon*, a feſtival held at Amphyſſa, the capital of Locris, in honour either of the Dioſcuri, or of the Curetes, or Cabiri, about which authors are not agreed.

ANACTORIA, now *Vonizza*, in *Ancient Geography*, a town of Acarnania, at the extremity of the peninſula, at the entrance of the gulf of Ambracia. Stephanus Byz. ſays, that it was founded by a colony of Corinthians. Auguſtus tranſported its inhabitants to Nicopolis.

ANACUIAS, in *Geography*, a people of America, in Brazil, on the borders of the country poſſeſſed by the Portugueſe, under the appellation of *Capitania de Seregippe*.

ANACYCLUS, *ſantolinoides* of Vaillant, and *cotula* of Tournefort, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs and order, of the natural order of *compoſitæ diſcoideæ*, and *corymbiferæ* of Juſſieu; its characters are, that the *calyx* is common, hemiſpherical, and imbricate, with many ovate, flat ſharp ſcales; the *corolla* is compound and radiate, with numerous hermaphrodite corollets in the diſk, from five to ten females in the ray, ſcarcely higher than the diſk; hermaphrodites funnel-ſhaped, with a quinquefid, ſpreading

ſpreading border; females with a flatted tube, and an ovate entire border; the *ſtamina* in the hermaphrodites; filaments five, capillary, and very ſhort; anther cylindric; *piſtillum* a germ flatted, ſtigma bifid, in the hermaphrodites, with a membrane on each ſide, ſtyle, filiform, of the length of the corollet, and two ſlender reflex ſtigmas in the floſcules; no *pericarpium*, calyx unchanged; *ſeed* in the hermaphrodites ſolitary, oblong, compreſſed, naked, or without down; in the females with a very broad, membranaceous wing on each ſide, and emarginate at top, but without down; the *receptacle* chaffy, chaffs obtuſe with a point. There are four ſpecies. 1. A. *creticus*, cotula cretica, &c. of Tournefort, ſantoniloides annua, &c. of Vaillant, trailing anacyclus, "with leaves decompound, linear, and folioles divided and flat." 2. A. *orientalis*, chamœmelum orientale, &c. of Tournefort, eaſtern a. "with leaves compound, briſtly, acute, and ſtraight." Theſe two ſpecies grow naturally in the iſlands of the Archipelago, from whence their ſeeds were ſent by Tournefort to the Royal Garden at Paris: their ſeeds have been alſo received from Portugal. They are low plants, with branches trailing on the ground. The firſt ſort has fine-cut leaves, like thoſe of chamomile; the flowers are ſmall, white, and grow ſingle, with their head declining, like thoſe of the common May-weed. The ſecond has leaves like thoſe of the ox-eye; the flowers are white, and like thoſe of chamomile. 3. A. *aureus*, chamœmelum luteum capite aphyllo of Bauhin, anthemis chryſanthemum of Lob. golden-flowered a. "with leaves bipinnate, roundiſh, hoary, and hollow-dotted." This ſpecies is a native of the ſouth of Europe and the Levant, and was cultivated here in 1570. 4. A. *valentinus*, chryſanthemum valentinum of Cluſius, buphthalmum lanuginoſum, foliis millefolii of Bauhin, chamœmelum tenuifolium, flore bulbato aureo of Barr. "with leaves decompound and linear, folioles divided, roundiſh, and acute; the flowers floſculoſe." This grows a foot and a half high, ſending out many ſide-branches; the leaves are finely divided and hairy; the flowers are ſingle at the end of the branches, and are of a bright yellow colour, with a ſilvery, ſcaly calyx; they are as large as thoſe of the ox-eye. It is a native of Spain and Italy; cultivated in 1656 by Tradeſcant; flowering in June and July.

Culture.—All theſe plants are annual; the ſeeds ſhould be ſown early in the Spring, in a border of light earth, where they are deſigned to remain, and need no other care that to be thinned and kept free from weeds; they flower in July and Auguſt, and their ſeeds ripen in September. Martyn's Miller.

ANADARA, in *Conchology*, a name by which ſome naturaliſts have diſtinguiſhed the ſpecies of ARCA, called *antiqua* by Linnæus. Adanſ. Seneg.

ANADAVADÆA, in *Ornithology*, the name of a ſmall bird of the Eaſt Indies, which has the beak of a chaffinch, and the feet of the lark. It is ſometimes brought over to England alive in cages, and will live here very comfortably.

ANADEMA, formed of αναδεισμαι, *to be bound round*, among the *Ancients*, denotes an ornament of the head, wherewith victors at the ſacred games had their temples bound.

Some confound the *anadema* with the *diadema*, worn by the ancient Perſian kings.

Anademata are alſo mentioned by ancient writers among the ornaments of the heads of women.

According to ſome, αναδεμα, anſwers to what the Latins call *redimiculum*.

ANADIPLOSIS, αναδιπλωσις, from ανα, *again*, and διπλοω, *I double*, in *Rhetoric* and *Poetry*, denotes a repetition of the laſt word of the former verſe or member in the beginning of the next; *e. gr.*

"Addit ſe ſociam timidiſque ſupervenit Ægle.
Ægle Naïadum pulcherrima———
———ſequitur pulcherrimus Aſtur,
Aſtur equo fidens———————."

"If children, then heirs, heirs of God, and joint heirs with Chriſt."

ANADIPLOSIS, in *Medicine*, denotes the redoubling or return of the paroxyſm of a fever, chiefly of a ſemitertian.

This is otherwiſe called *epanalepſis* and *epanadiploſis*.

ANADOSIS, from ανα and διδωμι, *I give*, in the *Ancient Medicine*, denotes the diſtribution of the aliment by the veſſels of the body.

In this ſenſe, anadoſis makes a part of nutrition or DIGESTION.

ANADROMOUS, in *Ichthyography*, a term of diſtinction applied by ſome early naturaliſts to thoſe migratory fiſhes that have their ſtated times of going from the freſh-water to the ſalt, and afterwards returning back to the freſh water again.

The word is derived from ανα, *back again*, and δρομος, a *courſe*. Many of the *ſalmo* genus are of this kind, and particularly *ſalar*, or the common ſalmon, whoſe periodical returns from the ſea to depoſit its ſpawn in freſh-waters is well known. The method nature has appointed for their courſe of changes ſeems to be this: they are firſt produced from the ſpawn in freſh-water rivers; they live there till they acquire ſome ſtrength and ſize, and then ſeek the ſalt-water to feed more at large in, and grow to their full extent; at which period they return to the freſh-water again to lay their ſpawn, that the young brood may have the ſame advantages which they had before, of being placed in freſh-water. Some uſe the word *catanadromi* in the ſame ſenſe.

ANADUOMENE *Venus*, in the *Grecian Mythology*, anſwered to the *Sea-Venus* in the Roman, and was the appellation given to one of the chief deities of the ſea. The moſt celebrated picture in all antiquity was that of this goddeſs by Apelles; and the famous Venus of Medici is a *Sea Venus*.

ANADYR, in *Geography*, a river of Siberia, that riſes in the country of the Tchuktchi, out of a lake (N. lat. 68° 20′. E. long. 179° 14′) among the frontier mountains which are a continuation of Stanovoi-Krebet, and diſcharges itſelf into that part of the Eaſtern or Pacific Ocean, which is called the *Sea of Anadyr*, Anadyrſkaian gulf, or bay of Anadyr. N. lat. 65°. E. long. 177° 34′. This river receives many ſtreams, beſides the brook Yablona, which gives the name of Yablonoi-Krebet to the range of mountains where it ſprings, but none of them are very large. Its bed is in general ſandy, and its current by no means rapid; its channel is very broad, and contains a conſiderable number of iſlets, but of ſo little depth, that it can ſcarcely be croſſed in any part with the common ferry-boats of that country, called ſhitiki, which are ſewed together, have no iron in their conſtruction, and draw no more than two feet of water. From the ſource of the Anadyr to the brook Yablona, the country is mountainous and bare; below the Yablona are ſome ſtripes of meadow-land and ſome poplar-trees; and on the mountains to the left, for at leaſt 100 verſts above Anadyrſkoi-oſtrog, are thin woods of larch trees and dwarfiſh Siberian cedars. The whole of the northern region, as far as the Anadyr, is in general deſtitute of ſtandard trees, and has ſcarcely any pieces fit for paſture;

whereas, ſouth of the river, at no great diſtance, eſpecially about the head of the main, the Penſhina, and the Aklan, are foreſts of tall timber in abundance. From the Anadyr to the Kolyma and the Frozen Ocean, and throughout the whole country of the Tchuktchi, no more foreſt has been diſcovered; the meadow ſhrubs ſcarcely ſhoot above a ſpan high, as in the whole tract along the northern coaſt of Siberia. But ſo much the more frequent are the flats, overgrown with yellow and white moſs, on which innumerable herds of wild rein-deer find paſture. Tooke's View of the Ruſſian Empire, vol. i. p 229.

ANADYSKAIA GULF, a bay of the Pacific Ocean, on the coaſt of Siberia, extending from Cape Apoſtola Thadæa, E. long. 178° 14'. N. lat. 63°, to the bay of Saint Lawrence, E. long. 187° 14'. N. lat. 65°.

ANADYRSKOI, a fortified town of Siberia, on the river Anadyr. E. long. 165° 14'. N. lat. 66°.

ANADYSIS, among *Ancient Divines*, denotes the ceremony of the emerſion in BAPTISM.

In which ſenſe ἀναδυσις ſtands contradiſtinguiſhed from κατάδυσις, or *immerſion*.

ANÆA, in *Ancient Geography*, a town placed by Stephan. Byz. in Caria, oppoſite to the iſle of Samos, which took its name from one of the Amazons who was buried there; and which was the birth-place of Menelas, a peripatetic philoſopher and celebrated hiſterian.

ANADÆIA, in *Antiquity*, a denomination given to a ſilver ſtool placed in the aræopagus, on which the defendant or perſon accuſed was ſeated for examination.

The word is ἀναιδεια, which imports *impudence*; but according to Junius's correction, it ſhould rather be ἀναιτια q. d. *innocence*.

The plantiff or accuſer was placed on an oppoſite ſtool, called *hybris*, or *injury*; here he propoſed three queſtions to the party accuſed; to which poſitive anſwers were to be given. The firſt, are you guilty of this fact? The ſecond, how did you commit the fact? The third, who were your accomplices?

ANAERETA, in *Aſtrology*, a place in the heavens, at which the *apheta* arriving, an infant born at that time, is pronounced by aſtrologers in danger of death.

The word is Greek, and literally imports a *cutter off*.

In this ſenſe, *anaereta* ſtands oppoſed to *apheta*.

ANAERETA, among the Greek *Aſtrologers*, amounts to the ſame with what the Arabs call *ahazin*.

ANAESTHESIA, ἀναισθησια, in *Medicine*, a privation of ſenſe, or of the faculty of perceiving external objects. The ſpecies or degrees of this are *ſtupor*, *hebetudo*, *depravatio*, &c. The ſenſe of feeling may be injured by any thing that obſtructs the nervous influence, or prevents its being regularly conveyed to the organs of touch, as preſſure, extreme cold, &c. It may likewiſe be impaired by too great a degree of ſenſibility, when the nerve is not ſufficiently covered by the cuticle or ſcarf-ſkin, or where there is too great a tenſion of it, or it is too delicate. Whatever diſorders the functions of the brain and nerves hurts the ſenſe of touching; and hence it ſeems to proceed from the ſame general cauſes, as palſy and apoplexy, and requires a ſimilar treatment. In a *ſtupor*, or defect of touching, which ariſes from an obſtruction of the cutaneous nerves, the patient muſt be firſt purged, and then recourſe ſhould be had to ſuch medicines as excite the action of the nerves, or ſtimulate the ſyſtem. For this purpoſe the ſpirit of hartſhorn, either by itſelf or combined with eſſential oils, horſe-radiſh, &c. may be taken inwardly; and the diſordered parts may, at the ſame time, be frequently rubbed with freſh nettles, or ſpirit of ſal-ammoniac. Bliſters and ſinapiſms applied to the benumbed parts will likewiſe be of uſe; and alſo warm bathing, eſpecially in the natural hot-baths.

ANÆTHETUS, in *Ornithology*, a name which has been ſometimes given to a ſpecies of tern found in Jamaica, and deſcribed by Brown. This is STERNA SOLIDA of Linnæus, which ſee.

ANAFA, or DAR BEYDA, in *Geography*, a town of Africa, on the weſtern coaſt of Morocco, ſituate in one of the moſt beautiful parts of the kingdom, formerly poſſeſſed by the Portugueſe, and populous, but now a heap of ruins; 30 miles ſouth-ſouth-weſt of Sallee.

ANAGADA, an iſland in the Weſt Indies, ſo low as to be almoſt covered with high tides. N. lat. 18° 38'. W. long. 64° 18'.

ANAGALLIDASTRUM, in *Botany*. See CENTUNCULUS.

ANAGALLIS, derived from αναγελαω, *to laugh*, becauſe, as it is ſaid, by curing the ſpleen it diſpoſes perſons to be chearful, a genus of the *pentandria monogynia* claſs and order, of the natural order of *rotaceæ*, and *lyſimachiæ* of Juſſieu. Its characters are, that the *calyx* is a perianthium five-parted, ſharp, and permanent, and diviſions keeled; the *corolla* is wheel-ſhaped, border five-parted, diviſions ovate-orbiculate, with the claws connected; the *ſtamina* have erect filaments, ſhorter than the corolla, ſhaggy below, anthers ſimple; the *piſtillum* is a globoſe germ, ſtyle filiform, ſlightly bending, and ſtigma capitate; the *pericarpium* is a globoſe, one-celled capſule, opening tranſverſely; the *ſeeds* are very many and angular; the *receptacle* globoſe, very large, (fungoſe, alveolate, and free, G.) Martyn enumerates 7, Willdenow 6, and Gmelin 8 ſpecies. 1. A. *arvenſis*, A. flore phœniceo of Ray, and A. mas of Ger. common or ſcarlet pimpernel, with leaves undivided, ſtem procumbent, and corolla finely notched; or with ſtem procumbent, leaves ovate-lanceolate, and ſegments of the calyx ſerrated; or, according to Dr. Smith, with leaves ovate, punctated underneath, and ſtem procumbent. Dr. Smith reckons three varieties, *viz.* β. A. phœnicea, foliis amplioribus ex adverſo quaternis of Ray; γ. A. fœmina of Ray and Ger. A. cerulea of Abbot, blue pimpernel; and δ. A. terreſtris flore albo of Ray. The root is ſmall; the ſtem procumbent, very branching at the baſe, tetragonous, ſmooth, and foliоſe; the leaves oppoſite, (thoſe of β in a rich ſoil being four) ſeſſile, ovate, entire, ſmooth, and underneath dotted with purple; the peduncles axillary, ſolitary, one-flowered, longer than the leaves; the laciniæ of the calyx lanceolate, acuminate, membranaceous at the margin; the corolla deeply quinquefid, minutely ciliated, moſtly ſcarlet, with a violet mouth; the ſtamina hairy and violet; the anthers yellow; the ſtigma obtuſe and crenated; the capſule globoſe and diaphanous, (marked with five lines as if the ſeams of ſo many valves, but always ſeparating tranſverſely into two parts, Withering); the ſeeds angular, and heaped together; the flowers in the variety γ are blue, but Dr. Smith has perceived ſcarcely any other difference. Dr. Withering obſerves, that every part of this plant is ſingularly beautiful; and will amply repay the trouble of a minute examination. It is an annual plant, frequent in ploughed grounds and gardens, particularly in ſandy ſoils, and flowers in June and July. The variety γ, female or blue pimpernel, grows wild in Sweden, Germany, and Swiſſerland, and is found between Stockwell and Camberwell, near London, near Mitcham in Surry, and Hiſton in Cambridgeſhire, on Bredon-hill, in a corn-field at the top of Overbury-wood in Worceſterſhire, at Dawliſh in Devonſhire.

ſhire, and between Bath and Bradford. Ray, Linnæus, and others, take the blue pimpernel to be only a variety of the red. Haller, after Blair and Boehmer, and followed by Allioni and Gmelin, conſiders it as a diſtinct ſpecies; obſerving, that it is a taller plant, with ſmaller leaves and larger flowers; that the capſule is more ovate, but the diviſions of the calyx are narrower, and the petals ſerrate about the edge. Haller mentions a blue ſort, with three and four leaves together. The variety β has been found in Cowley field. The bloſſoms of the male or common pimpernel open about eight in the morning, and cloſe in the afternoon; and from this circumſtance it is denominated the *ſhepherd's*, or *poor man's weather-glaſs*. But with rain, or much moiſture in the air, the flowers either do not open, or cloſe up again. Small birds are very fond of the ſeeds; ſwine and goats feed on it, but ſheep are ſaid (in the Amœn. Acad.) to refuſe it, whereas Schreber ſays, that ſheep eat it readily. It was formerly celebrated for its medical qualities, and given in maniacal caſes, and in the hydrophobia. It is now fallen into diſuſe, though Lewis obſerves, that it is not wholly deſtitute of medicinal powers; as the expreſſed juice of the leaves, on being depurated by ſettling, and then inſpiſſated to the conſiſtence of an extract, affects the organs of taſte with a pungent ſaline auſterity; and therefore theſe herbs have ſome claim to the reſolvent and detergent virtues aſcribed to them by ſome writers, though neither a decoction, nor tincture of them, nor their juice in its dilute ſtate, and much leſs their diſtilled water, can exert thoſe virtues in any conſiderable degree. Murray has cited ſeveral caſes, adduced by Gelin, which favour the efficacy of the anagallis as an antidote to the bite of mad animals. It has alſo been recommended as affording relief in cancerous complaints. 2. A. *monelli*, upright pimpernel, with leaves undivided, and erect ſtem. This is a very beautiful, ſmall plant, and produces a great number of fine blue flowers in April and May. It is a native of Verona, and cultivated in 1648 in the Oxford garden. 3. A. *latifolia*, broad-leaved P. with leaves heart-ſhaped, ſtem-claſping, and ſtem compreſſed. This is nearly allied to the firſt ſpecies, but diſtinguiſhed by its large broad leaves and compreſſed ſtem. It was ſent to Mr. Miller in 1759 from Spain, and is a trailing annual plant. 4. A. *linifolia*, flax-leaved P. with leaves linear, and ſtem erect. A native of Spain and Portugal. 5. A. *tenella*, lyſimachia tenella of Sp. Pl. Hudſon, Miller, and Dickſon; nummularia minor, flore purpuraſcente of Ray, Gerard, and Parkinſon, bog P. or purple-flowered looſe-ſtrife, or money-wort, with leaves ovate and ſharpiſh, and creeping ſtem. This has the habits of lyſimachia, the corolla almoſt of centunculus, but the ſtamina and fruit of the anagallus. It is not uncommon on wet heaths and turfy bogs in France, Italy, and England, in Suffolk and Staffordſhire, is perennial, and flowers in July and Auguſt. 6. A. *verticillata*, verticilled P. with ſtem-leaves verticilled, and ſtem erect. 7. A. *pumila*, dwarf P. with ſtem erect, and leaves roundiſh, acute and ſeſſile. It is annual and a native of Jamaica in the high mountains and marſhes.

Culture.— The four firſt ſorts being annual, are propagated from ſeeds which ſhould be ſoon ſown after they are ripe. The firſt, though beautiful, is a common weed, and never cultivated except in botanic gardens. The ſecond, third, and fourth require being ſheltered from extreme cold. The fifth is a bog-plant, and cannot be cultivated in gardens, but will flouriſh well enough in pots of bog-earth plunged in water. The ſixth, if it be a diſtinct ſpecies, has not yet been cultivated with us. Martyn's Miller. Smith's Flor. Brit. Willdenow. Gmelin's Linn.

ANAGALLIS. See CENTUNCULUS, EVOLVULUS, LYSIMACHIA, and PÆDEROTA.

ANAGALLIS *Aquatica*. See GRATIOLA, MONTIA, PEPLIS, SAMOLUS, and VERONICA.

ANAGALLIS *Cærulea*. See GRATIOLA.

ANAGLYPHA, in *Ancient Writers*, denote veſſels, or other things adorned with ſculpture in *baſſo relievo*; and hence the *anaglyphic* art is the art of carving, chaſing, engraving, or imboſſing plate.

ANAGLYPHICE, or ANAGLYPTICE, denotes that ſpecies of ſculpture wherein the ſtrokes or figures are prominent, or imboſſed; and is contradiſtinguiſhed from *diaglyphice*, where the ſtrokes are in lented.

The word comes from the Greek ανα̃γλυφω, *exſculpo*.

ANAGNIA, in *Ancient Geography*, a town of Italy, in Latium, ſouth eaſt of Præneſte, the capital of the Hernici; diſtinguiſhed among the ancients by the appellation of rich, noble, and illuſtrious. It ſubmitted, after a feeble reſiſtance, to the Romans, and obtained the freedom of the city. It was afterward by Druſus Cæſar walled round, and its territory aſſigned to the veterans. It is now *Anagni*, about thirty-ſix miles eaſt from Rome. N. lat. 42° 48'. E. long. 13° 45'.

ANAGNOSES, or ANAGNOSMATA, from ανα̃ and γινωσκω, *I know*, in the *Greek Church*, denotes an eccleſiaſtical book, containing the leſſons read at divine ſervice in the ſeveral feaſts, &c. of the year.

ANAGNOSTA, or ANAGNOSTES, among the *Ancients*, denotes a kind of ſervant retained in the families of perſons of rank to read to them at meals.

Theſe are called by the Greeks ανα̃γνωσται, and by the Romans lectores; ſometimes alſo a ſtudiis.

Even private families who lived in any degree politely, were not without this kind of literary ſervants. Servius makes mention of a female agnoſta, under the denomination of lectrix. Sometimes the maſter himſelf performed the office of reader. The emperor Severus himſelf read at table. Martial mentions one Ligurinus, who read his own poems at dinner to the great diſguſt of the gueſts.

Among the Greeks there were alſo anagnoſtæ in their theatres for public reading of the poets.

Some ſpeak of the anagnoſtæ as a ſpecies of acroamata, from which, however, in propriety, they differed.

Cornelius Nepos relates of Atticus, that no acroama was ever heard at his meals, but an anagnoſtes. He never ſupped without reading, ſo that the minds of his gueſts were no leſs agreeably entertained than their appetites. The ſame cuſtom, Eginhard obſerves, was kept up by Charlemagne, who at table had the hiſtories and acts of ancient kings read to him. This cuſtom ſeems to have been a relique of that of the ancient Greeks, who had the praiſes of great men and heroes ſung to them, while at table. The ancient monks and clergy kept up the like uſage, as we are informed by St. Auguſtin. Sidonius praiſes a man of quality in his time, who, in this reſpect, lived a clerical life, though he was no prieſt.

Bilbergius, and Th. Raynaud, have diſſertations expreſs on anagnoſtæ.

ANAGNOTSA, JOHN, in *Biography*, a Byzantine hiſtorian, flouriſhed in the reign of the emperor John Palæologus, and was preſent in Theſſalonica in the year 1430, when that city was beſieged by Sultan Morad, and reduced under the Turkiſh yoke. As he relates events that occurred two or three years after that ſiege, he muſt have lived at leaſt to the year 1433. His work "De rebus Conſtantinopolitanorum Macedonicis," records the particulars of the ſiege of Theſſalonica and its ſurrender to the Turks. This hiſtory was publiſhed in Greek, with a Latin tranſlation, by Allatius in 8vo, at Cologne. A. D. 1653.

ANAGNOSTIC, in *Middle Age Writers*, is ſometimes uſed for an epiſtle, or other writing.

ANAGOGIA, in *Antiquity*, ſolemn ſacrifices to Venus at Eryx, in Sicily, where ſhe was honoured with a magnificent temple.

The name of this ſolemnity was derived, απο τ αναγεσθαι, i. e. *from returning*; becauſe the goddeſs was ſaid to leave Sicily, and return to Africa at that time.

ANAGOGICAL, *tranſporting*, ſomething that raiſes the mind to things eternal and divine; the great objects of the next life.

The word is derived from αναγωγα, *carrying away*, which is formed of the prepoſition ανα, *upwards*, and αγω, *leading*.

The term is principally uſed in ſpeaking of the divers ſenſes of Scripture.—The *literal* ſenſe is the firſt, and natural ſenſe; the *myſtical* ſenſe is founded on the natural ſenſe, from whence it is taken by analogy or compariſon, by ſimilitude or reſemblance of one thing to another; and is divided into ſeveral kinds.

Where it regards the church, and matters of religion, it is called the *allegorical* ſenſe. Where it regards our morals, it is called the *tropological* ſenſe; and where it regards eternity, or the life to come, it is called the *anagogical* ſenſe.

ANAGOGY, ANAGOGE, a rapture or elevation of the ſoul, to things celeſtial and eternal.

Anagogy, in a more particular ſenſe, denotes the application of types and allegories of the Old Teſtament to ſubjects of the New; thus called, becauſe the veil being here drawn, what before was hidden is expoſed to open ſight. Some of the fathers place αναγωγη in oppoſition to ιστορια, *hiſtory*.

ANAGOGY, in *Medicine*, denotes a return of humours, or the rejection of matter upwards, or by the mouth.

Anagogy amounts to the ſame with what is otherwiſe called *anabol*.

ANAGOGY, αναγωγια, in *Ancient Hiſtory*, denotes a looſe education or diſcipline.

ANAGOMBRI, in *Ancient Geography*, mountains of Africa, placed by Ptolemy in Marmarica. M. d'Anville places them weſt of the temple of Ammon.

ANAGRAM, ANAGRAMMA, formed from ανα, *backwards*, and γραμμα, *letter*, a tranſpoſal of the letters of a name, with a combination thereof in ſome new manner, ſo as to exhibit one or more words, either to the advantage or diſadvantage of the perſon to whom it belongs.

Thus the anagram of Galenus is *angelus*; that of Logica, *caligo*; that of Alſtedius, *ſedulitas*; that of Sir Edmundbury Godfry, *I find murdered by rogues; or, by Rome's rude finger die*; that of Loraine, is *alerion*, on which account it was, that the family of Loraine took *alerions* for their armoury.—Calvin, in the title of his Inſtitutions, printed at Straſburgh in 1539, calls himſelf *Alcuinus*, which is the anagram of Calvinus, and the name of an eminently learned perſon in the time of Charlemagne, who contributed greatly to the reſtoration of learning in that age. Barclay, in his Argenis, anagrammatizes Calvinus by a leſs creditable name *Uſinulca*; and Rabelais, to be revenged of the ſame Calvin, who had made an anagram of his name, found in that of Calvin, *Jan. Cal.*

Such as keep cloſe to the definition of anagram take the liberty to omit or retain the letter H, and that letter only; but ſuch as ſtand up for the poetical licence, make bold ſometimes to uſe E for Æ, V for W, S for Z, and C for K; and *vice verſa*.

This way of writing was ſcarcely known among the ancients: Daurat, a French poet in the reign of Charles IX. is uſually ſaid to be the firſt that broached it; yet Lycophron, who wrote under Ptolemy Philadelphus, about 280 years before Chriſt, appears to have been no ſtranger to the art of making anagrams. Canterus, in his *Prolegomena* to Lycophron, gives us two of his pieces in this kind; the firſt on the name of king Ptolemy, Πτολεμαιος, in which he found απο μελιτος, *of honey*; to inſinuate the ſweetneſs and mildneſs of that prince; the ſecond was on queen Arſinoe, Αρσινοη, of whom he made Ιον Ηρας, *Juno's violet*.

There are two ways of making anagrams: for, 1. Some only conſiſt in dividing a ſingle word into ſeveral: thus the ænigma of the God Terminus, mentioned by Aulus Gellius, lib. xii. cap. 6. is founded on the anagram TER MINUS; and thus *fuſtincamus* yields *fus tinea mus*. This kind alone ſeems to have been uſed among the Romans.

The ſecond is, where the order and ſituation of the letters are changed; ſuch are thoſe above mentioned; and alſo theſe, *Roma, Maro, Amor; Julius, Livius; Corpus, Porcus, Procus, Spurco*.

To find all the anagrams any name will admit of, *algebraically*, ſee COMBINATION.

The fineſt and happieſt of all the anagrams extant, is that on the queſtion put by Pilate to Jeſus Chriſt; *Quid eſt veritas?* which anagrammatically makes *Eſt vir qui adeſt*: the anagram here is the beſt and juſteſt anſwer that could poſſibly be given.

Beſides the ancient kind of anagrams, there have been new ones invented: as, the mathematical anagram, invented in 1680, by which the abbot Catelan found, that the letters of the name Lewis XIV. made *vrai heros*, i. e. *true hero*.

We are now likewiſe furniſhed with the numerical anagram, more properly called *chronogram*; where the numerical letters (i. e. ſuch as in the Roman cyphering ſtood for numbers) taken together, according to their numerical values, expreſs ſome epocha: of which kind is that diſtich of Godart on the birth of Lewis XIV. in the year 1638, on a day wherein there was a conjunction of the eagle with the lion's heart:

eXorIensDeLphInaqVILæCorDIſqVeLeonIs
CongreſsVgaLLoſpeLætItIaqVerefeCIt.

ANAGRAMMATIST, a maker or compoſer of anagrams; Thomas Billon, a Provençal, was a celebrated anagrammatiſt, and retained by Lewis XIII. with a penſion of 1200 livres, in quality of anagrammatiſt to the king.

Lipenius gives a long liſt of anagrammatiſts.

Thomas Billon has given a ſet of prophecies in anagrams; Gul. Blancus, the art of compoſing anagrams.

ANAGROS, or ANEGROS, a meaſure for corn uſed in ſome cities in Spain, containing ſomewhat more than the Paris *mine*.

Four *anegros* make a *cabi*, four *cabis* a *tanega*, and 46 anegros are equal to about $10\frac{1}{4}$ quarters of London.

ANAGYRIS, in *Botany*, a genus of the *decandria monogynia* claſs and order, and of the natural order of *papilionaceæ*, or *leguminoſæ*: its characters are, that the *calyx* is a bell-ſhaped perianthium, mouth five-toothed, the upper pair of teeth more deeply divided; the *corolla* papilionaceous, ſtandard obcordate, ſtraight, emarginate, broader than the other petals, twice as long as the calyx, wings ovate-oblong, flat, longer than the ſtandard, keel ſtraight and very long; the ſtamina have filaments parallel, diſtinct, riſing, anthers ſimple; the *piſtillum* is an oblong germ, the ſtyle ſimple and riſing, the ſtigma villoſe; the *pericarpium* an oblong, large, roundiſh, obtuſe legume, a little reflex; the *ſeeds* ſix or more, kidney-form. Obſ. The eſſential character conſiſts in the very ſhort, ſtraight ſtandard, and in the great length of

the keel. Martyn enumerates three ſpecies, which are hardy deciduous flowering ſhrubs. 1. A. *fœtida*, ſtinking bean trefoil, with leaves ovate and flowers axillary. This is the only ſpecies mentioned by Gmelin in his edition of the Linnæan Syſtem, and alſo by Willdenow. It grows wild in the South of France, Spain, Italy, and Sicily, and alſo about Smyrna. It riſes to the height of eight or ten feet, and produces its flowers in April and May; they are of a bright yellow colour, growing in ſpikes, ſomewhat like thoſe of the laburnum; the ſeeds are never perfected in this country, and therefore it is ſcarce in England: it was cultivated in 1570 by Mr. Hugh Morgan. 2. A. *cretica*, with leaves oblong, and racemes longer. This is a native of Candia, and ſome of the iſlands of the Archipelago, and is at preſent very rare in Engliſh gardens; it has longer leaves than the former, and flowers later in the Summer, ſo that it never produces ſeeds; and it is probably only a variety. 3. A. *inodora*, with leaves pinnate, calyxes inflated and coloured, legumes compreſſed and ſtraight, racemes terminating and oblong. This is equal to a middle ſized tree, with branches hanging down, and frequently ſcandent; leaves unequally pinnate, leaflets oblong, acuminate, ſmooth, and without ſmell; flower white; a native of the woods of Cochinchina. It is doubted whether Loureiro's anagyris fœtida, found wild near Canton, in China, be the ſame with our European one.

Culture.—Theſe plants may be propagated by laying down their tender branches in the Spring, tonguing them in the ſame manner as the layers of carnations, and watering them in dry weather. By this management the layers will take root by the following Spring, and ſhould be cut off from the old plants before they begin to put out their leaves, and planted in a warm ſituation.

If the plants are propagated from ſeeds, they will be much handſomer, and riſe to a greater height. For this purpoſe the ſeeds ſhould be ſown in a moderate hot-bed in the beginning of March, or in a border of good rich earth, in a well-ſheltered place, ſifting over them about half an inch of fine mould, and covering them with a common frame, in order to protect them in ſevere weather. When the ſeeds are good, the plants will appear in a month after the ſeeds are ſown; they ſhould then be inured by degrees to the open air, and removed into a ſheltered ſituation towards the end of May. With this view the ſeeds may be ſown in pots, and plunged in a hot-bed, becauſe the plants will not bear tranſplanting till the following Spring; and it will be proper, during the two firſt Winters, to ſhelter them under a common frame, the glaſſes of which may be drawn off every day in mild weather, that the plants may be thus prepared for being planted abroad, when they have acquired proper ſtrength. They ſhould be kept in pots for three years, and they will then be fit for removal to the places where they are to remain; the beſt time for which is about the beginning of April, juſt before they begin to put out new leaves. At this time they ſhould be turned out of the pots with good balls of earth to their roots; and ſome of them may be planted againſt walls with warm aſpects, ſo as to be ſecure from the froſt; and others in warm ſituations, where by covering the ſurface of the ground about their roots with tanners bark in ſevere winters, and ſcreening their heads with mats, they may be preſerved for ſeveral years. In the fourth year from ſowing theſe plants will begin to produce their flowers, and will continue flowering every year; and they will be proper for intermixing with other flowering ſhrubs of the ſame growth in warm ſituations. Martyn's Miller.

ANAGYRIS. See CYTISUS LABURNUM.

ANAGYRIS, or ANAGYRUS, in *Ancient Geography*, a diſtrict of Attica, in the tribe of Erechtheis, between Phalereus and the promontory of Sunium, to the eaſt of Æxona. Some derive the name from a hero called Anagyrus, who overthrew the houſes in this diſtrict, becauſe the inhabitants had deſtroyed a chapel that had been dedicated to him. Others ſay, that its appellation was derived from the fœtid plant called Anagyris, which grew here, and which had the property of yielding a ſtronger ſmell the more it was handled; and hence aroſe the proverb, *Commovere Anagyrin*, or *Anagyrum*, to bring a misfortune upon one's ſelf.

ANAHARATH, a town of Judæa, in the tribe of Iſſachar. Joſh. xix. 19.

ANAITICA, a diſtrict of Aſia in Armenia, ſituate upon the Euphrates. It is ſaid to have derived its name from the goddeſs *Anaitis*, to whom the Armenians rendered peculiar worſhip. The Anaitic lake, mentioned by Pliny, was ſituated near this place, of which he ſays, that the beſt reeds that were uſed in writing grew upon its banks.

ANAITIS, called alſo TANAIS, in *Ancient Mythology*, a goodeſs held in great veneration by the Armenians. Strabo (lib. xi. tom. 2. p. 805.) ſays, that the Armenians principally worſhipped this goddeſs, and that the moſt illuſtrious perſons of the nation dedicated their virgin daughters to her, who, after having been for a long time proſtituted in her ſervice, were given in marriage; none diſdaining to marry them, but rather thinking it an honour to be thus allied to them. Pliny (lib. xxxiii.) informs us, that when the temple of this goddeſs at Aciliſene was plundered by the Romans, under Marc Antony, her ſtatue of maſſy gold was carried off, and broken to pieces. A report prevailed, that the firſt man who preſumed to touch the goddeſs, was ſtruck with an apoplexy, and inſtantly fell down dead. Auguſtus, being at Bologna a long time after this event, and ſupping with an old ſoldier who had ſhared the plunder, queſtioned him concerning the truth of the fact, and the ſoldier replied, "Cæſar, it is the goddeſs Anaitis's leg you are now eating for ſupper, and all I have in the world I owe to her."

ANAK, in *Scripture Hiſtory*, the father of the Anakims, was the ſon of Arba, who gave his name to Kirjath-Arba, of Hebron. Joſh. xiv. 15. Anak had three ſons (Joſh. xv. 14.) Shiſhai, Ahiman, and Talmai, who, as well as their father, were deemed giants; and they with their poſterity were denominated Anakims, and reputed as a fierce and warlike people, and alſo of extraordinary ſtature. To this purpoſe the Hebrews, who were ſent to view the land of Canaan, returned with a report, that they found there the giants, the ſons of Anak, in compariſon of whom they were both, in their own ſight, and alſo in that of the Anakims, as graſhoppers. Numb. xiii. 33. When the city of Arba, the father of Anak, was aſſigned to Caleb, in the diſtribution of Canaan, he drove out the Anakims about A.M. 2559. Joſh. xv. 13—15.

ANALATIVA, in *Geography*, a ſmall iſland near the north-weſt point of the iſland of Ceylon.

ANALECTA, in *Antiquity*, the fragments, or offals of meat, which dropped from the table on the ground.

Analecta was alſo uſed for a ſervant appointed to gather up the offals of the tables.

In this ſenſe the word is ſometimes alſo written *analectes*. Satellius Quadratus, in the way of deriſion, adviſed Calviſius Sabinus, a man of great wealth, and much affectation of learning, but with little memory, and leſs genius, to keep *analectæ, ut grammaticos haberet analectas*; a phraſe which has occaſioned much diſpute among critics and antiquarians.

ANALECTA is likewiſe, in a literary ſenſe, uſed for a collection of ſmall pieces or compoſitions.

The word is formed of ἀναλέγω, *I gather*.

ANALEMMA,

ANALEMMA, in *Mathematics*, derived from ἀναλαμβάνω, of ἀνὰ, *rurſum*, *I take backward*, a planiſphere, or projection of the SPHERE, on the plane of the meridian, orthographically made, by perpendiculars from every point of that plane, the eye being ſuppoſed to be at an infinite diſtance, and in the eaſt or weſt point of the horizon. In this projection, the ſolſtitial colure, and all its parallels, are projected into concentric circles, equal to the real circles of the ſphere; and all circles whoſe planes paſs through the eye, as the horizon and its parallels, are projected into right lines equal to their diameters; but all oblique circles are projected into ellipſes, having the diameter of the circle for the tranſverſe axis reſpectively.

The analemma was invented by John de Royas, a Spaniard. The advantages of this above the aſtrolabes of Ptolemy and Gemma Friſius, are, that all the lines proceeding from the eye are parallel to each other, and perpendicular to the plane of projection; conſequently not only the equator is a right line, as in the aſtrolabe of Gemma Friſius, but all the parallels to the equator are ſo too; ſince, in virtue of the infinite diſtance of the eye, they are all in the ſame caſe, as if their plane paſſed through the eye: for the like reaſon, the horizon and its parallels are alſo right lines. On the other hand, whereas in the two former aſtrolabes the degrees of circles converted into right lines become very ſmall towards the centre, and large towards the circumference, they become here ſmall towards the circumference, and large towards the centre: ſo that their figures will be no leſs altered in this than in the others. Add, that moſt of the circles here degenerate into ellipſes, which are often difficult to deſcribe. See ORTHOGRAPHIC PROJECTION.

ANALEMMA is alſo uſed for a *gnomon* or *aſtrolabe*, conſiſting of the furniture of the ſame projection, drawn on a plate of braſs, or wood; with an horizon, or *curſor*, fitted to it.

Its uſe is for finding the time of the ſun's riſing and ſetting, the length of the longeſt day in any latitude, and the hour of the day. The analemma is alſo of conſiderable uſe among *Dialliſts*, for laying down the ſigns of the zodiac, with the length of the days, with other matters of furniture, upon dials.

The moſt accurate treatiſe on the analemma now extant, was written by Ptolemy, and printed at Rome in 1562, with a commentary by F. Commandine. Since that time many authors, as Aguilonius, Tacquet, Dechales, Witty, &c. have written on the ſame ſubject.

ANALEPSIS, the reſtoration of a body waſted by diſeaſe, by the uſe of a nutritious diet.

ANALEPSIS is alſo uſed for the method of hanging a broken or diſlocated member, eſpecially the hand, in a ſling. This operation to the arm is called *analepſis*; to the foot, *theſis*.

ANALEPTICS, derived of ἀναλαμβάνω, *I re-eſtabliſh*, in *Medicine*, reſtoratives; or remedies proper to reſtore the body, when waſted or emaciated, either by the continuance of a diſeaſe, or by want of food.

This term is ſometimes applied to ſtimulants, but more commonly to thoſe ſubſtances which ſupply a deficient nouriſhment. As a term, however, ſays Dr. Cullen (Mat. Med. vol. i. p. 165.) attended with ſome ambiguity, it ſhould not be employed at all.

ANALIS, a ſpecific name that occurs in ſeveral genera, both in the *Linnæan* and *Fabrician* arrangement of *Entomology*.

ANALIS, a ſpecies of SCARABÆUS. It is black, with three equal tubercles on the head: ends of the wing caſes ferruginous-brown. Fabricius. Inhabits India.

ANALIS, a ſpecies of COCCINELLA. It is black, red at the end, and without ſpots. Inhabits Europe. Fabricius.

ANALIS, a ſpecies of CHRYSOMELA. It is black, wing-caſes brown, outer margin teſtaceous. Inhabits Europe. Fabricius.

ANALIS, a ſpecies of CERAMBYX of Linnæus, and SAPERDA of Fabricius. Its colour is teſtaceous, ends of the ſhells and tail black. Inhabits Africa.

ANALIS, a ſpecies of CRYPTOCEPHALUS. The general colour is reddiſh-brown; antennæ, ſpot on the wing-caſes and tail black. Inhabits Tranquebar. Fabricius and Gmelin.

ANALIS, a ſpecies of STAPHYLINUS. It is ſhining black, except the antennæ, wing-caſes, tail, and legs, which are teſtaceous brown. Fabricius and Paykull.

ANALIS, a ſpecies of CIMEX. It is oblong, green, abdomen red, and black at the end. Inhabits India. Thunberg and Gmelin.

ANALIS, a ſpecies of PHRYGANEA. Wings brown, a white anal ſpot, nape of the head and neck covered with golden hair. Found in the north of Europe. Fabricius.

ANALIS, a ſpecies of SPHEX. The general colour is ſhining black, end of the abdomen ferruginous, wings white. Inhabits India. Fabricius.

ANALIS, a large ſpecies of VESPA. It is blackiſh, firſt and ſecond ſegment ferruginous at the baſe, ſixth ſegment entirely yellow. Found at the Cape of Good Hope. Fabricius.

ANALIS, a ſpecies of APIS. Thorax hairy, and aſh-coloured, abdomen bluiſh, and black at the end. Inhabits America. Fabricius.

ANALOGICAL *ſyllogiſm*. See SYLLOGISM.

ANALOGISM, in *Medicine*. See ANALOGY.

ANALOGISM, among *Logicians*, the arguing from the cauſe to the effect.

ANALOGISTA, among *Civil Law Writers*, a tutor who is not obliged to give an account of his conduct. Perſons dying ſometimes appointed friends to be tutors to their children, with this clauſe, that they ſhould be analogiſtæ. Some lawyers hold, that this did not exempt a tutor guilty of glaring miſmanagement from being called to an account, and puniſhed accordingly.

ANALOGIUM, in *Eccleſiaſtical Writers*, denotes an *ambo*, or reading-deſk.

ANALOGIUM is ſometimes alſo uſed for a *martyrology*, or *obituary* of a monaſtery.

ANALOGY, in *Philoſophy*, a term denoting a certain relation, proportion, or agreement, which ſeveral things bear to each other in ſome reſpects, though different in others.

The word is Greek, which the Latins uſually render by *comparatio*, and *proportionalitas*.

The ſchoolmen define analogy to be a reſemblance, joined with ſome diverſity: its foundation, according to them, is laid in the proportion of ſeveral things, conſidered as that proportion proceeds upon different conſiderations.

Thus, a ſound animal, a ſound food, and a ſound propoſition, agreeing in this, that they have a common denomination, but the reaſon or quality whereon the denomination is founded, different, are ſaid to have an analogy, or to be analogous. Accordingly, analagous things are defined to be ſuch as have a common name, but the thing immediately ſignified by that common name different, yet with ſome correſpondence or relation diſcernible therein.

Philoſophers uſually diſtinguiſh three kinds of analogy, *viz.* of *inequality*, where the reaſon of the common denomination is the ſame in nature, but not in degree or order: in which

which ſenſe animal is analogous to man and brute.—Of *attribution*; where, though the reaſon of the common name be the ſame, there is a difference in its habitude or reſpect thereto: in which ſenſe healthy is analogous both to a man and an exerciſe. Of *proportionality*; where, though the reaſons of the common name do really differ, yet they bear ſome proportion to each other. In this ſenſe, the gills of fiſhes are ſaid to be analogous to the lungs in terreſtrial animals; and thus the eye and the underſtanding are ſaid to bear an analogy to each other.

Reaſonings by analogy may ſerve to explain and illuſtrate, but not to prove any thing; and yet a great part of our philoſophizing has no better foundation.

From a few *data*, a few points known and allowed, we reaſon by analogy, and deduce a number of others. It is thus that moſt branches of knowledge are extended to their preſent dimenſions. There are but few things actually obſerved, few experiments made; and all the obſervations and experiments we have are only ſingular. Such an effect was found from ſuch an individual body, under ſuch and ſuch circumſtances. We infer, that what has been obſerved of one body under ſuch circumſtances, will, from the analogy and uniformity in the works of the Creator, equally hold in all other bodies of the ſame ſpecies under the like circumſtances. Thus, without having recourſe to experiment, we never heſitate to conclude, that the fruit of trees of the ſame ſpecies will have the ſame taſte and properties. This has many times drawn us into great errors; it continues every day to lead us into new ones, and may be ſaid to be the ſource of moſt of the miſtakes committed in purſuit of ſcience. But nevertheleſs, while mankind extend their thoughts toward unknown and inacceſſible objects, they have no other guide to direct their reſearches but the ſuppoſed correſpondence between the objects they are acquainted with, and thoſe which are the ſubjects of their inveſtigation.

The analogy betwen the three kingdoms of plants, animals and minerals, has been the ſource of a variety of diſcoveries, either real or imaginary: hence it is we have learnt, that ſtones vegetate; that plants breathe; that the ſap circulates in them; that generation is performed by eggs in the human kind; that the planets have their atmoſpheres, their inhabitants, their trees, their ſeas, &c. Indeed, if we will follow whither analogy, real or imaginary, will lead us, there is no end of ſcience.

As to divine and ſupernatural matters, it is aſſerted we know nothing of them but by analogy; that is, by the mediation and ſubſtitution of thoſe ideas we have of ourſelves and other natural beings. Our ideas of God himſelf ariſe from this ſpring; we have no direct and immediate perceptiono f him. The knowledge we have of the Supreme Being is only an obſervation of his works, and a reflection of the mind, which ſhews what power, wiſdom, &c. appear neceſſary to enable him to produce them. Having no proper ideas of his perfections, we give them the names of thoſe faculties of men, which we judge neceſſary.

It is natural to men (ſays Dr. Reid, in his Eſſays on the Intellectual Powers of Man, Eſſ. i. ch. iv. p. 52, &c.) to judge of things leſs known, by ſome ſimilitude they obſerve, or think they obſerve, between them, and things more familiar or better known. In many caſes we have no better way of judging; and where the things compared have really a great ſimilitude in their nature, when there is reaſon to think that they are ſubject to the ſame laws, there may be a conſiderable degree of probability in concluſions drawn from analogy. Thus, we may obſerve a very great ſimilitude between this earth which we inhabit, and the other planets. They all revolve round the ſun, as the earth does, although at different diſtances, and in different periods. They borrow all their light from the ſun, as the earth does. Several of them are known to revolve round their axes, and, by that means, muſt have a like ſucceſſion of day and night. Some of them have moons, that ſerve to give them light in the abſence of the ſun, as our moon does to us. They are all, in their motion, ſubject to the ſame law of gravitation as the earth is. From all this ſimilitude it is not unreaſonable to think, that thoſe planets may, like our earth, be the habitation of various orders of living creatures. There is ſome probability in this concluſion from analogy. In medicine, phyſicians muſt, for the moſt part, be directed in their preſcriptions by analogy. The conſtitution of one human body is ſo like to that of another, that it is reaſonable to think, that what is the cauſe of health or ſickneſs to one, may have the ſame effect upon another. And this generally is found true, though not without ſome exceptions. In politics, we reaſon, for the moſt part, from analogy. The conſtitution of human nature is ſo ſimilar in different ſocieties or commonwealths, that the cauſes of peace and war, of tranquillity and ſedition, of riches and poverty, of improvement and degeneracy, are much the ſame in all.

Analogical reaſoning, therefore, is not, in all caſes, to be rejected. It may afford a greater or a leſs degree of probability, according as the things compared are more or leſs ſimilar in their nature. But it ought to be obſerved, that as this kind of reaſoning can afford only probable evidence at leaſt, ſo unleſs great caution be uſed, we are apt to be led into error by it. For men are naturally diſpoſed to conceive a greater ſimilitude in things than there really is. E. G. Anatomiſts, in ancient ages, ſeldom diſſected human bodies; but very often the bodies of thoſe quadrupeds, whoſe internal ſtructure was thought to approach neareſt to that of the human body. Modern anatomiſts have diſcovered many miſtakes into which the ancients were led, by their conceiving a greater ſimilitude between the ſtructure of man and of ſome beaſt than there is in reality. By this, and many other inſtances that might be given, it appears, that concluſions built on analogy ſtand on a ſlippery foundation; and that we ought never to reſt upon evidence of this kind when we can have more direct evidence.

Analogical reaſoning may be of excellent uſe in anſwering objections againſt truths which have other evidence. It may likewiſe give a greater or a leſs degree of probability in caſes where we can find no other evidence. But all arguments, drawn from analogy, are ſtill the weaker, the greater diſparity there is between the things compared; and, therefore, muſt be the weakeſt of all when we compare body with mind, becauſe there are no two things in nature more unlike. There is no ſubject in which men have always been ſo prone to form their notions by analogies of this kind as in what relates to the mind. We form an early acquaintance with material things by means of our ſenſes, and are bred up in a conſtant familiarity with them. Hence we are apt to meaſure all things by them, and to aſcribe to things moſt remote from matter the qualities that belong to material things. It is for this reaſon that mankind have, in all ages, been ſo prone to conceive the mind itſelf to be ſome ſubtile kind of matter: that they have been diſpoſed to aſcribe human figure, and human organs, not only to angels, but even to the Deity. Though we are conſcious of the operations of our own minds when they are exerted, and are capable of attending to them ſo as to form a diſtinct notion of them; this is ſo difficult a work to men, whoſe attention is conſtantly ſolicited by external objects, that we give them names from things that are familiar, and which are conceived to have ſome ſimilitude to them; and the notions we form of them are no leſs analo-

gical than the names we give them. Almoſt all the words, by which we expreſs the operations of the mind, are borrowed from material objects. To underſtand, to conceive, to imagine, to comprehend, to deliberate, to infer, and many others, are words of this kind; ſo that the very language of mankind, with regard to the operations of our mind, is analogical. Becauſe bodies are affected only by contact and preſſure, we are apt to conceive, that what is an immediate object of thought, and affects the mind, muſt be in contact with it, and make ſome impreſſion upon it. When we imagine any thing, the very word leads us to think that there muſt be ſome image in the mind of the thing conceived. It is evident that theſe notions are drawn from ſome ſimilitude conceived between body and mind, and between the properties of body and the operations of mind. The influence of analogical reaſoning from a ſuppoſed ſimilitude of mind to body as a fruitful cauſe of error, with regard to our mental operations, may be illuſtrated by the following inſtance. When a man is urged by contrary motions, theſe, on one hand, inviting him to do ſome action, thoſe, on the other, to forbear it, he deliberates about it, and at laſt reſolves to do it, or not to do it. The contrary motives are here compared to the weights in the oppoſite ſcales of a balance; and there is not perhaps any inſtance that can be named of a more ſtriking analogy between body and mind. Hence the phraſes of weighing motives, of deliberating upon actions, are common to all languages. From this analogy ſome philoſophers draw very important concluſions. They ſay, that as the balance cannot incline to one ſide more than the other, when the oppoſite weights are equal, ſo a man cannot poſſibly determine himſelf if the motives on both hands are equal; and as the balance muſt neceſſarily turn to that ſide which has moſt weight, ſo the man muſt neceſſarily be determined to that hand where the motive is ſtrongeſt. On this foundation ſome of the ſchoolmen maintained, that if a hungry aſs were placed between two bundles of hay equally inviting, the beaſt muſt ſtand ſtill and ſtarve to death, being unable to turn to either, becauſe there are equal motives to both. This is an inſtance of that analogical reaſoning that ought never to be truſted: for the analogy between a balance and a man deliberating, though one of the ſtrongeſt that can be found between matter and mind, is too weak to ſupport any argument. A piece of dead, inactive matter, and an active intelligent being, are things very unlike; and becauſe the one would remain at reſt in a certain caſe, it does not follow that the other would be inactive in a caſe ſomewhat ſimilar. The argument is no better than this, that becauſe a dead animal moves only as it is puſhed, and, if puſhed with equal force in contrary directions, muſt remain at reſt; therefore the ſame thing muſt happen to a living animal; for ſurely the ſimilitude between a dead animal and a living one, is as great as that between a balance and a man.

No author has made a more juſt and a more happy uſe of the analogical mode of reaſoning than Biſhop Butler, in his admirable treatiſe, entitled, "The Analogy of Religion, natural and revealed, to the Conſtitution and Courſe of Nature." Inſtead of indulging to idle ſpeculations how the world might poſſibly have been better than it is, or forgetful of the difference between hypotheſis and fact, attempting to explain the divine economy with reſpect to intelligent creatures from preconceived notions of his own, this excellent writer firſt inquires, what the conſtitution of nature, as made known to us in the way of experiment, actually is; and from this, now ſeen and acknowledged, he endeavours to form a judgment of that larger conſtitution, which religion diſcovers to us. If the diſpenſation of Providence which we are now under, conſidered as inhabitants of this world, and having a temporal intereſt to ſecure in it, be found, upon examination, to be analogous to, and of a piece with, that further diſpenſation, which relates to us as deſigned for another world, in which we have an eternal intereſt depending on our behaviour here, if both may be traced up to the ſame general laws, and appear to be carried on according to the ſame plan of adminiſtration; the fair preſumption is, that both proceed from one and the ſame Author. And if the principal parts objected to in this latter diſpenſation be ſimilar to, and of the ſame kind with what we certainly experience under the former; the objections, being clearly inconcluſive in one caſe, becauſe contradicted by plain fact, muſt, in all reaſon, be allowed to be inconcluſive alſo in the other. This way of arguing from what is acknowledged to what is diſputed, from things known to other things that reſemble them, from that part of the divine eſtabliſhment which is expoſed to our view to that more important one which lies beyond it, is, on all hands, confeſſed to be juſt. By this method Sir Iſaac Newton has unfolded the ſyſtem of nature; and by the ſame method Biſhop Butler has explained the ſyſtem of grace, and, as Mr. Mainwaring (in the diſſertation prefixed to his volume of ſermons, p. 12.) expreſſes it, "formed and concluded a happy alliance between faith and philoſophy." Although the argument from analogy be allowed to be imperfect, and by no means ſufficient to ſolve all difficulties reſpecting the government of God, and the deſigns of his providence with regard to mankind; yet ſurely it is of importance to learn from it, that the natural and moral worlds are intimately connected, and parts of one ſtupendous whole or ſyſtem; and that the chief objections which are brought againſt religion, may be urged with equal force againſt the conſtitution and courſe of nature, where they are certainly falſe in fact. This information we derive from the biſhop's work; the proper deſign of which is not to prove the truth of religion, either natural or revealed, but to confirm that proof, already known, by conſiderations deduced from analogy; and to anſwer objections againſt thoſe truths, which are eſtabliſhed upon their proper evidence. When objections are made againſt the truths of religion, which may be made with equal ſtrength againſt what we know to be true in the courſe of nature, ſuch objections can have no weight. The ingenious author has premiſed the following ſummary of the contents and plan of his work, which we ſhall here tranſcribe for the information of thoſe readers who may be deſirous of purſuing the inveſtigation of ſubjects of this nature. "The divine government of the world, implied in the notion of religion in general, and of Chriſtianity, contains in it—that mankind is appointed to live in a future ſtate—that there every one ſhall be rewarded or puniſhed; rewarded or puniſhed reſpectively for all that behaviour here, which we comprehend under the words, virtuous or vicious, morally good or evil—that our preſent life is a probation, a ſtate of trial, and of diſcipline, for that future one; notwithſtanding the objections which men may fancy they have, from notions of neceſſity, againſt there being any ſuch moral plan as this at all; and whatever objections may appear to be againſt the wiſdom and goodneſs of it, as it ſtands ſo imperfectly made known to us at preſent—that this world being in a ſtate of apoſtacy and wickedneſs, and conſequently of ruin; and the ſenſe both of their condition and duty, being greatly corrupted amongſt men, this gave occaſion for an additional diſpenſation of Providence, of the utmoſt importance; proved by miracles; but containing in it many things appearing to us ſtrange, and not to have been expected; a diſpenſation of Providence, which is a ſcheme or ſyſtem of things, carried

on by the mediation of a divine perſon, the Meſſiah, in order to the recovery of the world; yet not revealed to all men, nor proved with the ſtrongeſt poſſible evidence to all thoſe to whom it is revealed; but only to ſuch a part of mankind, and with ſuch particular evidence as the wiſdom of God thought fit." Such are the contents of this treatiſe; and the deſign of it is, to ſhew, "that the ſeveral parts principally objected againſt in this moral and Chriſtian diſpenſation, including its ſcheme, its publication, and the proof which God has afforded us of its truth; that the particular parts principally objected againſt in this whole diſpenſation, are analogous to what is experienced in the conſtitution or courſe of nature or providence; that the chief objections themſelves which are alleged againſt the former, are no other than what may be alleged with like juſtneſs againſt the latter, where they are found, in fact, to be inconcluſive; and that this argument from analogy is, in general, unanſwerable, and undoubtedly of weight on the ſide of religion, notwithſtanding the objections which may ſeem to lie againſt it, and the real ground which there may be for difference of opinion, as to the particular degree of weight which is to be laid upon it." See Butler's Analogy of Religion, by the Biſhop of Glouceſter, 8vo. 1788, Preface, p. 34, &c. and Introduction, p. 13, &c.

Analogy, according to the derivation of the word, ſays Profeſſor Caſtillon, of Berlin, (Haarlem Memoirs for 1786, or vol. xxii.) indicates a reſemblance diſcernible by reaſon; and its principal uſe in the inveſtigation of phyſical and moral truth, may be reduced to the four following particulars: 1. By means of our ſenſes to improve, firſt, our own judgment, and afterwards that of others, with reſpect to intellectual ſubjects. 2. To deduce a general from a particular truth. Having diſcovered and proved the truth of a propoſition with reſpect to any particular object, examine whether this truth flows from a quality peculiar to this ſingle object, or common to ſeveral objects. In the latter caſe, all theſe objects may be comprehended under one general idea, founded on their common quality. Subſtitute this general idea inſtead of the particular object, and the propoſition will become general without ceaſing to be true; becauſe whatever evidently and ſolely reſults from the identity on which an analogy is founded, muſt neceſſarily be true with reſpect to all thoſe objects in which the analogy is the ſame. 3. To prove the truth or falſehood of propoſitions which cannot otherwiſe be demonſtrated. 4. To diſcover new truths in both natural and moral philoſophy.

For the difference between analogy and experience, ſee EXPERIENCE.

ANALOGY, in *Botany*, is a term that has been uſed to denote the reſemblance or ſimilarity which plants bear to each other, with regard to their medical properties and uſes; and the ſtudy of botanical analogy, or the arguing from the known properties and effects of one ſpecies to thoſe of its congeners, has been recommended as a means of inveſtigating the powers of medicines derived from the vegetable kingdom. See a Short Attempt to recommend the Study of Botanical analogy, &c. 8vo. 1784.

ANALOGY, in *Geometry*, denotes a ſimilitude of ratios, or proportions.

ANALOGY, in *Grammar*, denotes the ſuitableneſs or agreeableneſs of a word or phraſe to the common rules or forms of language.

In this ſenſe, *analogy* ſtands oppoſed to ANOMALY.

ANALOGY, in reſpect to language, denotes a conformity with other points already eſtabliſhed, ſerving as a rule or model for the making of new words and phraſes ſimilar to thoſe already in uſe.

Or, analogy may be conſidered as a general or eſtabliſhed uſage, applied in ſimilar caſes to certain words, phraſes, or conſtructions not yet eſtabliſhed. Or, analogy is only a particular uſage, which, in certain caſes, is inferred from a general uſage already eſtabliſhed.

Grammarians are divided into two parties. Some, with Sanctius, contend, that the analogy or reaſon reigns through all the parts, all the phraſes and dictions of the Latin tongue. On the contrary, others, with Perizonius, aſſert, that there are many phraſes, contrary to analogy and reaſon, derived all originally from the populace. Such, *e. gr.* are, *Nemo, homo, deorſum, verſum*, &c.

Varro and Cæſar wrote expreſsly on the analogy of Latin words, but their works are now loſt. Jac. Operarius has endeavoured to ſupply that loſs, by tracing the analogy of 20,000 Latin words. Fab. Bib. Lat. lib. i. cap. 10.

ANALOGY *of conjugation*, *analogia conjugationis*, is not only when a verb is conjugated like another, but agrees with it in the quantity of the ſyllables.

Thus *clamo* is conjugated like *amo*, and *clamabam* pronounced like *amabam*.

ANALOGY *of declenſion*, *analogia declinationis*, is not only when a noun, pronoun, or participle is declined like another, but agrees with it in reſpect of the quantities of the ſyllables.

Thus, e. g. *mater* is declined like *pater*, *ſaltans* as *amans*, *ſuus* as *tuus*. So *pennarum* is pronounced as *menſarum*, and *funeris* as *muneris*.

ANALOGY *of doctrine*, among *Critics*, is one of the great rules to which regard is to be had in the interpretation of authors.

We are firſt to learn from the author himſelf the general ſyſtem which he follows; and as no writer is to be eaſily ſuppoſed to contradict himſelf, our interpretation is to be ſo conducted, as that nothing be admitted which is contrary to, or tends to overthrow this ſyſtem.

Thus, in interpreting an author who follows the Platonic ſcheme, we are to prefer a ſenſe which is conſiſtent with the Platonic doctrine to another which is contrary to it, unleſs there be ſome evident proof, that the author contradicts himſelf, or aſſerts things which are inconſiſtent.

ANALOGY, in *Rhetoric*. See COMPARISON.

ANALOGY *of faith*, among *Divines*, denotes that relation which the ſeveral articles of faith bear to each other.

Analogy of faith ſtands oppoſed to tradition and authority, which is the great rule of interpretation among catholics. By this it is required, that whether we interpret Scripture, or explain the doctrines of Chriſtianity, all our poſitions and explanations be conſiſtent with the analogy of our faith, and thoſe evident propoſitions deduced from Scripture.

Tortſchius, Antonius, Franckius, &c. have written expreſsly on the analogy of faith.

ANALOGY, in *Medicine*, is a certain relation or reſemblance between diſeaſes, in virtue whereof, we may reaſon and conclude from one to another, and treat them all much in the ſame manner; *e. gr.* pleuriſy being a ſpecies of inflammation, produced like inflammations of other parts, is to be treated like them, relaxing the ſolids, which are too much ſtretched, and giving free paſſage for the humours.

This method of deduction was called by the ancients *medicina rationalis*, or *dogmatica*, in oppoſition to the *empirica*, called alſo *epilogiſm*, which was conducted by appearances only without theory.

ANALYSIS, derived from ἀναλυω, *to reſolve*, in a general ſenſe, is the reſolution of ſomething compounded into its conſtituent parts.

Analysis, in *Chemistry*. The whole of the practical and experimental part of chemical science may be properly included under the art of analysis, a complete account of this, therefore, would require the enumeration of almost every known fact in chemistry; and the inferences and general deductions from these facts would comprehend all that is valuable in the philosophy of chemistry. To treat the subject thus fully would, however, be inconsistent with the plan of this work, and would be little satisfactory to the reader, except such a system of arrangement was adopted, as would admit of reference to any particular part without the necessity of consulting the rest. For these reasons we have thought it upon the whole most convenient to subdivide all that relates to the subject of analysis in the following manner. For the general method of analysing animal matters, see Animal *matter*; of vegetable matter, see Vegetable *matter*; of minerals in general, see Mineral *analysis*; of mineral waters, see Waters, *mineral*.

The analysis of metallic ores will be treated of generally under Ores, and particularly under each metal.

Analysis, *grammatical*, is that employed about words, their etymons, homonymas, or various acceptations, synonymas, constructions, uses, and the like.

Pasor has given a grammatical analysis of the difficult words in Hesiod, &c. Sturmius has published a method of making the analysis of Latin words.

Analysis, in *Logic*, is a method of applying the rules of reasoning to resolve a discourse into its principles, in order to a discovery of its truth or falsehood. Or it is an examination of some discourse, proposition, or other matter, by searching into its principles, and separating and opening its parts; in order to consider them more distinctly, and arrive at a more precise knowledge of the whole.

Analysis makes one great branch or species of method; and as it resolves a complex idea into its component principles, it is called also resolution.

It is particularly used for the reduction of an imperfect syllogism to a perfect one. This is otherwise called reduction.

The order of the *synthesis* is contrary to that of the *analysis*, one beginning where the other ends. The two methods cannot always be used indifferently; the *analysis* is most proper for the discovery of truth, and synthesis for teaching and explaining it in a systematical way. Hence some call *analysis* the method of invention. See Method.

Analysis *of ideas*, that whereby an idea is resolved into the ideas of its ingredients, and the ideas of these again into simple ones, till at length we arrive at the most simple.

Analysis, in *Mathematics*, is properly the method of resolving mathematical problems, by reducing them into equations; and may be divided into *ancient* and *modern*.

The moderns are at some loss concerning the *ancient analysis*, i. e. concerning the art and method whereby the ancients resolved problems, and invented theorems. Some traces of their method are extant in Pappus, Apollonius, and Euclid; and Dr. Hooke suspects, that their analysis went backwards through almost all the same steps by which their demonstrations went forwards.

That this might often be the case, seems evident to any one who has studied Euclid with care. They have indeed left us no precepts of their art. This, like almost all others, must be acquired by imitation, and the excellent examples left us by the Greeks. Men of genius among the moderns, who had studied the works of the ancient geometers, have been thereby enabled to imitate them, and penetrate into their methods: the works of Huygens and Newton, and also the treatise of Conic Sections by Mr. Simpson, professor of mathematics in the university of Glasgow; as also several parts of Mr. Maclaurin's Treatise on Fluxions, are evident proofs of this. Weigelius has endeavoured to retrieve the ancient analysis of Aristotle, from Euclid and other ancient geometricians.

The *ancient analysis*, as Pappus has described it in his "Mathematicæ Collectiones," lib. vii. p. 157, ed. Commandini, Pisaur. 1588, is the method of proceeding from the thing sought taken for granted, through its consequences, to something that is really granted or known; in which sense it is the reverse of synthesis or composition, that commences with the last step of the analysis, and traces the several steps backward, making that in this case antecedent, which in the other was consequent, till we arrive at the thing sought, which was assumed in the first step of the analysis. The principal authors on the ancient analysis, enumerated by Pappus *(ubi supra)* are Euclid in his "Data," "Porismata," and "De Locis ad Superficiem;" Apollonius, "De Sectione Rationis," "De Sectione Spatii," "De Tactionibus," "De Inclinationibus," "De Locis Planis," and "De Conicis;" Aristæus, "De Locis Solidis;" and Eratosthenes, "De Mediis Proportionalibus." Pappus himself, who has given many examples from the preceding writers, may be added to the above number. This analysis has also been cultivated by many of the moderns, as Fermat, Viviani, Ghetaldus, Snellius, Huygens, Simson, Stewart, Lawson, &c. and particularly by Hugo d'Omerique, in his "Analysis Geometrica," in which he has endeavoured to restore the analysis of the ancients. Sir Isaac Newton, as we are informed by Dr. Pemberton, ("View of Sir Isaac Newton's Philosophy," preface,) always professed himself a great admirer of the ancients, and even censured himself for not following them more closely than he did. He also regretted his mistake at the beginning of his mathematical studies, in applying himself to the works of Des Cartes and other algebraic writers, before he had considered the Elements of Euclid with that attention which so excellent a writer deserves. He used to commend the laudable attempt of Hugo d'Omerique to restore the ancient analysis; and very much esteemed Apollonius's book, "De Sectione Rationis," for giving us a clearer notion of that analysis than we had before; and he particularly recommended Huygens's style and manner. In the application of the ancient analysis for the solution of geometrical problems, strict rules cannot be laid down, nor any previous instructions be delivered, from which it may not be necessary to deviate. Some preparation is necessary in order to form a connection between the data and quæsita, which must be suggested to the mind of the analyst by a due consideration of the nature of the problem; and the skill of the analyst was manifested in discovering the most proper preceding operations, on which his analysis was to be founded. As an example we may give the 155th proposition of the 7th book of Pappus, p. 257. From the extremes of the base A and B (*Plate* I. *Geometry*, *fig.* 14.) of a given segment of a circle, let it be required to draw two lines AC, BC, meeting at a point C in the circumference, which shall have to each other the given ratio of F to G. Pappus resolves this problem in the following manner: *Analysis*. Suppose the thing done, or that the point C is found: and draw CD a tangent to the circle at C, and meeting AB produced in D. By the hypothesis AC : BC :: F : G; and $AC^2 : BC^2 :: DA : DB$; which may be thus proved. DC touches the circle, and BC cuts it; and therefore by Euclid, lib. iii. prop. 32, the angle BCD=BAC, and the angle D being common to both the triangles DCA and DCB, these triangles will be similar; and DA : DC :: DC : DB; and consequently $DA^2 : DC^2 :: DA : DB$. Moreover, DA : AC ::

DC : CB, and DA : DC : : AC : CB, or $DA^2 : DC^2 : : AC^2 : CB^2$; and therefore by equality, $AC^2 : BC^2 : : DA : DB$. But the ratio of AC^2 to BC^2 is given by prop. lvii. of Simſon's edition of the "Data;" becauſe the ratio of AC to BC is given, and conſequently that of DA to DB is given. Then by Data vi. the ratio of DA to AB is given; and hence by Data ii. DA is given in magnitude. Here the analyſis properly ends. For it has been ſhewn that DA is given, or that a point D may be found in AB produced, ſuch, that a tangent being drawn from it to the circumference, the point of contact will be the point ſought; and therefore we may begin the compoſition, or ſynthetical demonſtration, by finding the point D, or laying down the line AD, which was given in the laſt ſtep of the analyſis.

Syntheſis. Conſtruction. Make $F^2 : G^2 : : AD : DB$, which may be done, as AB is given, by making $F^2 - G^2 : G^2 : : AB : DB$, and then by compoſition, it will be $F^2 : G^2 : : AD : DB$; then from the point D thus found, draw a tangent to the circle, and from the point of contact C drawing CA and CB, the thing is done.

Demonſtration. Since by conſtr. $F^2 : G^2 : : AD : DB$, and $AD : DB : : AC^2 : BC^2$; we ſhall have $F^2 : G^2 : : AC^2 : BC^2$, and conſequently F : G : : AC : BC. Q. E. D.

In this problem we have an inſtance of the method of reſolution and compoſition practiſed by the ancients, the ſolution here given being that of Pappus himſelf. But as the method of referring to the "Data" may appear operoſe, and as it is not abſolutely neceſſary, the rigour of the ancient method of ſolution may be abated, whilſt its admirable elegance and perſpicuity are preſerved. This may be exhibited in another ſolution of the ſame problem, which is as follows:

Analyſis. Suppoſe again that the thing is done, *viz.* AC : BC : : F : G, and draw BH, making the angle ABH = ACB, and meeting AC produced in H. Then as the angle A is common, the triangles ABC and ABH are equiangular, and therefore AC : BC : : AB : BH, in a given ratio; and, AB being given, BH will be given in poſition and magnitude.

Syntheſis. Conſtruction. Draw BH, making the angle ABH equal to that which may be contained in the given ſegment, and take AH to BH in the given ratio of F to G. Draw ACH and BC.

Demonſtration. The triangles ABC, ABH are equiangular, therefore AC : BC : : AB : BH, which is the given ratio by conſtruction.

Modern Analyſis comprehends algebra, arithmetic of infinites, infinite ſeries, increments, fluxions, &c. for an account of each of which, ſee the reſpective articles. The modern analyſis is a general inſtrument by which the fineſt inventions and the greateſt improvements have been made in mathematics and philoſophy for the laſt two centuries. It furniſhes the moſt perfect examples of the manner in which the art of reaſoning ſhould be employed; it gives to the mind a wonderful ſkill for diſcovering things unknown by a few things given; and by employing ſhort and eaſy ſymbols for expreſſing ideas, it preſents to the underſtanding things which would otherwiſe lie beyond its ſphere. By means of this, geometrical demonſtrations may be abridged: a long train of reaſoning, aided and facilitated by viſible ſymbols, and the various operations which it requires, performed by the arrangement and combination of theſe ſymbols. By this artifice a great number of truths may be expreſſed in a ſingle line, whereas, in the ordinary proceſs, they would occupy pages, or even volumes: and thus by the contemplation of one line of calculation, we may acquire in a ſhort time the knowledge of a whole ſcience, which, without this aid, could ſcarcely be comprehended in ſeveral years.

Sir Iſaac Newton, indeed, who well knew the advantages of analyſis in geometry and other ſciences, frequently lamented, that the ſtudy of the ancient geometry ſhould be neglected and abandoned; and it muſt be allowed that the method employed by the ancients in their geometrical writings is more rigorous than that of the modern analyſis; and though it be greatly inferior to that of the moderns, in point of diſpatch, and facility of invention, it is nevertheleſs highly uſeful in ſtrengthening the mind, improving the reaſoning faculties, and accuſtoming the young mathematician to a pure, clear, and accurate mode of inveſtigation and demonſtration, though by a long and laboured proceſs, to which he would reluctantly have ſubmitted, if his taſte had been vitiated, as it were, by the modern analyſis. On this circumſtance were principally founded the complaints of Newton, who feared, leſt by the too early and frequent uſe of the modern analyſis, the ſcience of geometry ſhould loſe that rigour and purity, which characteriſe its inveſtigations, and the mind become debilitated by the facility of our analyſis. He was therefore fully juſtified in recommending, to a certain extent, the ſtudy of the ancient geometricians; whoſe demonſtrations, being more difficult and operoſe, afford greater exerciſe to the mind, accuſtom it to a cloſer application, extend its views, and habituate it to patience and reſolution, ſo neceſſary for making diſcoveries. This, however, is the only or principal advantage reſulting from it; for, if we were reſtricted to the method of the ancients, it is probable that perſons of the moſt acute and comprehenſive genius would have made few or inconſiderable diſcoveries, in compariſon of thoſe obtained by means of the modern analyſis. And even with regard to the advantage attending inveſtigations, purſued in the manner of the ancients, which is that of being more rigorous, it may perhaps be doubted whether this pretenſion be well founded. As for thoſe of Newton himſelf, who conducted his demonſtrations in the manner of the ancients, it is evident that he inveſtigates his theorems by a method different from that employed in the demonſtrations, which are commonly analytical calculations, diſguiſed by ſubſtituting the name of lines for their algebraical value; and though it muſt be acknowledged, that his demonſtrations are rigorous, it is no leſs true that they would be the ſame when tranſlated and delivered in the algebraic language; and what difference can it make in this reſpect, whether we call a line AB, or denote it by the algebraic character *a*? Indeed, this laſt deſignation has this peculiarity, that when all the lines are denoted by algebraic characters, many operations can be performed upon them, without thinking of the lines or the figure. And this circumſtance is very advantageous, as it relieves the mind, ſo that its whole energy may be employed in overcoming the natural difficulty of the problem itſelf. Upon a compariſon of the ancient and modern analyſis, the reſult ſeems to be, that the method of the ancients is the beſt adapted to the commencement of our ſtudies, as it ſerves to form the mind, and to fix proper habits; and that of the moderns ſhould ſucceed, and is beſt ſuited to extend our views beyond the preſent limits, and to aſſiſt us in making new diſcoveries and improvements. Montucla Hiſt. des Mathematiques, tom. i. p. 166. p. 195. Hutton's Math. Dict. tom. i.

ANALYSIS is divided by ſome authors into *ſimple* and *compound*.

ANALYSIS, *ſimple*, is that employed in ſolving problems reducible to ſimple EQUATIONS.

ANALYSIS, *compound*, or *complex*, that which gives the expreſſions or ſolutions of problems in compounded EQUATIONS.

ANALYSIS is farther divided, with regard to its object, into that of *finites*, and that of *infinites*.

ANALYSIS *of finite quantities*, is what we otherwiſe call *ſpecious arithmetic*, or ALGEBRA.

ANALYSIS *of infinites*, called alſo the new analyſis, is particularly uſed for the *method of* FLUXIONS, or the *differential calculus*.

The great advantage of the modern mathematicians beyond the ancients ariſes chiefly from the uſe of this modern analyſis.

The chief writers upon the analyſis of infinites are, its inventor Sir Iſaac Newton, in his "Analyſis per Quantitatum Series, Fluxiones, & Differentias, cum Enumeratione Linearum tertii Ordinis;" and "De Quadratura Curvarum;" and M. Leibnitz, in Act. Eruditor. an. 1684. The Marquis De l'Hôpital, in his "Analyſe des Infiniments petites," 1696. Carre, in his "Methode pour la Meſure des Surfaces, la Dimenſion des Solides, &c. par l'Application du Calcul integral," 1700. G. Manfredi, in a poſthumous piece, "De Conſtructione Æquationum differentialium primi gradus," 1707. Nic. Mercator. in Logarithmotechnica," 1668. Cheyne, in "Methodus Fluxionum inverſa," 1703. Craig, in "Methodus Figurarum lineis rectis & curvis comprehenſarum Quadraturas determinandi," 1685; and "De Quadraturis Figurarum curvilinearum & locis," &c. 1693. Dav. Gregory, in "Exercitatio Geometrica de Dimenſione Figurarum," 1664; and Nieuwentiit, in "Conſiderationes circa Analyſeos ad Quantitates infinitè parvas applicatæ principia, 1695. The ſum of what is found in l'Hôpital, Carre, Cheyne, Gregory, and Craig, is collected into one volume, and very well explained, by C. Hayes, under the title of a "Treatiſe of Fluxions," &c. 1704. And the ſubſtance of moſt of the reſt in Pere Reynau's "Analyſe Demontrée, 2 vols. 4to. 1728. De Moivre alſo, Maclaurin, and Mr. T. Simpſon, may be added to the number.

ANALYSIS *of powers*, denotes the reſolving them into their ROOTS. In this ſenſe analyſis amounts to the ſame with what we otherwiſe call EVOLUTION.

We find divers other kinds of analyſis treated of by mathematical writers, as the *analyſis* of *indiviſibles*, &c. M. Leibnitz ſpoke of an *analyſis ſitus*, different from the analyſis of magnitudes.

The analyſis of geometrical curves ſhews their properties and internal conſtitution, their curvature, points of inflection, ſtation, retrogradation, variation, &c. In this analyſis curves are uſually conſidered as polygons, compoſed of an infinite number of infinitely little ſides, but this ſuppoſition is neither accurate nor neceſſary, though it ſometimes affords convenient hints for invention.

F. Reynau, of the *Oratory*, has given a large ſyſtem of algebra, under the title of analyſis. F. Caſtel cenſures it as not ſufficiently methodical or ſyſtematical. The great diviſions and members are loſt in the multitude of particular rules and methods.

ANALYSIS, in *Rhetoric*, is that which examines the connections, tropes, figures, and the like, inquiring into the propoſition, diviſion, paſſions, arguments, and other apparatus of rhetoric.

Several authors, as Freigius and others, have given analyſes of Cicero's Orations, wherein they reduce them to their grammatical and logical principles; ſtrip them of all the ornaments, and additions of rhetoric, which otherwiſe diſguiſe their true form, and conceal the connection between one part and another. The deſign of theſe authors is to have theſe admired harangues, juſt ſuch as the judgment diſpoſed them, without the help of imagination; ſo that here we may coolly view the force of each proof, and admire the uſe Cicero made of rhetorical figures, to conceal the weak part of a cauſe.

A collection has been made of the analyſes formed by the moſt celebrated authors of the ſixteenth century, in three volumes folio.

ANALYSIS *of Soils*, in *Agriculture*. See SOILS.

ANALYSIS *of Vegetables*. See VEGETABLES.

ANALYSIS is alſo uſed as a kind of ſyllabus, or table of the principal heads or articles of a continued diſcourſe; diſpoſed in their natural order and dependency.

Analyſes are more ſcientifical than alphabetical indexes; but they are leſs uſed, as being more intricate.

ANALYSIS is likewiſe uſed for a brief, but methodical illuſtration of the principles of a ſcience; in which ſenſe it is nearly ſynonymous with what we otherwiſe call a *ſynopſis*.

ANALYST, a perſon who analyſes a thing, or makes uſe of the analytical method. In which ſenſe analyſt amounts to much the ſame with *computiſt* or *calculator*.

Some reſtrain the word more peculiarly to denote a mathematician, who makes a great uſe of the algebraic method or *calculus* in geometry, in excluſion of the *ſynthetic*, or ſtrict geometrical method.

In a ſenſe not unlike this Dr. Berkeley, an ingenious writer, gives the title *analyſt* to a book againſt the modern *geometry*, or doctrine of FLUXIONS.

ANALYTIC, ANALYTICAL, ſomething that belongs to, or partakes of, the nature of analyſis.

Thus we ſay, an analytical demonſtration; analytical inquiry; analytical table, or ſcheme; analytical method, &c. The analytic method ſtands oppoſite to the *ſynthetic*. See METHOD.

ANALYTICS, ANALYTICA, the ſcience or doctrine and uſe of ANALYSIS.

To the modern analytics principally belongs *algebra*; the hiſtory of which, with the ſeveral authors thereof, ſee under ALGEBRA.

ANALYTICS, in *Literary Hiſtory*, is particularly uſed to denote certain writings of Ariſtotle under this title.

Ariſtotle's Analytics conſiſt of four books, two under the denomination of *former*, Αναλυτικων πρoτερων, and as many under that of *latter*, υστερων. They belong to the claſs of his acroamatic works. Fabr. Bibl. Græc. lib. iii. cap. 6.

ANALYTICS is alſo uſed by ſome for a part of LOGIC, which teaches to decline and conſtrue reaſon, as grammar does words.

ANAM, in *Geography*, is called by the Portugueſe COCHIN-CHINA, and bends its hollow curvature along the coaſt, from lat. 13° to 17° 30'.

ANAMABOA, or JAMISIA, a large and populous town in the kingdom of Fantin, on the gold coaſt of Africa, where the Engliſh have a fort. The inhabitants are generally deceitful and fraudulent, and are very artful in debaſing and counterfeiting their gold coin. Anamaboa is reckoned the moſt powerful town upon the whole coaſt. It is divided into two parts; one part inhabited by the fiſhermen of Elmina, the other by thoſe of Fantin, who pay a certain duty to the braſſo for the liberty of purſuing their occupation. The greateſt inconvenience attending the ſituation of the Engliſh fort at this place, ariſes from the difficulty of landing from the ſhips, as the ſhore is covered with rocks projecting into the ſea, and the ſurf riſes to a great height; and, on this account, thoſe that trade here, are landed by means of canoes upon a ſandy point, ſurrounded by a wall, which is built by the company, and rendered convenient by lodgings for the negroes under the cannon of the fort. The ſoil is adapted for making bricks; the ſhells upon the coaſt furniſh excellent lime; and the country affords great plenty of timber. The adjacent country is mountainous, but the hills are at a diſtance from the town, ſerve as land-marks at ſea, and being covered with trees, afford an agreeable proſpect. The country is populous, and very rich in gold, ſlaves, and all the neceſſaries of life, but more

particularly

particularly in corn; and the palm wine is excellent. Their opulence has rendered the inhabitants haughty and arrogant. In the woods of this country are found the moſt beautiful parroquets, and a great variety of other birds. Fruits, roots, and vegetables of every kind abound, and are cultivated with little trouble. The Engliſh fort is a large edifice, flanked by two towers, and fortified towards the ſea with two baſtions; it is conſtructed of brick and ſtone cemented with lime. It ſtands upon a rock at the diſtance of 30 paces from the ſea; it is mounted with 12 pieces of cannon, and 12 patereroes, and defended by a garriſon of 12 whites and 18 blacks, under the command of the chief factor.

The natives formerly treated the Engliſh garriſon with ſo much inſolence, as often to block them within their walls, and frequently, if they diſliked the governor, they ſent him in a canoe to Cape Coaſt, with marks of the utmoſt contempt. The negroes of Fantin are the moſt turbulent upon the coaſt. In 1701 they declared war againſt the Engliſh, and, aſſembling in a tumultuous manner, ſet fire to the exterior building, and proceeded with their outrages, till they were diſperſed by a diſcharge of the cannon from the batteries. The Engliſh, however, took their revenge, by laying the greater part of the town of Anamaboa in aſhes; and hoſtilities continued for ſome time, till at laſt the natives were obliged to ſue for peace. The fort was abandoned in 1733, but again reſumed by the Engliſh, who have maintained poſſeſſion of it ever ſince.

ANAMANI, Anamanes, or Amanes, in *Ancient Geography*, were friends and allies of the Romans, who inhabited Ciſalpine Gaul, at the foot of the Apennines to the ſouth of the Po, having Trebia to the weſt, and Tarus for their principal rivers. In the extent of their country were found Placentia, Veleia, Florentia, and Julia Fidentia.

ANAMARI, a people mentioned by Polybius, and placed in the vicinity of Marſeilles.

ANAMASCIA, or Anamatia, a town of Lower Pannonia, and placed by M. d'Anville ſouth of Acineum.

ANAMBA, in *Geography*, an iſland in the Indian ſea, weſt of Borneo. N. lat. 2° 58′. E. long. 106° 44′.

ANAMIM, the ſecond ſon of Mizraim, Gen. x. 13. Broughton takes his deſcendants to be the Numidians, amongſt whom he finds Anubis. Others ſuppoſe that they were the Anaitæ of Ethiopia. But as they were the deſcendants of Mizraim, and muſt be ſought for about Egypt, the opinion of Bochart is more probable, who conceives them to be the Nomades, who lived about Ammon and Naſamonitis; and were called Anamii, from Anam, which ſignifies a ſheep among the ancient Egyptians, as it does among the Arabians. For the Nomades fed ſheep, as Herodotus informs us, and lived upon them, whereas, they abſtained from eating cows or ſwine; and their garments alſo were of ſheep-ſkins.

ANAMIS, in *Ancient Geography*, a river mentioned by Arrian (cap. xxxiii.), and ſuppoſed to be the ſame with that which is called Andamis by Pliny and Ptolemy. It belonged to Carmania. M. d'Anville places this ſmall river on a ſtrait, which forms the communication between the ſea and the Perſian gulf.

ANAMMELECH, in *Scripture Hiſtory*, an idol of the Sepharvites, who are ſaid (2 Kings, xvii. 31.) to have burned their children in honour of this deity and Adrammelech. Theſe were the ſame gods with Moloch, to whom the ſame ſacrifices were offered. The Jewiſh rabbins repreſent one in the form of a peacock, and the other of a pheaſant; but they were probably only different names of Moloch, which was the ſun: the addition of Addir, ſignifying magnificent or potent, makes Adrammelech or the mighty Moloch, and of Ana, denoting to anſwer, forms Anammelech, or the Oracular Moloch. Dr. Hyde (Rel. Vet. Perſ. cap. ii. p. 63). is of opinion, that Adrammelech ſignified the king of the flock; *Adre* denoting *greges*; and *Ana* being the ſame with *pecus* in the Perſian language, and expreſſing the leſſer cattle, *viz.* the ſheep and goats; Anammelech was of much the ſame ſignification. Theſe gods, he conceives, had the care of the flocks; and as the riches of theſe people conſiſted in cattle, were made the objects of their worſhip. They were alſo celeſtial conſtellations, as he obſerves, which, as the people imagined, promoted the breed and growth of cattle. Others make Adrammelech the ſun, and Anammelech the moon.

ANAMNESEIS, from ἀνα and μναομαι, *I remember*, in *Ancient Writers*, denote encomiums of perſons who had behaved well in war, or on other occaſions, rehearſed before the emperors of Conſtantinople, to put them in mind of beſtowing ſuitable rewards.

ANAMNESTICS, in *Medicine*, are uſed by ſome writers to denote thoſe ſigns which help to diſcover the paſt ſtate of a patient's body: in which ſenſe it ſtands oppoſed to PROGNOSTICS.

Theſe are otherwiſe called *rememoratives*.

Some have uſed this term for medicines that are ſuppoſed to improve the memory, or reſtore it when loſt. But this is a general title, ſays Dr. Cullen (Mat. Med. vol. i. p. 166.) which ſeems to have no foundation at all, or which, if it had, is too general, and would be very improperly employed.

ANAMOOKA, or Rotterdam, in *Geography*, one of the Friendly iſlands, in the South Pacific Ocean. It is ſituated in S. lat. 20° 15′, and W. long. 174° 31′, about 18 leagues diſtant from Tongataboo, or Amſterdam; which it reſembles in its aſpect. Its form is triangular, and none of its ſides exceed the length of four miles. Its extent is alſo diminiſhed by a large ſalt lagoon which almoſt cuts off its ſouth-eaſtern angle from the reſt. Its coaſts are ſurrounded by ſmall iſlets, ſand banks, and reefs, by which is formed a harbour on the ſouth-weſtern ſide of the iſland, with anchorage in 10 and 12 fathom, the bottom being coral ſand. It is well ſheltered, but no freſh water is to be obtained near the ſhore. On the north-weſt ſide are two coves, to which are narrow paſſages for boats through the reefs. To the ſouthward of theſe is a bank, free from rocks, with 20 and 25 fathom depth, one or two miles from ſhore. The coaſt riſes nearly perpendicular, 15 or 20 feet from the ſea, and the interior appears level, excepting ſome ſmall hillocks, and a more conſiderable one toward the centre of the iſland. It is ſimilar to Tongataboo in ſoil and productions, but leſs cultivated, even in proportion to its ſize. It is, however, better furniſhed with water, though ſomewhat brackiſh, having a pond about three quarters of a mile from the landing-place on the north-weſt ſide, of half a mile in circuit. This iſland was diſcovered by Taſman, in 1643, and called Rotterdam. Captain Cook arrived at it in 1774. Thefts were more frequently committed here than at the ſouthernmoſt iſlands of the group; the character of the women appeared alſo to be more licentious, and that of the men more daring. Some of the natives diſtinguiſhed themſelves by their good conduct, and moſt of them behaved well, except when they were tempted to ſteal ſome of the novelties poſſeſſed by their viſitors. Capt. Cook returned to this iſland in 1777. Lieutenant Bligh, in the Bounty, anchored at Anamooka in 1789. Pine apples, which had been planted in the iſlands viſited by Capt. Cook, were found here at that time in a flouriſhing ſtate. Capt. Edwards twice viſited Anamooka in 1791. No ſubſequent viſit to this iſland has been made known. It is ranked by the natives amongſt the ſmaller iſlands of their Archipelago, which

which contains 35 larger than this. A diſeaſe of the leprous kind, which ſeems to be common to all the iſlands of this ocean, is ſaid to prevail more at Anamooka than in any other part of this group. The venereal diſeaſe, introduced here by the Engliſh, has made a lamentable progreſs. As wood is an article procured here by all the ſhips, care ſhould be taken to avoid an accident, which may occur in cutting a tree, called by the natives faitanoo. This is a ſpecies of pepper, and yields a milky juice that injures the eyes and ſkin of the workmen. Miſſionary Voyage, Preſim. Diſc. p. 56—60.

ANAMORPHOSIS, compounded of ανα and μορφη, *form*, in *Perſpective* and *Painting*, a monſtrous projection; or a repreſentation of ſome image, either on a plane or curve ſurface, deformed and diſtorted: which at a certain diſtance ſhall appear regular, and in proportion.

To make an anamorphoſis, or monſtrous projection on a plane. Draw the ſquare ABCD (*Plate* I. *Perſpective, fig.* 1.) of any ſize at pleaſure, and ſubdivide it into a number of areolas, or leſſer ſquares. In this ſquare, or reticle, called the *craticular prototype*, let the image to be diſtorted be drawn. Then draw the line *ab* (*fig.* 2.) equal to AB; and divide it into the ſame number of equal parts, as the ſide of the prototype AB; and in E, the middle of it, erect the perpendicular EV, ſo much the longer, and draw VS perpendicular to EV, ſo much the ſhorter, as the image is deſigned to be more diſtorted. From each point of diviſion draw right lines to V, and join the points *a* and S, by the right line *a* S. Through the points *d*, *e*, *f*, *g*, draw lines parallel to *ab*; then will *abcd* be the ſpace in which the monſtrous projection is to be delineated; called the *craticular ectype*.

Laſtly, in every areola, or ſmall trapezium of the ſpace *abcd* draw what appears delineated in the correſpondent areola of the ſquare ABCD; by this means you will obtain a deformed image, which yet will appear in juſt proportion to an eye diſtant from it by the length of EV, and raiſed above it by the height VS.

It will be diverting to manage it ſo that the deformed image may not repreſent a mere chao but ſome other image: thus, we have ſeen a river with ſoldiers, waggons, &c. marching along the ſide of it, ſo drawn, that when viewed by an eye in the point S, it appears to be the ſatirical face of a man.

An image alſo may be diſtorted mechanically, by perforating it here and there with a needle, and placing it againſt a candle or lamp; and obſerving where the rays, which paſs through theſe little holes, fall on a plane, or curve ſuperficies; for they will give the correſpondent points of the image deformed; by means whereof, the deformation may be completed.

Let the image, whatever it be, e. g. IHS, be drawn upon a cylinder of paper or paſteboard, ABCD (*fig.* 3.); and the perforations being made as now deſcribed, place a candle G, behind the cylinder, and mark upon the ground the points correſponding to the perforations of the image, which will be diſtorted more or leſs, according to the poſition of the candle, or the plane, &c. Then, let the picture that is formed be an exact copy of this diſtorted image, and ſubſtitute a metallic ſpeculum in the place of the cylinder, and let the eye of the ſpectator have the ſame poſition before the cylinder that the candle had behind it, the diſtorted image will, by reflection from the ſpeculum, be reſtored to its proper ſhape.

ANAMORPHOSIS, *to draw the, or deformation of an image, upon the convex ſurface of a cone.*—It is manifeſt from the former caſe, that here it is merely required to make a craticular ectype on the ſuperficies of the cone, which ſhall appear to an eye duly placed over its vertex equal to the craticular prototype.

Let the baſe, or periphery, ABCD, therefore, of the cone (*fig.* 4.) be divided by radii into any number of equal parts; and let ſome one radius be likewiſe divided into equal parts; and through each point of diviſion draw concentric circles: thus will the craticular prototype be made. With double the diameter AB, as a radius, deſcribe the quadrant EFG (*fig.* 5.) ſo that the arch EG may be equal to the whole periphery: then this quadrant, duly folded, will form the ſuperficies of a cone, whoſe baſe is the circle ABCD. Divide the arch EG into the ſame number of equal parts as the craticular prototype is divided into; and draw radii from all the points of diviſion. Produce GF to I, ſo that FI = FG: and from the center I, with the radius IF, draw the quadrant FKH; and from I to E draw the right line IE. Divide the arch KF into the ſame number of equal parts as the radius of the craticular prototype is divided into; and draw radii through each of the points of diviſion, from the centre I, meeting EF, in 1, 2, 3, &c. Laſtly, from the centre F, with the radii, F 1, F 2, F 3, &c. deſcribe the concentric arches. Thus will the craticular ectype be formed, the areolæ of which will appear equal to each other.

Hence what is delineated in every areola of the craticular prototype, being tranſferred into the areolæ of the craticular ectype, the images will be diſtorted or deformed; yet an eye raiſed above the vertex of the cone, at a height equal to that of the cone itſelf, will perceive them in juſt proportion.

If the chords of the quadrants be drawn in the craticular prototype, and chords of the four parts in the craticular ectype, all things elſe remaining the ſame, you will have the craticular ectype in the quandrangular pyramid.

And hence it will be eaſy to deform any image, in any other pyramid, whoſe baſe is any regular polygon.

Becauſe the eye will be more deceived, if from contiguous objects it cannot judge of the diſtance of the parts of the deformed image; therefore, theſe kinds of deformed images are to be viewed through a ſmall hole; and when they are made to appear like the objects which they are intended to repreſent, by means of a mirror of any particular conſtruction, theſe anamorphoſes are ſaid to be reformed. See MIRROR.

The original author of this ingenious device is not known. Simon Stevinus firſt wrote upon it, without informing us from whom he acquired it. The principles of it are laid down by S. Vauzelard, in his "Perſpective Conique et Cylindrique;" and Gaſper Schottus, profeſſing to copy Marius Bettinus, in his deſcription of this piece of artificial magic. Other methods more exact and geometrical than that above deſcribed, in which a lamp or candle was uſed, were afterwards invented, and rules laid down for drawing the requiſite figures. Schottus quotes one of thoſe methods from Bettinus, another from Herigonius, and another from Kircher, which may be ſeen in his "Magia," vol. i. p. 162, &c. He alſo gives an account of the methods of reforming pictures by ſpeculums of conical and other figures. The method given by Dr. Smith, (in his Optics, vol. i. p. 250.) is, without doubt, the beſt; and from this any perſon may eaſily make a drawing of the ſame kind. The ſame deſcription anſwers to two mirrors, one of which, *fig.* 6, is convex, and the other, *fig.* 7, is concave. In order, therefore, to paint upon a plane a deformed copy, ABCDEKIHGF, of an original picture, which ſhall appear regular, when ſeen from a given point O, elevated above the plane, by rays reflected from a poliſhed cylinder, placed upon the

circle,

circle, *lnp*, equal to its given baſe; draw from the point R, which is ſuppoſed to be directly under O, the place of the eye, two lines R*a*, R*e*, which ſhall either touch the baſe of the cylinder, or elſe cut off two ſmall equal ſegments from the ſides of it; as the copy is intended to be more or leſs deformed. Then taking the eye, raiſed above R, to the given height RO, ſomewhat greater than that of the cylinder, for a luminous point, deſcribe the ſhadow *aekf*, of a ſquare *aexz*, *fig.* 8. or parallelogram ſtanding upright upon its baſe *ae*, and containing the picture required, any where behind the arc *lnp*. Let the lines drawn from R to the extremities and diviſions of the baſe *a*, *b*, *c*, *d*, *e*, cut the remoteſt part of the ſhadow in the points *f*, *g*, *h*, *i*, *k*, and the arc of the baſe in *l*, *m*, *n*, *o*, *p*; from which points draw the lines *l*AF, *m*BG, *n*CH, *o*DI, *p*EK, as if they were rays of light that came from a focus R, and were reflected from the baſe *lnp*; ſo that each pair, as *l*A, *l*R, produced, may cut off equal ſegments from the circle. Laſtly, tranſer the lines *laf*, *mbg*, &c. and all their parts, in the ſame order, upon the reſpective lines LAF, *m*BG, &c. and having drawn regular curves, by eſtimation, through the points A, B, C, D, E, through F, G, H, I, K, and through every intermediate order of points; the figure ACEKHF, ſo divided, will be the deformed copy of the ſquare, drawn and divided upon the original picture, and will appear ſimilar to it, when ſeen in the poliſhed cylinder, placed upon the baſe *lnp*, by the eye in its given place O.

The practical methods of drawing theſe images ſeem to have been carried to the greateſt perfection by J. Leopold, who, in the Leipſic acts, for the year 1712, has deſcribed two machines, one for images to be viewed with a cylindrical, and the other with a conical mirror. The perſon, who has this inſtrument, may take any point at pleaſure, and whilſt he goes over the outlines of it with one pen, another traces the anamorphoſis.

By methods of this kind, groves of trees may be cut, ſo as to repreſent the appearance of men, horſes, and other objects from ſome one point of view, which are not at all diſcernible in any other. This might eaſily be effected by one perſon placing himſelf in any particular ſituation, and giving directions to other perſons, what trees to lop, and in what manner. In the ſame method it has been contrived, that buildings, of circular and other forms, and alſo whole groupes of buildings, conſiſting of walls at different diſtances and with different poſitions to one another, ſhould be painted ſo as to exhibit the exact repreſentation of particular objects, which could only be perceived in one ſituation. Bettinus has illuſtrated this method by drawings, in his "Apiaria."

In the cloiſter of the Minims, in the Place Royale, at Paris, there are two anamorphoſes traced upon two of the ſides of the cloiſter, one repreſenting a Magdalen, and the other St. John, writing his goſpel. They are ſo managed that when viewed directly, they appear like a kind of landſcape, but from a particular point of ſight they appear very diſtinctly, like human figures. Theſe two figures were executed by Niceron, a Minim, who publiſhed a treatiſe, entitled "Thaumaturgus Opticus," in which he has deſcribed the manner of tracing anamorphoſes on any ſurfaces. In tom. iv. of the Memoirs of the Imperial Academy of Peterſburgh we have the deſcription of a ſimilar anamorphoſis, by Mr. Lutman, in honour of Peter II., emperor of Ruſſia. On the ſubject of this article, ſee Wolfii Elementa Matheſeos, &c. vol. iii. cap. v. p. 99, &c. Prieſtley's Hiſtory, &c. of Viſion, &c. p. 93—96.

ANAMSAGAR, in *Geography*, a town of Hindoſtan, in the county of Vijiapoor, 51 miles eaſt of Baddamy, and 71 ſouth-eaſt of Galgala.

ANANAS, in *Botany*, by ſome called *nanas*, and by others *jayama*, and popularly the *pine-apple*, on account of the reſemblance it bears to the cones of pines and firs, is a ſpecies of Bromelia.

Ananas, in *Natural Hiſtory*, a ſpecies of Madrepora, in the fourth order of Vermes, *Zoophyta*, the ſtars of which are angular, convex, and concave in the diſk. Linn. This kind inhabits the Mediterranean and South American ſeas, and is often found in a foſſil ſtate.

ANANCITIS, in *Antiquity*, a kind of figured ſtone, otherwiſe called ſynochitis, to which ſuperſtition aſcribed a magical virtue in raiſing the ſhadows of the infernal gods.

ANANDRIA, in *Botany*, a ſpecies of Tussilago.

ANANES, in *Geography*, three ſmall iſlands in the Grecian Archipelago, about three leagues ſouth-weſt of the iſland of Milo.

ANANISABATA, or Ananisapta, in *Antiquity*, a magical word inſcribed on coins and other amulets, and ſuppoſed to have efficacy in preſerving the wearer from the plague.

ANANTHOCYCLUS, in *Botany*. See Cotula.

ANANTPOUR, in *Geography*, a town of Hindoſtan, in the Myſore country, 85 miles north-eaſt of Chitteldroog, and 140 north-north eaſt of Seringapatam.

ANANUS, the Younger, in *Biography*, a Sadducee, was appointed high-prieſt of the Jews by Agrippa, the younger, about A. D. 60. Joſephus (Antiq. lib. xx. cap. 8. § 1.) repreſents him as fierce and haughty in his behaviour, and extremely reſolute and daring; and as belonging to the ſect of the Sadducees, who were above all other Jews cruel in their judicial ſentences. Upon the death of Feſtus the Roman governor, and before the arrival of Albinus, appointed to be his ſucceſſor, Ananus called a council, and bringing before it James, our Lord's brother, and ſome others, he accuſed them as tranſgreſſors of the laws, and had them ſtoned to death. Joſephus ſays, that many were offended at this proceeding. Some, he ſays, went running to meet Albinus, who was coming from Alexandria, and put him in mind, that Ananus had no right to call a council without his leave. Albinus approving of what they ſaid, wrote a very angry letter to Ananus, threatening to puniſh him for what he had done, and king Agrippa took away from him the prieſthood, after he had enjoyed it three months, and put in Jeſus, the ſon of Damnæus. Dr. Lardner infers from this circumſtance, as well as others, that the Jews had not at this time the power of life and death. Works, vol. i. p. 81.

Ananus, a learned Jewiſh Rabbi, who flouriſhed about the year 760. He was denied the title of gaon or excellent, though a man of great learning, on account of ſome material error of which his doctrine was ſuſpected; and the ſuſpicion appears to have been well founded, as he became the reviver and chief of the Sadducæan ſect, which, after having been long almoſt extinct, became formidable to that of the Phariſees. Gantz Tzemach David, p. 725.

ANAON Portus, in *Ancient Geography*, *Santo Hoſpitio*, an obſcure port, which the author of the "Itinerarius Maritimus," commonly ſuppoſed to be Antonine, places between the Portus Herculis and Nicæa. Cluvier has confounded it with Aviſio. M. d'Anville places it in a ſmall creek, at the extremity of a ſmall peninſula, to the eaſt of Nicæa, and forming to the weſt the Portus Dlivula, and to the eaſt the Portus Aviſio.

ANAPÆST, Anapæstus, a foot in the *Greek and Latin poetry*, conſiſting of two ſhort ſyllables, and one long, being the reverſe of the dactyl.

The word is derived from ἀναπαίω, *contra ferio*, because in dancing this meafure, the ground was ftruck in a contrary order from what it was in the dactyl. Whence the Greeks called it ἀντιδάκτυλος. Diom. iii. p. 74.

Such are the words *Ēgĭrānt, făcĭunt, rĕlĕō*.

Ifaac Voffius (de Viribus Rhythmi, p. 56) has faid that the Englifh have no perfect anapæft in their language. But Dr. Burney (Hift. Mufic, vol. ii. p. 79) obferves, that the charge is eafily confuted by the mere mention of the words *recommend* and *difappoint*.

ANAPÆSTIC, or Anapæst, is fometimes ufed in a fubftantive fenfe.

Such is the *anapæftus Ariftophanæus*, in Cicero, which is a verfe confifting of eight feet, as

"Axena ponti per freta colchos denique delatus adhæfi."

Vide Cic. in Orat. cap. 56. Fabr. Thef. in voc. *Anapæftus*.

This is otherwife called *anapæftus octonarius*.

Anapæstic, in an adjective fenfe, fomething relating to or compofed of *anapæfts*.

Anapæstic *kind*, *genus anapæfticum*, is a fort of verfe compofed of pure Ariftophanic or Parthenaic *anapæfts*.

Anapæftic verfes are either Ariftophanic or Pindaric.

Anapæfticus Ariftophanæus, called alfo *Parthenaicus*, confifts of three anapæfts, and one long fyllable, but fo as that inftead of the firft two anapæfts, as many fpondees may be ufed.

Its type ftands thus:

⏑⏑– | ⏑⏑– | ⏑⏑– | ⏑
–– | –– | | –

"Venient cito fæcula quum jam
Socius calor offa revifet
Animataque fanguine vivo
Habitacula priftina geftet
Lacrymas fufpendite cuncti
Mors hæc reparatio vita eft." Bona.

Pindaric Anapæft admits, in the firft place, either of an anapæft or a fpondee; in the fecond, only of an anapæft; in the third, of an anapæft or a fpondee; in the fourth, either of a fpondee or a trochee.

As in the following type:

⏑⏑– | ⏑⏑– | ⏑⏑– | ––
–– | | –– | –⏑

"In fumma pericula venturi
Multos timor ipfe mali mittit."

ANAPAUMENE, in *Ancient Geography*, a fountain of Greece, in the Moloffis, which was part of Epirus. It was fituated near that of Dodona, and was alfo denominated "fons Jovis."

ANAPES, in *Geography*, a town of Flanders, one league from Lille.

ANAPHE, in *Ancient Geography*, an ifland of the Cretan fea, fuppofed to be one of the Cyclades to the eaft of Thera. Steph. Byz. fays, that it was one of the Sporades. Its firft name was *Membliaros*, which it derived from Membliares, the Phœnician, who, when his relation went in queft of Europa, accompanied him, and fettled in the neighbouring ifland of Thera. It was afterwards called Anaphe, a Phœnician word, which, according to Bochart, fignifies fhaded and dark, an epithet given to this ifland, on account of its gloomy and thick forefts. But the moft commonly received opinion is, that it owes this name of Anaphe to the Greek word φαίνω, to *appear*, from the thunder having on a fudden occafioned it to rife from the bottom of the waters, in order to receive the fleet of the Argonauts, on its return from Colchis, when affailed by a furious tempeft. The fable of antiquity is the hiftory of the formation of this ifland, now called Nanfio, which a volcano caufed to appear fuddenly above the fea, in the midft of a violent agitation of the atmofphere and the waves, which has happened to fome other iflands of the Archipelago. In memory of this event was built a temple, mentioned by Strabo, which was confecrated to Apollo Ægletes, or dazzling with light. Slight veftiges of this temple ftill remain on the place which it occupied, in the fouth part of the ifland; and the marble of which it was conftructed was taken from a very fteep rock, of a terrifying afpect, on whofe fummit is now feen a chapel, dedicated to our lady of the reed; in modern Greek "panagia kalamitofa." For a further account of the prefent ftate of this ifland, fee Nanfio.

ANAPHLYSTUS, a fmall maritime town of Attica, in the tribe of Antiochides, very near Athens, towards the cape Colias, and north-weft of Œxona. It had temples of Pan, Ceres, Venus Colliades, and the goddeffes called Genetylides. This place is now called *Elimos*.

ANAPHORA, ἀναφορα, fignifying *repetition*, in *Rhetoric*, a verbal figure, whereby one or more words are repeated in the beginning of feveral fentences or verfes.

This is a lively and elegant figure, and ferves very much to engage the attention; for by the frequent return of the fame word the mind of the hearer is held in an agreeable fufpence till the whole is finifhed.

Such, *e. gr.* is this of the Pfalmift, "The voice of the Lord is powerful: the voice of the Lord is full of majefty: the voice of the Lord fhaketh the wildernefs."

"You do nothing," fays Cicero to Catiline; "you attempt nothing, you think nothing, but what I not only hear but alfo fee, and plainly perceive." This figure is frequently ufed by way of interrogation, which renders it not only beautiful, but likewife ftrong and nervous. Thus Cicero, at the beginning of the fame fpeech: "Does neither the night-guard of the palace, nor the city-watch, nor the people's fear, nor the agreement of all good men, nor the meeting of the fenate in this fortified place, nor the countenances and looks of this affembly, at all move you?" And in another of his orations: "What is fo popular as peace, which feems to afford a pleafure, not only to beings endowed with fenfe, but even to inanimate nature? What is fo popular as liberty, which even beafts as well as men feem to covet and prefer above all things? What is fo popular as eafe and leifure, for the enjoyment of which you and your anceftors have undergone the greateft labours?" Contra Rull. ii. c. 4. Ward's Oratory, vol. ii. p. 56.

Anaphora is ufed in the *Ancient Medicine*, for the rejection of matter by the mouth.

Hence alfo we met with the term anophorici, αναφορικοι, ufed for thofe labouring under an *hæmoptoe*, who bring up blood from the lower part of the mouth.

Anaphora, among *Ecclefiaftical Writers*, denotes the hoft, or fpecies offered in the *eucharift*.

Anaphora is alfo ufed to denote the rehearfing of a perfon's name from the diptychs in the liturgy.

Anaphora is alfo a title given to thofe little Syriac liturgies, wherein are contained the prayers after the *ofculum pacis*. Ignatius, patriarch of the Maronites, enumerates forty of thefe anaphoræ.

Anaphora, in *Aftrology*, denotes the fecond houfe, or that

that part of heaven which is thirty degrees diſtant from the HOROSCOPE.

The term anaphora is ſometimes alſo promiſcuouſly applied to ſome of the ſucceeding houſes; as the ſecond, fifth, eighth, and eleventh. In this ſenſe anaphora amounts to the ſame with *epanaphora*, and ſtands oppoſed to cataphora.

ANAPHORA is alſo applied by ſome to the oblique aſcenſions of the ſtars.

ANAPHRODISIA, from ανα and Αφροδιτη, *Venus*, denotes impotency in reſpect of venery. Some alſo uſe it for a want of deſire or inclination to the ſex.

In this ſenſe the academiſts *Naturæ Curioſæ* give an extraordinary inſtance of this kind in a perſon otherwiſe healthy and robuſt. Eph. Acad. N. C. Dec. i. ann. 8. Obſ. 94. See IMPOTENCY.

ANAPHUS, in *Entomology*, a ſpecies of PAPILIO, in the diviſion *Plebeii Urbicolæ*, that inhabits Surinam. It has no tail, and is uniformly brown, except the apex of the lower wings, which is yellow. Fabricius.—The antennæ are hooked at the end.

ANAPHYSEMATA, from ανα, and φυω, *I ſend forth*, in ſome *Ancient Writers*, denote winds iſſuing from under ground, at the clefts or apertures thereof.

Theſe are ſometimes called by later writers *apogæi*.

ANAPLASIS, from ανα and πλασσω, *I form*, in *Surgery*, the complete reſtitution of a broken bone, ſo that the two ends meet, and cloſe exactly together. This is the ſame with what is otherwiſe called *diaplaſis*.

ANAPLASIS alſo ſignifies a re..utrition of the extenuated fleſh.

ANAPLEROSIS, in the general ſenſe, denotes REPLETION. Anapleroſis is more particularly uſed to denote that part of ſurgery whereby things wanting are ſupplied.

In which ſenſe anapleroſis amounts to the ſame with what we otherwiſe call appoſition, or PROSTHESIS.

ANAPLEROSIS, in the *Civil Law*, is a name which ſome give to the four laſt books of Juſtinian's Code.

ANAPLEROTICS, from αναπλεοω, *I fill up*, in *Medicine*, ſuch remedies as incarnate and fill up ulcers and wounds with new fleſh.

Anaplerotics are the ſame with what we otherwiſe call INCARNATIVES.

ANAPODARI, in *Geography*, a river of the iſland of Candia, which riſes at Caſtel Bonifacio, runs near Caſtel Belvedere, and diſcharges itſelf into the ſea between Cape Matola and Caſtel de Girapetra. The ancients called it Cataractus.

ANAPODOPHYLLUM, in *Botany*. See PODOPHYLLUM.

ANAPUIA, in *Geography*, a province of Venezuela, in South America, towards the mountains of St Peter, and the ſource of the Buria.

ANAPUS, or ANAPIS, in *Ancient Geography*, the name of a river of Sicily, which ran from weſt to eaſt at the diſtance of about two miles from Ortygia, and ſomewhat leſs than a mile and a half from Neapolis, and diſcharged itſelf into the great harbour of Syracuſe. This ſtream, which is only 24 feet wide, and 12 or 15 deep at its mouth, flows, in a ſerpentine courſe, through a ſmall extent of country, which, though ſlightly elevated in its ſouth or ſouth-weſtern ſide, on the north and north-weſt conſiſts of an extenſive marſhy plain. This plain lying between the river and the city, is terminated by two fens or moors, the one called Syrac, whence the city was named, and the other Lyſimela. Between the Anapus and the promontory of Plemyrium, was ſituated the little ſuburb of Olympia, ſurrounding the ſite of the ancient temple of Jupiter Olympus, built upon an eminence, and bounded on either ſide by the vaſt Lyſimelian marſhes, extending from the head of the great harbour, half covered with water in the vernal months, and exhaling, under an almoſt vertical ſun, the moſt unwholeſome and pernicious vapours. To this river the ancients gave the name of ALPHEUS.

ANAPUS was alſo a river of Illyria, which ran near Liſſus.

ANAPUS was alſo a river of Epirus, in Chaonia. Thucydides reckons 80 ſtadia from this river to Stratos, or Stratus, a conſiderable place of Acarnania.

ANAQUITO, in *Geography*, a country of America in Peru and in the province of Quito.

ANARA, in *Ancient Geography*, a town of India, on this ſide the Ganges, according to Ptolemy.

ANARACI, a people of Scythia, on this ſide Mount Imaus, according to Ptolemy.

ANARCHI, people of Scythia, placed by Ptolemy below the Agathyrſi.

ANARCHI MONTES, mountains of Scythia, forming part of the chain of Imaus.

ANARCHI, in *Antiquity*, a name given by the Athenians to four ſupernumerary days in the year, during which they had no magiſtrates.

The Attic year was divided into ten parts, according to the number of tribes, to whom the preſidency in the ſenate fell by turns.

Each diviſion conſiſted of 35 days; what remained after the expiration of theſe to make the lunar year complete, which, according to their computation, conſiſted of 354 days, were employed in the creation of magiſtrates, and called αναρχοι ημεραι, and αρχαιρεσιαι.

ANARCHY, derived from the Greek privative α, and αρχη, *principality*, the want of government in a nation, where no ſupreme authority is lodged, either in the prince or other rulers; but the people live at large, and all things are in confuſion.

All kinds of ſtates are ſubject to anarchies. We read of civil anarchies, eccleſiaſtical or ſpiritual anarchies, and even anarchies in the republic of letters.

Anarchy is ſuppoſed to have reigned after the deluge, before the foundation of monarchies. We ſtill find it obtain in divers parts, eſpecially of Africa and America; *e. gr.* among the Itinois, who are obſerved by travellers to live in a perfect independency of any ſuperior; among the Californians, where every family makes its own laws as well as religion; in Chili, where every maſter of a family is a king; in the Marian iſlands, where neither prince nor law is known, but every perſon governs himſelf according to his own will; and to mention no more, among the Hottentots, where the only reſemblance of government is, that in each neighbourhood, the eldeſt is the firſt in honour, and his advice chiefly followed, not from any civil authority he is veſted with, but on account of his ſuperior experience.

Some extend the idea of anarchy farther, ſo as to make it comprehend all the more popular governments. In this ſenſe anarchy amounts to much the ſame with DEMOCRACY. Hobbes, in this ſenſe, calls the Roman commonwealth an anarchy.

It has ſometimes been controverted which of the two is beſt, a ſtate of anarchy, or of tyranny and arbitrary power. This controverſy, however, does not appear to be of any great uſe; it is of little purpoſe to determine which is beſt, ſince a ſtate of anarchy, naturally, nay, neceſſarily, paves the way for deſpotiſm; and confuſion is always the parent of oppreſſion.

ANARCHY is alſo applied to certain troubleſome and

diſorderly periods, even in governments otherwiſe regular. In Germany, the interval from the election of Richard, duke of Cornwall, to that of duke Rud. of Hapſburg, is commonly called the anarchy, or interregnum.

In England, the period between the death of Cromwell and king Charles's Reſtoration, is commonly repreſented as an anarchy. Every month produced a new ſcheme or form of government. Enthuſiaſts talked of nothing but annulling all the laws, aboliſhing all writings, records, and regiſters, and bringing all men to the primitive level. No modern nation has been more ſubject to anarchies than Poland; where every interval between the death of one king, and the election of another, was a perfect picture of confuſion, inſomuch that it became a proverb among that people, Poland is governed by confuſion.

The Jewiſh hiſtory preſents numerous inſtances of anarchies in that ſtate uſually denoted by this phraſe, *that in thoſe days there was no king in Iſrael, but every man did that which was right in his own eyes*, which is a juſt picture of an anarchy. The firſt anarchy we read of in that commonwealth, is that which enſued on the death of Joſhua, who leaving no ſucceſſor, the government devolved to the elders of the tribes, who ruled each according to his own will. After the death of theſe elders the anarchy became complete.

ANARGYRI, in *Eccleſiaſtical Hiſtory*, is an appellation given to certain ſaints in the Greek church, who having been phyſicians, gave not only their advice but their remedies *gratis*. They are alſo called *argentinopes*.

ANARGYRUS, from α and ἀργύριον, *money*, in *Ancient Writers*, denotes a perſon without money, though otherwiſe ſufficiently accommodated with land and other effects.

In a like ſenſe we ſometimes alſo meet with the word anargyria, uſed for lawyers for the condition of a perſon without ready money.

Mart. Phil. Fabricius has a diſſertation *De Exceptione Anargyriæ*.

ANARHAPHE, from ἀνα and ῥαφὴ, *ſuture*, in *Surgery*, denotes a kind of future or retraction of the upper eye-lid, when relaxed and hanging over the eye.

This is by ſome alſo called *futura blepharica*, by others *abbreviatio*, *contractio*, *collectio*, or *ſuſpenſio ſuperioris palpebræ*. It is uſed in the *phalangoſis*, *ptoſis*, or *chalaſis*; where the ſight is obſtructed by a *prolapſus* of the part, or the eye-lid itſelf is too thick beſet with briſtly hairs both within and without.

ANARHICHAS, in *Ichthyology*, a genus of the order Apodes. The head is obtuſe, fore teeth in each jaw conic, large, divergent, ſix in number or more grinders in the lower jaw, and palate rounded. Six rays in the gill membrane. Body roundiſh, tail fin diſtinct. Linn. Gmel.—The ſpecies of this genus are Lupus, Minor, and Pantherinus, which ſee.

ANARIA, in *Ancient Geography*, *Iſchia*, an iſland ſouth-eaſt of Baiæ. Auguſtus gave it to the inhabitants of Neapolis, in exchange for the iſland of Caprææ. It was alſo called Pythecuſa.

ANARIACA, a town which, according to Strabo, was near the Caſpian ſea. It is ſuppoſed to have been ſituated between Albania and Hircania.

ANARIS Mundi promontorium, was ſituated, according to Ptolemy, in the iſland of Taprobana.

ANARIUM, a town of Aſia, in Greater Armenia, according to Ptolemy.

ANARPI, a people placed by Ptolemy in Germany.

ANARRHINON, in *Botany*, a name given by ſome of the ancients to the plant called by others lychnis *agria*, and by others *antirrhinum*. Pliny tells us, that this plant reſembled flax, that it had ſcarce any root; that its flower was the colour of the hyacinth, and its fruit reſembled the noſe of a calf. It is from this reſemblance that we at this time call the plant *calves' ſnout*. Dioſcorides ſays, that it was like the *anagallis*.

ANARTES, or Anarti, in *Ancient Geography*, a people who inhabited the north-weſt part of Dacia, according to Cæſar and Ptolemy.

ANARTHRA, from α and ἄρθρον, *joint*, in *Natural Hiſtory*, a claſs of naked inſects, diſtinguiſhed from all others by having neither wings nor limbs. To this claſs belong all kinds of worms and leeches.

ANARTOPHRACTI, in *Ancient Geography*, a people placed by Ptolemy in Sarmatia, adjacent to the Ombrones, in European Sarmatia.

ANAS, now called Guadiana, a river of Spain in Bœtica.

ANAS, in the Linnæan ſyſtem of *Ornithology*, the name of an extenſive genus of birds, of the order Anseres, and known in England by the general names of Swans, Geese, and Ducks. The Linnæan character of this genus is taken from the form of the bill and tongue; the bill being convex, obtuſe, and the edges of both mandibles beſet with lamellated teeth: the tongue ciliated and obtuſe. Linn. Gmel. To this conciſe generical diſtinction ſome authors add, that the bill is ſtrong, broad, depreſſed, and commonly furniſhed at the end with an additional piece or nail; noſtrils ſmall and oval; tongue broad, and fringed at the edges, near the baſe; toes four in number, three being placed before, and one behind, and the middle one longeſt. Latham. Gen. Syn.

The ſpecies of this genus, according to the lateſt authorities of Linnæus, Latham, Gmelin, &c. are,

Acuta, pintail duck
Adunca, hooked bill duck
Ægyptiaca, Egyptian gooſe
Africana, African teal
Albeola, buffel-headed duck (Latham).
Albicans, brown-necked duck
Albifrons, white-fronted gooſe
Alexandrina, Alexandrian duck
Americana, American duck
Anſer, wild gooſe, or grey-lag
Antarctica, Antarctic gooſe
Arabica, Arabian teal
Arborea, black-billed whiſtling duck
Atrata, black ſwan (Phillips)
Autumnalis, red-billed whiſtling duck
Bahamenſis, Bathera duck
Balbul, cahira duck
Beringii, Bering gooſe
Bernicla, Brent, or Brand gooſe
Borealis, Gulaund duck
Boſchas, wild duck
Braſilienſis, Mareka duck
Bucephala, buffel-headed duck (Gmel.)
Cæruleſcens, blue-winged gooſe
Cana, grey-headed gooſe
Canadenſis, Canada gooſe
Capenſis, Cape wigeon
Carolinenſis, Carolina, or American teal
Caſarca, ruddy gooſe
Cinerea, aſh-coloured, or loggerhead gooſe
Circia, ſummer teal
Clangula, golden-eyed duck
Clypeata, ſhoveller
Coromandeliana, Coromandel teal
Coſcoroba, Chili gooſe
Crecca, common teal
Criſtata, creſted duck
Curviroſtra, curve-billed duck
Cygnoides, Chineſe gooſe
Cygneus, wild or whiſtling ſwan
Damiatica, Damietta duck
Diſcors, blue-winged teal
Diſpar, weſtern duck
Domeſtica, common tame duck
Dominica, St. Domingo duck
Dominicana, Dominican duck
Erythropus, Bernacle gooſe
Erythrorhyncha, crimſon-billed duck
Falcaria, falcated duck
Ferina, pochard, or red-headed wigeon
Ferruginea, ferruginous duck
Formoſa, Baikal teal
Fuligula, tufted duck
Fulva, Mexican pochard
Fuſca, velvet duck
Fuſcefcens, brown duck
Galericulata, Chineſe teal
Gambenſis,

A N A

Gambenſis, ſpur-winged gooſe
Gaittoir, Gattair duck
Georgica, Georgia duck
Glacialis, long-tailed duck (Latham)
Glaucion, grey-headed duck
Glocitans, bimaculated duck
Gmelini, Ruſſian teal
Grandis, great gooſe
Hina, Hina teal
Hiſtrionica, harlequin duck
Hybrida, Hybrid ſwan
Hyemalis, long-tailed duck (Edwards)
Hyperborea, ſnow gooſe
Jacquini, cheſnut-coloured duck
Jamaicenſis, Jamaica ſhoveller
Indica, barred-headed duck (Latham)
Iſlandica, Iceland duck
Kagolka, Kagolka duck
Kekuſchka, Kekuſchka duck
Labradoria, pied duck
Leuccephala, white-headed duck
Leucoptera, buſtard gooſe
Lurida, lurid duck
Madagaſcarienſis, Madagaſcar teal
Magellanica, Magellanic gooſe
Malacorhyncos, ſoft-billed duck
Manillenſis, Manilla teal
Marilla, ſcaup duck
Marſa, ural duck
Melanocephala, black-headed ſwan
Melanotos, black-backed gooſe
Melanura, black-tailed duck
Mexicana, Mexican duck
Minuta, minute duck
Molliſſima, eider duck
Monacha, white and black variegated duck
Montana, mountain duck
Moſchata, Muſcovy duck
Nigra, black duck
Nigricollis, black-necked ſwan
Nilotica, Nilotic duck
Novæ Hiſpaniæ, Mexican duck
Novæ Seelandiæ, New Zealand duck
Nyraca, Tanain tufted duck
Obſcura, duſky duck
Olor, mute ſwan
Orientalis, Muſcovy gander (Gmelin)
Penelope, wigeon, or whim
Perſpicillata, black duck
Picta, painted gooſe
Poecilorhyncha, ſpotted-billed duck (Latham)
Querquedula, garganey
Regia, white-collared blue duck
Rubens, red-breaſted ſhoveller
Rufa, rufous-necked duck
Ruficollis, red-breaſted gooſe
Rufina, red-creſted duck
Ruſtica, little brown duck
Scandiaca, Lapmark duck
Segetum, bean gooſe
Sirſair, Sirſair duck
Spectabilis, king duck
Spinoſa, ſpinous-tailed teal
Sponſa, ſummer duck
Stelleri, weſtern duck
Strepera, gadwall, or grey
Superciliosa, ſupercilious duck
Tardona, ſhieldrake
Torquata, ringed gooſe
Torrida, torrid duck
Variegata, variegated gooſe
Viduata, Spaniſh duck; which ſee reſpectively.

ANASARCA, from ἀνὰ and σὰρξ, *fleſh*, in *Medicine*, a ſort of univerſal dropſy, wherein the whole or conſiderable part of the body is ſtuffed or bloated with watery fluid.

This diſtemper is ſometimes alſo called *cataſarca*, ſometimes *hypoſarcidium*, ſometimes *epiſarcidium*, ſometimes *aqua inter cutem*, or *intercus*, becauſe the humour ſpreads itſelf through the fleſh. Serenus Samonicus elegantly calls it *lymphaticus error*; Albucaſis calls it a dropſy by infiltration.

Preternatural collections of water in any part of the body, except the urinary bladder, are called Dropsies. Some of theſe are confined to particular cavities, and take their name from that of the cavity, as, *hydrothorax*, or a dropſy in the cheſt; *aſcites*, a dropſy of the abdomen, &c. but anaſarca may take place in any part of the body where there is *cellular membrane*. Dr. Cullen places it in his third claſs, Cachexiæ, order, *Intumeſcentiæ*, aquoſæ, and admits ſeveral ſpecies of it, depending on the remote cauſe. The moſt uſual and general *Cauſe* of anaſarca is debility, whether induced by fatigue, or watching without lying down, by hæmorrhage, by eruptive fevers, or by deficient or watery food. It is ſometimes believed to ariſe during pregnancy, from the preſſure of the uterus on the veins which return the blood from the lower extremities.

The *Eſſential Character* of this diſeaſe is founded on the ſwelling being pale, ſoft, and leaving a pit after preſſure with the fingers.

Symptoms. As anaſarcous affections differ much in degree or ſeverity from a ſlight ſwelling of the feet and ankles towards night, to a general diffuſion of water throughout the cellular membrane of the whole body and extremities; ſo the ſymptoms or degrees of diſtreſs experienced by the patient are greatly diverſified. That which firſt attracts his attention is a ſtiffneſs of the ankles, after remaining long in the erect poſture. This increaſes daily till the feet, legs, and thighs become ſo large, that the ſkin ſeems in danger of burſting. When the diſeaſe approaches towards this magnitude, the water ſhifts its place with the poſture of the body; ſo that after lying in the horizontal poſture all night, the ſwelling of the legs will be much diminiſhed, while that of the trunk, arms, and face will be increaſed. In this ſtage the patient often experiences *dyſpnæa* and thirſt, with loſs of appetite; the ſecretion of urine is diminiſhed; the *ſcrotum*, or *labia* are ſo diſtended, that walking becomes impracticable, when the ſwelling and ſtiffneſs of the feet alone would not have rendered it ſo. This is the uſual progreſs of anaſarca; but it ſometimes ſupervenes ſo ſuddenly, that the whole body will partake of the ſwelling in twenty-four hours. There is no doubt that it may often exiſt alone, without any other ſpecies of dropſy; we however very commonly find it combined with Hydrothorax, or Ascites; and it is then of courſe more difficult of cure. The *prognoſis* is generally unfavourable, in old people eſpecially, or thoſe who have injured their conſtitution by the abuſe of ſpirituous liquors. Where the affection is ſlight, and brought on by ſitting up for ſeveral days and nights, in a good conſtitution we may always expect a cure.

The *treatment* ſhould be adapted to the ſtate and degree of the diſeaſe. In ſlight affections of ſhort ſtanding, flannel rollers to the feet and ankles, with bark or ſteel internally, will generally ſucceed. In ſevere caſes we attempt the cure on the following plan, *viz.*

1. We obviate all cauſes of debility by diet, air, and exerciſe; and we endeavour to reſtrain all debilitating evacuations.

2. We ſhould then employ the means which are found moſt ſucceſsful in evacuating the collected fluid. The firſt of theſe is to promote its abſorption; which is done,

A. By the *preſſure* of bandage and friction, with or without mercurial ointment.

B. By *Emetics*; eſpecially hydrarg. vitriolatus, cuprum vitriolatum, pulvis antimonialis, and, above all, elaterium in powder.

C. By *Purgatives*, ſuch as calomel, gamboge, elaterium and jalap combined with cryſtals of tartar, nitre, or kali acetatum. The abſorption, in this caſe, moſt probably, is a conſequence of the increaſed excretion from the inteſtines.

When the aqueous fluid is abſorbed and carried into the blood, the ſecretion by the kidneys is commonly increaſed, by which it is carried out of the body. But if this ſhould not take place, we have recourſe to thoſe medicines called

D. *Diuretics*. Whether theſe exert their action on the kidneys alone, or whether they produce their effect by promoting the activity of the abſorbent ſyſtem, is not aſcertained. The moſt ſucceſsful diuretics are mercury, whether introduced by friction or taken internally; and it appears to be a good prepara-

tion

tion for the employment of all other remedies of this claſs. Squills, recent or dried, or an infuſion of them in Liſbon wine; the tincture of digitalis, which being a medicine of great power, requires diligent watching; kali fatuated with vinegar of ſquills; the juice of leeks: the extract of broom tops; the infuſion of juniper berries with ſweet ſpirit of nitre, infuſion of tobacco, &c. &c. The *doſes* of theſe medicines are not ſet down, as practitioners know them, and they are too powerful to be preſcribed by others. If theſe remedies fail of producing the deſired effect, and the ſkin of the legs, ſcrotum, &c. ſeems in danger of burſting, we may have recourſe to punctures. Theſe ſhould be made in depending parts, that the water may drain off more freely, and very ſmall, on account of the danger of *gangrene*, which is a frequent conſequence of large and deep inciſions.

5. When by ſuch means as theſe we have evacuated the water, or a great part of it, we muſt attempt to invigorate the ſyſtem by bark, ſteel, bitters, riding, ſea bathing, and a generous diet.

Dr. Dover's cure for an anaſarca is an electuary compoſed of ſteel prepared with ſulphur and crude antimony, each an ounce; *diagridium*, four ounces; make a fine powder of theſe: then add as much of any ſyrup as will make a ſoft electuary.

ANASCHOUADI, in *Botany*. See ELEPHANTOPUS.

ANASSA. See BROMELIA.

ANASSAS, in *Natural Hiſtory*, the name of a fruit very common in Guinea, and in ſome other parts of Africa. It is very beautiful to the eye, and not leſs agreeable both to the taſte and ſmell, and is by ſome accounted the fineſt fruit in the world. The deſcriptions we meet with of it are very imperfect; but as there is nothing in them that contradicts its being the pine-apple, it may be that fruit, and if ſo, it deſerves all the praiſe that is given it. See BROMELIA.

ANASSUS, or ANAXUS, in *Ancient Geography*, a river of Italy, in the territory of Venice, now the *Piave*. According to M. d'Anville, it runs from the north to the ſouth, and falls into the bottom of the gulf, to the weſt of Aquileia, near Muranum.

ANASTAMIA, in *Geography*, a conſiderablb ſea-port town of Japan, the principal commerce of which is wood.

ANASTASIA, in *Ancient Geography*, a town of Meſopotamia, nearly ſouth of Niſibis. It was for a long time a ſmall place known by the name of Dara. When the Perſians and Romans concluded a treaty, the emperor Anaſtaſius fortified Dara, enlarged and beautified it, and called it Anaſtaſia.

ANASTASIOPOLIS, a name given to five cities; one in Syria, another in Phrygia, a third in Caria, a fourth in Galatia, and a fifth in Thrace.

ANASTASIS, a Greek word adopted into the Engliſh language, which denotes a reſurrection.

Chiflet has given us a diſſertation on Childeric's tomb, under the title of *Anaſtaſis Childerici*. Truer has publiſhed the figure of a man and woman in the ancient German habit, as found in an ancient urn, under the title of *Anaſtaſis veneris Germani Germanæque Feminæ*.

ANASTASIS, among *Ancient Phyſicians*, denotes a riſing up to go to ſtool. It likewiſe ſignifies a migration of humours, when expelled from one place and obliged to remove to another.

ANASTASIUS I. in *Biography* and *Hiſtory*, emperor of the eaſt, was born at Duras, in Illyricum, A. D. 430; and, from being one of the officers of the great chamberlain, called Silentiarii, and before he had obtained the rank of ſenator, was advanced to the empire, A. D. 491. His promotion was owing to the intereſt and influence of Ariadne, the widow of Zeno, who prevailed upon the ſenate to acknowledge Anaſtaſius, in oppoſition to the claims of Longinus, the brother of Zeno, as his ſucceſſor. As ſoon as he had attained this dignity he married Ariadne, being then in the 60th year of his age. Such was the eſtimation in which he was generally held, on account of his temperance and integrity, before his advancement, that, upon his receiving the purple and diadem in the circus, the people, applauding his promotion, exclaimed with one voice, "Reign, Anaſtaſius, as you have lived." The firſt act of his reign confirmed their expectations; for he immediately remitted whatever was due to the treaſury, and entirely aboliſhed the infamous tax, called the CHRYSARGYRUM. He alſo expelled all informers from Conſtantinople, and put a ſtop to the enormous abuſe, introduced by his predeceſſor Zeno, of expoſing to ſale all public offices, and beſtowing, to the great oppreſſion of the people, the beſt governments on the higheſt bidders. The tranquillity of his reign, though thus popular at its commencement, was ſoon interrupted by the rebellion of Longinus and the Iſaurians, who, leaving the arms and money lodged by Zeno in a fort of Iſauria, were enabled to raiſe and equip an army of 150,000 men. Conon, biſhop of Apamea, in Syria, abandoning his flock, joined his countrymen, and became one of the ringleaders of the revolt. The emperor, however, ſoon collected a force, which, under the conduct of two of the moſt renowned generals of that age, viz. John, the Scythian, and John, ſurnamed Gibbus, or the hunch-backed, encountered the rebels in the vicinity of Cotyæa, in Phrygia, cut off a great number of them, and obliged the reſt to ſeek refuge among the inacceſſible mountains of Iſauria, where they maintained themſelves for ſix years, notwithſtanding the utmoſt efforts of the beſt generals of the empire. In the following year the emperor, whoſe temper was naturally avaricious, deviated from the liberal plan with which he commenced his reign, and laid a heavy tax on the inhabitants of Conſtantinople, called evagrius chryſotelia, which, being unexpected, incenſed them to ſuch a degree, that they recurred to arms, demoliſhed the emperor's ſtatues, and dragged them through the chief ſtreets of the city, together with thoſe of the empreſs Ariadne, uttering very injurious invectives againſt her and Anaſtaſius. This tumult was no ſooner ſuppreſſed than it was ſucceeded by others equally miſchievous and dangerous; in one of which the emperor narrowly eſcaped being murdered in the circus by the populace, becauſe he refuſed to releaſe ſome priſoners who had been concerned in a riot. In 499 the Bulgarians invaded Thrace, and defeated the Romans; and in 502 the Perſians entered Armenia with a powerful army, took Amida, pillaged the town, and put moſt of the inhabitants to the ſword. In the mean time Anaſtaſius diſpatched a ſtrong force againſt the enemy, which was defeated. However, in the following year, Amida was again beſieged, and upon the concluſion of a truce between the Romans and Perſians, the city was reſtored to the former, on condition of their paying to the king of Perſia fifty talents. This truce between the two empires was concluded A. D. 505. About this time, Mondo, a Goth, having ſettled, with many of his countrymen, in ſome uninhabited places beyond the Danube, ſeized on a fortreſs called Herta; and from hence, by frequent incurſions into the Roman territories, continued to haraſs the ſubjects of the empire, and aſſumed the title of king. Anaſtaſius diſpatched againſt him Sabinianus, at the head of 10,000 choſen men; and this circumſtance obliged Mondo to ſeek the ſuccour of Theodoric, the Gothic king

of Italy, who had the year before reconquered Pannonia, and recovered Scrinium out of the hands of the Gepidæ. Mondo, by this alliance with Theodoric, was enabled to defeat Sabinianus in a pitched battle, near Margus, in Lower Dacia, and forced him to take refuge in the caſtle of Nato. The conſequence of theſe hoſtilities was a miſunderſtanding between Anaſtaſius and Theodoric. Such were the dangers that threatened Conſtantinople and the adjacent country, that Anaſtaſius was obliged to betray the impotence of his arms by building a bulwark, called the *long wall*, and the *wall of Anaſtaſius*, of which the Byzantine hiſtorians make frequent mention. This wall was diſtant from Conſtantinople about 40 miles, and extended about 60 miles from the Propontis to the Euxine, incloſing not only the metropolis, but the city of Selymbria, and the neighbouring country, which was a cultivated garden, with an incredible number of ſtately villas and houſes of pleaſure, richly furniſhed and adorned. It was 20 feet broad, and defended by towers at ſmall diſtances from each other, by which means the inhabitants, upon the ſhorteſt warning, had an opportunity of putting themſelves in a poſture of defence, and of eaſily repulſing the barbarians. He likewiſe cauſed the city of Daras, a frontier town towards Perſia, to be repaired and fortified, in order to prevent the Perſians from invading the empire on that ſide. The other difficulties with which Anaſtaſius ſtruggled were inconſiderable, compared with thoſe in which he was involved by a religious war, the firſt that diſgraced the Chriſtian name. The emperor, who was a zealous patron of the doctrine of Eutyches, aboliſhed the orthodox addition, "who was crucified for us," that had been made by the devotion of Antioch to the "Triſagion," *i. e.* thrice holy, "Holy, holy, holy, Lord God of hoſts," which was a hymn uſed in public worſhip. This alteration occaſioned a violent tumult, in which many perſons loſt their lives; and the emperor was compelled to take refuge in his galley, till the orthodox patriarch, Macedonius, had pardoned and interceded for him. Macedonius was afterwards baniſhed, and upon his exile the ſedition was again renewed; the ſtatues of the emperor were broken, and his perſon was concealed in a ſuburb, till, at the end of three days, he ventured to implore the mercy of his ſubjects. Accordingly Anaſtaſius, without his diadem, and in the poſture of a ſuppliant, appeared on the throne of the circus, and was happy to reconcile himſelf with his people by the ſacrifice of two unpopular miniſters who were condemned to the lions. Theſe furious but tranſient ſeditions were encouraged by the ſucceſs of Vitalian, one of the emperor's generals, who, eſpouſing the cauſe of Macedonius, and the other orthodox biſhops, perſecuted by Anaſtaſius, approached Conſtantinople with a numerous army of Huns and Bulgarians, and threatened to depoſe the emperor, if the baniſhed biſhops were not reſtored, and the Eutychians expelled. As the emperor heſitated in complying with this demand, Vitalian, the champion of the catholic faith, depopulated Thrace, beſieged Conſtantinople, and exterminated 65,000 of his fellow Chriſtians, till at length he obtained the recal of the biſhops, the ſatisfaction of the pope, and the eſtabliſhment of the council of Chalcedon. In conſequence of this treaty, which Anaſtaſius was compelled to ſign, A. D. 514, Vitalian withdrew from Conſtantinople, and diſbanded his troops. Pope Symmachus, it is ſaid, engaged in this quarrel, and, by excommunicating Anaſtaſius, ſet the firſt example of the employment of ſpiritual thunder againſt ſovereigns. Anaſtaſius, delivered from his fears, renewed his perſecution of the catholics; but he did not long ſurvive the humiliating act to which he was obliged to ſubmit. In the year 518, the 88th year of his age, and the 28th of his reign, he ſuddenly cloſed his life, being as much hated and reproached by his ſubjects in his latter years, as he had been beloved and extolled in his earlier days. By the Catholic hiſtorians he is charged with avarice and cruelty, and almoſt all the crimes that could diſgrace a ſovereign; but his want of orthodoxy, which, in their judgment, was one of his greateſt crimes, might poſſibly induce them to exaggerate his other bad qualities. The vaſt treaſure which he poſſeſſed at his death was accumulated by the ſale of public offices, and by ſharing with his governors the ſpoils of an oppreſſed people. Anc. Un. Hiſt. vol. xiv. p. 443—451. Gibbon's Hiſt. vol. vii. p. 129. vol. viii. p. 314.

Anastasius II. whoſe proper name was Artemius, was advanced by the free voice of the ſenate and people, to the throne of Conſtantinople, A. D. 713, from the low condition of a ſecretary to his predeceſſor Philippicus, who had been depoſed.

He was a man of learning and prudence, and had been from his youth employed with ſingular ſucceſs in the management of public affairs. In the beginning of his reign he appointed Leo, the Iſaurian, a perſon of great military experience, commander in chief of all his forces, and ſent him with a powerful army to the frontiers of Syria, in order to protect Aſia Minor againſt the inroads of the Saracens. He alſo prepared for defeating their deſign of laying ſiege to Conſtantinople by a naval armament, by repairing the walls, by filling the public granaries, and by ordering thoſe citizens, who had not laid up proviſions for three years, to quit the city. When news was brought that the enemy's fleet had ſailed to Phœnicia, he ordered his to aſſemble at Rhodes; but the admiral by his endeavours to maintain ſtrict diſcipline, occaſioned a mutiny, and loſt his life. The ſeamen, dreading the puniſhment which they deſerved, and knowing that they could not avoid it, openly revolted, declared Anaſtaſius unworthy of the empire, and obliged Theodoſius, a perſon of mean extraction, and receiver of the revenue at Adramyttium, to accept of the purple. Anaſtaſius, when he heard of this revolt, fled to Nice; and Theodoſius haſtened to beſiege Conſtantinople, which he reduced after a defence, on the part of the garriſon, for ſix months. Anaſtaſius, being promiſed his life by the conqueror, renounced all claim to the empire; and, aſſuming the habit of a monk, was baniſhed to Theſſalonica, after he had enjoyed the title of emperor about two years. In 719, whilſt Leo was emperor, Anaſtaſius quitted his retirement, and induced the Bulgarians to acknowledge and ſupport his claim to the crown. With a numerous army of theſe barbarians he laid ſiege to Conſtantinople; but his followers, being diſappointed in their expectation of eaſily becoming maſters of the city, ſeized the unfortunate Anaſtaſius, and delivered him up to the emperor, who put him and his accomplices to death. Anc. Un. Hiſt. vol. xv. p. 35, &c. Gibbon's Hiſt. vol. ix. p. 24. vol. x. p. 8.

Anastasius, pope, ſucceeded Syricius in the papal chair, A. D. 398. During his pontificate a diſpute aroſe between Jerom and Ruffinus, occaſioned by the following circumſtance. Ruffinus, being an admirer of Origen, had publiſhed a Latin tranſlation of his "Periarchon," or treatiſe of principles, which was much read at Rome, and ſerved to diſſeminate the diſtinguiſhing ſentiments of this celebrated father. Having publiſhed this tranſlation, without any animadverſions on the part of Syricius, he left Rome, and returned to Aquileia, where he was preſbyter. Upon the elevation of Anaſtaſius, Marcella, a Roman matron, complained to the new pope of the prevalence of new doctrines, requeſted his interpoſition for preventing the evil, and accuſed

Ruffinus

Ruffinus is the author of the tranſlation to which it was owing. Anaſtaſius for ſome time declined either proceeding againſt Perſons, or cenſuring his tranſlation; but at length Jerom, in a new version of the work, undertook to prove that ſeveral opinions of Origen were heretical, and as ſuch ought to be condemned by the church. He alſo inveighed againſt Ruffinus, ſuggeſting, that he had tranſlated the work of Origen merely for the purpoſe of propagating the errors which it contained. A council was convened, which condemned the errors of Origen, and Origen himſelf as a heretic, and forbade all perſons, under the juriſdiction of ſeveral of the biſhops, who were aſſembled, either to read or to retain in their poſſeſſion, any of his works. Origen being thus condemned as an heretic, about 150 years after his death, Anaſtaſius, at the inſtigation of Marcella, and ſome of Jerom's friends, ſummoned Ruffinus to Rome, and demanded an account of his faith. Ruffinus ſent a confeſſion of his faith to Anaſtaſius, but it was not ſatisfactory; and the pope was at laſt prevailed upon to ſeparate himſelf from communion with him. Anaſtaſius has no other claim to notice than that of being a zealous defender of the catholic faith. He died in 402; and his epiſtle to John, biſhop of Jeruſalem, who had written to him in behalf of Ruffinus, is extant. Fabr. Bib. Græc. lib. v. c. 35. § 8. Dupin's Ecc. Hiſt. vol. iii. p. 58. Bower's Lives of the popes, vol. i. p. 277, &c.

Anastasius II. pope, was the ſon of a Roman citizen, and ſucceeded Gelaſius, A. D. 496. He was more peaceably diſpoſed than either of his two predeceſſors, and was deſirous of effecting a reconciliation between the ſee of Rome and that of Conſtantinople, which had for ſome time been at variance. With this view he wrote a humble and reſpectful letter to the emperor Anaſtaſius, and ſent two biſhops, accompanied by Feſtus the patrician, as legates, to execute his purpoſe. Although the biſhops were well received by the emperor; he choſe to confer with Feſtus rather than with them; and he contrived to perſuade him to uſe his intereſt with the pope for reconciling the eaſtern and weſtern churches, upon ſuch terms as he thought proper to propoſe. The pope himſelf was diſpoſed to acquieſce; and to allow the name of Acacius to remain in the Diptychs, as well as to receive and ſign the Henoticon; but this condeſcenſion on his part gave great offence to the Roman clergy. The church of Alexandria, availing themſelves of the peaceable diſpoſition of the pope, ſent deputies to Conſtantinople in order to negotiate a reconciliation with Rome. But theſe pacific meaſures were defeated by the premature death of Anaſtaſius. Whilſt the legates were on their return to Italy, and before they reached Rome, the pope died, A. D. 498; and this unpropitious event was a great diſappointment and mortification to Feſtus, who, depending on his inclination to peace, and the confidence repoſed in him by the pope, had entertained hopes of ſoon reſtoring the ancient harmony between the eaſt and weſt, and of being himſelf inſtrumental in accompliſhing ſo deſirable an object. The diſpoſition and conduct of Anaſtaſius, who was ready to ſacrifice even the pretenſions of his ſee to the welfare of the church, however laudable in themſelves, were no recommendation to the honours that were conferred in that age of ignorance and bigotry. He was not thought worthy of a place in the calendar; and his memory has been aſperſed, as if he were an enemy to the Catholic faith; and his death, before he had completed two years of his pontificate, has been repreſented by Platina and others as a judgment from heaven. His letter to the emperor, and another to Clovis, the firſt Chriſtian king of the Franks, congratulating him on his converſion to the Chriſtian religion, are ſtill extant in the Books of councils. Cave's Hiſt. Lit. vol. i. p. 465. Fabr. Bib. Græc. lib. v. c. 35. § 8. Bower's Hiſt. Popes, vol. iii. p. 236, &c. Dupin, Eccl. Hiſt. vol. iv. p. 181.

Anastasius III. pope, was by birth a Roman, and ſucceeded Sergius, A. D. 911. This pope, at the requeſt of Berengarius, king of Italy, ſent many rich ornaments to the church of Pavia, and granted to the biſhop of that city the uſe of a canopy, the privilege of riding a white horſe, with the croſs carried before him, and of ſitting in all councils at the pope's left hand. He died in 913, and was buried in the Vatican. He is commended in his epitaph for the mildneſs of his government, his integrity, and the purity of his manners. He died nothing blame-worthy, ſays Platina, which, in the popes of thoſe days, was a ſubject of commendation. Bower, vol. v. p. 88.

Anastasius IV. pope, was a native Roman, of the name of Conrad, and ſucceeded Eugenius III. A. D. 1153. His temper was mild and peaceable; of which he gave evidence in his method of compromiſing a difference that had ariſen in the laſt pontificate between the emperor Frederic and the Court of Rome. For this purpoſe he ſent cardinal Gerard into Germany, whoſe imperious behaviour incurred the diſpleaſure of the emperor, ſo that he was ordered to quit the country. The cardinal, it is ſaid, died of grief in his way to Rome. This pope took no notice of the affront, but yielded to the emperor the point in diſpute. This conciliatory conduct, which might poſſibly have been the means of preventing the horrors of war, has been condemned by the advocates of the dignity of the papal ſee, as an inſtance of irreſolution and puſillanimity. Anaſtaſius reſtored William, archbiſhop of York, who had been depoſed by Eugenius, to his ſee; and in the ſame year he alſo iſſued a bull, confirming and enlarging the privileges of the Knights of the Hoſpital at Jeruſalem, ſince known by the name of the Knights of Malta. In a great ſcarcity of corn, which happened during his pontificate, he manifeſted his humanity by liberally contributing to the relief and ſupply of the poor. After a Pontificate that laſted little more than a year, Anaſtaſius died, A. D. 1154; and was buried in the church of the Lateran, in a tomb of porphyry, exquiſitely wrought, in which had lain the body of St. Helena, the mother of the emperor Conſtantine. Ten letters of this pope are preſerved in the Collections of Councils by Labbè and Harduin, and in Du Cheſne's Hiſtory of France. Fab. Bib. Græc. lib. v. c. 35. § 8. Bower's Hiſt. vol. vi. p. 72, &c.

Anastasius, anti-pope, was elected in 855 by the envoys of the emperors Lotharius and Lewis in oppoſition to Benedict III.; but the biſhops of Oſtia and Albano, alleging that he had been depoſed in a council, refuſed to conſecrate him: upon which the envoys abandoned Anaſtaſius, and he was obliged to relinquiſh his pretenſions. Bower's Hiſt. vol. iv. p. 260, &c.

Anastasius *Sinaita*, a monk of Mount Sinai, lived in the ſixth century, in the year 561 was promoted to the dignity of patriarch of Antioch, and died in 599. Evagrius repreſents him as a perſon eminently ſkilled in ſacred literature, exemplary in his conduct, and ſcrupulouſly attentive to the duties of piety. He was the author of ſeveral works in Greek, which are ſtill extant; ſuch as "Ὁδηγος; or, "A Guide in the Way againſt the Acephali;" printed in 4to. at Ingolſtadt in 1606. "Queſtiones et Reſponſiones de variis Argumentis in S. Scripturam," numero 154; printed in Greek and Latin at Ingolſtadt in 1617, 4to. "Anagogicarum Contemplationum in Hexameron, libri ii." or, "Myſterious Contemplations on the ſix Days' Creation," publiſhed

publiſhed in Latin, at Paris, in 1609; the 12th book was publiſhed in Greek and Latin by Alix, in London, in 1682, 4to.; a treatiſe, which, according to the opinion of Moſheim, betrays the levity and ignorance of the author. Other tracts are preſerved in the "Bibliotheca Patrum." Cave's Hiſt. Lit. vol. i. p. 531. Moſheim's Eccl. Hiſt. vol. ii. p. 127. Fabr. Bib. Græc. lib. v. c. 35. § 1.

Anastasius, Theopolitanus, was biſhop of Antioch, and flouriſhed in the ſixth century. He eſpouſed the opinions of a ſect denominated Aphthartodocetæ, and on this account Juſtinian deſigned to depoſe him; but being prevented by death from executing his purpoſe, Juſtin the younger baniſhed him in 570, and he remained in exile twenty-three years. Mauritius reſtored him to his ſee in 593. He died in the year 599, and was ſucceeded by another Anaſtaſius, who was killed in a tumult by the Jews in 609. This biſhop of Antioch has left ſome ſermons, and treatiſes on the Trinity, and other points of faith, which were publiſhed in Latin at Ingolſtadt in 1616, in 4to.; and alſo the "Annunciation of the Virgin Mary, and Transfiguration of Chriſt," publiſhed in Greek and Latin, in the firſt volume of "Combefiſii Auctarius," fol. Paris, 1648. Fabr. Bib. Græc. lib. 5. c. 35. § 1. tom. ix. p. 312. p. 332.

Anastasius, the *Librarian*, was a Roman abbot and preſbyter, and flouriſhed in the ninth century. He had the charge of the Vatican Library under ſeveral popes; in 869 he aſſiſted at the general council of Conſtantinople, and tranſlated into Latin the acts of that council, and alſo the acts of the council of Nice, held in 787, which are ſtill extant. To this tranſlation he prefixed "A Hiſtory of the Schiſm of Photius and the Council." He alſo wrote, or compiled, the lives of the popes down to Nicholas I. continued by others, and publiſhed with the eccleſiaſtical hiſtory of Nicephorus Syncellus, and Theophanes, at Paris, in 1649, fol. An enlarged edition of this work has been ſince publiſhed by Bianchini, in four volumes folio, at Rome, in 1718. Anaſtaſius was a learned man, and a tolerable writer. Cave's Hiſt. Lit. vol. ii. p. 56. Fabr. Bib. Græc. lib. v. c. 35. § 8. tom. ix. p. 339.

ANASTATIA, St. in *Geography*, a ſmall iſland near the coaſt of Eaſt Florida, ſouth of Maſtances inlet, where the river Maſtances forms two iſlands of the ſame name at its mouth. St. Anaſtatia iſland is bounded on the north by St. Auguſtine's bar. It has a quarry of fine ſtone for building.

ANASTATICA, formed from ἀναστικος, *reſuſcitating*, from its quality of reviving in water, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs and order, of the natural order *ſiliquoſæ*, or *cruciformes*, and the *cruciferæ* of Juſſieu: its characters are, that the *calyx* is a four-leafed and deciduous perianthium; leaflets ovate, oblong, concave, erect and deciduous; the *corolla* is tetrapetalous and cruciform, the petals roundiſh, flat and ſpreading, with claws nearly as long as the calyx, but more ſpreading; the *ſtamina* have ſix filaments, ſubulate, of the length of the calyx, from erect ſpreading; anthers roundiſh; the *piſtillum* has a bifid, very ſmall germ, ſubulate ſtyle of the length of the ſtamens, and permanent, the ſtigma capitate; the *pericarpium* is a very ſhort filicle; partition ending in a ſubulate point, oblique and longer than the filicle itſelf, the valves parallel, making a cell of the lower half, but ſtanding out from the upper, rounded, concave, gaping, and oblique, and hence having the form of a ſheep's hoof; the *ſeeds* are ſolitary and roundiſh. There are two ſpecies. 1. A. *hierochuntica*, thlaſpi roſa de hiericho of Mor. Hiſt. roſa hierochuntica of Bauhin and Ray, &c. common anaſtatica, or roſe of Jericho, with leaves obtuſe, ſpikes axillary and very ſhort, filicles hoofed and thorny. This plant grows naturally on the coaſts of the Red Sea, in Paleſtine, and near Cairo, in ſandy places; and was cultivated in Kew Garden by Tradeſcant in 1656. It has had the epithet of the roſa Mariæ given to it by the monks, who have ſuperſtitiouſly imagined that the flowers open on the night in which our Saviour was born. But the truth is, that the dry woody plant being ſet for ſome time in water, will dilate and open, ſo as to diſcloſe the ſeed veſſels and ſeed. This has been done when the plants have been many years gathered; ſo that ſome curious perſons preſerve them in their repoſitories of curioſities, for the ſingularity of this property. 2. A. *ſyriaca*, bunias ſyriaca of Gærtner, myagrum roſtratum of Scop. Zan. and Pallas, thlaſpi, &c. of Bocc. Muſ. roſa hiericontea ſylveſtris of Bauhin, Syrian anaſtatica, with leaves acute, ſpikes longer than the leaf, filicles ovate, beaked, and not at all bifid. This is a native of Auſtria, Stiria, Carniola, Syria, and Sumatra, and was introduced in 1788 by M. Thouin. It flowers in May and June.

Culture.—Theſe plants, being annual, can only be propagated by ſeeds, which rarely ripen in England, unleſs they be ſown on a hot-bed in the Spring, and the plants afterwards put into pots, which ſhould be plunged into another hot-bed, in order to bring them forward. They will not perfect ſeeds unleſs the Summer is very hot and dry; but if they are kept in a frame, with free air in warm weather, they will flower in June, and the ſeeds will ripen in September. Martyn's Miller.

Anastatica, in *Natural Hiſtory*, a ſpecies of vorticella, in the fifth order of Vermes, infusoria. It is compound, with bell ſhaped flowers; foot-ſtalks ſcaly and rigid. Linn. and Mull.

This is the ſecond ſpecies of cluſtering polype deſcribed by Trembley. Theſe polypes form a group reſembling a cluſter, or more properly an open flower; this flower or cluſter is ſupported by a ſtem, which is affixed by its lower extremity to ſome of the aquatic plants, or extraneous bodies, that are found in the water; the upper extremity forms itſelf into eight or nine lateral branches perfectly ſimilar to each other; theſe have alſo ſubordinate branches, whoſe collective form much reſembles that of a leaf. Every one of theſe aſſemblages is compoſed of one principal branch or nerve, which makes with the main ſtem of the cluſter an angle ſomewhat greater than a right one; from both ſides of this nerve the ſmaller lateral branches proceed; theſe are ſhorter the nearer their origin is to the principal branch.

At the extremity of the principal branch, and alſo of all the lateral ones, there is a polype or vorticella. There are others on both ſides of the lateral twigs, but at different diſtances from their extremity. Theſe polypes are all exceedingly ſmall, and of a bell-like figure; near their mouth a quick motion may be diſcerned, though not with a ſufficient diſtinctneſs to convey an adequate idea of its cauſe; upon the branches of theſe cluſters are round bodies.

Every cluſter has eight or nine of theſe branches or leaves; they do not all proceed from the ſame point, but the points from whence they ſet out are not far aſunder; each of theſe branches is bent a little inwards, ſo that all of them taken together form a kind of ſhallow cup. If the eye is placed right over the baſe of this cup, the appearance of the whole eight or nine branches is like that of a ſtar, with ſo many rays proceeding from the center. If the cluſter is ſlightly touched, all the branches inſtantly fold up, and form a ſmall round maſs. The ſtem which ſupports the cluſter contracts alſo at the ſame time, folding up like a workman's meaſuring rule, that conſiſts of three or four joints. This extraordinary aſſemblage conſtitutes one organiſed whole, formed of a multitude of ſimilar and particular ones. A new ſpecies of ſociety, in which all the individuals are members of each other in the ſtricteſt ſenſe, and all participate of the ſame life.

A few days after one of theſe cluſters is formed, ſmall

round bodies or bulbs may be perceived to protrude in ſeveral places from the body of the branch; theſe grow very faſt, and arrive at their greateſt growth in two or three days. The bulbs detach themſelves from the branches out of which they ſpring, and go away, ſwimming till they can ſettle upon ſome ſubſtance which they meet with in the water, and to which they affix themſelves by a ſhort pedicle; the bulbs are then round, only a little flatted on the under ſide, the pedicle continues to lengthen gradually for about twenty-four hours, during which time the bulbs alſo change their figure, and become nearly oval; there are in a cluſter but few of theſe bulbs compared with the number of vorticellæ, neither do all the bulbs come out at the ſame time. The bulb then divides lengthways into two ſmaller ones, but which are ſtill much larger than the vorticellæ themſelves. It is not long before theſe are ſeparated like the firſt, and thus form four bulbs on the ſame ſtalk; theſe again divide themſelves and form eight, which again ſubdivide, and conſequently make ſixteen. They are all connected with the ſtalk by a proper pedicle, but they are not all of an equal ſize; the largeſt continue to divide, and the ſmalleſt begin to open, and take the bell-formed ſhape. Mr. Trembley obſerved from one round bulb in about twenty-four hours, by repeated diviſions, one hundred and ten vorticellæ to be formed. Vide Phil. Tranſ. Adams Microſc. &c. &c.

ANASTOMASIS, or ANASTAMOSIS, formed of ανα, *through*, and στομα, *mouth*, in *Anatomy*, is ſometimes uſed to expreſs ſuch aperture of the mouths of the veſſels as lets out their contents.

ANASTOMASIS is more frequently uſed to denote the opening of two veſſels into one another; or the union and juncture of the mouths of two veſſels, whereby they come to communicate with one another.

Anaſtomaſes take place in conſiderable number in the abſorbing and circulating veſſels of animals. For an account of their number, ſituation, and uſes, the reader is referred to the articles ABSORBING *Veſſels*, ARTERY, *Circumſtances obſervable in the Ramification of*, and VEIN, *Circumſtances obſervable in the Diſtribution of*.

ANASTOMASIS, in *Botany*, a ſpecies of PHALLUS.

ANASTOMOSIS, in *Entomology*, a ſpecies of PHALÆNA of the bombyx tribe. Thorax reddiſh-brown; anterior wings grey, with three whitiſh, anaſtomiſing ſtreaks. Linnæus.

The larva is brown, with white ſpots on the back, lateral line yellow, with a red dot on each ring; a bifid protuberance on the ſhoulders and tail; pupa black, with two red, longitudinal ſtreaks; feeds on the willow.

ANASTOMOTICS, formed from αναστομοω, *I unſtop*, or ANASTOMOTIC *medicines*, are, in a general ſenſe, the ſame as aperients; but in a more ſpecial ſenſe, the term denotes ſuch as are ſuited to open the extreme orifices of blood-veſſels, ſo that the blood may circulate the more freely.

ANASTROUS *ſigns*, in *Aſtronomy*, an appellation given to the *dodecatimoria*, or the twelve portions of the ecliptic which the ſigns poſſeſſed anciently, but have deſerted by the preceſſion of the equinox.

ANASTROPHE, from ανα and στρεφω, *I turn*, in the *Ancient Military Art*, denotes the turn of a battalion to its former ſtation, after a turn or evolution either to the right or left. The anaſtrophe ſtands oppoſite to the epiſtrophe.

ANASTROPHE alſo denotes a grammatical figure, whereby a prepoſition, which regularly ought to precede, is placed after its caſe, *e. gr.* "Saxa per et ſcopulos," for "per Saxa et ſcopulos."

ANASTROPHE, in *Rhetoric*, denotes a quaint inverſion of the order of the words in a ſentence, *e. gr.* "ut ſcire poſſis ad quo te expediat loqui," for "quo ad expediat te loqui."

ANASUS, or ANISUS, in *Ancient Geography*, now the *Ens*, a river of Norica, which fell into the Danube. See ENS.

ANATAJAN, in *Geography*, called alſo the iſland of St. Joachim, one of the Ladrone or Marianne iſlands, is about 30 miles in compaſs, and is the firſt of thoſe called the northern iſles. N. lat 16° 42′. E. long. 145° 50′.

ANATHEMA, from ανα and τιθημι, *I lay up*, in *Antiquity*, denotes a preſent offered to ſome god, and hung up in his temple.

Making preſents to the gods was a cuſtom even from the earlieſt times, either to pacify them when angry, or to obtain ſome future benefit, or as a grateful acknowledgment of ſome paſt favour. They conſiſted of crowns and garlands, garments, cups of gold, and other valuable metals, and any other things which conduced to the ornament, or to the enriching of the temples.

Theſe were commonly termed αναθηματα, and ſometimes ανακειμενα; from their being depoſited in the temple, where they were ſometimes laid on the floor, ſometimes hung upon the walls, doors, pillars, or the roof, or any other conſpicuous place. Sometimes the occaſion of the dedication was inſcribed either upon the thing itſelf, or when the matter of that could not bear inſcription, upon a tablet hung up with it.

When any perſon left his employment, or way of life, it was cuſtomary to dedicate the inſtruments belonging to it, as a grateful commemoration of the divine favour and protection. Thus in an ancient Greek epigram we find a fiſherman makes a preſent of his nets to the nymphs of the ſea. Shepherds hung up their pipe to Pan, or ſome of the country deities, as we find done by one in Tibullus. So Lais, decayed with age, dedicates her mirror to Venus. Pauſanias has left us a particular deſcription of the anathemata, in the Delphian temple, which was the richeſt of any in Greece.

The term anathema alſo occurs in a like ſenſe, applied to Chriſtian offerings.

The anathemata, or ornaments of the ancient churches, are otherwiſe called in eccleſiaſtical writers donaria.

Such in particular were thoſe called εκτυπωματα, anſwering to the votive tablets of the heathens. Alſo pictures, moſaics, inſcriptions, and at length images, ſtatues, crucifixes, &c.

Cebes's beautiful tablature of Human Life, is ſaid, in the introduction to it, to have been among the αναθηματα, in the temple of Saturn.

ANATHEMA, in an *Eccleſiaſtical ſenſe*, denotes an EXCOMMUNICATION, attended with execrations and curſes. In this ſenſe the word is uſually written in Greek αναθεμα, to diſtinguiſh it from an offering to the gods, called αναθημα; though it is certain ſeveral of the Greek fathers do not obſerve this diſtinction; but uſe αναθεμα indifferently for either.

There are two kinds of anathemas; the one *judiciary*, the other *abjuratory*.

The former can only be denounced by a council, a pope, biſhop, or other qualified perſon; and differs from a ſimple excommunication in this, that an excommunication only prohibits the criminal from entering within the church, or from holding communion with the faithful, whereas an anathema cuts him off from the body, the ſociety, and even the commerce of the faithful, and delivers him over to the Devil.

The latter kind of anathema uſually makes a part of the ceremony of ABJURATION; the convert being obliged to anathematize the hereſy he abjures.

The critics and commentators are divided about the manner wherein St. Paul wiſhes to be anathema for his brethren. Romans ch. ix. 3. See ACCURSED.

In ancient cenſures we meet with an extraordinary formula,

mula, called *marantha*; and authors are divided concerning its import and uſe.

St. Chryſoſtom ſays it is a Hebrew word, ſignifying *the Lord is come*; and he particularly applies it to the confuſion of thoſe who ſtill abuſe the privilege of the goſpel, notwithſtanding that the Lord was come among them.

St. Jerom ſays it was more a Syriac than an Hebrew word, though it had ſomething in it of both languages, ſignifying *our Lord is come*. But he applies it againſt the perverſeneſs of the Jews, and others, who denied the coming of Chriſt, making this the ſenſe of the apoſtle; *if any man love not the Lord Jeſus Chriſt, let him be anathema, the Lord is come.*

According to this ſenſe, *maranatha* could not be any part of the form of excommunication, but only a reaſon for pronouncing the anathema againſt thoſe who expreſſed their hatred againſt Chriſt, by denying his coming, either in words, as the Jews did who blaſphemed him, and called Jeſus anathema, or accurſed; or elſe by wicked works, as thoſe who lived profanely under the name of Chriſtians. Others of the ancients interpret the word of the future coming of Chriſt, particularly St. Auſtin, who ſays, *maranatha* is a Syriac word, ſignifying *the Lord will come.* And he particularly applies it againſt the Arians, who could not be ſaid, as he uncharitably thought, to love the Lord, becauſe they denied his divine nature. Dr. Hammond and others will have *anathema maranatha* to have anſwered to the third and higheſt degree of excommunication among the Jews, called *ſhammatha.*

Balduinus, Deutrohmannus, Durrius, Stevartius, and others, have written expreſsly concerning *anathemas.* Her. Labertus, a German writer, has given an *Anathematologia*, or a diſcourſe on the church curſes. See a form of the anathema denounced againſt robbers in the middle ages, in Bouquet's Recueil des Hiſt. tom. x. p. 517. cited by Robertſon, in Hiſt. Charles V. vol. i. p. 398. That which was iſſued A .D. 988, after the uſual introduction, and mentioning the outrage which gave occaſion to it, runs thus: "Obtenebreſcant oculi veſtri, qui concupiverunt; areſcant manus, quæ rapuerunt; debilitentur omnia membra, quæ adjuverunt. Semper laboretis, nec requiem inveniatis, fructuque veſtri laboris privemini. Formidetis, et paveatis, a facie perſequentis, et non perſequentis hoſtis, ut tabeſcendo deficiatis. Sit portio veſtra cum Juda traditore Domini, in terra mortis et tenebrarum; donec corda veſtra ad ſatisfactionem plenam convertantur.—Ne ceſſant a vobis hæ maledictiones, ſcelerum veſtrorum perſecutrices, quamdiu permanebitis in peccato pervaſionis. Amen. Fiat. Fiat."

Pope Clement VIII., immediately after his election, publiſhed a bull againſt duelling, denouncing an Anathema againſt all thoſe who ſhould give, receive, or carry a challenge, and a ſentence of interdiction againſt the places where duels ſhould be fought.

ANATHEMATISING, the act of pronouncing an *anathema.* In which ſenſe it amounts to the ſame with *excommunicating.* The term is not only applied in ſpeaking of perſons but of doctrines and opinions.

ANATHEMATISM denotes the ſame with *anathema* or imprecation.

ANATHO, or ANNAH, in *Ancient Geography*, a city of Meſopotamia, the actual reſidence of an Arabian Emir, was compoſed of two long ſtreets, which incloſed, within a natural fortification, a ſmall iſland in the midſt, and two fruitful ſpots on either ſide, of the Euphrates. It was ſituated to the ſouth-eaſt of Circeſium. The warlike inhabitants of Anatho ſhewed a diſpoſition to ſtop the march of a Roman emperor; till they were diverted from ſuch fatal preſumption by the mild exhortations of prince Hormiſdas, and the approaching terrors of the fleet and army. They implored, and experienced, the clemency of Julian, who tranſplanted the people to an advantageous ſettlement near Chalcis, in Syria, and admitted Puſæus, the governor, to an honourable rank in his ſervice and friendſhip. See ANAH.

ANATHOTH, a city of Paleſtine, north-eaſt of Jeruſalem, and not far from it. This city had been given to the Levites, and was one of the cities of refuge. It belonged to the tribe of Benjamin; and was the birth-place of the prophet Jeremiah, and the inheritance of many of the Jewiſh pontiffs.

ANATHREPSIS, in *Medicine*, amounts to much the ſame with ANALEPSIS.

ANATICULA, a diminutive of *anas*, and uſed by the old Roman *Authors*, as a term of fondneſs, to expreſs the paſſion of love. There is another of the ſame kind from a different bird, *palumbula.*

My little duck, my little dove, were the moſt endearing terms the lovers of thoſe times could uſe; nor was this the cuſtom of the Romans only, but the Greeks, as far back as Ariſtophanes, have it.

ANATIFERA, in *Conchology*, a ſpecies of LEPAS, called bernacle, that adheres by means of its membranaceous pedicle to the bottoms of ſhips, timber, and other ſubſtances floating in the water. The ſhell is compreſſed, and conſiſts of five valves, is ſmooth, and affixed to a pedicle. Linnæus.

This curious marine production conſiſts of many unequal membranaceous branches, or arms, at the ends of which the ſhells are diſpoſed in an irregular manner; the larger cluſtering with the ſmaller in groups, and forming bunches of various ſizes. The branches are of a fine red: the ſhells of a bluiſh violet. The animal within is a *triton*, and is furniſhed with many *cirrhi*, or *tentacula*, with which it takes its food. Theſe tentacula are pectinated like feathers, and hang out of the ſhells when open. In the 16th century they were in fact ſuppoſed to be feathers, and hence aroſe the whimſical belief that theſe ſhells produced geeſe, of the ſpecies called bernacles. (Anas Erythropus of Linnæus.) Nor was this a vulgar opinion only; it was ſanctioned by the grave details of naturaliſts of that time, and particularly by Gerard, whoſe obſervations are worthy of notice.

"What our eyes have ſeene, and hands have touched, we ſhall declare. There is a ſmall iſland in Lancaſhire, called the *pile* of *Foulders*, wherein are found the broken pieces of old and bruiſed ſhips, ſome whereof have been caſt thither by ſhipwrake, and alſo the trunks and branches of old and rotten trees, caſt up there likewiſe; whereon is found a certaine ſpume, or froth, that in time breedeth unto certaine ſhels, in ſhape like thoſe of the muſkle, but ſharper pointed, and of a whitiſh colour, wherein is contained a thing in form like a lace of ſilke, finely woven as it were together, of a whitiſh colour; one end whereof is faſtened into the inſide of the ſhell, even as the fiſh of oiſters and muſkles are; the other end is made faſt unto the belly of a rude maſſe, or lumpe, which in time commeth to the ſhape and form of a bird. When it is perfectly formed, the ſhell gapeth open, and the firſt thing that appeareth is the foreſaid lace or ſtring; next come the legs of the bird, hanging out, and as it groweth greater it openeth the ſhell by degrees, till at length it is all come forth, and hangeth onely by the bill; in ſhort ſpace after it cometh to full maturitie, and falleth into the ſea, where it gathereth feathers, and groweth to fowle bigger than a mallard, and leſſer than a gooſe, having blacke legs and bill or beak, and feathers blacke and white, ſpotted in ſuch manner as is our magpie, called in ſome

places a pie-annet, which the people of Lancaſhire call by no other name than a tree gooſe; which place aforeſaid, and all thoſe parts adjoining do ſo much abound therewith, that one of the beſt is bought for three-pence. For the truth hereof, if any doubt, may it pleaſe them to repaire unto me, and I ſhall ſatisfie them by the teſtimonie of good witneſſes." Gerard's Herbal.—Vide Donov. Brit. Shells, &c.

ANATILII, in *Ancient Geography*, a people of Gallia Narbonnenſis, mentioned by Pliny. Their ſituation is diſputed. Martin ſays, that they were ſituated to the left of the mouth of the Rhone, near the ſide of the lake called *Stagnum Tauri*, and he ſuppoſes that they were the ſame with the Atlantici of Avienus. Some authors have inferred from an inſcription of queſtionable authority, that their capital was Heraclea. M. d'Anville places them at the mouth of the Rhine, more to the right than to the left.

ANATINA, in *Conchology*, a ſpecies of Mya. Shell globoſe, ſnowy-white, and pellucid; primary tooth of the hinge prominent and roundiſh. Gmelin. This ſhell is found on the ſhores of Guinea, and other parts of Africa, and bears ſome affinity to ſolen anatinus. It is marked with ſtreaked lines that interſect each other.

Anatina, is likewiſe a ſpecies of Ostrea, that inhabits the Nicobar iſlands. The ſhell is pellucid, lamellated and laterally incurved. Gmel. It is thin and fragile, and variegated with white and violet, and about three inches in length, including the incurvature, which is nearly half of that length. From a fancied reſemblance of this ſhell to a duck when ſitting it has acquired the ſpecific name *anatina*.

ANATINUS, in *Conchology*, a ſpecies of Solen. The ſhell is ovate, membranaceous, and covered with pile or ſoft hairs; a hooked rib at the hinge. This ſpecies is found on the ſandy ſhores of the Indian ocean, and is named by Rumphius roſtrum anatis. It is pellucid, white, and very thin; one end rounded, the other gaping. Tooth in both valves of the figure of an ear-picker. Gmel.

Anatinus, is likewiſe a ſpecies of Mytilus, of an oval ſhape, ſomewhat compreſſed fragile, with a membranaceous margin, and decorticated beaks. Gmel. This ſpecies has been frequently confounded with Mytilus cygneus; from which it differs in ſeveral particulars. It is very common in the rivers of England, and is known by the name of duck or ſmall horſe muſcle. Vide. Donov. Brit. Shells, pl. 113.

ANATIS, in *Ancient Geography*, a river, which, according to Pliny, belonged to Mauritania Tingitana.

Anatis, in *Entomology*, a ſpecies of Pediculus that infeſts the wild duck. It is whitiſh; firſt ſegment of the thorax orbicular, truncated on each ſide, the other and the abdomen long and narrow. Schranck.

Anatis, in *Natural Hiſtory*, a ſpecies of Ascaris, of the order Inteſtina in the Vermes claſs, that is found in the inteſtines of the wild duck, (anas boſchas). It is from four to ſix inches in length, and is viviparous. The ſpecific character, according to Gmelin, is, white, poſterior part flattiſh.

Anatis is alſo the ſpecific name of another creature that is found in the inteſtines of the velvet duck. The body is ſcarlet, its form ovate, thorax and proboſcis covered with hooked points, and it has a long ſmooth intermediate neck. Gmelin. This belongs to the genus echinorhynchus, in the order inteſtina and Vermes claſs.

Anatis is likewiſe the ſpecific name of a third creature of the order of the Inteſtina in the claſs of Vermes. This is fasciola anatis of Gmelin. The body is reddiſh, and of a roundiſh form, with a ſingle pore. This kind is found in the inteſtines of the domeſtic duck. It is ſmall, ſomewhat pellucid, and uſually white, the forepart truncated and triangular, behind roundiſh, inteſtines flexuous and blackiſh. This is cuculanus conoideus of Bloch, and hirudo falciolaris of Mull. Z ol. Dan.

ANATOCISM, Anatocismus, an uſurious contract, wherein the intereſts ariſing from the principal ſum are added to the principal itſelf, and intereſt exacted upon the whole. The word is originally Greek, but uſed by Cicero in Latin; whence it has deſcended into moſt other languages. It comes from the prepoſition ἀνὰ, which in compoſition ſignifies *repetition* or *duplication*, and τόκος, *uſury*.

Anatocism is what we properly call *intereſt upon intereſt*, or *compound intereſt*.

This is the worſt kind of uſury, and has been ſeverely condemned by the Roman law, as well as by the common laws of moſt other countries. See Interest.

ANATOLIA, in *Geography*, a province of Turkey, in Aſia. See Natolia.

ANATOLIUS, in *Biography*, patriarch of Conſtantinople, ſucceeded Flavian in the year 449. Before his preferment to this dignity, he favoured the Eutychians; but after the acceſſion of Marcian, he attached himſelf to the party, which he patronized, and which held the orthodox faith of two natures in Chriſt, and thus ingratiated himſelf both with the emperor and with pope Leo. Whilſt he was ſupported by the imperial power, he maintained a vigorous conteſt with Leo, for the equality of the two churches of Rome and Conſtantinople, but when Marcian ſeemed to be inclined to allow to the ſee of Rome the ſupremacy in the church, he acquieſced. In order farther to engage Leo's favour, he called a council at Conſtantinople, which denounced an anathema againſt Neſtorius and Eutyches; and then ſent deputies to the pope to aſſure him of the purity of his own faith. He afterwards concurred with the emperor Marcian and the pope in hoſtile meaſures againſt thoſe who did not openly profeſs the doctrine of the church. Upon the whole, Anatolius ſeems to have been a time-ſerving eccleſiaſtic, whoſe character claims no commendation. Dupin's Eccl. Hiſt. vol. iii. p. 2. p. 228.

Anatolius, biſhop of Laodicea, in Syria, was a native of Alexandria, flouriſhed under the emperors Probus and Carus, and ſucceeded Euſebius about the year 270. He was the moſt eminent perſon of his time, for his acquaintance with philoſophy and the Greek literature, and for his ſkill in arithmetic, geometry, aſtronomy, grammar, rhetoric, and logic. His diſtinguiſhed qualifications recommended him to the citizens of Alexandria, and at their requeſt he is ſaid to have ſet up a ſchool for the Ariſtotelian philoſophy. The tenets of the Peripatetic ſect were the baſis of his ſyſtem, and with them he incorporated other doctrines, both Pagan and Chriſtian, thus forming a new ſchool, in which Ariſtotle was the chief maſter. Some have doubted whether he actually complied with the requeſt of the Alexandrians, and ſet up ſuch a ſchool; however this be, none of his commentaries upon Ariſtotle are extant, and, therefore, the particular manner in which he philoſophiſed is unknown. Whether he was a native chriſtian or a convert from paganiſm, is not certain; but he was undoubtedly a chriſtian long before he became biſhop of Laodicea, for he was upon terms of intimate friendſhip with Euſebius, his predeceſſor in that ſee, about the year 263, when Bruchium, or Pyruchium, one of the quarters of the city of Alexandria, in which was the citadel, was beſieged. A circumſtance occurred on this occaſion, which reflects peculiar honour on his character. See Alexandria.

Euſebius

Euſebius ſays of him, that with univerſal conſent he had pre-eminence above all the magiſtrates or ſenators of Alexandria, that were in Bruchium. Soon after this ſiege, Anatolius left Alexandria, and went into Syria; and he was ordained biſhop by Theotecnus, biſhop of Cæſarea, deſigned by him for his ſucceſſor, and actually appointed his colleague; but in his way to a council at Antioch, held by the Chriſtian brethren upon the concerns of Paul of Samoſata, he was detained at Laodicea, and appointed biſhop of that city. Anatolius appears to have been a diſtinguiſhed ornament of the Chriſtian church; and though he did not write many books, yet his eloquence and extenſive knowledge and learning are ſufficiently manifeſt in thoſe that are extant. His work on Eaſter, entitled, "The Paſchal Canon," is cited by Euſebius; and an ancient Latin verſion of it, ſaid to be Rufinus's, was publiſhed by Ægidius Bucherius, in folio, at Antwerp, in 1634. Of his ten books of "Inſtitutes of Arithmetic," extracts are preſerved in a collection, entitled "Theologumena Arithmetica." Some fragments of his philoſophical writings are collected by Fabricius, from which it appears, that, after the example of Pythagoras, Plato, and Ariſtotle, he made mathematical learning ſubſervient to philoſophy. This learned Alexandrian concurred with other Chriſtians, in a high reſpect for the ſcriptures of the Old and New Teſtament. The time and manner of his death are not certainly known; but ſome have ſuppoſed that he died a martyr. Euſeb. Hiſt. Eccl. lib. vii. c. 32. p. 284. ed Valeſ. Cave's H. L. vol. i. p. 136. Fabr. Bib. Gr. lib. iii. c. 11. tom. ii. p. 273—278. Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 306. Lardner's Works, vol. iii. p. 265—269.

Fabricius (B. G. lib. v. c. 1. tom. v. p. 277.) has mentioned ſeveral other perſons of the ſame name, who ought to be diſtinguiſhed from Anatolius, of whom we have given an account. Cave alſo (*ubi ſupra*) ſhews, that this Anatolius is different from him, whom Eunapius mentions as maſter of Jamblichus; though they are confounded by Valeſius, and his opinion has been approved by Baſnage. Anatolius, of Berytus, in Phænicia, was a man of great learning, good judgment, and much candour. He was a faithful ſubject and able officer, under the emperor Conſtantius, being præfect of Illyricum, from the year 358 to the time of his death in 360. Photius, ſpeaking of his work concerning agriculture, ſays, that it is a collection out of ſeveral writers upon the ſame ſubject, ſuch as Democritus, Africanus, Tarantinus, Apuleius, Florentius, Valens, Leon, and Pamphilus, and alſo from the paradoxes of Diaphones. The work conſiſts of 12 books or ſections. It contains, ſays Photius, many uſeful directions for agriculture and huſbandmen, and may be reckoned one of the beſt books written upon the ſubject. There are inſerted at the ſame time many ſtrange and incredible things, favouring of the error of Gentiliſm: but he adds, a pious huſbandman may let thoſe things alone, and ſelect only what is uſeful. Anatolius is highly commended for his integrity and eloquence, for his knowledge of the laws, and for his patronage of learning. Lardner's Works, vol. ix. p. 8—11.

ANATOMY. The word ſignifies ſimply diſſection, yet there are uſually comprehended under this term all thoſe artifices by which the ſtructure of animal bodies is developed and exhibited. As a ſcience, anatomy muſt be admitted to be highly intereſting and important; while other ſciences lead us abroad in purſuit of knowledge, in this we are engaged at home, in concerns truly intereſting, in enquiring into the means by which we live, and move, and have our being. Anatomy alſo furniſhes us with knowledge which teaches how to preſerve health, to correct diſeaſe, and rectify the effects of thoſe injuries to which we are inevitably expoſed.

Anatomy is divided into human and comparative; in the former our reſearches are reſtricted to our own bodies, but in the latter, we may range over the whole field of animated nature.

The anatomical deſcription of the body is technically arranged under the following heads, to which we refer the reader for more particular information.

1ſt. Oſteology, or the deſcription of the ſtructure, ſhape, and uſes of the bones.

2d. Syndeſmology, or a deſcription of their connection by ligaments, and the ſtructure of the joints.

3d. Myology, or a deſcription of the moving powers or muſcles.

4th. Angeiology, or a deſcription of the veſſels engaged in nouriſhing the body, in abſorption, and in the removal of ſuperfluous parts.

5th. Adenology, or a deſcription of the glands, in which various liquors are ſeparated or prepared from the blood.

6th. Splanchnology, or a deſcription of the different bowels, which ſerve various and diſſimilar purpoſes in the animal economy.

7th. Neurology, under which title the brain, the nerves, and organs of ſenſe muſt be comprehended.

This arrangement, which is not very well adapted to the purpoſes of anatomical deſcription, is, however, not at all ſuited to the views of phyſiology; for this ſubject, therefore, we muſt refer the reader to another ſeries of articles. The functions carried on in animals, in the explanation of which phyſiology conſiſts, may be thus arranged.

The terms, however, by which they are diſtinguiſhed, do not correctly expreſs the nature of each function, as will be ſhewn more at large under their reſpective titles.

1ſt. Digeſtion, or the converſion of extraneous matter into the nature of their own bodies.

2d. Circulation, or the diſtribution of the converted matter to every part of the animal for its repair and augmentation. The proceſs is named circulation, from the mode in which it is carried on in the generality of animals.

3d. Secretion, or the ſeparation and depoſition of the particles compoſing the ſtructure of animals and vegetables, as well as various ſubſtances which they produce from the circulating fluids.

4th. Abſorption, by which external matter is imbibed, and that which is depoſited by ſecretion more or leſs removed.

5th. Reſpiration, or the expoſure of the nutritive fluid to the action of the atmoſphere.

6th. Irritability, or the action which is exerted in carrying on the circulation, ſecretion, and abſorption, and which is more ſtrikingly manifeſted in the occaſional motions of the muſcular powers.

7th. Senſation, by which animals become conſcious of the exiſtence of external objects, and alſo of their own.

8th. Generation, by which new beings, ſimilar to the parents, are formed and produced.

Moſt of theſe powers are obſervable in vegetables.

ANATOMY, *Hiſtory of.* The writers on the hiſtory of medical ſcience, and of anatomy, as forming a part of it, generally divide it into four portions. The firſt contains the ſtate of theſe ſciences previous to the life of Hippocrates, who was born about 460 years before the Chriſtian æra; the ſecond contains an account of the additions and alterations that were made before, and by the labours of Galen, who lived about one hundred and fifty years

years after the birth of Chriſt. The third part comprehends the declenſion of theſe ſciences, with learning in general, in the ſixth and ſeventh centuries, and their revival in the fourteenth and fifteenth, to their more perfect eſtabliſhment by Harvey's diſcovery of the circulation of the blood. The fourth part contains an account of the more perfect ſtate of theſe ſciences from Harvey to the preſent time. The deſire of inveſtigating the ſtructure of the body ſeems ſo natural a kind of curioſity, and ſo intimately connected with ſelf-preſervation, that we cannot wonder if a conſiderable portion of ſuch knowledge ſhould be acquired, even where the opportunities of reſearch may have been very limited and inadequate. Omai, who was brought by Capt. Cook from Otaheite, when he ſurveyed Dr. Hunter's Muſeum, manifeſted conſiderable acquaintance with the ſubjects before him, and a great deſire of further information. The ſlaughter of animals for food, the preparation of them for ſacrifice, and accidental opportunities of examining the human ſkeleton, &c. were the firſt ſources of anatomical information.

Amongſt the Egyptians, the moſt ancient nation, of whoſe manners we have authentic memoirs, the rites practiſed in honour of the dead, by embalming their bodies, would familiarize the people to anatomical inquiries. The cuſtom of carrying about, at their feaſts, a ſkeleton, left their gueſts, in the midſt of feaſting and merriment, ſhould forget the frail tenure of life and its enjoyments, ſeems a ſufficient proof of this aſſertion. It is alſo related, that one of their kings left writings on anatomy.

Our accounts of this ſcience are, however, very ſlight and imperfect, till it was cultivated by the enlightened inhabitants of Greece. If the purſuit of anatomical knowledge is ſo natural and important as to intereſt even barbarous nations, it was likely to be proſecuted with greater ardour and ſucceſs as knowledge increaſed, and the powers of the mind in obtaining it became ſtrengthened by exertion. At the time of Homer the Grecians ſeem to have poſſeſſed much general anatomical knowledge, as the writings of that poet evince. We read, that the ſtone, which Diomede threw at Æneas, not only cruſhed the bone of his thigh, but alſo tore the ligaments of the acetabulum. Merion was wounded in one of the large veins, which return the blood to the heart, known to anatomiſts by the name of vena cava; and Ulyſſes meditated to wound the Cyclops juſt where the liver adheres to the diaphragm. Anatomical facts were collected, and the phyſiology of animals inveſtigated by the philoſophers of Greece, who taught theſe ſubjects, as well as other branches of ſcience, at the philoſophical ſchools of Rhodes, Cos, Cnidos, Cyrene, and Crotona. The firſt diſſection on record, is one in which Democritus, of Abdera, was engaged, in order to aſcertain the ſources and courſe of the bile. It is natural to ſuppoſe that anatomical and medical knowledge would be hereditary in families; the father would inſtruct the ſon how to explore the ſtructure of animals by diſſection, and the ſon would communicate his knowledge to his children. Thus would medical ſcience be retained and augmented in ſuch families. This was the caſe in the family of Hippocrates, who was ſaid to be the fourteenth deſcendant from Eſculapius. In the eightieth Olympiad, about 460 years before Chriſt, Hippocrates formed medicine into a diſtinct ſcience, and collected, arranged, and publiſhed all the anatomical and medical information which mankind then poſſeſſed. Anatomical knowledge was conſiderable for the age in which he lived, and it has been diſputed whether he diſſected human ſubjects; but if he did, the number muſt have been very ſmall, his anatomy ſeeming to be of that kind and extent which the contemplation of the human ſkeleton, and the diſſection of brutes, would naturally produce.

No important additional knowledge of anatomy was obtained, till the formation of a medical ſchool at Alexandria, in Egypt, where the diſſection of human bodies was patronized by the deſcendants of Alexander. Here Herophilus and Eraſiſtratus flouriſhed about 200 years before the birth of Chriſt. They ſeem to have been accurate diſſectors, and ſome minute parts of the body are ſtill named after them as diſcoverers. Their writings have been loſt, and it is chiefly Galen who has made us acquainted with their labours and their merits. The Alexandrian ſchool long flouriſhed, and medical men reſorted to it for a knowledge of anatomy, which they could obtain in no other place. Here even Galen received his education. It is quite unneceſſary to notice the unimportant anatomical remarks made in the writings of the Roman authors before or after the time of Galen.

Galen, however, greatly deſerves our attention and praiſe; not merely becauſe he collected and arranged all the then acquired information, but becauſe he was alſo an induſtrious diſſector, and conſiderably enlarged the limits of anatomical knowledge. He alſo inveſtigated phyſiology by experiments, of which it may be right to mention one inſtance; he refuted the opinions of the Alexandrian anatomiſts, that the arteries were tubes, diſtributing air throughout the body. By laying bare one of theſe veſſels in a living animal, tying it in two places, and opening it between the ligatures, he aſcertained that it contained blood and nothing elſe. He therefore concluded, that both veins and arteries ſerved the ſame purpoſe, that of diſtributing blood for the ſupply of the body, but that the florid arterial blood contained more air than the purple blood of the veins. In an hiſtory of this kind it ſeems right to mention the effect of anatomical ſtudies on the mind of Galen: after contemplating the ſtructure of the hand and foot, and their adaptation to their different functions, he breaks out into an apoſtrophe, which has been much admired, and in which he is ſaid to have exceeded any ancient in pointing out the nature, attributes, and proper worſhip of the Deity. In explaining theſe things, he ſays: "I eſteem myſelf as compoſing a ſolemn hymn to the author of our bodily frame, and in this, I think, there is more true piety than in ſacrificing to him hecatombs of oxen, or burnt-offerings of the moſt coſtly perfumes: for I firſt endeavour to know him myſelf, and afterwards to ſhew him to others, to inform them how great is his wiſdom, his virtue, his goodneſs." There was no addition made to anatomy worth remarking by the writers who ſucceeded Galen: the ſcience gradually diminiſhed, and afterwards ſeemed almoſt loſt amongſt the Arabians.

The firſt Arabian phyſicians appear to have employed themſelves in compiling ſyſtems from the Grecian writers, and the later ones in copying from each other. Medicine certainly declined amongſt them, and their religious notions made them almoſt entirely neglect anatomy. In the tenth century Conſtantine, a native of Bagdat, brought with him the Arabian doctrines on medicine to the Salernitarnian ſchool in Sicily; and here anatomy began ſlowly to revive. In the fourteenth century Mundinus diſſected human bodies in Italy, and by degrees other nations acquired that uſeful boldneſs.

Anatomical knowledge, on its revival in Europe, was greatly promoted by the exertions of eminent painters, who were early and accurate diſſectors, correctly delineating the muſcles, after they had removed the integuments which covered them. Raphael, Titian, and Leonardo da Vinci were famous for their anatomical ſkill, which is indeed ſufficiently evident in their paintings. A number of ſketches, deſigned

as

as ſtudies by Leonardo da Vinci, are ſtill extant in his Majeſty's collection of drawings, and are ſpoken of by Dr. Hunter in the moſt encomiaſtic terms. Albert Durer, who alſo is ranked by Haller among the reſtorers of anatomy, publiſhed many plates repreſenting the proportions and geſtures of the human form and countenance.

When the Turks had ſubdued Greece, the inhabitants fled for ſafety to the weſtern nations of Europe, bringing with them the Grecian authors on medicine, and tranſlating them; which works the invention of printing, that happened about the ſame time, greatly conduced to diſperſe throughout Europe. People had now an opportunity of becoming acquainted with the writings of Galen and the ancients, and, by theſe means, of arriving at the ſource of that knowledge which they had hitherto obtained only through the channel of the Arabian phyſicians. The ſuperiority of the former was ſoon diſcovered, and the opinions of the Grecian writers were conſidered, even in anatomy, as unimpeachable.

In the middle of the ſixteenth century ſeveral eminent anatomiſts flouriſhed, particularly Sylvius and Veſalius, Fallopius and Euſtachius. Sylvius taught anatomy in Paris in 1532. Veſalius firſt adviſed anatomiſts to inject coloured fluids into the veſſels of the body, in order to facilitate the labour of minutely tracing them. Whilſt he was a young man in college, he purſued anatomical inquiries with great ardour and aſſiduity, and publiſhed ſome of his diſcoveries before he was twenty-five years of age, and ſeven books on the anatomy of the human body before he was twenty-nine, A. D. 1542. Theſe books contain great diſcoveries, and, in many circumſtances, correct the ancients. But although they have entitled their author to the gratitude of poſterity, they procured to him ſcarcely any thing but animoſity from his contemporaries. At that time the authority of Galen was held in high veneration; but when Veſalius expoſed his errors, the hatred of all ſeemed turned againſt him. People could not bear to be ſet right by ſo young a man, and even Sylvius denounced perpetual enmity againſt him. But knowledge was increaſed by theſe contentions, all parties were obliged to refer for the materials and ſupport of controverſy, to the book of nature, which they could not conſult without receiving inſtruction. Even Veſalius was detected, in ſome inſtances, in the error with which he charged Galen; that of deſcribing the anatomical ſtructure of the human body from the diſſections of brutes. In 1561 Fallopius, in Italy, publiſhed his Obſervationes Anatomicæ; he was an indefatigable anatomiſt, and made great diſcoveries. About the ſame time Euſtachius made himſelf conſpicuouſly eminent by promoting anatomical knowledge. He ſeemed calculated for ſubtle inveſtigations; he drew many figures of the human body, and engraved his own plates, the accuracy of which cannot fail of exciting ſurpriſe in an anatomiſt of the preſent day. When the labours of theſe eminent men had, as it were, ſmoothed the path, anatomy was taught with a moderate degree of correctneſs and minuteneſs in the different ſchools of Europe.

Shortly after, as Haller has obſerved, the different nations being engaged in war, the ſame attention was not paid to public inſtitutions and diſſections. Anatomiſts had therefore recourſe to the examination of the bodies of brutes, from which they derived many important diſcoveries.

In the year 1628 Harvey publiſhed his diſcovery of the circulation of the blood. The principal facts relating to this ſubject were known before his time: it remained for him to reject the ſpecious conjectures then maintained concerning the blood's motion, and to examine the truth of thoſe facts which were then known, and by experiments to diſcover thoſe which remained to be detected. This he did, and thereby rendered his name immortal. His doctrines were at firſt oppoſed; but when they could no longer be contended againſt, the merit of the diſcovery was aſſigned to former anatomiſts.

It ſeems proper, in this place, to review the ſeveral ſteps which were made in the inveſtigation of this important ſubject. Hippocrates believed that all the veſſels communicated with each other, and that the blood underwent a kind of flux and reflux from and to the heart, like the ebbing and flowing of the ſea; and he mentions the throbbing of the temporal arteries, as an evidence of this fact. The anatomiſts at Alexandria adopted a wrong, but ingenious opinion; as they found the arteries empty, and the veins containing blood, in their diſſections, they imagined that the former were tubes for the diſtribution of air, and gave them that name which they have borne ever ſince; and that the veins were the only channels for the blood. The heart of man, conſiſting of two ſets of cavities not communicating with each other, and its connection with the lungs, were to them deluſive circumſtances, and ſeemed to favour their opinions. It is true they ſometimes found blood in the arteries, and in the left cavities of the heart, but then they believed that the air or ſpirit had eſcaped, and that the blood had oozed through the ſides of theſe air veſſels, and ſupplied its place. Galen, as has been ſaid, refuted this opinion by experiment, and aſcertained that blood flowed both by the arteries and the veins, though he knew not then its natural courſe. On the revival of anatomy in Europe, the pulmonary circulation was known to many eminent men. The valves at the mouth of the pulmonary artery proved the courſe which the blood muſt take in that veſſel, and it ſeemed naturally to follow, that it muſt return to the pulmonary veins. This appeared to be the caſe to Realdus Columbus, Michael Servetus, and the celebrated Sarpi. But when Veſalius afterwards examined the ſubject of the blood veſſels, we can only attribute his failure in diſcovering the truth of the circulation to his mind being more directed to expoſe the errors of Galen, than to a candid examination of the ſubject. Fabricius ab Aquapendente, the preceptor of our famous Harvey, particularly deſcribed the valves of the veins, the mechaniſm of which would abſolutely prevent the blood from flowing in thoſe veſſels towards the extremities. When Harvey returned from his ſtudies in Italy, his attention being excited to the ſubject, he began thoſe experiments, by which he learned and demonſtrated the fact of the circulation. Harvey's firſt propoſition of the ſubject impreſſes conviction ſo ſtrongly on the mind, that we are left in perfect aſtoniſhment, that a circumſtance ſo luminouſly evident ſhould ſo long remain unobſerved. It muſt be granted, that the heart projects about two ounces of blood into the aorta at every pulſe; what, then, it may be aſked, becomes of this large quantity of blood, unleſs it circulates? It muſt be granted, that the heart receives that quantity prior to every pulſe. From whence is it received, unleſs the blood circulates? Harvey tied an artery, and the correſponding vein received no blood: he tied a vein and all its branches, and thoſe of the correſponding artery were choaked with blood, even to the entire obſtruction of circulation and motion. But Harvey was not acquainted with the direct communication which exiſts between theſe ſyſtems of veſſels. He imagined that the blood tranſuded from the arteries into the veins through a ſpongy, or parenchymatous ſubſtance. Much yet remained to be aſcertained by microſcopical obſervations, and ſubtile anatomical injections and diſſections.

In 1621, a little before the publication of the circulation, the lacteal abſorbents of the inteſtines were diſcovered

covered by Aſelli; and ſhortly afterwards, the lymphatic or general abſorbents of the body were brought into notice by Rudbeck and Bartholin. In 1654 Pecquet publiſhed his diſcovery of the trunk of this ſyſtem of veſſels, by which all the matter abſorbed from every part of the body, as well as the chyle when imbibed from the inteſtines, is poured into the left ſubclavian vein. (See the article ABSORBING VESSELS.) Swammerdam, about the year 1660, taught anatomiſts to uſe waxen injections, which, hardening when cold, enable us to trace and examine the intertexture of minute veſſels with certainty and exactneſs. Shortly after, in the art of injecting and making anatomical preparations, Ruyſch, who was profeſſor at Amſterdam, particularly excelled; and by the anatomical artifices which he inſtituted, he was enabled to develope the vaſcular ſtructure of the body, with a degree of minuteneſs and exactneſs hardly credible.

Malpighi, a great anatomiſt and profeſſor at Meſſina and Bononia, in 1666, broached very ingenious and clear ideas reſpecting ſecretion. He believed that the minute arteries poured a liquor into little cells contained in glands, from which it paſſed off by other tubes, called excretory ducts. Ruyſch denied the exiſtence of cells, and affirmed, that the ſecretory and excretory veſſels were continuations of the ſame tube. Theſe eminent men had each numerous partizans, but the opinion of Ruyſch, which is moſt ſimple, and drawn from accurate obſervations, is now conſidered as aſcertained. Ruyſch alſo contributed to our knowledge of the abſorbing ſyſtem, by particularly deſcribing the ſtructure of its veſſels, and Nuck had no inconſiderable ſhare of merit on the ſame account. Leuwenhoeck, who greatly promoted anatomy, not merely by his own microſcopical obſervations, but by ſhewing what important diſcoveries might be made by the microſcope, ſaw the circulation in the tranſparent parts of fiſh and amphibia, and thus was the knowledge of the circulation perfected.

By theſe diſcoveries much light is thrown on the animal economy; and we are enabled clearly to diſcern many circumſtances which before either eſcaped obſervation, or were imperfectly ſeen. By the diſcovery of the circulation we ſee the truth of the ſcriptural expreſſion, that in the blood is the life of an animal; for from this vital fluid every part is formed and maintained. By the diſcovery of the abſorbents we perceive how the blood itſelf is ſupplied, from the food, which is converted into a milky fluid, by the digeſtive organs; and how the old particles of our bodies, which are no longer fit to remain in it, are removed and conveyed into the blood, to be eliminated by the excretory organs.

When anatomy had thus become a clear and diſtinct ſcience, it was inculcated and taught, in the different nations of Europe, by numerous profeſſors, with a zeal and induſtry highly honourable to themſelves and uſeful to mankind. It would occupy a volume to relate their labours and diſcoveries; we muſt reſtrict ourſelves to mention only the names of the moſt eminent, and the principal ſubjects, which engaged their attention. The celebrated Harvey led the way in inveſtigating one of the moſt curious proceſſes in the animal economy, that is, the procreation of the ſpecies. Leuwenhoeck and Buffon obſerving certain genera of microſcopic animalcules in the ſeminal fluid, formed rather wild ſpeculations reſpecting them, which, however, conſiderably excited the public attention. De Graaf, in 1672, was the propoſer of the moſt rational opinion on this ſubject. In viviparous animals he ſhewed the exiſtence of minute ovulæ formed in the ovaria, which, when fecundated, paſs through the fallopian trumpet into the uterus, and there grow to maturity; the late experiments of Spallanzani, in Italy, and ſome in this country, ſeem to have confirmed his opinion, and proved that the female of almoſt every ſpecies prepares an ovum, which contains parts, which are, as it were, animated, and ſet in motion by the ſemen of the male. As a proſecution of the hiſtory of the ſame ſubject, we may mention, that Dr. Hunter, in this country, has given a moſt complete hiſtory, with beautiful explanatory engravings, of the growth of the human ovum, and of the changes which the uterus undergoes after the ovum has been received into that cavity.

The more conſpicuous parts of the body, the bones and the muſcles, have been moſt accurately deſcribed and delineated; the former by Albinus, Cheſelden, and Sue: the latter by Albinus and Cowper. Albinus, as a minute anatomiſt, alſo deſerves the higheſt praiſe.

In 1672, Diemerbroeck, profeſſor at Utrecht, publiſhed a ſyſtem of anatomy; and in 1711, Winſlow publiſhed a very excellent and accurate work of the ſame kind in Paris, which long ſerved as a kind of text book for ſtudents. But when Albinus and Haller had greatly ſimplified the deſcription of the body, and improved the knowledge of its minute ſtructure, ſome other ſyſtematic work became neceſſary, but none for a long time appeared.

In the mean while Haller publiſhed, at Gottingen, in 1743, his Icones Anatomicæ, with a view to ſupply the deficiencies and correct the errors of Winſlow. The deſcription of the arteries particularly deſerves our praiſe and gratitude. Profeſſor Walthen, of Berlin, has with equal, or even ſuperior diligence, traced the diſtribution of the moſt important nerves, and publiſhed ſplendid repreſentations of them; and lately Maſcagni has given to the public a moſt elaborate and complete account, with elegant plates, of the abſorbing veſſels. Haller not only promoted anatomical knowledge by his accurate diſſections, but diſcovered and eſtabliſhed phyſiological truths by experiments made on living animals. In like manner Mr. John Hunter purſued his enquiries; he was an accurate and minute diſſector, a patient experimentaliſt; and in his researches ſurveyed the whole field of animated nature. To him we owe in anatomy the deſcent of the teſtis, and the natural hiſtory of the teeth; by him phyſiology has been greatly promoted, and the ſtructure and economy of animals diſplayed and explained. In Germany the brain has been examined, and the nerves traced with the moſt ſedulous attention; and of late Vic D'Azyr, in France, an anatomiſt equally comprehenſive and minute, has publiſhed repreſentations of the brain, which are allowed to excel all others. Dr. Monro, in our own country, has alſo publiſhed on theſe ſubjects. Some anatomiſts ſeem to have directed their attention chiefly to the inveſtigation of ſome ſingle organ. Zinn has examined and explained the ſtructure of the eye with ſurpriſing minuteneſs and accuracy. Cotuninus, Meckel, and Scarpa, the ear; and the latter has alſo paid attention to the organ of the ſmelling ſenſe. Of late ſome excellent ſyſtems of anatomy have been publiſhed by Sabatier, in France, and Soemmering and Hildebrand, in Germany.

Morgagni, the pupil of Valſalva, profeſſor of anatomy in Padua, who had very extenſive opportunities of obſervation, and who much improved anatomy in his old age, in the year 1761 publiſhed the reſult of his obſervations De Sedibus & Cauſis Morborum per Anatomen indagatis, a work of the greateſt utility. Doctor Baillie has of late, in this country, proſecuted the ſame ſubject, though in a different manner. He has publiſhed on the morbid anatomy of the body, and illuſtrated his deſcriptions by many elegant, expreſſive, and accurate plates; the proſecution of this ſubject promiſes the greateſt advantages.

We have thus curſorily mentioned the principal ſubjects, in which the moſt eminent anatomiſts have been engaged. The names and employments of numbers of men of high

deſert have, however, been omitted; indeed, they could not be properly noticed unleſs this article were of itſelf to make a volume. Chronological order has been much treſpaſſed againſt, and we therefore return to mention the moſt remarkable anatomiſts, in a ſeries, according to the time in which they lived. As it is difficult to adjuſt their precedency in this reſpect, we ſhall rely on the authority of Haller, whoſe knowledge and judgment will not perhaps be called in queſtion. He conſiders Benedictus, Berengarius Carpenſis, Nicolaus Maſſa, Sylvius, Veſalius, Servetus, and Columbus, as the chief reſtorers of anatomy, whoſe writings are dated from the beginning to the middle of the ſixteenth century. After the reſtoration of anatomy, the ſchools in Italy particularly excelled, and moſt anatomiſts received their education in them. From amongſt the moſt eminent of the Italian ſchool we may ſelect the names of Fallopius, Euſtachius, Aurantius, Cæſalpinus, Varolius, Plater, Caſpar Bauhinus, Aldrovandus, Caſſerius, Fabricius ab Aquapendente, Riolanus, Hoffman, and Spigelius, whoſe writings extend from the middle to the concluſion of the 16th century.

In the beginning of the 17th century the diſſection of human bodies began to decline in the Italian ſchools, and more attention was paid to comparative anatomy and phyſiology. Amongſt the moſt eminent in this department of ſcience we may recite the names of Aſellius, Harvey, Marcus Aurelius Severinus, T. Bartholin, C. V. Sneider, Van Horne, Highmore, D. de Marchettis, Rudbec, Gliſſon, Wepfer, Blaſius, Malpighi, Steno, De Graaf, Herbom, Ruyſch, Swammerdam, C. Bartholin, Brunner, Leuwenhoeck, Duverney, Bidloo, and of thoſe who confined themſelves chiefly to human anatomy, R. Vieuſſens, Cowper, Raw, &c. &c. all of whom flouriſhed in the 17th century. In the beginning of the 18th century, Haller conſiders anatomiſts as having attained a greater degree of learning and knowledge in the ſcience which they ſtudied, and under the title of the more learned in anatomy he gives an account of the works of Morgagni, Winſlow, Cheſelden, &c. which were dated in about the firſt 30 years of that century, except Morgagni's work, "de Sedibus et Cauſis Morborum," which he publiſhed at an advanced age. Under the title of the perfect ſtate of anatomy Haller reviews the works of Albinus, Senac, Monros, (the father and ſon), Haller, Nicholls, Lieutaud, Ludwig, Leiberquyn, Dr. Hunter, and his brother Mr. Hunter, Daubenton, Camper, Walther, Meckel, Zinn, Fontana, Wriſberg, Spalanzani, Hewſon, Portal, Sabatier, Scarpa, Blumenbach, Troja, &c. whoſe writings extend to the preſent time. The Hiſtory which is given muſt neceſſarily be brief, and cannot, in conſequence, be otherwiſe than imperfect. We therefore refer the reader for more ample and correct information on this ſubject, to the writings of Le Clerc, Freind, Goelicke, Portal, and to the Bibliothecæ of Haller.

Anatomy, *Comparative.*—By this term is popularly underſtood the anatomy of animals, compared with the ſtructure of the human body as a ſtandard.—This definition, however, is not ſufficiently comprehenſive. The organization of every animal forms a part of our knowledge of nature, and as far as it exemplifies or explains any of the functions exerciſed by animal bodies, furniſhes thoſe data which conſtitute the baſis of phyſiology. The anatomy of the human body is not more applicable to this purpoſe than that of other animals, and many of the moſt important functions can only be underſtood by comparing the organs by which they are performed in the different claſſes of animals.

The agreement which neceſſarily exiſts between the ſtructure and the habits of animals, renders comparative anatomy an eſſential branch of zoology. No claſſific diviſion of the ſubjects of natural hiſtory can be either permanent or uſeful, which is not founded upon internal ſtructure as well as external characters, and in proportion as this is attended to, we come nearer to that natural arrangement, which ſhould be the chief object of all claſſification. It is in comparative anatomy, then, that the phyſiologiſt principally diſcovers the laws which determine the phenomena of organized matter, and that the naturaliſt finds all his obſervations upon the appearances and manners of animals verified and explained.

The anatomy of animals muſt have formed one of the very firſt ſubjects of human inveſtigation, becauſe in the moſt ſimple and early ſtages of ſociety, almoſt all the means of ſubſiſtence or of enjoyment which mankind poſſeſs, are drawn from other animals. The ſavage, therefore, in killing his prey, and preparing it for the different purpoſes to which it is to be applied, is neceſſarily led to diſtinguiſh the ſtructure and appearance of the ſeveral parts, one ſerving for food, another for raiment, a third for a weapon or an ornament, and ſo on; it cannot be ſuppoſed that this examination ſhould be frequently made, even by the moſt ignorant, unaccompanied by ſome reflections upon the uſes of thoſe parts to the animal in which they are found, or without comparing in ſome degree the anatomy of one animal with that of another: —a very conſiderable portion, therefore, of knowledge on this ſubject muſt have been obtained in ſavage ſociety, but which has been loſt to after ages, from the want of any record of human knowledge.

The ſacrifice of animals which has always made a part of the religious worſhip of uncivilized nations, afforded alſo many opportunities of obſerving the internal ſtructure of animals.

The firſt account that we poſſeſs of comparative anatomy being ſtudied as a branch of philoſophy is amongſt the Greeks. Democritus is reported to have directed himſelf to this ſubject with ſo much ardour, that he at firſt incurred the ſuſpicion of inſanity, but when his objects were explained, the utility of his purſuits was fully acknowledged.

Ariſtotle may be conſidered as the firſt profeſſional anatomiſt; his zootomical reſearches were carried ſo far that his works are read with pleaſure and improvement, even at the preſent day: his opportunities of ſtudying the ſubject were indeed unparallelled; for we are told that Alexander beſtowed upon him 100 talents, (a ſum equal to 50,000l.) to be ſolely expended in procuring animals for diſſection.

Herophilus and Eriſtratus, who ſucceeded Ariſtotle in the ſchool of Alexandria, are ſaid to have diſſected human bodies; but it is more probable that the anatomy of Alexandria was ſtill taught by the diſſection of animals, as beſides the natural feelings to be conquered, there prevailed at that time a notion, that the touch of a dead body communicated a moral pollution: notwithſtanding which, this ſchool became ſo celebrated, that it was not only viſited by the learned men of Greece, but by thoſe of all nations. During the dark ages, comparative anatomy ſuffered nearly an equal depreſſion, with the other ſciences, and it was not until the latter part of the 15th, and the beginning of the 16th centuries, that it began again to be much cultivated; about this time flouriſhed Rondeletius, Bellonius, Euſtachius, Coiter, Fallopius, Fabricius ab Aquapendente, Caſſerius, Severinus, and ſeveral others, whoſe works may be ſtill conſulted with profit. The diſcovery of the circulation of the blood, and of the abſorbent ſyſtem, which may be reckoned as the commencement of another æra in anatomy, opened the door to phyſiological enquiry, from which com-

parative anatomy derived the greateſt improvements, as many of theſe reſearches were moſt conveniently conducted upon animals about this time; alſo the application of the microſcope to the obſervation of the more minute ſtructure of parts, furniſhed a new field for inveſtigation; amongſt thoſe who moſt illuſtrated the anatomy of animals during this period may be enumerated Aſellius, Harvey, Stenon, Borrichius, De Graaf, Redi, Willis, Ruyſch, Malpighi, Swammerdam, Leuwenhoeck, Perault, Needham, Blaſius, Olygerus Jacobæus, Liſter, Borellus, and Tyſon. Comparative anatomy continued to improve in a regular and ſteady manner, during the early part of the laſt century, which will appear in the works of Valiſneri, Valentini, Geoffrey, De Reaumur, Bradly, Maitre Jean Petit, the elder Monro, Trembley, Baker, Bonnet, &c. but it was not until the middle, and towards the cloſe of the laſt century, that the anatomy of animals became a connected ſcience; the diſcourſes of the preceding ages were then arranged, compared, and ſyſtematically applied to the purpoſes of phyſiology; many new and important facts were added, and ſeveral of the moſt curious and intereſting circumſtances in the animal œconomy were fully inveſtigated and explained; collections of preparations to exhibit the ſtructure of animals were formed in Paris, Paria, Gottingen, London, and ſome other parts of Europe; in the three firſt places, public lectures were delivered, by which a knowledge of the ſubject was diffuſed over the continent; this might be conſidered as the Auguſtan age of comparative anatomy, in which we meet the names of Camper, Daubenton, Vic d'Azir, Blumenbach, Pallas, Scarpa, Comparetti, Hunter, Monro, Hewſon, beſides a great number of others of the firſt character.

Some of theſe eminent men are ſtill living, to whom may be added, as the moſt diſtinguiſhed anatomiſt of the preſent time, citizen Cuvier.

It would be impoſſible, within the limits of this article to give any detail of the ſeveral diſcoveries which have been made upon this ſubject; they have only in a very few inſtances been publiſhed in diſtinct eſſays, and are chiefly to be found ſcattered through works on natural hiſtory and human anatomy, or in the tranſactions of literary ſocieties. The works of Collins, Valentine, and Blaſius, which were publiſhed under the name of ſyſtems, are mere collections of facts, without any ſuitable arrangement, and although as a ſimple compilation no book can have more merit than the "Anatome Animalium" of Blaſius; it is, however, to citizen Cuvier we are indebted for the firſt ſyſtematic work on comparative anatomy; the want of ſuch books, and of public lectures has hitherto made this ſcience leſs an object of general attention than its utility and intereſting nature would deſerve; but it may be expected that theſe deficiencies will be ſupplied by the preſent age, in which the value of every kind of knowledge is duly appreciated.

All thoſe who have lately written or lectured upon comparative anatomy, have very properly choſen to arrange the ſubject in a phyſiological manner, inſtead of deſcribing the ſtructure of each kind of animal ſeparately. This mode, however, if ſtrictly adopted, would prove highly inconvenient in a dictionary, in which the matter ſhould be ſo diſtributed, that it could be immediately reſorted to, under familiar heads or titles; on the other hand, to multiply diviſions much is tedious and perplexing, and incompatible with the perfect underſtanding of this ſubject, which requires that a number of facts ſhould be known before any compariſon or concluſion can be drawn. The plan purſued in the preſent work, combines in ſome degree both methods of arrangement. Thus certain claſſes of animals are eſtabliſhed upon the baſis of an agreement in their general anatomical ſtructure; each of theſe claſſes forms a diſtinct article; and the faculties or functions belonging to the animals it contains, make ſo many ſubdiviſions or leſſer heads, under which the ſtructure of the organs, ſubſervient to theſe functions, is diſcuſſed.—See CLASSIFICATION of ANIMALS and FUNCTIONS.

ANATOMY, *Vegetable*.—All natural ſcience conſiſts in the diſcovery and application of facts; its uſual progreſs, therefore, is gradual; hiſtory records no period in which nature has not been ſtudied, and in which the foundation of moſt of the ſciences has not been clearly laid. The internal ſtructure of vegetables, however, during the early ages of mankind, was involved in almoſt perfect obſcurity. It was not indeed until the latter part of the 16th century that the anatomy of plants was formed into a diſtinct ſcience; before this period the ſame opinions were entertained upon the ſubject that were taught by the Greeks, and which were not eſtabliſhed upon actual obſervation ſo much as the analogy that was very properly imagined to exiſt between animal and vegetable bodies. Thus they attributed four parts to all plants:

Firſt, the *ſap* or *juice*, which they conſidered ſimilar in its uſes to the blood.

Secondly, the *fibres* of plants, which they called nerves, from their reſemblance to thoſe parts in animals to which, however, they did not aſcribe the property of ſenſation.

Thirdly, the *veins* or veſſels that were ſuppoſed to contain the fluids.

Laſtly, the *pith*, which they conceived to be analogous to the fleſh of animals. A further account of the early ſtate of this branch of ſcience may be obtained in the writings of Ariſtotle, Theophraſtus, &c. and in the phytologia of Du Val.

It was only by inveſtigations, conducted with the microſcope, that the real ſtructure of vegetables could ever have been developed; it is to the invention of this inſtrument, therefore, that we owe almoſt all the knowledge that is at preſent poſſeſſed upon the ſubject.

The microſcope was firſt made uſe of to diſcover the organic ſtructure of plants by Grew and Malpighi, for what was done before them by Mr. Hooke, and ſome others, ſcarcely deſerves to be noticed, as their attention was chiefly directed to the examination of the external parts of vegetables. In no inſtance, perhaps, have the firſt labours on any branch of ſcience gone ſo far as thoſe of Malpighi and Grew. The books which they publiſhed under the title of the anatomy of plants, rank amongſt the higheſt authorities upon the ſubject at the preſent time. It is remarkable alſo that on the 7th December, 1671, the ſame day on which Grew preſented to the Royal Society the firſt part of his Anatomy of Plants, the ſociety alſo received the manuſcript of the firſt part of Malpighi's "Anatome Plantarum."

In conſequence of the degree of perfection to which theſe eminent men carried vegetable anatomy, the writers who have followed them have been employed in the inveſtigation of the functions, rather than the ſtructure of plants. Some curious and highly important facts have, notwithſtanding, been added with reſpect to the growth of timber, the anatomy of the bark, and the more minute organization of the veſſels, leaves, flowers, ſeeds, &c.

Theſe more modern diſcoveries in vegetable anatomy may be principally found in the writings of Leuwenhoeck, Bonnet, Duhamel, Relreeuter, Gærtner, Hill, Baron de Gleichen, Reichel, Mayer, Guettard, Hedwig, Walther, Deſauſſure, Desfontaines, and Mirbel.

There is ſcarcely any branch of ſcience more intereſting

in

in the purſuit, or which holds out a more valuable end, than vegetable anatomy. The delicate, minute, and complicated arrangement of parts, which appears in the organization of vegetable bodies, preſents a continual ſubject of admiration and amuſement, in procuring which, the feelings are never wounded, nor the ſenſes diſguſted. But this ſcience is not a ſubject of mere curioſity or idle ſpeculation; it affords the greateſt illuſtration of the ſtructure and functions of animals, and tends in an eminent degree to improve the arts of agriculture and gardening, from which civilized man derives all his means of ſubſiſtence, either by his own immediate conſumption, or the ſupport which is obtained for domeſticated animals.

There are certain parts of vegetables which may be termed common, on account of their being generally diſtributed thoughout the ſyſtem. Theſe are the cortical ſubſtances uſually included under the name of *bark*—the *wood*, the medullary part or *pith*, and the different orders of *veſſels* for containing the ſap, air, or ſecreted fluids.

There are other parts again which from poſſeſſing different external figures, and performing ſeparate uſes in the vegetable economy, might be called peculiar parts; theſe are the *root*, the *trunk* or *ſtem*, the *branches*, the *buds*, the *leaves*, the organs of reproduction contained in the *flower*, the *ſeed* or *fruit*. It is under theſe ſeveral heads that the anatomy of plants is diſcuſſed at large in this dictionary. Such an arrangement appears the moſt convenient, if not the moſt ſuitable, as by adopting it popular terms are obtained for moſt of the articles, a thing very deſirable in conveying knowledge by means of a dictionary. This diſpoſition of the ſubject alſo is nearly the ſame, that has been choſen by other ſyſtematic writers upon the anatomy of plants.

The functions of vegetable bodies are deſcribed, arranged, and their proper references pointed out, under the article PHYSIOLOGY *vegetable*, which ſee.

ANATOMY, *Picturesque*.—By this term is implied that degree and kind of anatomical knowledge, which is requiſite for painters and ſculptors, &c. comprehending chiefly the bones which ſupport the figure, the muſcles which move them, and the integuments with which they are covered.

Every conſiderate perſon will allow, that the painter, &c. who repreſents the human figure, cannot obtain any great celebrity in his art without ſome knowledge of anatomy; but it may not ſoon appear to every one, that there is a neceſſity for that conſiderable degree which it is requiſite for him to know; and it may be concluded, that little or none of this kind of information will be abſolutely neceſſary for thoſe artiſts, who devote themſelves to the repreſentation of clothed figures. It may alſo be conceived, that however proper the knowledge of the external muſcles may be to the painter of nudities, the bones, being moſtly covered by them, will be no conſiderable object of his attention; and that ſtatues, with the living model, will communicate all the information required.

The ſkeleton being the frame-work ſupporting the human fabric, it would be diametrically oppoſite to our opinion to think lightly of oſteology. As the bones deſcribe the grand points of the figure, and are acted upon by the muſcles and tendons, a principal part of the painter's attention ſhould be given to the configuration of the bones, eſpecially of the joints; and although the knowledge of the muſcles which move them and fill up the cavities demand much of the artiſt's conſideration, yet it is preſumed, that with the uſe of ſtatues and living models, a perſon well informed in oſteology would make a more rapid progreſs in the repreſentation of figures, where great knowledge of the muſcles has not been obtained, than he who has well ſtudied the myology, but had not a competent acquaintance with the bones. This obſervation will alſo apply to the ſuppoſition of clothed figures being painted without a prior acquaintance with anatomy; it being preſumed, that however capable ſuch a perſon may be of painting drapery, without a conſiderable degree of anatomical knowledge, his figures will reſemble bundles of cloth or linen without that animation and grace, which are to be ſeen in the works of thoſe artiſts who have been honoured with the approbation of the judicious.

It is certain that ſtatues and living models are of great uſe to the painter; the antique figures will form his taſte, and living figures are ſo continually uſed by all painters who ſtrive to excel, that they form a very conſiderable branch of the education of artiſts in all their academies. It is, however, next to impoſſible that a painter ſhould copy the object before him, if he do not underſtand it; for, let him be ever ſo diligent and attentive, he will fall into conſiderable miſtakes. Although in attitudes without motion or exertion, the living figure may for a long time direct his pencil with ſucceſs; yet, when violent motion and exertion are to be expreſſed, the living model can but aſſiſt him for a few moments; here the knowledge of anatomy lends its aid, without which the wearied figure before him will only perplex and render his repreſentations inanimate.

"Nor is it, as ſome may be apt to imagine," ſays Algarotti, "merely to repreſent athletic and vigorous bodies, in which the parts are moſt bold and determined, that anatomy is requiſite: it ſhould be underſtood, to repreſent perſons of the moſt delicate frame and conſtitution, even women and children, whoſe members are ſmootheſt and roundeſt, though the parts made known by it are not to be ſtrongly expreſſed in ſuch ſubjects; juſt as logic is equally requiſite under the poliſhed inſinuations of the orator, and rough arguments of the philoſopher. But it is needleſs to ſpend much time in proving, that a painter ſhould be acquainted with anatomy, or in ſhewing how far his acquaintance with it ſhould extend.

"He muſt be acquainted with the figure and connection of the bones, the origin, progreſſion, and ſhape of the muſcles, the different degrees with which they are covered with fat, which ſubſtance lies thicker upon them in ſome places than in others: but above all he ſhould know in what manner the muſcles effect the various motions and geſtures of the body." Count Algarotti wrote with judgment upon painting, and his remarks upon anatomy deſerve reſpect. The following extract was written by a phyſician, who ſeems to have had a taſte for painting; although ſome of his remarks may have been anticipated, it is thought proper to preſent them to our readers; they will be found, amongſt other uſeful things, in Dr. Briſbane's Anatomy of Painting. After ſpeaking, in the preface, to ſurgeons, the doctor obſerves, that "as the repreſentation of the outſide, or the ſurface of the human body, is the chief object of his art, he ought to ſtudy the ſtructure of the body and its inward parts, chiefly for the ſake of, or as they affect, or are referred to the external ſurface, and make their appearance there, or are aſſiſtant in the better drawing and repreſentation of it. Hence the parts which ſhew themſelves upon, or affect the ſurface of the body, ought to be the ſole or chief object of the ſtudy of a painter. The parts, therefore, that lie neareſt to the ſurface, or outſide of the body, and conſequently [illegible] are moſt immediately concerned in forming its outline, are firſt to be conſidered by a painter, *viz.* the external layer of the muſcles, eſpecially the larger ones, and thoſe that are moſt ſubject to appear in the movement and attitudes of the body. As to the ſkin and fat under it, theſe are ſpread over the

the whole body, and are to be conſidered merely as a drapery or covering to the more inward parts, which appear every where more or leſs through them, at ſome times and places in a ſtronger, and at other times in an obſcurer manner. But though the parts neareſt to the ſurface are the firſt and moſt obvious that belong to the ſtudy of a painter, yet nature has ſo contrived the human body, that the external parts cannot be well underſtood, without a juſt idea of the internal ones, even of thoſe which are, as it were, buried in the centre of the body; I mean the bones or ſkeleton, which are the foundation and frame on which the whole fabric is built, and to which, as a baſis, all the other parts are mediately or immediately referred; particularly the muſcles, ſo neceſſary to be known by painters, which are chiefly inſerted into the bones, and make conſiderable marks and impreſſions upon them; and conſequently without the knowledge of the bones, the muſcles, and other ſoft parts cannot be underſtood; but there is another reaſon why the bones muſt be ſtudied by the painter, *viz.* becauſe parts of the bones, though covered by the integuments, appear not obſcurely to the eye in many places of the body, and, like the large muſcles, are the cauſe of the outline, and of the character, proportion, beauty, and appearance of many parts; and when properly conſidered and underſtood, the bones, by ſo many fixed points, give the ſineſt direction to a painter, not only how to find and place the muſcles, but alſo how to draw the human body; nor can it be ſo juſtly or readily drawn by any painter, as by one who underſtands anatomy in a maſterly manner, particularly the bones and external muſcles, and can point them all out upon a living man, and, by means of that knowledge, determines all his points, and the forms and proportions of every part and member, adding one part to another as he knows they lie upon the body; this is the true and natural method of drawing the human figure. But though the bones and external muſcles are the moſt neceſſary part of the anatomical ſtudy of a painter, yet it muſt be confeſſed, that at leaſt a general knowledge of the whole fabric is of great uſe, in order to a more complete and maſterly repreſentation of the human body, and in order to be able to diverſify, and give reaſon for every appearance; and not only the ſolids muſt be known by a painter, but he ought likewiſe to have ſome idea of the fluids, as on theſe chiefly depend the various tints and colours of the ſkin that appear in the different ſexes and ages of life, in different characters and occaſions, climates, and nations. And as the human frame is ſo contrived, that the movements and paſſions of the mind affect the body, and are evidently ſeen and diſtinguiſhed upon the countenance, and are expreſſed there and in other parts of the body by ſtrong and certain characters; and as this is the moſt delicate and higheſt part of the painter's art, by which he is capable to move, to delight, and to inſtruct mankind, and to recommend himſelf and his art to their eſteem and admiration; therefore, the ſtudy of the mind, and its various characters, paſſions, and movements, ſo far as they are marked upon and expreſſed by the body, ought to be above all things the ſtudy of a painter; for as the members of the human body, in a good picture, beautifully appear through the drapery; and as the bones and muſcles appear through the ſkin, ſo the mind itſelf, in all its characters and paſſions, appears upon the countenance, and in the expreſſive proportions, attitudes, and tints of the various parts. A lover of the arts of deſign, or indeed any anatomiſt of true taſte, will look upon the human body, and all its parts, with the eye of a painter; otherwiſe, he will ſee and deſcribe it in an ignorant and ruſtic manner. Obſerving the human body with the eye of a painter, enables us to ſee all its beauty and perfection, and raiſes in our minds a thouſand ideas of the uſes and propriety of the ſeveral parts, whereof one ignorant of painting will be totally inſenſible; and, in deſcribing the human body upon this plan, we naturally do it in the moſt clear, ſhort, and agreeable manner." We wiſh to impreſs upon the mind of the young painter, that he *muſt* abſolutely obtain a competent knowledge of anatomy, and therefore have ſtrengthened by quotation what we before obſerved. At the ſame time we have purpoſely omitted Dr. Puſbane's reprehenſion of the method adopted by all artiſts, *viz.* that of proportioning the figure by heads, &c. (ſee Adrian's meaſures of the antique figures) which, if he had well conſidered and underſtood, he could not have rejected.

In a well-formed figure, all its parts are in proportion to each other: if the head be the tenth part of the height of a perfect model, its imitation cannot be well, or with certainty, made without this being uſed as a ſcale for the other parts: if the face be divided into three parts, and one of theſe parts be allowed to be the length of the noſe, which it is in all the fine ſpecimens of beauty and proportion, either ancient or modern, then may the figure be ſaid to meaſure eight heads in height, or thirty times the length of the noſe; and this ſcale will give a right proportion to figures of all dimenſions. It is well to caution the ſtudent againſt departing from the revered *ancient* path by the haſty determination of any perſon, as the young artiſt may be ſeduced by his adherence to *individual* inſtead of the *generale* of nature. See Reynolds's Diſcourſes to the Students of the Royal Academy. See alſo Fuſeli's Lectures. While he is beginning this purſuit, at the very time when he is the moſt liable to err, we preſent our caution. It is not intended to ſpeak of picturesque anatomy, merely to amuſe perſons who wiſh to have ſome conception of it, but to endeavour ſo to treat the ſubject, as to aſſiſt thoſe who deſire to be directed into the right path of attaining neceſſary information in order to practice; to point out the method, by which the ſtudy is to be purſued; what books, tables, and caſts are conceived to be moſt proper; and which, by experience, have been found the moſt uſeful. Some obſervations will alſo be made that we apprehend are very much required, and which are not to be found in any printed work upon this ſubject, that we know to be extant. Some of our readers may think too great ſtreſs is laid upon anatomy for artiſts, while to others theſe inſtructions will ſeem ſuperficial. To the former, we recommend a ſecond conſideration of what has been ſaid; to the latter we ſubmit, and refer our readers, for deeper knowledge, to the anatomical labours of the gentlemen, to whom thoſe parts of the Cyclopædia are committed; while at the ſame time we adviſe the ſtudent in painting not to pay too much attention to thoſe curious parts of anatomy, which do not concern his profeſſion. In excuſe for any want of connection which may appear, though it is meant to be as methodical as the nature of the requirements will admit, it ſhould be noticed, that ſome of our obſervations are meant to be impreſſed upon the memory, and retained as diſtinct maxims.

Having thus far offered general obſervations, we might now immediately proceed in the particular ſteps, by which the ſtudent is to purſue his practical knowledge, were it not for a conſideration, that an attention to theory ſhould in a ſlight manner, at leaſt, precede practice, for which reaſon it is thought neceſſary to exhibit a general ſyſtem of the bones and muſcles in this place. This has been done by excellent writers upon anatomy, but many of them have been too particular for our preſent purpoſe. As we think it may not be in the power of our readers to procure thoſe works which are written in a ſlight manner, ſuch as is at preſent required, when it will be neceſſary; for this reaſon the following

lowing general ſyſtems of oſteology and myology may be here introduced with great propriety.

The ſyſtem of the bones or ſkeleton, is, as it were, the ſolid frame that contains, defends, and gives ſtability to the ſofter parts, and to which they are ultimately attached, and conſequently this bony fabric has of itſelf the general form, ſize, and appearance of the entire body. This ſolid frame is moſt artfully compoſed of different parts, jointed to one another, ſo as to be capable of every uſeful and graceful motion in the whole and in all its parts: and the various bones and pieces of which it is compoſed differ in ſize, form, and ſtrength, in poſition, connexion, and motions, according to the uſes and exigencies, and even the beauty of every part, to which they often add a certain grace and character, by obſcurely appearing here and there through the ſofter parts, even in the living body.

The head is, as it were, the dome or cupola to the whole edifice. In this higheſt part the ſenſes are placed, and the brain defended by ſolid bone. The head, like the reſt of the body, derives its ſize, form, proportions, and principal characters firſt from the bones; but the ſofter parts that cover them add life to the motions and the finiſhing beauty, in which laſt the hair alſo concurs; and it is ſurpriſing how ſo few ſimple organs, and ſo thin a covering to the ſoft parts, are capable of ſuch infinite variety of forms and expreſſions as we ſee in the human countenance, affording an endleſs field of ſtudy. In the head the bony part is a more complete fabric, and comes nearer to the form of the living ſubject than any other part of the ſkeleton; being the ſeat of ſo many noble organs, and the chief part to be ſtudied by the painter, it deſerves the firſt place, according to the cuſtom of ſome anatomiſts.

Here veſtiges of the ſmooth poliſhed bone ſhew themſelves in the forehead, in the riſings all around the eye, in the hollow of the temples, on the noſe and cheek bones, and margin of the jaw, giving great pleaſure to the painter who underſtands anatomy.

Next comes the elegantly bent pillar of the ſpine, ſtrong, yet flexible, by conſiſting of ſo many parts firmly tied together. This bony column, at the ſame time, gives ſize, ſtrength, and motion to the body, attachment to many ſurrounding parts, and being hollow through its whole length, ſerves to conduct and ſecure the ſpinal marrow, and to tranſmit nerves to every part of the trunk and extremities. The ſpine conſiſts of four and twenty vertebræ, generally increaſing in ſize as they deſcend, and gradually varying in their figure; ſeven of theſe vertebræ belong to the neck, which admit of peculiar and conſiderable motion, and allow of many graceful movements to the head and neck. The next twelve belong to the back; theſe are almoſt rigid, and admit of very little motion: to theſe, as to a ſolid baſis, the twelve ribs of each ſide are attached, which, together with the ſternum and their own cartilages, form a kind of yielding cage or baſket to contain the heart and lungs. This bony cage admits of a ſmall motion when we breathe; to the lower margin of it all around is fixed the diaphragm, a tranſverſe muſcular partition, dividing the thorax from the abdomen, a main organ of reſpiration, and of other functions. The five lower vertebræ belong to the loins, admit of conſiderable motion, and are of great uſe in the firm and graceful attitudes, and flexions of the trunk, and in many offices of common life. Between the ribs and pelvis there is a great void in the ſkeleton, eſpecially before. In this ſpace lie many of the abdominal viſcera, with the parts that contain and cover them, making on the fore-part the beautiful ſwell of the abdomen, elegantly marked by the containing parts.

To the ſuperior part of the thorax, by means of the tranſverſe clavicles, and of large and ſtrong muſcles, are appended the upper extremities, which, at the ſhoulders, give breadth to the thorax above, and ſerve many noble purpoſes of ſtrength, of art, of defence, of expreſſion, and of beauty. Theſe are divided into the ſhoulder, conſiſting of the clavicle before, and the thin broad ſcapulæ behind, which, moving free among the muſcles, by their means govern the motions of the whole arm, and its triangular form has a moſt beautiful effect, ſeen floating among the ſoft parts in the naked figure; and indeed the whole ſhoulder is a moſt noble part, and a fine exerciſe to a painter; for, beſides many large muſcles, the bones themſelves alſo moſt beautifully and diſtinctly appear. Next comes the arm bone, capable of a large and free motion, whoſe round head at the ſhoulder, in lean perſons, obſcurely appears, and at the lower end its condyles are evidently ſeen, where it is joined to the fore arm; this conſiſts of the radius and ulna, which move upon the arm bone with the more confined motion of flexion and extenſion; but for the ſake of the hand, and its various and important uſes, the radius and ulna likewiſe revolve upon each other lengthways, in a very curious and ſingular manner, turning the hand alternately prone and ſupine, as upon an axis. Laſtly comes the hand itſelf; it conſiſts of the carpus, metacarpus, and five fingers, the thumb being, as it were, an antagoniſt to the other four; the whole together, by its general form, and different parts and motions, ſerving almoſt every poſſible uſe, and its various attitudes being capable of great beauty and variety.

We come now to the pelvis and lower extremities; the pelvis ſupports and defends the lower viſcera. The back part, or os ſacrum of a triangular form is, as it were, the baſis and continuation of the ſpine, whoſe vertebræ it obſcurely reſembles, and performs its offices by receiving the extremity of the ſpinal marrow, and tranſmitting nerves to the ſurrounding parts. The lateral and fore-parts of the pelvis, though fixed and immoveable, anſwer in ſome reſpects to the ſcapulæ and clavicles, as they afford ſockets for the thigh-bones, and alſo a ſeat to many ſtrong muſcles that belong to the trunk and extremities. The upper margins of the oſſa ilium appear gracefully in the living body on the fore-part, and form a kind of boundary between the belly and the thighs. The ſpines of the os ilium, as of the vertebræ, obſcurely appear in bodies not loaded with fat, and alſo the great trochanter is deeply immerſed among large and ſtrong muſcles; but at the knee the bones make a very fine appearance, *viz.* the condyles of the thigh-bone, the tops of the tibia and fibula, and the patella, a bone ſo beautiful and ſo uſeful in the government and defence of this joint. The bone of the tibia appears through the whole length of the leg, and at the lower part of the tibia and fibula, the two ankles elegantly appear, and fix the bounds between the leg and foot. The foot, a thick and ſolid part, ſerving as a baſis and ſupport to the whole body, conſiſts of the tarſus, metatarſus, and toes; in the whole, and in every part, it in ſome ſort reſembles the hand, and, although much inferior, comes next to it in beauty.

The ſkeleton is one ſimple ſyſtem of ſolid parts, ſerving as a jointed frame on which to build the reſt of the body. But the muſcular or fleſhy parts that clothe and move the ſkeleton are ſoft, and form a more various and complicated ſyſtem, conſiſting of different ſtrata or layers, one covering another, and divided into numerous portions of different ſize and figure, regularly diſpoſed over the whole body, compoſing a great part of its bulk, and the chief cauſe of the ſize and form of the members; for when ſtripped of its uniform coverings, *viz.* the ſkin, and cellular or fatty membrane, the

the external muſcular figure nearly reſembles that of the entire body.

The muſcles differ greatly in their ſize, figure, and other particulars, according to the parts where they are ſituated, and the uſes to which they are applied. But in general they are compoſed of fibres; the middle part or belly being large, ſoft, and red, and the extremities or tendons, which are generally inſerted in bones, being ſmaller and harder, white and ſhining. The red part is properly the moving power, and acts by contraction, during which it ſwells, and becomes hard and ſhorter, ſometimes to a great degree, and thereby pulls the parts to which its extremities are affixed. The muſcles are governed by the power of the will, except the fibres of the heart and of the inteſtines, &c. which are of all others the moſt irritable; the muſcles of reſpiration act in both ways. The muſcles can act in a moſt gentle and delicate manner, and alſo with great ſtrength and velocity, though much of their power is loſt by the places and manner in which they are often ſituated and inſerted on the parts to be moved. The cauſes of muſcular motion are difficult to be accounted for.

The muſcles are arranged in their places, and allowed to ſlide upon each other by means of the cellular or fatty membrane; and their fibres are lubricated every where by the oil it contains, and in the fabric of the body, and of the muſcles themſelves, many contrivances are uſed to aſſiſt their actions. The muſcles are in ſufficient number, and ſo diſpoſed and contrived, as to be a warm covering and defence to the more inward parts, as well as to move the joints in all the directions they are capable of, to aſſiſt in many functions of the body, and to place and retain it in every poſſible attitude; in doing which the particular muſcles ſeldom act alone, but in the moſt various manner co-operate with, or oppoſe each other; ſo that the whole muſcular ſyſtem may be conſidered as one muſcle, every fibre being under the power of the will, at the pleaſure of which the whole body, and all its parts, are at once or alternately moved and governed, as it were, by ſo many bridles. Beſides this grand purpoſe of the muſcles, they likewiſe ſerve the general uſes of the animal machine, being the chief cauſe of reſpiration, and of the circulation of the blood and juices; alſo promoting digeſtion, abſorption, ſecretion, excretion, nutrition, and growth; hence they likewiſe prevent and cure obſtructions, and other diſeaſes, and by their inceſſant action, are one great cauſe of the hardening and waſting of the body, and the decays of old age.

Although we think too great an attention to the minutiæ ſhould be avoided by the ſtudent, eſpecially at the firſt, yet it will be worth the attention of the young artiſt to examine the nature of a muſcle a little more carefully; and to know that the fleſhy part of a muſcle conſiſts of a bundle of thin long threads, and is divided into a great number of faſciculi, or little muſcles, each incloſed in its proper membrane. The faſciculi of muſcular fibres have not always the ſame ſituation in regard to each other, nor run in the ſame direction, but ſometimes run parallel to themſelves and their tendons, and are ſometimes diſpoſed obliquely both to their tendons and to each other; but information reſpecting circumſtances of this nature will be more completely obtained by inſpecting the muſcles themſelves. A ſight of the object will impreſs the knowledge conveyed by the anatomiſt in the moſt forcible manner upon the ſtudent's mind.

Some have thought that the moſt proper method for the painter to begin his ſtudies is under the inſtruction of ſome able anatomiſt; but, unleſs the anatomiſt underſtand the arts of deſign, this we diſapprove, and think it beſt that the aſſiſtance of diſſections ſhould rather follow than precede the general practical knowledge. It is therefore recommended that the ſtudent provide himſelf with ſome of the tables which anatomiſts have publiſhed. The tables of Albinus are deſervedly eſteemed; and what are, perhaps, better, thoſe cut in wood, and which illuſtrate the ancient folio volume of Veſalius, edited in 1543, ſaid to be drawn by Titian; but whoever the artiſt was, they are delineated with great judgment, the figures are graceful, the muſcles are repreſented in a robuſt ſtate, and properly ſwelling to the action of the figures: if this be of no great conſequence to ſurgeons it is to painters. Theſe tables may be copied with great advantage. We ſuppoſe the ſtudent to be expert in drawing, which is the firſt ſtep to be taken in the painter's art. Tinney's compendious treatiſe of anatomy is alſo to be recommended: it is a ſelection made with judgment, although the plates are copied; the ſhapes and ſituation of the external muſcles, their names, attachments, and uſes are mentioned. This compendium was publiſhed by Sayer, in Fleet-ſtreet, in 1772. While ſuch repreſentations as theſe are copying, which ſhould not be in a careleſs but in a decided and determined manner, the ſtudent will attain a great deal of the general knowledge of anatomy, eſpecially if he ſhould write upon the margin of his different views of the ſkeleton the names of the principal muſcles, which, in the complete figure, unite themſelves by their tendinous attachment to the bones, with lines drawn to their origin and their inſertion; and alſo if the drawings of the muſcular figures in this work have in their margins the names of the muſcles, to which may be added their characters as flexors or extenſors, and the limb they bend, extend, or rotate, pronate, or ſupinate, &c. Tinney's compendium, before mentioned, will readily aſſiſt in this particular, although the original figures in Veſalius are more recommended as objects to copy after, if that work can be procured.

The next ſtep we recommend is to obtain the uſe of a good ſkeleton, ſupplied with a careful imitation of the natural cartilages and its articulations. With this ſhould be compared the drawings which the ſtudent has been directed to make, and the different views they repreſent, as in front, ſideways, or behind, gratifying his curioſity, and imprinting the object upon his memory. To the complete bony fabric, the head, trunk, and limbs ſhould be obtained ſeparate, for convenience, and their more particular inſpection; and ſome of the bones ſingly, that the joints, &c. may be more carefully obſerved. We adviſe the young artiſt to draw theſe in different views; firſt, the ſeparate bones as large as nature, marking the tuberoſities and ridges, which give attachment to the muſcles, the condyles of the joints, &c. with written remarks on the margin. We conclude that the ſtudent has been initiated into the principles of grace, and knows, in ſome degree, how to produce a figure in eaſy progreſſive motion, or prepared for ſuch motion, which is what painters mean by grace (ſee GRACE.) In the ſkeleton he will obſerve how the joints, &c. by their mechaniſm, admit the muſcles to produce theſe effects in the living body: this will open a great field of contemplation reſpecting his art, and in the wonderfully contrived object before him, the profound wiſdom of his *Maker*. When he has thus advanced to an examination of the ſkeleton itſelf, he may derive much aſſiſtance from an anatomiſt, who knows how to point out to the artiſt ſuch parts as will be requiſite in his art; adapting himſelf properly to the degree of attainment which the ſtudent has made. In the want of ſuch a friend, however, the works of anatomiſts are recommended.

The following hints, we apprehend, will be of uſe; they are few and ſhort, though they may be important, as we only mean to give directions reſpecting the manner in which the painter is to purſue his ſtudies.

It

It is of no great conſequence whether we commence with the head or the pelvis: but in conformity to the ſyſtem already given, the head is firſt mentioned; in which it was obſerved, the bony part comes nearer to the form of the living head than any other part of the ſkeleton. This ſhould, like the reſt, be drawn carefully; the face being complicated in its parts demands great attention, which may be deferred for the preſent. Let the artiſt, however, examine the maſtoid proceſs of the head, which will be important to him in future; let him obſerve how the head is placed upon the atlas of the ſpine, which moves freely upon the tooth-like proceſs of the ſecond vertebra. Let him obſerve the general ſupport which is given to the trunk and upper extremities by the baſis of the ſeveral vertebræ, the degree of motion which is allowed to each part, much in the neck and loins, little in the back, and none in the vertebra of the ſacrum; how near the centre of the body this is placed, although the ſpinal proceſſes of the vertebræ in the back approach ſo near to the contour of the figure, forming that ridge which is uſually called the back-bone; yet the pillar of ſupport which is compoſed by the baſis of the vertebræ, articulated in a peculiar manner to each other, is, upon the whole, much nearer to the centre of the body than will be ſuppoſed upon the firſt inſpection. Although the figure of each rib, which is attached to the ſpine, may be examined in future with more attention, yet, at firſt, we recommend the conſideration of the whole together, that is, the general figure of the ribs with the ſternum and cartilages, as the ſtudent's proper object, for conſideration; the ſudden turns which the ribs take backwards from their connexion with the ſpine, after which their curvature is not ſo ſenſible; alſo that the capacity of the upper part of the trunk is very ſmall when compared with that which is below, contrary perhaps to what might be expected from a ſight only of the living figure: he may be inquiſitive reſpecting the extent of motion of the ribs while breathing, in which his anatomical inſtructor can greatly aſſiſt him. Let him examine the junction and ſituation of the clavicle; the degree of elevation to which the other end of the clavicle being attached to the acromium of the ſcapula, is permitted to riſe by the elevation of the ſhoulder. The ſcapula ſhould be carefully drawn as well as inſpected, the outſide of the parts behind, and eſpecially the ſpine of that important bone; how much it can be moved by the elevation of the arm above the head, and how much nearer the baſes of the ſcapulæ can approach each other, when the ſhoulders are drawn backward; alſo how diſtant from each other the baſes are, when the ſhoulders are drawn forwards. Several views of the end of the ſcapula ſhould be delineated, both in connexion with, and without, the bone of the arm, marking the acromium and coracoid proceſs. The inſide view of this bone ſhould be ſketched with the clavicle and humerus removed; that the mind may be clear in theſe parts, although they are very much hidden by muſcles, &c. in the living figure. When the nature of the ball and ſocket-joint of the humerus with the ſcapula has been well obſerved, nothing need, at preſent, to be noticed, but to draw and mark that bone of the arm, and notice the parts upon it which give attachment to the muſcles, until the ſtudent come to the extremity united to the ulna; which, we think, ſhould have conſiderable attention paid to it, both as united with the bones of the fore-arm, and ſeparate, that the hinge-joint may be well underſtood, being careful to examine the condyles, and alſo the ſmaller tuberoſities, &c. If he can have an opportunity of drawing from a natural ſkeleton (a natural ſkeleton is one prepared with its own proper cartilages) it will be greatly advantageous to him; and more ſo, if he can inſpect and draw from theſe parts when newly diſſected. We alſo adviſe that particular attention be given to the inner and outer protuberance of the humerus, giving attachment to ſome very important muſcles with which artiſts ought to be acquainted.

The ulna ſhould be drawn ſeparate and in connection with the radius, its hinge-joint alſo with the humerus: this ſhould not be paſt over haſtily. Its extremity at the elbow ſhould be very much conſidered, and the permiſſion it receives by the hollow of the humerus, &c. of ſinking, as it were, into that hollow, when the fore arm is extended. The ſame attention muſt be paid to the peculiar ſhape of the radius, the junction of the upper extremity of this bone with the ulna and humerus, the rotary motion which is admitted, in pronation and ſupination; the ſize of theſe bones at the elbow and at the wriſt, the head of the ulna being larger above, ſmaller below, and the contrary in the radius; as well as the general ſhape and proportion when both are united together. Laſtly, with reſpect to the preſent conſideration of the radius, we call particular attention to the tubercle, in which is inſerted the tendon of the biceps muſcle. The compact bones of the wriſt or carpus being articulated to the radius, with the conſiderable motion it allows, will be an object to which, even at firſt, the attention is due, and its union with the hand, &c. The metacarpal bones, and thoſe of the fingers may be well underſtood by making careful drawings.

We now deſcend to the pelvis, compoſed indeed of ſeveral bones, but perhaps better underſtood by artiſts, when they are together, than when ſeparate, as they admit of no motion in themſelves, except at the coccyx: but the motions of the pelvis itſelf, upon the thighs, demands, we think, even at the very firſt, as much attention, if not more, than any other bone of the human body.

The underſtanding of the turns which this compages of bones take in ſtanding or moving figures, will particularly aſſiſt the informed artiſt to produce graceful effects in his imitations, or, at leaſt, without knowledge of this particular, it is by accident only that he can produce his figures in graceful poſtures. When by drawing this baſon for the abdominal viſcera (without concerning himſelf with its contents), he is become acquainted with its form, he ſhould ſtudy in the following manner: let him obſerve the upright poſture of a graceful figure, ſtanding upon one leg, right or left; let him next conſider how the ſpine of the ilium will appear in that ſtate; then place the pelvis ſo before him, and draw it carefully, the inclination of that important part being according to the poſture. This hint will do for a perſon who is eager in the purſuit of knowledge, in all other ſtates in which the action moves the pelvis; and will exhibit to him the different nature of the ſtudy of anatomy, in a ſurgeon or a painter, or to what different ends the ſame ſtudy may be applied.

The ball and ſocket-joint ſhould be well conſidered, where the femur is articulated with the ilium, the whole form of the thigh-bone ſhould have due attention paid to it: particular notice ſhould be taken of the great trocanter, and alſo ſome obſervation ſhould be made upon the ridges in the femur. This ſhould be ſtudied by the artiſt; being ſet in the different poſtures that it ſuſtains, under particular actions, as was before directed for the pelvis; but the condyles, and the nature of the joint, and its tuberoſities, demand ſtrict attention in connection with the large bone of the leg. It ſhould be obſerved, that this joint is very ridged when the leg ſupports the figure, and admits of no rotatory motion; this joint ſhould alſo be ſtudied without, as well as in connection with the patella. When the leg is firmly extended, as in ſupporting the body, the patella is drawn up by ſtrong muſcles, and riſes above the joint, being then ſtationed on the outſide of

the

the head of the femur; but when the leg is bent, the point of the patella again falls within the joint

By carefully drawing the tibia and fibula they will be underſtood; but the protuberances forming the ankles muſt be obſerved, and the faithful delineation of them ſtored up in the mind; noticing that the inner ankle, formed by the tibia, is higher, and advances more forward than the outer ankle formed by the fibula. The heel and tarſal bones with the metatarſal, ſhould be ſtudied as they are united, noticing the manner in which the bones of the leg are placed upon them, together with the whole of that finely conſtructed arch that bears up the whole body.

In addition to what has been ſaid upon the ſtudy of the knee, the aid which the natural ſkeleton affords, ſhould lead the draftſman to correct knowledge of this important and beautifully formed and uſeful joint. If he has opportunity, it ſhould be alſo ſtudied after a freſh diſſected ſubject, with the leg in extenſion, as well as in its ſtate of flexion, and, as before hinted, his obſervations written on the margin ſhould accompany the drawings.

In contemplating the articulations in the natural ſkeleton, it will be obſerved, that the lengthening of the body at one time more than another, is not by drawing out like a worm one part of the body from another, but by the muſcles bringing the bones more perpendicularly over each other. This leads to the conſideration of the *muſcles*.

"A muſcle is compoſed of two tendinous and ſlender parts," as Count Algarotti expreſſes himſelf; "one called the head, and the other the tail, both terminating at the bones, and of an intermediate part, called the belly; the action of a muſcle conſiſts in an extraordinary ſwelling of this intermediate part, while the head remains at reſt, ſo as to bring the tail nearer to the head, and conſequently the part to which the head of the muſcle is fixed, nearer to that part into which the head of it is inſerted. There are many motions, to effect which ſeveral of the muſcles (for this reaſon called co-operating muſcles) muſt ſwell and operate together, while thoſe calculated to effect a contrary motion (and therefore called antagoniſt muſcles) appear ſoft and flaccid. Thus, for example, the biceps and the brachiæus internus labour; and when the arm is to be bent, and become more prominent than uſual, while the gemellus, the brachiæus externus, and the anconæus, whoſe office is to extend the arm, continue as it were flat and idle. The ſame happens reſpectively in all the other motions of the body. When the antagoniſt muſcles of any part operate alone and at the ſame time, ſuch part becomes rigid and motionleſs; this action of the muſcles is called tonic." It is to be wiſhed that the ſtudent may be informed by a diſſected ſubject of the nature of the different ſorts of muſcles, as thoſe whoſe fibres are direct, like the biceps, of others which are oblique, as the pectoral muſcle, of thoſe which are called penniform or feathery, as that which moves the thumb. Thoſe which are round, being internal or little ſeen, do not belong to his ſtudies. He ſhould alſo be taught that the tendons admit of no contraction or extenſion; that they are long for convenience, and that they are in general confined near the centre of motion, by annular ligaments, to prevent deformity, and alſo to admit of a more quick motion, as in the wriſt; but where the contrary arrangement renders them more uſeful, they are not thus confined as in the hamſtrings, and the bend of the fore-arm.

He ſhould know that the ſame muſcles are uſed to draw the body to the arm, which draw that member to the body; alſo, that thoſe muſcles which bend the thigh on the body, when the feet are fixed, bend the body on the thigh; that ſome muſcles have not all their motions engaged in every action in which ſuch muſcles are employed, but only part of them, as the deltoid, the portions of which have various motions; ſuch portions, however, never act without the concurrence of ſome other aſſiſting muſcle with them.

Theſe things being premiſed, the ſtudent is to be directed how to proceed, and what are the readieſt means. We before directed him to the tables publiſhed by anatomiſts: this advice, we ſuppoſe, to have been complied with. It is, therefore, recommended him to draw with care from a good caſt of a muſcular figure, after the ſkin and other integuments have been taken away by a ſkilful anatomiſt. In the Royal Academy there is a valuable figure of this kind, which is ſtrongly recommended to thoſe who can have acceſs to it; and where he will alſo find other ſubjects of this nature worthy his attention, as well as proper inſtruction from a very reſpectable profeſſor of anatomy; but in the want of the inſtruction which that inſtitution has provided for its ſtudents, &c and the uſe of the large anatomical caſts, which it poſſeſſes, a caſt ſhould be procured from thoſe ſhops which ſupply artiſts with anatomical and other figures in plaſter of Paris. Mr. Banks made an excellent model after the original, which we mentioned to be in the Royal Academy, about three feet in height, which was caſt in plaſter; and we recommend it above any others that we know can be obtained. The figure (of which this is an admirable copy, though of reduced ſize) was prepared for the artiſts by the late Dr. William Hunter, to which every attention was paid both by him and the artiſts who aſſiſted in placing the figure in a graceful attitude.

The unfortunate ſubject of that caſt was executed for murder, the body was taken from the place of execution as quickly as poſſible, and while warm, and the muſcles capable of contraction, to which their nature diſpoſes them (even without the influence of the will), the body was ſet in the poſture it now ſtands, and in which ſtate it was diſſected; then the caſt, of which we ſpeak, was produced. Many ſimilar attempts have been made, but this appears to be by far the moſt ſucceſsful of any figure we are acquainted with, which ariſes from ſeveral concurring circumſtances; ſuch as its being a well proportioned figure, its attitude graceful, the limbs ſo diſpoſed as to ſhew each part diſtinctly, and its having been prepared by a great anatomiſt. Being a caſt from nature itſelf, the mind has an unbounded confidence that he who ſtudies from it cannot be miſled by the miſtakes of an artiſt; and that the figure being ſet while the muſcles were warm, they have, in a great degree, the proper ſwell, comporting with the ſtate of the limbs. Mr. Spong made a ſmall model of this figure, the bronze caſts from which, for their ſize, are excellent. There are ſeveral other caſts to be met with which may greatly aſſiſt the ſtudent: that after the anatomical figure which was modelled by Mr. Rubiliac, is very natural and good; there are alſo ſome executed by the French Academy. We recommend the head and neck as large as life from the French, and alſo the trunk and upper extremities in a reduced ſize; one ſide having the external muſcles taken off, and the other ſide retaining them for the ſake of compariſon. Another of the leg and thigh of a man with half the pelvis, exhibiting the pſoas muſcle; the laſt which we particularize, and deſerving as much notice as any, are two diſſected arms, caſt under Dr. Hunter, which are fine exhibitions of muſcular ſtrength. While the ſtudent is in practice, and as his judgment expands, or his fellow practitioners recommend, he will find aſſiſting objects of this nature preſented to him in abundance. Theſe hints concerning the caſts, &c. may be of uſe to ſome of our readers, eſpecially thoſe who are ſituated at a diſtance from the metropolis.

Whatever caſt of the muſcles the ſtudent's judgment or con-

convenience has ſelected, he ought to examine and copy different views, writing upon the margin (as we directed concerning the ſtudy of oſteology) the names of the muſcles, their origin, inſertion, and their uſe, as flexors, extenſors, and rotators; obſerving, with the ſame attention, the ſituation of the bones behind the muſcles, and where the projections on the ſurface are cauſed by them. While the young artiſt is making ſuch drawings, he will do well continually to examine and compare the living figure with the anatomical caſt; the figure being placed in the ſame attitude with the object of his imitation; tracing with the finger the bones and muſcles of the living ſubject to aſcertain the cauſes of the effects he obſerves, and which he cannot otherwiſe account for. This will greatly facilitate his knowledge.

A common-place book for anatomical ſketches, as well as the complete drawings he has been adviſed to make, will be very uſeful, in which the ſeparate parts may be delineated; beginning with the head, and deſcending to the lower extremities, in the following manner. Firſt, ſuppoſe it to be the front view of the head and face of the ſkeleton; then he may draw from a plaſter caſt of the head, &c. with the ſkin taken off; ſuch as the large diſſected head, from nature, which we mentioned as being prepared by the French academy; or if this be not at hand, the head from any of the before-mentioned anatomical figures. Then a drawing ſhould be made in the ſame view from a living perſon, one in whom the muſcles are to be diſtinguiſhed, the ſubject not being covered too much with fat. Several views of the face ſhould be treated in this manner.

What has been ſaid of the head will apply to the neck, trunk, the arms, hand, thighs, legs, and feet; this practical method will be of conſiderable uſe to the artiſt, and if the ſeparate parts in different views be alſo drawn from ſome of the antique figures, ſuch as are placed in a ſimilar poſture, his taſte and ſtyle will, at the ſame time, be greatly improved; it will naturally ſuggeſt itſelf, that ſuch of the antiques as are robuſt and herculean, will be moſt proper for him at firſt to ſelect, for ſuch purpoſes; theſe objects will lead him not only into the knowledge of the parts, but he will naturally imbibe the right ſtyle of repreſenting muſcular motion from them. We are acquainted with no critic who has obſerved any anatomical error in the antique ſtatues, or an inſtance in which the profound knowledge of anatomy does not appear; none who have detected a falſe ſwelling of the muſcles, or any oſtentatious diſplay of anatomy; for thoſe well-informed artiſts exhibited no more of their knowledge than was proper, as it reſpected the character of the ſubject, either delicate or robuſt, at reſt, in motion, or in violent exertions.

This remark, we believe, is ſtrictly due to the ſtatues and fragments of the ancients, though it may not be ſo applicable to the valuable works, in other reſpects, of the great *Michael Angelo* himſelf; whoſe figures will, notwithſtanding, be of a very improving nature, eſpecially while the artiſt is in purſuit of anatomical knowledge; but he ſhould be cautioned not to follow even this extraordinary man in repreſenting theſe appearances too ſtrong, where it is not requiſite; nor in giving the ſwelled motion of the muſcles to the whole body and limbs, flexors, and extenſors, at the ſame time,—which cannot be, but in rare inſtances, as in ſudden ſtarts of ſurpriſe or agony. A common-place book of the nature which has been recommended, beſides the original exerciſe, will reſtore to his memory the impreſſion which time may efface from it. This being the ſtudent's own work, a ſight of it, and his other ſtudies of the ſame nature, will more aſſiſt his recollection, concerning the ſubject he has formerly conſidered, than a much longer examination of prints or drawings by other perſons can be ſuppoſed to do.

In order to prevent embarraſſment amongſt the great number of muſcles, the following arrangement is made; by which the ſtudent's attention at firſt may be circumſcribed, and *theſe* demand his particular attention, *viz.*

Temporalis
Zygomaticus
Maſſeter
Sternohyöidæus
Sternomaſtoideus
Latiſſimus colli
Cleidomaſtoideus
Trapezius or cucularis
Rhomboides
Pectoralis
Deltoides
Biceps
Brachiæus internus
Gemellus
Anconæus
Pronator teres
Supinator radii longus
Flexor carpi radialis
Flexor carpi ulnaris
Palmaris
Perforans
Perforatus
Extenſor digitorum
Extenſor minimi digiti
Extenſor pollicis manus
Serratus major anticus
Obliquus deſcendens
Rectus abdominis
Latiſſimus dorſi
Teres major
Infraſpinatus
Splenius
Sacrolumbaris
Longiſſimus dorſi
Glutæus major
Glutæus medius
Triceps
Pſoæ
Membranoſus
Sartorius
Gracilis
Biceps femoris
Seminervoſus
Semimembranoſus
Vaſtus internus
Vaſtus externus
Rectus femoris
Tibialis anticus
Peronæus
Gaſtrocnemius
Soleus
Extenſor digitorum pedis
Extenſor pollicis pedis.

Theſe muſcles ſelected, and thus arranged, are few in number, and will not perplex the ſtudent; conſidering how important they are to his art, he ſhould not be diſcouraged when informed, that with moſt of theſe he ought to be intimately acquainted. With reſpect to the pſoæ, and one or two more of the internal muſcles, it is neceſſary only to know that they exiſt, and where they are ſituated; but moſt of the other muſcles, thus particulariſed, ſhould be very familiar to him, not only where they are placed, but how they appear when at reſt, in common action, or in violent exertion; and if the method we have recommended be adhered to, a tolerable capacity will attain a great degree of knowledge reſpecting the muſcles, as well as the bones of the human figure.

In the Royal Academy will be ſeen, beſide that already mentioned, another muſcular figure, prepared by Dr. Hunter, one ſide only of which has the ſkin, fat, &c. taken off, that a compariſon may be made with the other ſide of the figure, in which it may be ſeen how much thicker ſome parts of the human body are covered than others. The ſtudent ought to have information reſpecting this circumſtance by other means, if he has not acceſs to this figure. It ſhould alſo be known that although there is a conſiderable difference in the ſize of the muſcles in different ſubjects, between thoſe who are accuſtomed to labour and exerciſe, and thoſe who are more ſedentary; yet it is the cellular membrane, or fat, which principally conſtitutes the difference between corpulence and meagreneſs, and not the muſcular fleſhy ſubſtance of the body; and alſo that children's muſcles are in proportion with adult, according to their ſize and age: the painter will ſee the propriety of this remark.

One more obſervation is neceſſary to be made reſpecting the covering of the muſcles, which is concerning thoſe tendinous expanſions that wrap up and bind them together

in many parts; theſe are uſually ſtrong, although thin and tranſparent; on that account they cannot in general be ſo well expreſſed by caſts or drawings, but in the diſſected ſubject, which the ſtudent ſhould inſpect if poſſible; the ſkin and fat being taken off, the expanſions are diſcovered by their white and ſhining appearance. We adviſe all young artiſts to obtain inſtruction reſpecting theſe aponeurotic expanſions, and particularly the faſcia, which ariſes from the tendon of the biceps muſcles inſerted into the radius, and alſo from the palmaris covering the palm of the hand, and the expanſion from the glutæus, where it is united with the trochanter, covering the muſcles of the thigh; he ſhould conſider this as no trivial object of his concern. In the fore-arm the ſtructure from the aponeuroſis is ſo ſtrong as greatly to affect the form of that part of the limbs where it paſſes over the pronator teres, flexor, carpi radialis, palmaris, &c. and it is ſtrong enough to ſhew itſelf, even in caſts from nature; in the caſt from an arm prepared by Dr. Hunter, this is beautifully preſerved, although a diſſected arm will ſhew it better. It will perplex the ſtudent to account for ſuch appearances in general, although he may have the moſt perfect knowledge of the bones and muſcles, unleſs he be informed reſpecting this circumſtance alſo.—In various parts of the body ſome of the larger veins appear, ſuch will be found upon the ſurface of the ſubjects, from which the painter makes his ſtudies, and therefore he need not to be particularly directed, nor concerning thoſe which redden the parts upon exertion, as the fore-arm, when the hand is ſtrongly graſping a ſword, &c. or the redneſs and paleneſs occaſioned by the different paſſions of the ſoul. See PASSIONS.

We might deſcribe the action of the muſcles we have ſelected, and in the order they are arranged; but this would be deſcending to particulars more than we propoſed, eſpecially as they are beſt learned under the immediate inſtruction of an anatomiſt, pointing them out on the living figure, or which the ſtudent may obſerve upon his own perſon in a glaſs, (a method much recommended by the late Dr. Wm. Hunter,) or upon a living muſcular ſubject. We ſhall, however, particularize a few muſcles as ſpecimens, in order to lead him into the proper method, by which he is to proceed with the reſt, and alſo preſent ſome obſervations for his conſideration.

A figure ſtanding gracefully cannot, with propriety, be ſaid to be in motion or exertion, but many of the muſcles are in exertion to produce even this effect, *i. e.* thoſe which ſupport the figure in the erect poſition, eſpecially the muſcles of the ſtanding leg and of the loins.

When the body is prepared by the mind to receive and ſupport a weight, the muſcles are in exertion, prepared to ſupport what it expects to be received: ſhould a man offer to another any heavy weight, covered with a light ſubſtance, as cork, &c. bringing it with ſuch an air as to imply it was not heavy; from the mind being thus deceived, there would not be a preparation or exertion of the muſcles adequate to ſupport it, and conſequently it would fall and endanger his toes, although the perſon would be more than capable of ſupporting it under other circumſtances. On the contrary, if a body of a light nature be thus preſented, covered ſo as to repreſent a very heavy ſubſtance, and the perſon conveying it ſeems to exert himſelf as bearing a conſiderable weight, ſo ſoon as the palms of the hand come in contact with the pretended heavy ſubſtance, the muſcles would be ſo prepared to exert themſelves, as immediately to heave it into the air. This may be ſeen alſo in the muſcular exertion of a perſon catching a ball projected with a ſtrong degree of force. An artiſt may obtain information reſpecting the propriety of muſcular exertion, from the ancients, by placing a living perſon in the action of any of the antique figures, as performing what they repreſent the figure doing; ſtrictly comparing with the figure the ſeveral muſcles and limbs, as well as the general form; whether ſtanding gracefully, as the Antinous, more exerted as the Apollo Belvedere, or in violent exertion, as the Laocoon.

This method is the beſt we can recommend for the improvement of the ſtudent's taſte and judgment, other methods will conduce to his knowledge of the parts; but this will communicate the idea of graceful motion and the proper expreſſion of the figure. Studies from the living figure ſhould be continually made, and thoſe who are wiſe and are not prevented by other avocations, ſhould in England, as in France and Italy, never forſake the life academy, in which ſchool much of practical knowledge will be learned; but the ſtudent's taſte muſt be formed from the antique figures, in all that relates to proportion, elegance of form, and anatomical propriety. A ſound knowledge of anatomy, is the ground of the painter's art; it is, however, better to know and produce the effects like the ancients, after their deepeſt reſearches, ſo as to hide the artifice by which thoſe effects are produced. *Ars eſt celare artem.*

Although it is not our intention to deſcribe the minutiæ of the muſcles, included in the liſt, yet we ſhall notice a few of them and ſome other circumſtances, as a ſpecimen. Dr. Hunter has often been heard to ſay, that the principal method he uſed in order to attain the knowledge of muſcular motion was by conſulting his own body, becauſe he could give the action to thoſe muſcles he wiſhed to examine, and he ſtrongly recommended this method to others. This trial, from ſo eminent a character, will be adopted ſo far at leaſt, as it reſpects the intricate muſcles of the fore-arm, and by a glaſs he may inſpect the front of the whole figure; but ſuch parts as cannot thus be examined, muſt be ſought for in another perſon. When a living muſcular ſubject is placed before the ſtudent, (with an aſſiſtant to oppoſe the effort which he is to make, in order to retain the muſcles in action for a ſhort ſpace of time, while they are under immediate notice), the commencement may be with the head. The maſſeter and temporal muſcles will be in exertion when the teeth are ſtrongly preſſed together; this exertion will be ſeen in a man when he is lifting a great weight; theſe muſcles ſhould be felt as well as ſeen, that the mind may be quite ſatisfied reſpecting them. The effect of the zygomatic muſcles in drawing up the corners of the mouth will be perceived when the ſubject is ſmiling, &c. Although theſe muſcles do not always ſhew themſelves, they ought to be conſidered attentively, as they have a great influence in expreſſing the paſſions. Sternohyoideus will be in action when there is an attempt to ſwallow any thing. We ſuppoſe all the muſcles in our arangement have been well conſidered; and that the ſtudent has become acequainted with their form, origin, and inſertion, and alſo with the uſe of the ſeparate muſcles.

The ſterno-maſtoideus draws the head downwards, forwards, and ſideways; now in order to notice the action of this muſcle, firſt let the man turn his head over the right ſhoulder, when it will be found that the portion of this muſcle, which is on the left ſide, will belly out, conſequently it will grow tenſe, and ſhorten itſelf, while that portion which is on the right ſide, will be longer and flaccid; this will be evidently ſeen, and may be felt and meaſured with a ſtring, that the ſtudent may be perfectly informed reſpecting a muſcle ſo important to all artiſts. The face ſhould be then placed in the centre, and the perſon muſt be then directed to endeavour to bring his face down upon the breaſt,

breaſt, while an aſſiſtant places his hands upon the forehead of the living model, to oppoſe his bringing it down; while making this attempt the ſterno-maſtoideus will be ſeen in ſtrong action in both portions, and be very conſpicuous; but when the head is in the centre, and in each way in the ſame direction with the body, and that perfectly upright, this muſcle will not ſo viſibly ſhew itſelf, excepting near the inſertion in the ſternum.

The pectoralis will be ſeen in very ſtrong action, by the man endeavouring to bring the fore-arm to his breaſt, the hand being lifted up about the height of his ſhoulder; if the aſſiſtant, at the ſame time, make an effort to keep the arm outwards. If the man with his arm thus raiſed, move it inwards and outwards ſeveral times, an opportunity will be given to obſerve the motion of this muſcle: ſo alſo if the hand be lifted higher than the head, then brought downwards and inwards, he will alſo perceive that the pectoralis ſhould properly be conſidered as a muſcle belonging to the arm, notwithſtanding it is ſituated upon the breaſt.

Thus the flexors and extenſors, pronators and ſupinators, ſhould be examined in motion, after their place and uſe have been rendered familiar by the order and method of ſtudy we have been detailing. What has been advanced upon the ſtudy of muſcular motion in a few inſtances, we hope, will be a proper clue to all the other external muſcles; many errors may be avoided, and much time will be ſaved, if the ſeveral parts be pointed out to the ſtudent, by a ſkilful anatomiſt, who will demonſtrate to him, that although it may be proper to remark the action of the ſeparate muſcles by themſelves, yet ſtill no action of a limb is performed without the co-operation of ſeveral muſcles. This ſhould become as evident to the mind of the artiſt, as that the deltoid elevates the humerus, or that the biceps is a flexor of the fore-arm.

He will, by ſuch an inſtructor, be informed that ſome of the muſcles, or parts of them, are ſo thin, as to ſhew the motion of thoſe which lie underneath, as the latiſſimus dorſi; and although others are deeply ſeated, yet they have great expreſſion in ſome actions, as the longiſſimus dorſi, which will become very conſpicuous, when the body of the figure, being bent downwards, endeavours to regain an erect poſition.

The ſtudent ſhould let the figure before him raiſe his head and depreſs it again; turn it over one ſhoulder, then over the other; this may be done quickly and repeatedly, while he makes his obſervations on the muſcles in the neck.

He ſhould direct the man to bow his body downwards, and bring it up again repeatedly, at one time more quickly than at another, while he obſerves the motion of the rectus abdominis, &c.

The model ſhould alſo be directed to draw in his breath, to ſhew the boundary of the true and falſe ribs, which muſt be well obſerved. He ſhould make him ſtand upon one leg, then upon the other, ſhifting them continually more or leſs quickly, while he notices, with great ſtrictneſs, the change this will cauſe in the ſpine of the ilium, and the other parts of the pelvis; on this we lay particular ſtreſs, as in a preceding inſtance, when directing the ſtudy of the bones, without the muſcles.

He may now examine the motion of the patella, and the muſcles rectus and vaſtus of the thigh, with the ſame care.

He ſhould cauſe the man to lift up one foot, and bring the heel to the other knee, in order to exhibit the motion of the ſartorius muſcle.

By quickly moving the toes, the man will ſhew the muſcles in action, which give them their motion.

He ſhould be directed to elevate and depreſs the arms, as well as bend the fore-arm, to ſhew the performing muſcles of thoſe parts; to turn the palm of the hand upwards and downwards, which will exhibit the pronators and ſupinators. The wriſt bent and extended, and the fingers quickly moved will ſhew their muſcles.

When the back of the figure is ſeen, the ſame method ſhould be purſued to expreſs thoſe muſcles which are behind upon the trunk, and the extremities; carefully noticing the motion of the ſcapula, eſpecially the different ſituations of that bone, when the arm is lifted upwards, and brought downwards; likewiſe examining the motion of the muſcles in the ſide view of the figure in the ſame manner.

Particular attention ſhould be given to thoſe muſcles which form the edges of the armpits, and of the hamſtrings of the thighs; and laſtly, as ſtudy and drawing ought to be conſidered by the painter as ſynonymous words; we adviſe that ſuch things as ſtrike the mind, when they are newly diſcovered, ſhould be noted by the ſtudent in a book kept for the purpoſe, with ſuch ſketches as may tend to recal to his mind in future, or deſcribe to others, what cannot be ſo well conveyed by words alone. Advice of this ſort has been repeated under each head of ſtudy, as we know the conſequence it may be of to ſome of our readers.

Dr. Briſbane judiciouſly obſerves, reſpecting comparative anatomy, "that the painters ſhould at leaſt be acquainted "with the anatomy of thoſe animals which are moſt commonly introduced into their works, particularly of that "noble and uſeful animal, the horſe, and of that faithful "companion of mankind, the dog; as for other animals, as "they more rarely appear in pictures, and are leſs particularly known and attended to, a ſlighter repreſentation of "them may generally ſuffice." We, however, believe that birds ſhould be examined in the interior, as opportunity offers, eſpecially the ſkeleton. In reſpect to the horſe, we recommend the painter to read, and examine the valuable labours of Mr. Stubbs and Mr. Blaine, which we conceive to be an honour to our country. He may alſo be furniſhed with an anatomical caſt of an horſe, which is ſold at the ſhops; from whence information in this reſpect may be derived, eſpecially after the human figure has been well underſtood; for, by knowing which are flexors, and which are extenſors, in general, the ſtudent will be in a great meaſure informed how they will act in this animal. Aſſiſtance will be alſo gained by obſerving the animal itſelf, which he will have before him while he is painting it. Some animals, but eſpecially leopards and tigers, are formed ſo much like a cat, that this common animal will be very uſeful to him; their muſcles may be judiciouſly expreſſed, if a dead cat be put into the poſture of the animal to be repreſented, before its muſcles are cold, and then the ſkin being taken off, it will be an almoſt perfect direction to the painter, who is familiarly acquainted with the action of the muſcles in general.

See the names of the MUSCLES of the human body in the Cyclopædia, their character, nature of their fibres, origin, inſertion, and uſes, to which our readers are referred for more particular directions concerning them.

ANATOMY, *Veterinary*.—Human anatomy, in point of intereſt and importance to mankind, evidently holds the firſt place; that of brutes, particularly ſuch as are domeſticated and employed for various important purpoſes in ſociety, in reſpect to their anatomy, holds the ſecond place. The anatomy of theſe, without being entered upon ſo circumſtantially as the human anatomy, deſerves a due ſhare of regard equal to its importance. To deſcribe each part of the horſe individually and ſeparately, would be often only repeating the more elaborate

deſcriptions of the human anatomy more frequently than thoſe but little converſant with this ſubject would ſuſpect; many of the viſcera, and even the myology of the trunk and extremities, often correſpond in their principal circumſtances: there are, however, great and various differences in the ſtructure of the two animals, which it will be our duty more particularly to deſcribe. For the ſame reaſon that the ſtudy of the human anatomy is uſeful, as it tends to preſerve the health and lives of men, equally ſo is that of brutes, inaſmuch as it tends to ſave the lives of theſe uſeful and often coſtly animals. Nor will it be neceſſary to deſcend far down the chain of quadrupeds; the few only which from their domeſtication are rendered ſerviceable to mankind, deſerve this particular notice; in carrying anatomical reſearch farther among the brutes, and in deſcending into the more ſubordinate orders of animated beings, the ſtudy of their anatomy receives its ſhare of importance, in proportion only as it ſerves to illuſtrate the uſes and functions of particular organs and parts of the more complicated and noble animals, from the very various figure and ſtructure theſe parts are found to aſſume in them, from which much information of their uſe may be obtained; and then, inſtead of *veterinary anatomy*, it becomes properly the ſubject of, and arranges under the head of *comparative anatomy*.

This ſcience may be properly termed *veterinary anatomy*, which, in ſtrict propriety, ſhould include only thoſe animals employed as beaſts of burden, as the root of the word (*veho vecto*) from whence it is derived implies; but it is neceſſarily extended to all domeſticated animals employed in the ſervice of man. The horſe, the aſs, the camel, the ox, the hog, the dog, the ſheep, &c. rank principally under this claſs. The anatomy, however, of the horſe has only been much cultivated, and that but of late years; various eſtabliſhments of conſiderable munificence have appeared within the preſent century for the cultivation of this ſtudy, as that of Charenton near Paris, Lyons, Berlin, London, Copenhagen, Vienna, &c. Theſe inſtitutions, together with the exertions of individuals, have begun to advance this ſcience into reſpect and eſtimation; the anatomy and ſurgery have already received a high ſtate of cultivation, as being more eaſily attainable by direct mechanical means; the progreſs of medicine is more ſlow, and it will be more readily admitted by thoſe moſt converſant with the ſubject, to be at preſent in a ſtate of great obſcurity; and from certain difficulties attending the culture of medical ſcience in general, and particularly in theſe animals, a long period will be neceſſary for it to obtain much conſiſtency or preciſion; ſmall effects are with difficulty traced in mute animals, and no feeling or change in them can be deſcribed or known, unleſs powerful enough to be externally viſible. On the other hand it is but juſt to remark, there is a more free and unlimited opportunity of experimental inquiry and reſearch, as their diſeaſes are fewer, and ariſe from leſs complicated cauſes, than thoſe of men.

This ſcience, though it has long lain in a neglected and degraded ſtate in this country eſpecially, and throughout all Europe, yet has not wanted men of refinement for its cultivators. Among the writers who have diſtinguiſhed themſelves in this line of ſcience are to be enumerated among the ancient Romans, Vegetius; he is ſuppoſed to have lived about the time of the emperor Valentinian the Third, in the fourth century, and is generally conſidered the ſame writer, whoſe book "De Re Militari," has been ſo much admired, as giving the beſt account of the military tactics and warlike weapons of the ancients; his treatiſe "De Arte Veterinaria," is not leſs curious in the preſent age, as handing down to us the practice and opinions on the veterinary art at a very refined period of the Roman empire: his work is principally a compilation from the moſt eſteemed authors of his own time, and eſpecially the Greeks; the prefaces, or introductory chapters to his four books carry with them ſufficient evidence of their author, and are remarkable for ſtrong and elegant language. Better reaſons or apologies for the cultivation of this ſcience have, we believe, never been penned; and though medical reaſoning and phyſiology were at this period in a low ſtate, ſtill we view with ſurpriſe, that the practice was very often not materially different from that which would be ſuggeſted by the moſt refined reaſoning of the preſent day. Columella has treated largely on this ſubject; he lived prior to Vegetius, in the ſecond century, under the emperor Tiberius. Cornelius Celſus, about the ſame period, is alſo underſtood to have written on this ſubject, but of his work there are unfortunately no remains. At a ſtill more remote period than this we find Greek writers on this ſubject of conſiderable note; no leſs than ſeventeen are enumerated by Ruellius, who was phyſician to Francis Firſt, king of France. The ſurviving fragments of theſe authors were edited by Ruellius, by the orders of his munificent patron, firſt in Latin, in folio, in the year 1530; afterwards the original Greek text, in 8vo. in the year 1537; both ſplendidly printed, ſo as ſcarcely, in this reſpect, to be ſurpaſſed by any thing of the preſent day. To this collection of eſſays, Abſyrtus, Eumelus, Hierocles, Pelagonius, Theomneſtus are among the chief contributors: their writings conſiſt of diſſertations on the various diſeaſes of the horſe, beginning moſtly in the epiſtolary form, with the uſual ſalutations in uſe among the Greeks. We learn from Suidas, that Abſyrtus was a Bithynian by birth, and ſerved under Conſtantine in the Scythian war. Hierocles appeared in the courts of law in trials reſpecting thoſe animals, and did not, like Theomneſtus and Abſyrtus, ſerve in the armies of the emperor. The period in which the others lived there are no means left of aſcertaining; it appears, however, to be moſt probable that they lived at an early period after the formation of the eaſtern empire. In theſe writers the ſymptoms of ſome diſorders are pointed out with much acuteneſs, in which conſiſts the greateſt value of their writings. Their preſcriptions are often ill-digeſted farragoes, compoſed of many incongruous ingredients, ſome but little known, and others altogether diſuſed at preſent in medicine. In the adminiſtration of remedies of a ſurgical nature they were more happy, eſpecially that of topical bleeding, which they well underſtand, from every part of the body. Xenophon has alſo treated expreſsly on theſe ſubjects in twelve ſhort eſſays or chapters reſpecting the training, management, and external figure of horſes, and is the moſt ancient of all the writers extant on horſes, being between three and four hundred years before Chriſt. At the decline of the Roman empire this ſcience underwent the general fate of all the other ſciences, and ſuffered an occultation longer than almoſt any of them. A period of more than a thouſand years elapſed without adding as much to the human knowledge of this ſubject as has been done within the laſt twenty only in Europe: during this period, however, of the obſcuration of ſcience, at an uncertain date, was propagated the art of ſhoeing horſes' feet with iron, and which at length became general; an art that has been variouſly practiſed, and never yet reduced to certain rules. It appears alſo, that, during this period of declining literature, the veterinary art ceaſed to exiſt as a diſtinct profeſſion, or was practiſed ſo feebly, that, on the diſcovery of the art of ſhoeing, what knowledge then remained of it was eaſily transferred to the working ſmiths, who alone could practiſe this art. Its ſiſter ſcience, human ſurgery (it would hardly now be credited), underwent a ſimilar fate; and, for the

want

want of ſchools to teach, and profeſſors to practiſe, paſſed into the hands of the barbers, from whom it has not been entirely removed till within the laſt century. Theſe ſmiths became at length from habit, and the cuſtom of mankind in ſeeing them ſo employed, as it were, the legitimate ſons of veterinary ſcience; their labours, through a long period of years, have not advanced the ſcience a ſingle ſtep, and they were neceſſarily employed in this art when it had no regular profeſſors, as being more likely to be ſkilled in theſe matters than thoſe leſs deeply engaged in them, though it would be clearly ſeen, on reflection, that the good practice of medical knowledge, even on brutes, would require as much knowledge of anatomy and the principles of medicine as the ſame practice in the human being. Therefore, for the liberal practice and advancement of it previous information on theſe points was abſolutely neceſſary. In the modern revival of this ſcience the French appear to have led the way; and in taking a ſhort review of thoſe men who have principally promoted it, we ſhall firſt mention the name of Bourgelat, (Les Elemens de l'Art Veterinaire) and Lafoſſe (Cours d'Hippiatreque) as among the earlieſt uſeful authors on this ſubject. The Earl of Pembroke very much promoted the ſcience in this country by a ſmall treatiſe on the manege, in which he firſt ſuggeſted the idea in England of ſchools being formed expreſsly for the cultivation of this ſubject, having ſeen thoſe in France about this time. Many expenſive and oſtentatious works were publiſhed on the manege, which nevertheleſs did not appear in the ſmalleſt degree to promote the medical branch of this art. Berenger's work in 4to. 1771, "on the hiſtory and art of horſemanſhip," is filled with intereſting matter reſpecting the manege, and muſt highly gratify every inquirer after this branch of the art. We cannot recommend too ſtrongly the writings of Mr. James Clark, of Edinburgh, on theſe ſubjects, as poſſeſſing much good ſenſe, and none of that fulſome ſufficiency which marked moſt of the later writings of our countrymen previous to his time. In France Vitet (Medicine Veterinaire) has laboured the anatomy of the ox, and added it to that of the horſe, which had not been much cultivated before. Our countryman, Mr. Stubbs, has, however, done the greateſt ſervice to the ſcience by his excellent anatomical engravings of the bones, muſcles, and many of the blood veſſels and nerves of the horſe, a work in port folio ſize, which, for faithful deſign and good engraving, will not eaſily be exceeded. Snape's work is alſo reſpectable on the general anatomy of the horſe. Blundeville publiſhed a uſeful treatiſe on all the different branches of this art in the reign of Queen Elizabeth, written with conſiderable learning and modeſty; and there is another publication of this deſcription by Leonard Maſcal, in the year 1662. Soon after this a bad ſtyle of writing on theſe ſubjects crept in, and has too much held its place to the preſent time. Gervaſe Markham, in the reign of Charles II., publiſhed his "Maſterpiece," and here appear to begin the preſumptuous ſtyle and empty knowingneſs which has characteriſed the greateſt ſhare of the works which have followed; theſe have not promoted the ſcience in the ſmalleſt degree, but have groſsly declaimed againſt and abuſed what they were pleaſed to denominate the ignorance of grooms, the ignorance of ſmiths, and the ignorance of all their predeceſſors, taking all unfair advantages of their works, in judging concerning them by the improvements of ſucceeding times. In this way we find Markham, Burdon, Bracken, following each other with uncharitable aſperity and "puny criticiſm;" and to this liſt others might be added of the preſent day. They have written page on page in this abuſive way, without adding one ſingle diſcovery or uſeful fact to that art they ſo arrogantly pretend to teach.

And in this place we cannot help noticing a ſingular barbariſm, that appears to have been the offspring of the above writers, which has found its way into common uſe, in one of the terms belonging to the veterinary ſcience, and which we conceive ought no longer to paſs uncorrected, as terms miſapplied in ſcience always confuſe, and often lead to error. The word *farriery* is at this preſent time univerſally in this country employed to ſignify the whole veterinary art, and is a barbarous mode of ſpelling the word *ferriery*, as it is immediately derived from *ferrer*, French, to ſhoe a horſe, and that from the radical *ferrum*, Latin, iron; and ſhould ſignify no more than what the word implies, the application of the iron ſhoe to the horſe's foot. The want of regular practitioners in the veterinary art rendered it neceſſary that the ferrer ſhould adopt the art; and hence the whole art became included in the general term ferriery. In reducing this word to its proper ſpelling, for there can be no authority to juſtify the preſent mode of ſpelling it, and in expunging it, we commit no violence on the uſage, or introduce any innovation on the Engliſh language, for there exiſts ſufficient teſtimony to prove that the old Engliſh writers did not ſpell it as we do at preſent; as in Blundeville, who wrote during the reign of Queen Elizabeth, which, according to Johnſon (ſee preface to his Dictionary), was the pureſt æra of the Engliſh language, we find it ſpelt, with great propriety, with an *e*; ſee book fourth, in his "Addreſs to the Gentlemen of England:" he writes, "All horſes, for the moſt part, do come into their decay ſooner than they ſhould do, by one of theſe four waies: that is to ſay, either for lacke of being well bred, or through the raſhneſs of the rider, the negligence of the keeper, or elſe through the unſkilfulneſſe of the *ferrer*." Again, in the ſame chapter, "Martin Ghelly, of Arton, called Martin Alman, chiefe *ferrer* to the Queen's majeſtie;" and ſo on throughout the work. The title of Earl of Ferrers and Derby might alſo be adduced in proof of this being the ancient and proper mode of ſpelling this word, the arms of this nobleman being quartered with the horſeſhoe, and formerly accompanied with ſome ſingular privileges to the family. This word, therefore, reduced to its original and proper ſignification, only relates to the art of making and applying the iron ſhoe to the horſe's foot; and in this ſenſe we ſhall have occaſion to employ it, as the veterinary art embraces this and all the other branches of the ſcience.

Indeed, on purſuing an hiſtorical retroſpect of the ſtate of this ſcience in England, it has ſeemed to us, for the laſt hundred years and upwards, to have been taking a retrograde courſe, which we feel rather diſpoſed to attribute to the unbounded rage for horſe-racing, which, while it was of great ſervice to the Britiſh nation, by encouraging the beſt breeds of ſtrong and fleet horſes, was of diſſervice, by promoting an artificial vitiated taſte with regard to theſe animals, which overawed all attempts at modeſt inquiry reſpecting their diſeaſes. The knowledge of horſes was ſuppoſed to conſiſt in a ſort of intuition, which was not to be defined or taught to others. Jockeys, ſharpers, and gamblers, were ſuppoſed principally to poſſeſs this knowledge, which was all that was thought neceſſary reſpecting them, and all farther information could be of no uſe. Jockeys before this period were of ſmall note, but from being entruſted with the ſecrets of the courſe, ſoon became engines of great importance in purſuing this ſpecies of traffic, and men at length were brought to reſign their underſtandings to them, imagining it a ſubject too myſterious and difficult for them to comprehend; hence alſo appears to have ariſen the great difficulty of founding a ſeminary for the ſtudy of veterinary medicine and ſurgery in this kingdom, which was almoſt the laſt country in Europe that adopted this ſalutary ſtep for the improvement of the art.

A more

A more just and candid mode of conſidering this ſubject has now ariſen; and a ſtyle of writing and enquiry, which muſt (however it may labour under difficulties for a time) bring forth light, and, with the great improvements in chemiſtry, and all the arts and ſciences which can promote it, will ſoon place it on a footing far beyond what was known in ancient or modern times.

Having gone through what appears to us to be the outline of the hiſtory of the art, as far as we are at preſent acquainted with it, we ſhall immediately paſs to a deſcription of the ſkeleton of this uſeful animal.

On taking a general ſurvey of the bones of the horſe, (ſee *Plate* I.) we may divide them into thoſe of the head, ſpine, trunk, fore and hind extremities; and here it will be proper, in purſuing this general view of the ſkeleton, to remark a circumſtance that is not univerſally known, *viz.* that the horſe, when in the beſt poſſible proportion and ſhape, comes within the ſquare, the head and upper part of the neck only being excepted; and this applies alike to horſes of every deſcription, as well the race-horſe as the dray-horſe: to explain this aſſertion, the dotted line is given, pointing out the limits of the ſquare. If this principle was more generally known to the painters and ſtatuaries, we ſhould not have ſo many ugly and miſerably diſproportioned animals from their hands. This ſubject we propoſe to treat of more extenſively under the article SYMMETRY of *Horſes*.

On a farther examination into the general properties of the ſkeleton, we propoſe to ſhew alſo, that the weight of the horſe is ſupported by a *contrapoſition* of the angles of the ſuperior part of the fore and hind extremities, as the ſhoulder-blade, or ſcapula, *a*, *b*, *c*, *d*, *e*, from the withers, leans obliquely forward, forming an obtuſe angle with the arm, or humerus, *f*, *g*, *c*, *h*; in the hind extremity the reverſe of this ſtructure is obſervable in the poſition of the bones, as the hip-bone, or ilium, *a*, *b*, *c*, *d*, *g*, and the iſchium, *f f*, which paſs in a ſloping direction backwards, and form with the thigh-bone, or femur, *h*, *m*, *k*, *n*, an obtuſe angle forwards. Now it is evident, that the angular poſition of theſe bones being oppoſed to that of the ſhoulder and arm, will readily, by acting in oppoſition to it, ſuſtain the weight of the body which is placed between the two angles; the reſt of the two extremities are diſpoſed nearly in the perpendicular line to theſe angles, and ſupport the weight as ſimple columns, ſtill, however, following, in a ſlight degree, at the hocks and knees the above angle of ſupport. From this curſory view of the entire ſkeleton, it will be neceſſary to paſs to a more detailed examination of the bones which compoſe it, without being too minute for an elementary work of this kind; and we ſhall begin with the *head*, which is formed of the ſkull, face, and jaws, and which are diviſible into about 32 diſtinct bones; the *ſkull* conſiſts of 11 bones; the two *frontal* (ſee *Plate* I.) bones, *a*, *b*, the two *parietal*, *c*, four *temporal*, *h*, *i*, *k*, one *ſphenoid*, one *ethmoid*, and one *occipital* bone, *d*, *e*, *f*, *g*. The temporal bone in the horſe is made up of two diſtinct portions, the ſquamous and petrous, which in this animal always remain diſtinct. The occipital bone differs much from the correſponding one in the human ſkull, forming the top of the head, and is poſſeſſed of very great ſtrength and thickneſs, with a deep depreſſion on the centre, where the cervical ligament is attached. The *face* is made up of 21 bones, as follows, two *naſal* bones, (ſee *Plate* I.) *r*, two *angular* bones, *m*, two *malar*, or cheek bones, *l*, two ſuperior maxillary, *n*, *o*, *p*. The inferior maxillary bone, *q*, is not found in the human ſkeleton, and has been termed by Profeſſor Blumenbach, the *intermaxillary* bone: it was ſuppoſed by him for a conſiderable time to be peculiar to the brute, and would ſerve for a diſtinctive mark by which every other genus of the *mammalia* might be diſtinguiſhed from the human; his latter reſearches have, however, diſcovered that no ſuch bone exiſted in ſome of the long-tailed monkies, though, it is worthy of remark, the ſame bone is found in ſeveral of this tribe of animals with ſhort tails. There are two ſuperior palatine bones, two inferior palatine, two ſuperior turbinated, two inferior, two pterygoid bones, and the vomer. The turbinated bones are particularly large in the horſe, as are alſo the maxillary cavities; and by the elongation of the face, the head of the horſe is extended in length beyond almoſt every other quadruped. Two thin plates of bone, almoſt diſtinct from the palatine bones, and divided by a ſuture, following the ſame direction as the large palatines, are obſervable in the ſpace between the incitor and molar teeth of the upper jaw: theſe might be termed the leſſer palatines; they are, however, merely proceſſes of the intermaxillary bones, and not divided from them by any ſuture. The intermaxillary bones in this animal contain the whole of the inciſor teeth, but not the canini, or tuſks, the ſuture paſſing between them. The inferior maxilla, or rather, in the horſe, the poſterior, or jaw bone, is formed of one bone, at leaſt in the adult, and is not, as in the human, made up of two bones, united by ſymphyſis at the chin; it is neceſſarily longer and deeper than the jaw of moſt other quadrupeds. The jaws are furniſhed with alveoli, or excavations, which receive 40 teeth, *viz.* 12 nipping, or inciſor teeth; 4 tuſks, or canine teeth; and 24 grinders. The tuſks are never ſhed in the horſe, though they are in the dog, and ſome other carnivorous animals; the three firſt pair of molar teeth are alſo ſhed in the horſe, and receive a ſecond ſet; the three laſt pair are permanent; the firſt ſet of inciſors, or milk teeth, are alſo ſhed as in all other animals. For the growth, ſtructure, and other particulars of theſe bones, and ſome remarks reſpecting the indications of the age, we refer the reader to the article TEETH of *Horſes*. The *ſpine* is a canal of bone, of a very elongated conical figure, and, in the horſe, is made up of about 32 pieces, independent of the bones of the tail, which is formed of about 14 bones. The cervical vertebræ are ſeven in number, which number it has been remarked by anatomiſts, prevail in all quadrupeds, whether the neck be long or ſhort. Theſe bones in the horſe are altogether different from thoſe of the human ſkeleton in their formation: the body of the bone is conſiderably more elongated, and the proceſſes of a different figure.

The firſt vertebra in the horſe is termed, as in the human ſkeleton, *atlas*, but evidently with not ſo much propriety, as the head of the horſe is rather ſuſpended from this bone than reſting upon it; it differs eſſentially in figure from the other vertebræ of the neck, being more extended laterally, and in being without any dorſal apophyſis; it is alſo much ſhorter than any of this range of vertebræ; it receives anteriorly the condyloid proceſſes of the occipital bone, and likewiſe poſteriorly the tubercle of the ſecond vertebra within its articulating cavities.

The ſecond cervical vertebra is in figure almoſt the reverſe of the former, being long and narrow in its body, the dorſal proceſs, or criſta, very elevated and enlarged, rough on its upper ſurface, for the ſtrong inſertion of ligament; and this ſpine, or elevated plate of bone, at its poſterior part, is bifid, or cloven, with a middle depreſſion, or foſſa, affording a ſtronger and wider ſurface for muſcular and ligamentous attachment. This vertebra has no ſuperior oblique proceſſes, and enters the former bone by a half tubercle, or capitulum, expoſing the ſpinal marrow on its upper part, and is kept in its ſituation by two broad lateral articulating ſurfaces.

The

The other five bones, which compoſe the neck, are of a more uniform figure than the two former, conſiſting of a body of bone, ſomewhat lengthened, having a large cylindrical perforation for the paſſage of the ſpinal marrow, externally of an irregular, almoſt quadrangular, figure, having various angular and ſpinous elevations of bone, which are termed according to their ſituation, as the ſpinal apophyſis, the ſuperior and inferior oblique proceſſes, the tranſverſe and anterior proceſſes, which are intended for the ſtrong inſertion of muſcles, tendons, and ligaments for the ſupport and motions of the neck. The articulating proceſs of theſe bones conſiſts of a round head of bone, the poſterior articulating ſurface of a ſuitable indentation to receive it. This knob of bone is obſerved by Stubbs to be wanting in the ſixth vertebra of the neck: theſe bones poſſeſs alſo various perforations for the tranſmiſſion of blood veſſels and nerves.

The dorſal vertebræ are 18 in number, ſometimes 19, and are remarkable in the horſe for the length of the dorſal or ſpinous proceſſes, extending from the firſt to the eighth, and which form what is called the withers of this animal, and againſt which the ſuperior part of the ſhoulder is brought to recline.

The dorſal vertebræ differ in ſtructure from the cervical, being much ſhorter in the body or ſolid part of the bone, the ſpinous apophyſis being longer, the anterior proceſs is wanting for the underſide of theſe vertebræ, and thoſe of the loins preſent a ſmooth rounded ſemicircular ſurface to the viſcera. The interpoſing cartilage, or elaſtic ligament, in the cervical vertebræ, is not conſiderable in the dorſal vertebræ; it makes in the recent ſkeleton more than an eighth part of the whole length of this part of the ſpine.

A dorſal vertebra of the horſe poſſeſſes almoſt a ſimilar number of proceſſes as are found in thoſe of the neck, though very differently ſituated and proportioned; theſe proceſſes are all placed ſuperiorly to the two articulating ſurfaces of the ribs; and it is almoſt unneceſſary to repeat that they poſſeſs foramina for the paſſage of nerves and blood veſſels, and the ſpinal marrow.

The lumbar vertebræ. Where the ribs terminate, begin the lumbar vertebræ, which are ſix in number, and poſſeſs very much the ſame proceſſes and character as thoſe of the back. The ſpinous proceſſes are ſtronger, the lateral proceſſes broader and longer, and ſometimes articulate with the body of the vertebra, and in ſome meaſure ſerve the purpoſe of ſpurious ribs. Theſe bones are often united into one maſs in the horſe, by oſſific depoſit, as are alſo thoſe of the back.

The five next bones of the ſpine are united into one maſs in the adult, to give ſtrength and energy to the various motions of the hind quarter, and in their conſolidated ſtate are called the os ſacrum. The interſtices occaſioned by the union of theſe bones on their underſide, form what, at firſt ſight, appear to be huge foramina, being rounded, as theſe generally are.

The ſuperior part of this bone poſſeſſes longer ſpinous proceſſes than thoſe of the loins, and admits a vaſt ſurface for the attachment and depoſit of muſcles; and here are placed the muſcles of *loco-motion*, which, in all animals, are the largeſt in the body.

On the ſuperior ſurface of the tranſverſe proceſſes of this bone reſts the flat inferior ſurface of the ilium, to which ſurface it is attached by ſtrong ligaments, ſo that the body of the horſe is, as it were, entirely ſuſpended by ligamentary and muſcular ſubſtance, for the ſcapula has no other than this ſpecies of attachment: hence the entire excluſion of a ſolid bony articulation of the extremities with the ſpine muſt ſoften every motion of the animal to itſelf, and conſequently to what it has to carry.

The remaining portions of the ſpine, conſiſting, in the horſe, of 18 pieces, gradually loſe the ſtructure and properties of the foregoing parts of the ſpine, and become ſimple rounded cylinders of bone, ſolid and enlarged at the points of articulation, and towards the extremity of the tail are of a conſiſtence nearly cartilaginous.

Of the trunk. The coſtæ, or ribs, are bones of a curved figure and elaſtic, ſerving to defend the principal part of the thoracic and abdominal viſcera; and in the horſe are generally 18 in number, ſometimes 19; theſe are articulated by one extremity to the dorſal vertebræ by two ſurfaces, a lateral and terminating articulating ſurface. The eight firſt of theſe ribs terminate on the ſternum itſelf by an *oſſeo-cartilaginous* ſubſtance; the others do not reach the ſternum, but are attached to each other by a long ſurface of adheſion of the ſame kind.

The ſternum in the horſe is compoſed of ſeven pieces of bone firmly united, and differs widely from the human in being curved, and, inſtead of being flattened, is anteriorly acute, like the prow or keel of a veſſel. This anterior part is alſo of an oſſeo-cartilaginous conſiſtence, terminating above by an obtuſe eminence above the articulation of the firſt rib, and inferiorly by the ſcrobicular cartilage of an oblong figure. This ſtructure enlarges the cheſt, and gives room for a ſtronger attachment of the fore extremities to the ſhoulder for the ſupport of the body.

Of the ilium, iſchium, and os pubis.—Theſe we may conſider as forming part of the trunk; they are, however, only attached to the ſpine by ligaments, having no actual articulation, and might be referred to the hind extremities. Theſe bones form collectively the haunch, the thigh being included, and internally the pelvis.

The ilium, or hip-bone, in the horſe, is not of a rounded figure, as in the man, but is extended in three directions, forming three powerful branches or proceſſes, which may be denoted, by way of diſtinction, the ſuperior, inferior, and poſterior rami, the three exterior margins or edges of the bone included; between the above rami we propoſe to diſtinguiſh by the terms anterior, ſuperior, and inferior criſtæ. The ramus inferior is ſhorter than the others, and obtuſely truncated, giving an anterior and poſterior pointed angle. The extended branches and wide upper ſurface of the ilium give a place for the attachment of ſeveral ſtrong muſcles which are thus ſituated, to the greateſt mechanical advantage, to the points on which they are to act, giving with the iſchium a magnitude and power to the buttock not equalled perhaps by any other animal.

The iſchium in the horſe is remarkably extended, forming a ſtrong proceſs poſteriorly for the reception and attachment of powerful muſcles, and which proceſs is entirely wanting in the human ſkeleton. This elongation of the iſchium may be denominated the *proceſſus triquetrus iſchii*, from its figure: this ſingular proceſs diſpoſes the muſcles attached to it very advantageouſly for powerful action on the thigh and leg, by removing them to a diſtance from the centre of motion.

In the os pubis there is to be remarked the very extraordinary depth of the ſymphyſis, affording an extenſive ſurface for muſcular attachment.

The above three bones unite in forming the acetabulum, or cup, which receives the head of the thigh bone, in both the human and equine ſkeleton.

There appears to be a ſlight degree of motion of the ilium

on

on the tranſverſe proceſſes of the ſacrum, ariſing from the ligamentous connection between theſe bones; in the dog this motion of the ilium is more evident, and on diſſecting this part we have obſerved a ſingularity which, we believe, has not been generally noticed, and which is worthy of remark in this place. The os ilium in this animal riſes ſo conſiderably above the tranſverſe proceſſes of the lumbar vertebræ on its interior part, that the inſide of it, inſtead of being occupied as in other animals with the iliacus internus muſcle, is entirely filled up by the muſcles of the back, and the above muſcle is entirely wanting. We may, perhaps, illuſtrate the cauſe of this peculiar ſtructure by remarking, that the action of the dog, as in galloping, is performed principally by the muſcles of the back, in the horſe it is more effected by the action of muſcles of the extremities.

In taking a view of the figure of the pelvis in this animal we may obſerve its depth is greater, its area wider, and axis more in the line of the ſpine than in the human.

Of the extremities.—The great variety of accidents and diſeaſes to which the extremities are liable, and the peculiarity of ſtructure which attends theſe parts in the horſe, render a knowledge of them more intereſting and neceſſary to the veterinarian or amateur in theſe matters than any other part, and will engage us to conſider them with more minuteneſs and detail than we have done in executing the preceding imperfect outline of the deſcription of the other parts of this animal.

The extremities of the horſe are conſtructed of much the ſame members as the human, though very differently diſtributed and proportioned; the human hand, the firſt of all executive inſtruments, is here converted into the ſolid foot, uſeful only for ſupport and progreſſion: the hand grows more complex towards its termination, while the horſe's foot becomes more ſimplified, following the purpoſe for which it is deſigned. Notwithſtanding, theſe parts in all quadrupeds have a relation to each other, and poſſeſs rudiments which even appear ſuperfluous, but ſerve to point out the connexion between the different families of them; as the ſtyloid bones of the horſe are evident rudiments or relics of the two outſide metatarſal bones of the digitated animals, and appear to ſerve no very important purpoſe, as the mammæ or nipples of the male quadrupeds are rudiments void of uſe of the ſame parts, which are highly uſeful in the female.

Of the fore extremity. The ſcapula, blade bone, or ſhoulder of the horſe is conſiderably lengthened, and is proportionably narrower than the human, being of an oblong triangular figure, poſſeſſing neither acromion nor coracoid proceſs, though there is a prominent, obtuſe point of bone in the ſituation of the latter, and a rounded eminence often on the ſpine of the ſcapula, which denotes the ſituation of the former. The horſe, we may obſerve, poſſeſſes in this part no proper back, for the withers can hardly be conſidered as ſuch, therefore the ſcapula does not materially paſs out of the plane of the os humeri, or arm, as in the human, but is ſimply reclining on the ſide, its upper part reaching near the extremities of the dorſal apophyſes or withers, its lower part directed forwards, and approaching the firſt rib and upper extremity of the ſternum. The under ſide of this bone is concave, and is found in old horſes covered with aſperities for muſcular attachment: the upper ſurface is divided longitudinally into two unequal parts by a bony ridge, called its ſpine, affording ſurface for the attachment of various muſcles and tendons; the baſe or broad extremity of the ſcapula is furniſhed with a cartilage, which embraces the muſcles of the withers; its ſmall end poſſeſſes an articular cavity which receives the head of the humerus, and is termed the glenoid cavity. The motion of this bone is different from any other in the body, not moving upon either extremity, but librating round a point which is ſituated near the centre of the bone.

Of the humerus, or arm. This bone is particularly ſhort when compared with the bone of the human arm, ſcarcely paſſing beyond the line of the cheſt, and is proportionably ſtronger, paſſing from the point of the ſcapula in an oblique direction backwards; and inſtead of partaking of the various motions of the above bone, poſſeſſes but one motion, that of being brought from its inclined poſition forwards to the perpendicular line of the body. This bone poſſeſſes various ſtrong elevations and depreſſions for the lodgment and inſertion of muſcles, of which there is hardly any trace in the bone of the human arm. It articulates inferiorly by two ſtrong condyles with the radius. It is this bone, often by being too long, that brings the horſe's fore-legs too much under his body, a fault much diſliked by the amateurs of riding horſes; this may alſo ariſe from the ſhoulder being too upright. The fore-limb of the horſe not requiring any rotatory motion, as in the human arm, we find no diſtinct os ulna, but the point of the elbow, or olecranon, being very much enlarged and extended in length, is firmly fixed to the back of the radius, ſending off a proceſs of bone downwards, which is brought to a point about the middle of the radius, uniting firmly with it; from its poſition being fixed in reſpect to the radius, it can perform but one of the offices of the human ulna, and ſerves for the attachment of thoſe muſcles, which bring back the fore-arm, from its bent poſition forwards, to the ſtraight line, under the preſſure of the weight of the body. For the os radius, ſee *Fig.* I. *l. l.* The radius or fore-arm of the horſe is nearly ſtraight towards its middle and inferior extremity, bending a little forwards; it is uſually miſtaken for the arm of the horſe by caſual obſervers, its poſterior ſurface is flattened, it grows broader at its extremity, forming two condyles, poſſeſſing motion, upon the bones of the knee, admitting an extent from the perpendicular of the leg, conſidered together with the bones of the knee, to a very acute angle backwards.

Bones of the carpus, (ſee *Plate* I. *fig.* 1, 2, 3, 4, 5, 6,) are the bones which compoſe the carpus, vulgarly called the knee of the horſe, and correſpond to the bones of the human wriſt; theſe bones do not afford a ſimilar extent of motion with the ſame bone in the human carpus, not admitting any motion forward beyond the perpendicular line, nor of any lateral motion whatever.

On a firſt view of the bones of the knee of the horſe, their poſition ſeems reverſed to the human wriſt, the olecranon or elbow being placed at the back of the radius, and the flexion taking place in a direction towards it; and the bones which form the back of the wriſt appear to form the front of the knee. This inverſion, however, is only apparent, and not really ſo, as by a ſlight rotation of the radius, the human wriſt may be placed in the ſame relative poſition to the ulna, as the bones of the knee of the horſe are with reſpect to it.

The knee of the horſe is made up of ſeven bones, ſometimes eight, a very ſmall, round bone being often ſuperadded on the ſide, about the ſize of a pea, and is not preſerved in the generality of the ſkeletons of the horſe.

This joint is formed of two regular layers or phalanges of bone, the upper phalanx or row being placed upon and between the diviſions of the other three in each phalanx, the 7th being thrown behind.

The firſt layer, *viz.* that placed on the cannon, has little

or no motion; the ſecond layer has conſiderable motion on the firſt as thoſe have alſo on the radius, making in their total flexion about 30 degrees of a circle.

To ſtrengthen this joint, and to ſecure theſe bones more firmly in their ſituations, they are formed with alternate elevations and depreſſions both in their upper and lower ſurfaces; this joint is alſo rendered ſtronger from having an articulation, which admits of motion in one direction only, that of flexion, and that in the oppoſite direction to the flexion of the hock, tending by this means to ſupport the animal, as we have before obſerved.

The weakneſs of this joint, called *knuckling* in horſes, obſervable in thoſe that have been overworked, or grown old, does not, we believe, proceed from any defect of the joint itſelf, but from the rigidity of thoſe muſcles which ſerve to bend it, and eſpecially thoſe which paſs to the foot, the extenſors, which are comparatively ſmall, not having ſufficient power to counteract it.

Theſe bones have but little reſemblance to thoſe of the human wriſt, though they occur in the ſame number; it will therefore anſwer no good purpoſe to force an analogy between them by calling them by the ſame names; for the uſe of the names deduced from the human anatomy makes a perpetual recurrence to thoſe bones neceſſary to ſee where they may, without impropriety, be introduced, and where they cannot be admitted; it is this circumſtance which has rendered it abſolutely neceſſary to compare both the ſkeletons in this preſent eſſay.

Theſe bones might very naturally be denominated from their ſituations as follows; the *os externum ſuperius* and *inferius*, *os internum ſuperius* and *inferius*, *os medium ſuperius* and *inferius*, *os poſticum*, *os acceſſorium*, and this would be a very deſirable thing, for they would belong to a great number of quadrupeds without being miſapplied. There is, however, a conſiderable objection to their adoption, which is, that in deſcribing the attachment or inſertions of ligaments or muſcles, it would render a circumlocution neceſſary if any other language was uſed, which would be attended with inconvenience, and for which reaſon we decline the uſe of them.

Mr. Stubbs, in his excellent work, in following too cloſely the names of the bones after the human ſkeleton, has been betrayed into the uſe of names, which cannot well be admitted in the equine anatomy. The *piſiforme* is a very ſmall rounded bone in the human, not larger than a pea; the *os poſticum*, though a perfectly diſtinct bone, and differently figured from any in the human anatomy, has been deſcribed by Mr. Stubbs under that name.

If it were deſirable to make any analogy between theſe bones and the human *carpus*, we ſhould on comparing them remark, that in the horſe's knee there is a conſolidation of ſome of the human *carpal* bones, and a ſeparation or diviſion of others; there is, however, the ſmall acceſſorium bone included, the ſame number in each, *viz.* eight bones.

The *os trapezoides* and *magnum* appear conjoined in the horſe, forming one large flat bone, whilſt the bone in the horſe, which ſerves the purpoſe of the unciform bone at the back of the knee, is made of two diſtinct bones; the human *unciform* bone appears in front of the wriſt as well as behind and is one ſingle bone. This curved bone alſo differs in the horſe in being removed to the upper row or phalanx, for the bone, ſerving the ſame purpoſe in the human wriſt, is ſeen in the lower row of the carpal bones.

In this way they may be compared and underſtood, as, after this explanation, the others fall in very naturally in their proper ſituations in both. Were it not on account of the names, it would not be neceſſary at all for the veterinarian to purſue any compariſon with the human ſkeleton, and we think it would be advantageous to avoid it; for the alteration of their figure, on which the human names are founded, renders the ſame names in the horſe totally inadmiſſible.

A nomenclature for the oſteology, which would include nearly, or quite all the quadrupeds known, might be conſtructed, and would be attended with great utility; ſuch a nomenclature, however, would require, that neither figure nor ſituation ſhould ſupply the names, as theſe would be perpetually varying.

It is no eaſy matter to give appropriate and unexceptionable names to all theſe bones, nor ſhould we be deſirous of undertaking it, if the above circumſtances, and others that might be adduced, did not point out the abſolute neceſſity of it; we are aware of the circumſpection neceſſary in ſuch a meaſure; and after as much conſideration as we have time to devote to this ſubject at preſent, venture the following as the beſt adapted which at preſent occur to us.

The middle bone in the upper phalanx we propoſe to name *os intermedium*, being found near the middle of the upper range of bones in all the animals we have examined.

The large internal bone of the ſame phalanx we propoſe to denominate *os parietinum*, which, not conveying any preciſe geometric figure, will apply, without glaring impropriety, to a great variety of ſhaped bones: the external bone of this range, *os gibboſum*, having ſome gibbous elevations on its ſurface.

Of the lower ſeries, the central one we ſhould be led to expreſs by the term *os majuſculum*.

The external one, *os pollicare*, carrying the thumb in all digitated animals, and reſting even in the horſe on the internal ſtyloid bone, which appears evidently the correſponding rudiment of this member in the horſe, and is actually elevated above the level of the ſhank bone, and is placed higher than the ſtyloid bone on the oppoſite ſide, ſerving to confirm the reſemblance. It is this bone which ſo frequently becomes diſeaſed with oſſific depoſit, termed ſplints.

The external bone of this range we would denominate *os ſubunciforme*, being provided with various elevated points, rudiments of the hook-like proceſs, and correſponding to the human *unciform* bone.

The bone ſerving the office of the unciform bone in the horſe, and holding nearly the ſituation of the piſiform, connecting and ſupporting the tendons, &c. which paſs through it, being altogether a different bone from that of the human ſerving the ſame office, which has a curved proceſs on the inſide the wriſt; that no confuſion might ariſe with this bone, we change the terms unciform, or piſiform, in the horſe, and call this additional bone, which is found in moſt quadrupeds, and even in the feline tribe, whoſe digitated extremity is a much nearer approach to the human hand, the *os poſſicum*, or the *poſt-carpal* bone.

This bone gives great force and ſupport to the tendons which paſs through it, or are attached to it, allowing depth and ſolidity to the knee. It is this bone which occaſions the prominent point at the back of the knee, affording a ſtrong and handſome outline to this part; it alſo ſerves for the attachment of a very ſtrong tendon at its extremity, which being then removed farther from the centre of motion in the joint, is empowered to act with very great force, and reſembles, in this reſpect, the office of the *os calcis* on the hind extremity.

The *os acceſſorium* is a ſmall round bone, about the ſize of a pea, which articulates with the poſterior ſurface of the *os pollicare*.

The *os poſticum* has been termed by Vitet, a celebrated French writer on this ſubject, *os hors de rang*, a name perfectly

ſcarcely intelligible in any other language. *Medicine Veterinaire*, Lyon. 1788; tom. i. p. 100.

We ſhall only farther obſerve on the bones of the preſent joint, that the ſurfaces for motion between the ſecond phalanx and the firſt are particularly diſpoſed to the outſide of the joint, tending by this means to ſeparate the legs when in action from each other, and prevent cutting. This is particularly remarkable in the *os ſubunciforme* and *majuſculum*. The flexion of the upper phalanx upon the radius is directly backwards only, and forwards to the perpendicular of the extremity.

Of the metacarpal or ſhank bones.—The great difference of proportion in the parts which compoſe this extremity to the human is no where more conſpicuous than in the metacarpal bones. The range of bones which form the wide palm, or the paws, of animals, is here for the principal part condenſed into one ſolid cylindrical bone, longer conſiderably than the humerus itſelf, the rudiments conſiderably abbreviated of the two exterior metacarpal bones remaining to point out the general connection among quadrupeds; the cow has the ſhank bone deſtitute of ſplint bones, but at its inferior extremity is divided, forming two condyles for the reception of the two claws, and in this way forms as near an approach to the fingered animals, though in a different way.

The ſhank bone is flattened poſteriorly for the reception of the ſuſpenſory ligament and tendons going to the foot, which we may obſerve is more conſiderable in the fore extremity than the hind one; the latter is longer, and of a more cylindrical figure, being generally deſcribed as having no perceptible difference. The ſtyloid, or ſplint bones, adhere to the ſhank bone ſtrongly, and are moſtly united to it by oſſific depoſitions, otherwiſe every where preſerving a divided outline between the two bones. In the fore extremity theſe moſtly dwindle to a point, about two-thirds down the length of the ſhank bone, and are not ſo large as in the hind extremity. Theſe ſplint bones, though ſo often productive of diſeaſe, tend to ſtrengthen the joint laterally; and perhaps by their elaſtic yielding to the perpendicular preſſure of the limb, being elevated above the general articulating ſurface of the ſhank, may act as cuſhions in a ſlight degree in preventing concuſſion; they alſo ſerve to ſtrengthen the limb, by affording a ſurface for ligamentary attachments. The inferior extremity articulates with the paſtern bone by a condyle, having an elevated ridge of bone in the middle to ſupport it, which enters a correſponding depreſſion in the paſtern bone. This joint, though ſtrongly fortified with ligament and tendon, is more ſubject to ſuffer from violent uſage than any in the body. In the cloven footed animals the diviſion begins in this part.

Oſſa ſeſſamoidea. Seſamoid bones, *fig.* 1. *p. p. v. v.* are placed at the back of the paſtern joint, and reſemble, in their figure and properties, the ſame bones in the human foot; diminiſhing friction, powerfully aſſiſting the tendons going to the foot, and at the ſame time ſupporting the paſtern joint by their preſſure.

Of the os ſuffragineum, or paſtern bone. This bone correſponds to the firſt phalanx of bones of the fingers, the five bones of which may be conſidered as conſolidated into one ſingle bone; its general figure reſembles ſufficiently a bone of this part.

The paſtern bone, at either end, is indented for the reception of the prominent condyles of both the ſhank and coronet bone, *fig.* 1, *o, o, u, u.*

The *os coronæ*, or coronet bone, *fig.* 1. *r, r, w, w*, is, like the former, a ſimilar condenſation of the five bones of the ſecond phalanx of the fingers, and is proportionably ſhorter than it; it articulates by a divided condyle with the coffin bone.

This and the preceding are rough on their ſides, with depreſſions for the ſtrong inſertion of ligament, eſpecially laterally, in the point of the axis of the condyle, where a deep indentation is obſervable.

Of the os baſis, or coffin bone. Fig. 1, *s, s, x, x*.—This name, and that of the two former bones, have been taken from thoſe Latin writers who have treated on this ſubject, and, we conceive, will not require any alteration.

A diſtant reſemblance may be traced between the enlarged rounded point of the extremity of the bone of the finger and this bone. The particular ſtructure, however, of this bone and the ſhuttle bone, and their various appendages and integuments, is ſufficiently important to form a ſeparate deſcription. See FOOT *of the Horſe.*

Of the hind extremity.—The *femur*, or thigh bone, of the horſe, compared with the human, and, indeed, with moſt other quadrupeds, is unuſually ſhort, ſo as ſcarcely to appear beyond the *parietes* of the abdomen externally on a curſory view, and is therefore overlooked by thoſe unaccuſtomed to this ſubject; and the bone below is uſually miſtaken by them for the thigh of the horſe.

This bone is of vaſt ſtrength, poſſeſſing ſeveral elevated and depreſſed points for the ſtrong inſertion of tendons and muſcles, which ſerve to diſtinguiſh it from the thigh bone of every other animal. See *Plate* I. *fig.* 1. *h, i, k, l, m, n.*

The head of the thigh bone in the human is carried by an oblique proceſs, or neck, to a diſtance from the bone, whereas, in the horſe, the head is without any length of proceſs of this kind, placed at right angles, nearly to the bone, not affording that variety of motion which the human ſtructure of this part does; a motion directly backwards and forwards, being for the moſt part the only movement requiſite in this animal.

In a ſtate of reſt the thigh bone is not nearly in the perpendicular line of the body as in the human thigh, but inclines forwards, making an angle with the body of about 45 degrees, and forms poſteriorly an obtuſe angle with the reſt of the extremity. This circumſtance is neceſſary to be obſerved with attention previouſly to underſtanding the deſign of the muſcles of this extremity, concerning the uſes of which we propoſe to advance ſome ideas, which, as far as we know, have not before been entertained reſpecting them.

The muſcles which are attached to the poſterior part of this bone are called its extenſors, ſerving to draw it from the oblique line it deſcribes forwards, backwards to the perpendicular of the body, being attached near its head, and rather laterally.

Thoſe muſcles alſo which render thisangle more acute, by drawing it forwards under the belly, are called its flexors, and are attached to its anterior ſuperior part. We mention theſe rules reſpecting the functions of the muſcles of this part the more particularly, as the terms flexion and extenſion but ill expreſs the operation of theſe two claſſes of muſcles on this bone, for the inverſion of the terms would apply almoſt equally well; adduction and abduction are alſo generally attributed to other muſcles, as they are found to attach to the inſide or outſide of the limb. We propoſe to demonſtrate that ſuch are rarely or never neceſſary among quadrupeds; and that ſuch a vaſt body of muſcles as there are to be found in both extremities of this deſcription, have a much more important purpoſe to perform.

The great trocanter of the horſe, ſee *fig.* 1. *Plate* I. riſes conſiderably above its articulation with the acetabulum. This removal of the ſurface of attachment of the glutæus muſcle farther from the head of the bone, muſt beſtow uncommon

power

power on this muſcle in the horſe, in extending the thigh backwards.

The leſſer trocanter in the human thigh is placed almoſt behind it, in the horſe laterally internally.

The moſt notable circumſtance in the thigh bone of the horſe is a ſtrong, curved proceſs of bone on the outſide oppoſite the leſſer trocanter, ſee *fig.* 1. *k*, which receives in its curvature the *vaſtus externus* muſcle, *muſculus faſciæ latæ*, and muſculus faſciæ glutealis ſend off portions of tendon, which are inſerted in this curved proceſs.

As this proceſs is altogether wanting in the human, and in the ox, hog, dog, and in moſt quadrupeds, it is without a name; we have, in our deſcription of muſcular and tendinous attachments, termed it the *proceſſus recurvatus femoris*. Mr. Stubbs terms it the protuberating part of the *linea aſpera*; and Vitet *l'apophiſe recourbée*, tom. i. p. 121.

On the poſterior and inferior part of this bone, near its exterior condyle, there is a deep cavity, in which the *perforatus* muſcle takes its riſe.

The condyles of this bone are remarkable for their magnitude and ſtrength; the outer condyle is larger, and is placed poſteriorly to the inner condyle.

In the dog, and alſo in the cat, we have obſerved a ſmall, round, moveable bone attached to the exterior condyle by a ligament not obſervable in the horſe.

Of the patella.—The knee-pan, or ſtifle bone, is particularly large, elevated, and thick in the horſe, having the lubricous cartilage on its inſide where it meets the femur poſſeſſing correſpondent, impreſſed condyles for this purpoſe. This ſpecies of cartilage is common to all ſurfaces of bones which are contiguous; therefore the continual repetition of this circumſtance, in deſcribing the articulations of the bones of the ſkeleton, has been omitted.

This bone ſerves to increaſe the ſurface for tendinous inſertion of the muſcles of the thigh, &c. paſſing over an angle on which it can eaſily glide; it elevates the tendons high above the point they are deſtined to act upon, and in this way vaſtly increaſes their force on the principle of the pulley and block: and we may here obſerve a property of this bone not generally obſerved, that it ſerves to unite in one focus the action of the muſcles lying on the oppoſite ſides of the bone, as the *vaſtus externus*, *internus*, and *anterior*, bringing them to act for one purpoſe on a ſingle point, in which is clearly ſeen an inſtance of a principle we are about to deduce reſpecting the adductor and abductor muſcles.

Of the tibia, or leg-bone of the horſe.—This bone correſponds in ſtructure with the human much more than the *femur*; it is, however, ſhorter, *cet. par.* There is near its head a ſharp apophyſis, which might be called its anterior criſta; its external ſide is concave, in which lie the bodies of ſeveral muſcles; its internal ſide convex, poſteriorly it is flattened; its epiphyſis may be divided into two condyles, external and internal, in the young foal; from the latter ſprings a ſmall, ſpinous proceſs of bone, the rudiment of the human *fibula*, which is totally wanting in the ox; the hog, cat, and dog poſſeſs a perfect fibula.

Of the tarſus, hough, or hock of the horſe.—This important joint in the horſe is made up of ſix bones, ſometimes ſeven; the internal cuneiform being ſometimes divided in two parts, as in the preparation at preſent before us. This joint in the ox, deer, and ſheep appears to have no more than four bones, which ſeems to point out an extraordinary proviſion in the horſe to increaſe the perfection of the joint, and prevent the ill conſequences of violent concuſſion, as the additional bones in the joint of this animal are evidently well calculated for ſuch a purpoſe.

The human tarſus makes a right angle with the tibia, and, in the act of ſtanding or walking, meets the ground; in the horſe it makes a very open angle with the tibia, and is very far elevated above the ground: and here we may remark, that all the bones from the hock downwards are uſed for walking on by different tribes of animals; where the metatarſal bones are elongated, it is raiſed above the ground. The kangaroo, however, appears to be a remarkable exception to this general rule.

The aſtragalus bone in the horſe poſſeſſes two very ſtrong, prominent condyles, which are not obſervable in the human aſtragalus.

The *os cubiforme* is found holding the ſame figure and ſituation in both animals reſting by its inferior ſurface upon the external ſtyloid and ſhank bone, its upper ſurface receiving the inferior extremity of the os calcis by an articulation not poſſeſſing motion.

The two central cuneiform bones of the human tarſus appear to be united in the horſe to form one flat extended bone, which reſts upon, and covers greateſt part of the articulating ſurface of the head of the ſhank bone.

The *os naviculare* alſo of the human tarſus is here converted into a flat extended bone, reſting on the former; theſe two bones together equal in height the *os cuboides*. By theſe two flat plates of bone, with their interpoſing cartilages, a ſpecies of cuſhion is formed, which renders the effect leſs ſevere of the violent efforts and concuſſions this part is expoſed to: that they have a purpoſe of this kind may be inferred from their taking no part in the flexion of the joint.

The internal cuneiform bone, or a bone that holds its ſituation in this animal, is found reſting on the head of the internal ſtyloid bone, which appears to correſpond with the bone of the great toe in the human anatomy.

We are again ſubject to the ſame difficulty in giving appropriate names to the bones of this joint as we were reſpecting thoſe of the knee. The bone, called in the human anatomy *os naviculare*, in no reſpect in the horſe reſembles a boat, nor the one beneath it a wedge, therefore to continue theſe names would be abſurd; their ſituation alſo as little correſponds as does the purpoſe they ſerve in the two animals.

The cuboid bone, the *aſtragalus*, the *os calcis*, and the internal cuneiform bone may, without any impropriety, continue to receive thoſe names in the horſe, and particularly as it will be attended with convenience to hold as many names as can be admitted correſponding to the human anatomy, by which, at all times, a more ready communication can be held between the two ſciences, but not ſo as to preſs this compariſon too far by a ſervile copy of it, and a compariſon between things which have little or no reſemblance, or relation, by which the greateſt confuſion may be created, and the ſcience at its commencement be clogged with improprieties.

The only changes it will be neceſſary to make in this joint from the human anatomy reſpects the two flat bones, which may be termed, with propriety, the *os planiforme ſuperius* and *inferius*. Theſe are the bones which often become diſeaſed with the depoſition of oſſific matter, forming an enlargement which is termed ſpavin, and alſo the internal *cuneiform* bone.

The metatarſal, or ſhank bones of the hind extremity do not differ in any reſpect, ſo as to deſerve a ſeparate deſcription, from thoſe of the fore extremity; to the differences there adduced, we may perhaps add, that the ſtyloid bones in general deſcend lower in the hind extremity, and are often clavated at the extremity inſtead of being pointed.

Of the muſcles of the horſe, &c. The following is a brief account and explanation of a large portion of the moſt intereſting muſcles of the horſe; the ſhort ſpace of time al-

lowed for the preparation of this article, and the preſſure of other affairs have prevented us from conſidering more accurately this ſubject; the muſcles of the extremities, as being the moſt intereſting and important, are more particularly ſelected; they are accompanied with deſcriptions taken from actual diſſection, during our ſtudies, in the year 1793. The remainder is an explanation of two of the principal muſcular figures, given by Mr. Stubbs.

This account is neceſſarily imperfect; it may nevertheleſs afford thoſe who are deſirous only of an elementary knowledge of the ſubject ſufficient information; thoſe who wiſh to deſcend deeper into the ſtudy will do well to conſult the following writers: Bourgelat, Elemens de l'Art Veterinaire; Lafoſſe, Cours d'Hippiatrique, and eſpecially the uſeful work above mentioned of Mr. Stubbs: a good monograph on the muſcles of the horſe, giving a proper deſcription of their figure, attachment, inſertion, and uſe, ſtill remains a deſideratum in veterinary ſcience, to which ſhould be ſubjoined the ſynonyma of the different writers on this ſubject.

Our deſcription of the muſcles of the hind extremity is with diffidence preſented to the public, as a ſpecimen of the manner we conceive ſuch a work ſhould be executed.

Of the panniculus carnoſus. The fleſhy panniele is the moſt exterior and general of all the muſcles of the body; it is found in moſt or all quadrupeds, and often ſerves them in lieu of hands, lying immediately underneath the ſkin, to which it is attached, and over the cellular membrane covering the muſcles; it is of a pale red colour, and envelopes a large part of the body; as it paſſes towards the extremities it forms a thin expanded tendon or *aponeuroſis*, which deſcends to the ſuperior part of the extremities, enveloping the muſcles, and loſing itſelf in the cellular membrane of thoſe parts, and by attachment to the tendons and elevated points of bone.

When this muſcle contracts it corrugates the ſkin, and aſſiſted perhaps by other muſcles, it can ſhake the whole frame with conſiderable violence, thereby diſlodging from the coat duſt, dirt, flies, and other offending matters.

The butchers are careful in expoſing this muſcle on their meat, which ſerves to give it a more agreeable appearance; it is ſeen of a pale red colour, and here and there they cut through it a longitudinal nick or ſlit to expoſe the white cellular membrane and fat which lye beneath.

The muſcles of the fore extremity of the horſe are about 34.

They are diſpoſed about the limb when detached from the body ſo as to form a pyramidal figure, whoſe baſe is attached to the body, and whoſe apex is reſting on the ground: on the baſe of this pyramid, if we may be allowed the expreſſion, or upper end of the extremity, the muſcles are found to poſſeſs a four-fold poſition, *viz.* an exterior, interior, anterior, and poſterior poſition; ſuch is eſpecially their arrangement about the ſcapula and humerus; as we deſcend they become more ſimple, and occupy at length only a two-fold poſition, ſerving for mere flexion and extenſion, as is obſervable about the *radius;* at the apex of the cone no muſcles are obſervable but merely the tendons of the laſt ſeries of muſcles, with the bones and ligaments to which they are attached.

Abduction and adduction have been the uſe imputed to ſuch muſcles as are attached to the inſide or outſide of the ſcapula, extenſion and flexion to ſuch as are attached behind or before it; it will, however, we believe, be obvious on reflexion that the ſcapula can have no occaſion for ſuch movements as adduction or abduction, and ſo alſo reſpecting thoſe of the *humerus;* therefore we are diſpoſed to conclude that theſe muſcles in whatever direction ſituated have their principal effect in producing a combined operation, promoting the grand object in view, the ſupport and progreſſion of the animal; and we ſhall endeavour to ſhew hereafter, that an abductor and adductor contracting at the ſame inſtant of time with equal force, will not produce an effect in either of thoſe directions, but will co-operate according to the poſition of the bone in an extenſor or flexor motion.

The muſcles of the ſcapula are ſix: *trapezius, rhomboideus, levatorius, pectoralis anticus, triangularis, ſerratus major.*

1. The *trapezius*, is a thin extended muſcle of a triangular figure, whoſe point or termination is fixed on the ſpinous ridge of the *ſcapula*, rather above its middle, its baſe extending from the cervical ligament along the ligament of the 1ſt, 2d, 3d, 4th, 5th, 6th, 7th, ſpinous apophyſes of the dorſal vertebræ or withers. It ſends off an aponeuroſis which envelopes great part of the abdominal muſcles, terminating at length on the linea alba; it alſo ſends off a fleſhy portion to the muſcles of the neck. Le Trapeſe, Vitet. tom. 1. p. 155. Stubbs, Anat. Horſe, tab. 1. o. p. *q. q. r. ſ. t. w. x. x. x.*

2. The *rhomboideus* is a ſhort almoſt ſquare, fleſhy muſcle beneath the former, takes its attachment to the cervical ligament and ligament connecting the ſpinous apophyſes of the dorſal vertebræ, and paſſes underneath the cartilage at the baſe of the ſcapula, which it almoſt wholly occupies by its fleſhy adherence.

This muſcle poſſeſſes no tendon, and ſerves, independent of its effects on the motion of this part, ſtrongly to attach the ſcapula to the body.

See *Plate* II. letters *a, a, b.* Triangulaire, Vitet. Med. vet. i. p. 157. Stubbs, Anat. Horſe, *pl.* ii. *a, a, b.*

3. *Levatorius*, or *extenſor ſcapulæ.* This muſcle is of conſiderable length, and of a conical figure, its baſe being fixed to the ſuperior and anterior angle of the ſcapula, its fibres mixing with thoſe of the *rhomboideus*, from which in ſome ſubjects it can hardly be ſeparated; it paſſes tapering along the neck, adhering to the cervical ligament till it terminates in a point or tendon on the ſame ligament about the ſecond vertebra.

4. *Triangularis.* The triangular is a fleſhy muſcle ariſing from the occiput; where it embraces the neck it grows narrower as it approaches the ſcapula, where it terminates by a flat tendon, uniting itſelf to the *rhomboideus*, and to the tendinous inſertion of the ſerratus major; its fibres are ſtraight, and the muſcle is divided into diſtinct faſciculæ by interpoſed cellular membrane.

5. *Serratus major.* This very large muſcle forms collectively the figure of a fan inverted, the point thereof being towards its inſertion beneath the ſcapula, its circumference on the ribs.

It takes attachment by numerous digitations of muſcle from the firſt to the 10th or 11th rib, the poſterior digitations of this muſcle interweave themſelves with the digitations of the oblique muſcles of the abdomen, and the anterior portions or *radii* with the intercoſtal muſcles. The *triangularis* above deſcribed may alſo be conſidered as a part of this very extenſive muſcle; the fibres converging from this vaſt circumference at length terminate by a tranſverſe fleſhy adherence to the ſuperior interior part of the ſcapula between the *rhomboideus* and *ſubſcapularis* muſcles. There is a faſcia ariſing from the upper ſurface of this muſcle which runs to the linea alba over all the muſcles of the abdomen.

Theſe digitations of the ſerratus major may act in ſucceſſion, as ſo many ſeparate muſcles, or in maſſes, the motion being transferred from one to the other, by which it can co-operate with any other ſeries of muſcles or alone, by producing a ſpecies of rotation of this bone about its axis.

It

It is alſo in quadrupeds a powerful ſuſpender of the body, raiſing it on its contraction upon the extremities. *Plate* II. *c, d, e, f.* Vitet, Le grand Deuntle. Stubbs, Anat. H. *Plate* II. *c, d, e. f.*

6. *Pectoralis anticus.* This is a fleſhy muſcle of conſiderable length, of the figure of a very elongated cone; its baſe being attached by fleſhy fibres to the ſternum and firſt rib, anteriorly to the large pectoral, from whence it grows narrower till it terminates on the anterior *criſta*, or edge of the ſcapula, it alſo contracts a ſtrong adherence to the pectoralis minor, and its aponeuroſis covers all the muſcles of the ſcapula. *Plate* II. *c, d, e, f.* Vitet I. p. 155. Le pectoral anterieur. Stubbs Anat. Horſe. *Plate* II. *c, d, e, f.* Serratus minor anticus, p. 12.

Note. The human *ſubclavius* muſcle is only wanting, all the other muſcles belonging to this part in the human anatomy are found in the horſe.

The muſcles of the *humerus* of the horſe are 12: *Elevator, anteſpinatus, communis, pectoralis major, depreſſor, dorſalis major, latiſſimus dorſi, ſubſcapularis, pectoralis brevis, adductor, poſtea ſpinatus abductor, abductor brevis.*

1. *Elevator proprius* lies immediately before the *anteſpinatus*, uniting itſelf with it. Its attachment is along the anterior criſta of the ſcapula; paſſing with the *anteſpinatus* it terminates on the lateral internal part of the humerus. This muſcle is ſo cloſely connected with the anteſpinatus, that one tendinous expanſion is common to them both. It terminates on the anterior proceſs of the head of the humerus by a tendon which ſurrounds it.

2. *Anteſpinatus.* This muſcle fills the whole ſpace of the ſcapula anterior to the ſpinous ridge, adhering to its whole ſurface by fleſhy fibres; it terminates by a ſtrong tendon on the head of the *os humeri*, covering entirely the protuberance repreſenting the coracoid proceſs.

Plate II. *a, b, c, d, e, f.* Vitet. Med. Vet. L'Anti-epineux. tom. i. p. 159. Stubbs, Anat. Horſe. *Plate* II. *a, b, c, d, e, f.* ſupra-ſpinatus ſcapulæ.

3. *Communis.* This muſcle is of conſiderable length and nearly uniform ſize throughout, and is common to the *humerus* and neck; the panniculus carnoſus forms ſtrong fleſhy adheſions to this muſcle; its firſt attachment is by a ſmall tendon to the ſide of the atlas; it there forms attachments to the muſcles of the neck by fleſhy portions ſent to them, and lower down the neck it ſends off ſimilar portions, mixed with tendon, to be inſerted in the oblique proceſſes of the 4th, 5th, and 6th cervical vertebræ, paſſing fleſhy over the articulation of the *humerus* with the *ſcapula*, it terminates on the anterior part of the humerus, about its middle, by a ſhort tendon; it ſends off a large aponeuroſis, which unites ſeveral muſcles together, and forming at the joints the annular ligaments. It alſo contracts a very ſtrong adheſion to the leſſer pectoral muſcle. Vitet. Med. Vet. i. p. 158. L'Humero-cervical.

The above three muſcles come under the denomination of extenſors.

4. *Pectoralis major.* On removing the ſkin and fleſhy pannicle this muſcle is ſeen taking its attachment along the ſternum and ribs, from the middle of it, between the fore-legs, to its poſterior extremity, growing ſmaller as it approaches the humerus, terminating on the internal ſurface of the ſuperior condyle of the humerus.

Plate II. 1, 1, 2, 3, 5, 6. Vitet Med. Vit. i. p. 160. Le grand Pectoral. Stubbs, Anat. Horſe. *Plate* II. 1, 1, 2, 3, 5, 5, 6. Pectoralis, p. 12.

5. *Latiſſimus dorſi.* This vaſt muſcle is ſituated above the *ſerratus major*, and under the *panniculus carnoſus*: its *aponeuroſis* is covered by that of the *trapezius*. It takes riſe by a very ſtrong *aponeuroſis* on the ſpinous proceſſes of the laſt dorſal vertebræ, extending to the loins; on the back it becomes fleſhy about its middle, covering part of the falſe ribs, and part of the ſurface of the *ſerratus major*; paſſing between this laſt muſcle, and the ſcapula, it terminates by a thin tendon on the lateral internal part of the humerus: it has likewiſe a ſtrong attachment by tendon to the middle of the *depreſſor* muſcle, paſſing with the tendon of that muſcle to the ſmall prominence on the inner ſide about the middle of the humerus, going between the extenſors of the *ulna*. *Plate* II. *r. r. ſ. t. w. w.* Vitet, Le grand Dorſal. i. p. 160.

6. *Depreſſor, or teres major.* This muſcle is of ſome length, oval, and ſomewhat flattened, lying on the underſide of the ſcapula, and cloſely embracing the *ſubſcapularis*, having its attachment to the ſuperior and poſterior edge of the ſcapula; paſſing over the articulation, it terminates by a flat tendon with the preceding muſcle, obſerving the ſame direction in its courſe as the long abductor does on the oppoſite ſide of this bone. Le grand rond. Vitet. i. 159.

The above three muſcles are depreſſors or flexors of the humerus.

7. *Abductor proprius ſeu coraco-humeralis.* This is a ſmall muſcle, cylindrical, and tapering at each extremity, forming a tendon; the uppermoſt takes its attachment to the lateral internal part of the coracoid proceſs of the ſcapula, the lower tendon to the inferior and anterior part of the humerus, paſſing over the articulation, and in contact with the inſide of that bone. This muſcle acting ſingly draws the lower part of the humerus to the body, as the ſubſcapularis does the upper part of this bone. Vitet. Med. Vet. Le Coraco Humeral. i. p. 161.

8. *Pectoralis brevis.* This muſcle will admit of being variouſly divided, and is ſtrongly attached to the *panniculus carnoſus*. This muſcle forms the breaſt like prominence between the fore-legs of the horſe; it is of a figure nearly ſquare, diviſible into diſtinct parallel faſciculæ, from the point of the ſternum, where it joins the muſcles on the oppoſite ſide, it paſſes, forming a flattiſh tendon to the humerus. We have ſeen this muſcle deficient on the one ſide, and full on the other.

9. *Subſcapularis.* It occupies the underſide of the ſcapula, with which it accords in figure, and needs not any particular deſcription, growing narrower with this bone it deſcends, forming a broad tendon in the large inner proceſs of the head of the humerus, and will admit of being ſeparated into ſeveral ſmaller muſcles. Vitet. Med. Vet. Le ſous ſcapulaire, i. 160.

There are alſo two other ſmall muſcles, which may be conſidered as adductors, or perhaps rather inflexors; the firſt of theſe is not ſo ſmall as the other, and takes its riſe at the interior projection of the ſcapula, or rather ſuperior part of the glenoid cavity by a flattiſh tendon paſſing over the joint on the inſide, and taking an oblique direction over the humerus; it terminates in the cavity formed by the condyles of the humerus. We give it the name of *M. articularis major.* The other, which is much ſmaller *(M. articularis minor)* ariſes from the tendon of the preceding muſcle, or the ſuperior and internal ſide of the glenoid cavity, and terminates on the head of the humerus by a fleſhy attachment. This muſcle is not found, we believe, in every ſubject. Theſe ſmall muſcles, it is clear, cannot produce any motion of the limb; their bulk is too ſmall, and they are ſituated too near the centre of motion to operate with any force in this way. Some have imagined theſe ſmall muſcles about the articulation were deſigned to move the capſular ligament out of the way of being pinched, an idea we cannot ſubſcribe to: thoſe ligaments ſurrounding the cavity of the joint not being

lax

lax enough to be in any danger of this ſort, and with their inner ſurface too well lubricated to be caught hold of by an obtuſe round head of bone. The above three muſcles may be conſidered, with the two ſmall ones when acting ſingly, as adductors.

10. *Poſtſpinatus* occupies the oſſeous part of the ſcapula, behind the ſpinous ridge; it grows narrower with the bone till it reaches the joint, where it forms a lubricous cartilage, which is kept in its ſituation by two round prominences in the head of the os humeri, acting like the ſides of a pulley-block: it then terminates on the external round proceſs of the head of the humerus. *Plate* II. *k, i, l, l, m, n.* Vitet. i. p. 101. le poſt épineux.

11. *Abductor longus* takes its attachment at the ſuperior part of the poſterior edge of the ſcapula; in deſcending it cloſely adheres to the *poſtſpinatus*, becoming gradually broader and more fleſhy; it terminates on the curved proceſs, which is obſervable on the upper part of the exterior ſurface of the humerus, following the ſame direction on this ſide as the adductor does on the oppoſite ſide of the bone. *Plate* II. *o, p, q, q,* Vitet. Le grand rond. i. 159. Stubbs. Teres Minor, *Plate* II. *n, p, q, q.*

12. *Abductor brevis* takes its riſe at the inferior and poſterior edge of the ſcapula, or rather from the fibres of the *poſtſpinatus* muſcle, lying between it and the *longus abductor.* This and the former paſs over the extenſors of the cubitus, and terminate between the above muſcles on the large crooked proceſs of the humerus. It only differs from the former in being conſiderably ſhorter. It ſends a tendon to the ſcabrous edge of the cotyloid cavity. Vitet. Med. Vet. i. p. 162. Le petit rond. The effect of the principle we wiſh to eſtabliſh reſpecting the co-operation of muſcles on oppoſite ſides of the bone, is no where more obvious than in the two foregoing muſcles, with their congeners, the adductors on the inſide. This mode of operation of theſe muſcles appears to have eſcaped entirely the writers hitherto on this ſubject. Vitet has remarked reſpecting them, "ils font executer a l'humerus des mouvemens, de flexion, et de demirotation en dehors."

The muſcles of the radius and ulna are ſeven; two to bend, five to extend them.

1. *Extenſor longus ſeu poſterior.* This muſcle is the moſt exterior of thoſe which fill up that triangular ſpace formed by the humerus and ſcapula. It takes attachment at the ſuperior and poſterior edge of the ſcapula, and paſſing down cloſely, adhering to the large extenſor, it terminates on the extreme point of the olecranon. This muſcle is the moſt powerfully ſituated of any of this extremity. *Plate* II. P. Stubbs Vitet. Med. Vet. p. 165, Le long anconé.

2. *Extenſor magnus.* This is nearly the largeſt muſcle of the extremity, of a triangular figure, and occupies great part of the angle between the humerus and ſcapula poſteriorly; it riſes by tendinous fibres from two-thirds of the poſterior and lower edge of the ſcapula, growing narrower, it terminates on the inner ſide of the olecranon by ſtrong and ſhort ligamentous fibres. *Plate* II. *fig.* 1. N. Vitet. Med. Vet. Le Moyen anconé, p. 164. Stubbs, *Plate* II. N.

3. *Extenſor tranſverſus.* This muſcle is of a figure nearly ſquare; paſſing obliquely acroſs the other muſcles, it riſes from the interior part of the crooked ſpinous proceſs of the humerus, and terminates on the point of the ulna, uniting often with the preceding. *Plate* II. O. Vitet, Med. Vet. p. Le Court anconé.

4. *Extenſor pygmæus,* is ſituated beneath the others, of a cylindrical figure, tapering to either extremity, riſing from the middle part of the humerus, and terminating by tendon on the inſide of the olecranon. Le petit anconé. Vitet, Med. Vet. 165.

5. *Extenſor minimus.* This is a ſmall muſcle of a pyramidal ſhape, whoſe baſe is fixed by fleſhy fibres to the *olecranon* on its anterior edge, growing narrower, it terminates by fleſhy fibres on the back part and inſide of the humerus, rather below its middle; this muſcle fills up the cavity formed by the two condyles of the humerus poſteriorly. Stubbs, Anat. Horſe, tab. 5. *c.* Vitet, Med. Vet. L'Olicranien, p. 165.

Theſe muſcles ſtraighten the limb after it has been carried forward by the flexors, raiſing the body upon the extremity as a fixed point.

6. *Coraco-radialis.* This beautiful muſcle is externally covered with a ligamentous coating, which gives it a ſilvery appearance, eſpecially on its inſide, a ſtrong tendinous faſcia enveloping it; it occupies the front of the humerus, extending from the coracoid eminence of the ſcapula to the anterior part of the head of the radius, to which it is fixed by ſtrong, ſhort, ligamentous fibres. Near its lower extremity it ſends off a ſtrong tendon, which, paſſing along the radius, inſerts itſelf into the tendon of the extenſor muſcle of the ſhank. This muſcle, in paſſing the joint, is lodged between the two circular, ſmooth prominences on the anterior part of the head of the humerus, and is provided with a lubricous cartilage beneath. This muſcle is the biceps of the human anatomy, which name will not apply in the horſe, having but a ſingle origin. Its body is very deeply cleft. Stubbs, Anat. Horſe, *Plate* VIII. *i, k, l, m, n.* Vitet. Med. Vet. Le Curaco-Cubital. p. 166.

7. *Flexor convolutus.* This muſcle lies in contact with the bone, filling the large cavity or neck of the humerus; formed by the curved proceſs on its exterior part it riſes under the poſterior part of the head of the humerus, making a ſpiral turn, it paſſes over the bone, filling the cavity above-mentioned, and terminates anteriorly in the hollow of the head of the *radius.* Stubbs, Anat. Horſe. tab. 9, *r, s.* Brachialis internus. Vitet. Med. Vet. p. 165. La brachial.

The two laſt muſcles are termed flexors; they carry the lower part of the extremity forwards, and the extenſors ſerve the purpoſe apparently of removing the body to it as a fixed point on the ground.

The muſcles of the knee and ſhank are ſix, two to extend, four to bend them.

1. *Extenſor carpi.* It is the body of this muſcle which forms the handſome rotundity obſervable on the lateral and rather external part of the radius. It is attached ſuperiorly to the anterior condyle, uniting to the extenſor of the foot; it decreaſes, ſuddenly, forming a flat, broad tendon lying cloſe to the bone, paſſing under the lateral extenſor tendon, and over the bones of the knee, it terminates on the ſuperior part of the ſhank bone, on the anterior tuberoſity, by ſtrong ligamentous fibres. Stubbs, *Plate a, a, b. Plate* II. *d, e.* Extenſor carpi radialis. Vitet. Med. Vet. Le Cubital externe anterieur, p. 168.

2. *Extenſor lateralis.* This muſcle takes its attachment for a conſiderable length along the ſharp edge on the external ſide of the *radius*; forming a flat tendon, it takes a direction acroſs the leg, and paſſing over the tendon of the principal extenſor, purſuing an oblique direction over the bones of the knee, it terminates on the inſide this joint on the *os pollicare. Plate* II. *g.* Stubbs, *Plate* II. *q.* L'extenſeur de Genou, Lafoſſe.

3. *Flexor carpi poſterior.* This muſcle has an attachment by ſtrong tendons to the poſterior and lateral external part of the humerus; increaſing in ſize, and becoming very flat, it deſcends, keeping an uniform ſize, down the radius, forming a large flat tendon, dividing into two parts; one is

ſtrongly

ſtrongly inſerted in the crooked bone, *(os poſticum,)* the other paſſes to the ſhank, and is inſerted on its head. Stubbs, *Plate* II. *m, n, n, o, o, p, q, r, s.* Vitet. i. p. 169. Le Cubital externe poſterieur.

4. *Flexor oſſis poſtici.* This muſcle takes its attachment on the oppoſite ſide of the humerus to the former, ſending off a conſiderable branch to the inſide of the *olecranon*, it terminates by ſtrong tendon on the external convexity of the poſt-carpal bone. Stubbs, *Plate* XII. *f.* Vitet, Le Cubital interne poſterieur.

5. *Flexor internus.* This muſcle is ſmaller than the two former, and is placed more internally; it takes attachment at the lateral internal condyle of the *humerus*, and, paſſing along the radius, forming a thin tendon, which paſſes through the capſular ligament, it at length terminates on the poſterior part of the cannon or ſhank bone, and ſuſpenſor ligament of the perforans muſcle. Vitet. Med. Vet. Le Cubital interne.

6. *Flexor poſtremus.* This ſmall muſcle is the moſt poſterior of thoſe about the head of the radius, extending from the point of the ulna on its inſide to the annular ligaments of the knee, uniting to the cartilage which ſurrounds the flexors of the foot, its aponeuroſis covers the whole ſurface of the extenſors of the cubitus. Le cubital grêle, Vitet. i. p. 170.

Beſides the above muſcles, there are two others belonging to the ſhank bone which are very minute; they are termed by Lafoſſe *les canoniers*, and by Vitet lombricaux, p. 175. Theſe very ſmall muſcles, which are not always deſcribed, are found between the ſuſpenſory ligament and the ſtyloid bones, one on each ſide; they riſe under the knee, are fleſhy about two or three inches, then form a tendon, which terminates on the cellular membrane of the fetlock joint. They appear of little uſe, and may rather be conſidered as the effête rudiments of the interoſſei muſcles, or *lumbricales* of digitated quadrupeds.

The muſcles of the paſtern, coronet, and foot are five; two to extend, and three to bend them.

Theſe three bones always forming one line and making an angle to the reſt of the limb, we conſider as one bone in deſcribing the muſcles and their effect, as any diviſion would tend to confuſe rather than elucidate the general purpoſe of the muſcles going to theſe parts. Lafoſſe has, we think, erred in being too minute in this reſpect by ſubdividing parts neceſſarily connected.

1. *Extenſor ſuffraginis* is a ſmall, thin muſcle, riſing by fleſhy fibres from the external condyle of the humerus; it paſſes fleſhy about half way down the *radius*; adhering to its external ſharp edge, it paſſes in a groove through the annular ligaments and capſular ligaments of the knee, and continues its courſe along the outſide of the ſhank to the fetlock, where it becomes wider, and terminates by a broad tendon on the ſuperior anterior part of the paſtern bone. It ſends off a branch of tendon which paſſes round the knee to the flexor tendons under the poſtcarpal bone. Vitet. i. 1752. L'extenſeur anterieur du Paturon.

2. *Extenſor pedis.* This is the largeſt of that aſſemblage of muſcles which ſurrounds the head of the radius. It ariſes from the external condyle of the humerus uniting its fleſhy fibres with thoſe of the extenſor of the cannon or ſhank, it becomes tendinous above the knee, being lodged and confined by ligaments in a groove; it perforates the capſular ligaments of the joint, and, paſſing down the front of the ſhank at the fetlock joint, it forms an union with the extenſor of the paſtern, and growing broader, and enveloping almoſt the whole front of the coronet, it finally terminates on the anterior eminence of the coffin bone. Stubbs, Anat. Horſe, tab. viii. 1, 2, 2, 3, 4, 5, 6, 6. Extenſor Digitorum Communis. Vitet Med. Vet. i. p. 173.

The two former muſcles ſerve to bring the three bones of the foot forward, and we may remark are, when compared with the flexor, diſproportionably ſmall, for the weight of the horſe operates as a powerful extenſor of this part, and renders great muſcular power unneceſſary.

3. *Perforatus.* This muſcle takes its attachment by fleſhy and tendinous fibres to the internal condyle of the humerus; uniting with the *perforans* near the knee, it forms a ſtrong tendon, which, at the back of the knee, (within the concavity of the poſtcarpal bone,) is received within a ſtrong ligamentous groove, paſſing down the ſhank behind the tendon of the perforans; at the paſtern it forms a remarkable ligamentary *annulus* for the reception and paſſage of the perforans tendon, expanding into a broad flat tendon at the back of the paſtern, and, covering the perforans, it divides, forming two tendons which paſs obliquely over the joint, and terminate on the upper part of the coronet. Stubbs, Anat. Horſe, tab. 13. *m, n, o.* Sublimis, p. 42. Vitet. Med. Vet. i. p. 173. Le Perforé.

4. *Perforans*, is a conſiderable muſcle riſing with the former, and lying more internally; it will admit of diviſion into three parts, which Monſ. Lafoſſe has deſcribed, with his uſual bounty, as three diſtinct muſcles. This muſcle is fleſhy till it reaches the knee, when it forms a flat tendon joined by the *flexor poſtremus cubiti*, and *radialis* tendons inſerted into a flat, ſmooth cartilage under the *os poſticum*, forming here a large cylindrical tendon, when about half way down the ſhank it is joined by a ligament from the poſterior part of that bone arriving at the fetlock, it paſſes through the *annulus* of the *perforatus*, and continuing between its divided tendon, terminates by a broad, flat tendon on the inferior ſurface of the coffin bone being covered by the frog. Stubbs, Anat. Horſe, Profundus. Vitet. Med. Vet. i. p. 174. Le Perforant.

5. *Adjutorius.* This is a flat muſcle lying cloſe to the *radius*, and filling the hollow on the poſterior part of that bone, it ſoon becomes tendinous, uniting with the tendon of the perforans.

Of the Ligaments of the Fore Extremity. 1. *Ligamentum ſuſpenſorium*, ſuſpenſory ligament, takes its riſe a little below the head of the ſhank by muſcular and ligamentous fibres, lying between the heads of the ſtyloid bones, it paſſes down the poſterior ſurface of this bone, quitting its adherence to it about the middle, and, becoming detached, it divides at the fetlock into two branches, which cloſely and ſtrongly embrace the ſeſamoid bones; it forms one ligament again at the back of the paſtern, filling its hollow cavity, and finally terminates on the head of the coronet bone. At the fetlock it alſo ſends off two branches in an oblique direction downwards, which unite with the extenſor tendon of the coffin bone, and preſerves it firmly in its ſituation. Stubbs, Anat. Horſe. Interoſſeum. Lafoſſe has made a muſcle of it. Flechiſſeur du Paturon.

This ligament is the main ſupport of the fetlock joint, and this joint, though ſo ſtrongly fortified, is, for obvious reaſons, the moſt ſubject to be injured of any part of the body.

There are many other ligaments belonging to this extremity, which the propoſed limits of this article will not allow us to give a deſcription of, as the lateral ligaments, the capſular ligaments, the burſal ligaments, the reſtraining ligaments, crucial ligaments, &c.

The muſcles of the abdomen, allowing for the magnitude and depending poſition of this part in the horſe, are much reſembling thoſe of the human.

The Muſcles of the poſterior extremity of the Horſe and other domeſticated Quadrupeds, with the Synonyma of human and veterinarian Authors.

Quis vituperationi det id poſſe curare, quod laudi ducitur poſſidere? VEGETIUS, Lib. 1^mus.

The different motions of the hind extremity of the horſe are performed by the means of about thirty two muſcles.

15 proper to the thigh, 3 to extend, 3 to bend it, 4 termed adductors, 5 called rotators.
2 common to the thigh and leg, 1 to bend and turn them inwards, 1 to extend and turn them outwards.
8 proper to the leg, 3 extenſors, 2 flexors, 3 adductors.
2 proper to the hock and ſhank, 1 to the os calcis, called an extenſor, and the other to the anterior ſide of the head of the ſhank, called its flexor.
1 to the coronet bending it backwards.
4 to the foot, 1 flexor, 1 extenſor, and their lateral muſcles, — 1 to each.

32

On diſſecting the muſcles of a man's thigh and leg, and thoſe of the thigh and leg of the horſe, and comparing them together, the diſſimilarity has been found ſo great, that it would only create confuſion and miſconception to apply the ſame names to both; where they agree we gladly embrace the human names, where they are not at all alike, we do not attempt to make them appear ſo by impoſing the ſame names, but have given names expreſſive of the ſituation, attachment, or ſhape of the muſcle. Where the compariſon between the human and the horſe was doubtful, we have taken ſome intermediate animal not ſo diſtantly removed from man in ſtructure, by which we could more eaſily detect the coincident part, and transfer them to the horſe.

The muſcles of the thigh are 15, diſtributed as follows:

Glutæus externus, magnus, parvus } Straighten the thigh by drawing it backwards, or rather move the body forwards to the thigh already advanced by the flexors.

Pſoas magnus, Iliacus major, minor } Flexors, advancing the thigh forwards.

Adductor teres, magnus, parvus, Muſculus faſciæ latæ } From their ſituation appear to act as drawing the thigh cloſer to the body, but probably in conjunction with the common muſcles on the oppoſite ſide, which terminate about the ſtifle, co-operate in the general purpoſe of removing the body.

Obturator externus, internus, Pyramidalis internus, M. parvus articulationis Gemelli. } Termed *rotators*; a purpoſe they cannot ſerve in this animal, and therefore their uſe appears by human anatomiſts to have been wrongly aſſigned; they appear to co-operate according to their ſituation with the muſcles above deſcribed.

From the manner in which theſe muſcles are deſcribed, and their uſes aſſigned in the publications on human anatomy, we conceive they convey but a feeble idea to the mind of the ſtudent of their real purpoſes. In the horſe their uſes are more ſtriking and ſtrongly marked, which ſuggeſted the explanations which are here given of their effects, though we are convinced much more remains to be done than has been hitherto done on this extenſive and complicated ſubject.

Previouſly to entering on theſe muſcles we muſt advert to the deſcription given of the thigh bone in the oſteology, to which we muſt refer the reader.

Glutæus

Glutæus externus. This muſcle lies the moſt exteriorly of all the muſcles of the buttock, and is of a ſmall ſize: it extends from the ſecond and third ſpinous proceſſes of the ſacrum to the anterior angle of the inferior *ramus* of the ilium, where it joins the *faſcia lata*; from thence it extends to the *proceſſus recurvatus externus* of the thigh. This muſcle is ſurrounded on all ſides by *aponeuroſis*, that on its ſuperior part, covering over the muſcles of the rump, is affixed to the ſpinous proceſſes of the loins; the aponeuroſis of its poſterior part paſſes underneath the *ſacrotibialis externus*, to which this muſcle is contiguous in paſſing to the external curved proceſs of the thigh.

The *glutæus externus* is ſo ſmall in quadrupeds, that a doubt might ariſe whether this was not a part of the *faſcia lata*, and the muſcle beneath it the correſponding one to the *glutæus maximus* of the human anatomy. From a farther inveſtigation of this ſubject, we believe that not to be the caſe, and that it is the real repreſentative of the *glutæus maximus*.

The ſingular diminution of this muſcle in the quadruped may be, perhaps, explained on the following principles of the difference of ſtructure neceſſary to the two animals. In the man, the legs have to perform a greater variety of motions, as abduction, adduction, rotation, &c. which the horſe, whoſe motions are principally confined to going ſtraight forwards in a line, does not require, ſo we ſee this great abductor of the human anatomy becoming a very ſmall one in this animal, while the muſcles of the rectilinear progreſſion are vaſtly increaſed in bulk, as we may ſee by looking on the *glutæus medius*, which is the *maximus* of the horſe in point of ſize, and from its attachments, is evidently a direct extenſor of the thigh. Others might ſay it was diminiſhed on account of the increaſe of the purchaſe obtained by its inſertion into the extended point of the curved proceſs of the thigh being taken farther from the centre of motion, which would compenſate for its want of power; for it ſeems pretty nearly the ſame thing whether we make a muſcle very large, or give it a powerful inſertion; ſometimes bulk, ſometimes power only is neceſſary, but the conſideration of the circumſtance in which power ſhould be obtained by accumulated muſcular fibres, or by favourable inſertion, would lead us beyond our preſent purpoſe.

This point once admitted, *viz.* that it is the *glutæus maximus* of the human body, the others follow naturally, and admit of a nearer compariſon. The anatomy of the thigh of the dog, which has no curved proceſs, ſeems to confirm this opinion.

Its uſe. The direction of this muſcle ſeems to point it out as an abductor; the beſt way, however, of conſidering it is to regard it in this animal as a *tenſor aponeuroſis* of the buttock, aſſiſting the muſcles of this part, by its gentle compreſſion and elaſtic ſpringing and reaction, in their motions.

In the ox it exiſts with pretty much the ſame characters.

In the dog it is much larger than in the horſe, cæt. par. and more fleſhy, having a ſtrong attachment to the ſacrum underneath the muſcles of the tail, and terminating in the back of the thigh by a long tendon.

In the cat the ſame as in the dog; but here it might well be denominated the glutæus poſticus.

Synonyma. Stubbs Anat. Horſe, p. 23. *Tab.* II. *m, n, o, o, p.* Glutæus externus. Lafoſſe, Cours D'Hippiatrique, p. 118. Le moyen feſſier. Lafoſſe, Dictionnaire, p. 456. Bourgelat Elemens D'Hippiatrique, p. 278. Le petit feſſier extenſeur de la Cuiſſe. Vitet. tom. i. p. 181. Le feſſier externe. Winſlow, Expoſition Anatomique, p. 135. Le grand feſſier. Glutæus magnus ſeu maximus omnium auctorum humanæ anatomiæ.

2. *Glutæus medius.* This vaſt muſcle lies immediately under the preceding, occupying great part of the upper ſurface of the ilium; it takes its riſe by a point on the lumbar muſcles, growing more fleſhy as it reaches the ilium; it takes a ſtrong adherence, by fleſhy fibres, to the external angle of the inferior *ramus*; after paſſing the ilium it becomes ſmaller, and dividing itſelf into two bodies, one terminates on the ſuperior poſterior trocanter, the other by a very ſtrong tendon on the inferior external trocanter, which is covered by the tendon of the external glutæus. This muſcle may be divided into two diſtinct parts, one of which might be conſidered by ſome as the maximus of the human; however, the nature of its attachments ſeems fully to prove its agreement with the *medius*.

Its uſe. To draw back the thigh, or (the leg being made a fixed point on the ground) to advance the body upon it.

In the ox. This muſcle is more diſtinctly divided into two bodies, nor does it paſs ſo far over the muſcles of the loins. There is alſo a ſmall almoſt linear muſcle not found in the horſe.

In the dog. It is not at all attached to the muſcles of the loins, but fills up the ilium entirely, and terminates on the poſterior trocanter; and in the cat the ſame.

Synonyma. Stubbs Anat. Horſe, p. 18. tab. 3. *a, a, a, b, b, b, c, d.* Glutæus Medius. Lafoſſe, Cours D'Hippiatrique, p. 18. Dictionaire, 457. Vitet, Medecine Veterinaire I. Le grand et le moyen feſſier. Bourgelat, Elemens D'Hippiatrique, p. 278. Le grand feſſier. Monſ. Sainbel, firſt profeſſor of the Veterinary College of London, in his lectures, principally adhered to the names and arrangement given by Bourgelat. Douglas, Myographia comparata, p. 130. Glutæus medius. Winſlow, Expoſition Anatomique, p. 329. Le moyen feſſier. Glutæus medius omnium auctorum hum. anat.

3. *Glutæus parvus.* This is a ſhort, ſtrong, (and though ſmall, compared with the former) not inconſiderable muſcle, lying immediately over the joint; it takes attachment round the poſterior ramus of the ilium; paſſing over the head of the femur it fills the anterior concavity formed by the ſuperior trocanter of the thigh.

Its uſe. It operates in the combined effect of extending the thigh; its poſition is that of an abductor.

In the ox, nearly the ſame. Le petit feſſier, Vitet. p. 185.

In the dog, it is of a different ſhape, being more pyramidal, and attached at the anterior ſuperior part of the thigh.

In the felis, it is attached to the inferior and poſterior ramus of the ilium, and terminates at the anterior part of the thigh in a nick or excavation. Stubbs Anat. Horſe, tab. 4. *b, i, k, k, l, l, l.* Vitet. Med. vet. p. 181. Le petit feſſier. Lafoſſe, Cours d'Hippiatrique, p. 118. Dictionaire, p. 457. Le petit feſſier. Bourgelat. il n'a rien dit la deſſus. Douglas, Myologia comp. p. 131. Glutæus internus. Winſlow, Expoſ. Anatomique. Le petit feſſier. Glutæus minor, Albinus. minimus, Innes.

4. *Pſoas magnus.* On removing the inteſtines from the abdomen and the peritoneum, this beautiful muſcle preſents itſelf; it is attached to the inſide of the two laſt ribs, and to the tranſverſe apophyſes of the lumbar vertebræ, paſſing to the edge of the pelvis it joins the iliacus, and is with it inſerted into the little trocanter, running between the iliacus major and minor: this muſcle can never be miſtaken for any other in any animal; it is rather depreſſed at its origin, but becomes cylindrical and pointed going to its termination; this muſcle, near its inſertion, is confined by a ligament which binds it and the iliac muſcles in their ſituation.

The *pſoas parvus* we conſider as a flexor of the loins, by bending the pelvis (to which it is always attached) on the lumbar vertebræ.

Veterinary writers have moſtly deſcribed this muſcle as belonging to the thigh; it, however, generally terminates where the ſartorius begins, forming together a digaſtric muſcle of great length.

Ox nearly the ſame. Le grand Pſoas. Vitet. p. 188.

Dog. It is attached to the four laſt lumbar vertebræ, is vaſtly larger, and more fleſhy in proportion to the animal; it terminates in the ſame place: but the iliacus parvus, we may obſerve, does not in this animal terminate where the ſartorius begins, for this muſcle riſes from the anterior angle of the ilium.

In the cat there are three very diſtinct muſcles of this deſcription.

Vitet. Med. Vet. Le grand Pſoas I. 179. Lafoſſe, Cours D'Hippiatrique. Le grand Pſoas, p. 117. Dict. 455. Bourgelat, Elemens D'Hipp. Le Pſoas, 281. Stubbs, p. 18. tab. 9. *a*, *a*, *b*, p. 34. Pſoas magnus omnium auctorum hum. anat.

5. *Iliacus major.* This muſcle takes attachment to the whole inferior *ramus* of the ilium growing cylindrical, and tapering it is joined to the *pſoas magnus*, paſſing with it through Poupart's ligament to the little trocanter of the thigh.

In the ox it is more intimately blended with the iliacus parvus.

In the dog it is remarkable this muſcle is entirely wanting. The ilium is elevated ſo far above the lumbar vertebræ, that the muſcles of the back occupy its place: it is ſingular, that this circumſtance ſhould have eſcaped the notice of Douglas, who has expreſsly treated of the anatomy of this animal.

In the felis the ſame as in the dog.

Stubbs Anat. Horſe. p. 18. tab. 3. tab. 9. p. 34. Lafoſſe, Cours D'Hippiatrique. p. 117. Dict. Hipp. 455. Bourgelat, Elem. D'Hipp. L'Iliaque. Iliacus internus auctorum hum. anat.

6. *Iliacus minor.* This muſcle, which, in general, is quite ſeparate from the iliacus major, takes its riſe from the inſide of the firſt ſacral apophyſes all the length of the poſterior ramus of the ilium, paſſing over the head of the femur it terminates with the pſoas and iliacus on the little trocanter; it permits the pſoas to paſs between it and the iliacus major, and might be conſidered as a portion of the latter; it is connected by aponeuroſis with the muſcles which line the pelvis.

Theſe three laſt muſcles have all the power of bending the femur; the two laſt on the pelvis, the pſoas on the loins, bending both femur and pelvis.

Ox. Not a diſtinct muſcle.

Dog. Is altogether wanting, but appears to be compenſated for by having three pſoas muſcles.

Cat. The ſame as in the dog.

Lafoſſe, Cours D'Hippiatrique. Planche 22. Dict. 456.

7. *Adductor teres* is a cylindrical muſcle, which makes its appearance on the inſide of the thigh; the integuments being removed, it takes its riſe on the os pubis, near the ſymphyſis, attached to the ſame ligament with the rectus abdominis; it terminates along with the adductor magnus, about half way down the inſide of the thigh, or rather on the back part of this bone.

Stubbs, Anat. Horſe. tab. 5. *s. s.* Le pectineus. Lafoſſe, Cours d'Hippiatrique. p. 118. Le pectineus. Vitet. Med. Vet. p. 180. Le petit pictiné. Bourgelat, Elem. Hipp. Le pectineus. Douglas Pectineus. p. 153.

Compariſon of this muſcle with the human pectineus. We ſee by its attachments that it is by no means the ſame muſcle; it is much more nearly allied to the triceps adductor primus, which it alſo differs from; it riſes too near the ſymphyſis inſtead of the brim of the pelvis to be the pectineus, and terminates by inſertion along with the large adductor low down the thigh; it is alſo a more external muſcle than the pectineus; but as there is no real pectineus, nature ſeems to have united in this one muſcle the properties of the pectineus and adductor longus, ſo that we have choſen to call it by a different name from either, *viz. adductor teres.*

The ox has a much flatter muſcle, and it ſends off a ſlip to the ligaments of the knee.

Dog. This muſcle is rounded, and much reſembles the human long head of the triceps.

The cat. There are four adductors, one of which reſembles more nearly the human pectineus.

8. *Adductor magnus.* There are three diſtinct muſcles of this deſcription in the horſe; this portion of it is ſeen very diſtinctly by removing the adductor planus of the leg, taking attachment to the ſymphyſis pubis, and extends down to the poſterior and inner part of the thigh, and ſending off another portion which is attached to the tibia, or rather to the joint of the femur and tibia by a flat tendon. This muſcle may be divided into two portions; one has been called by veterinary writers, *la portion moyenne, et la portion anterieure*; but this we conſider as unneceſſary and unnatural; for after ſuch diviſion it does not correſpond to the three portions of the triceps muſcle in the human.

Stubbs, Anat. Horſe. p. 18, 15. 36. 36. 36, &c. tab. 3. p. 46. tab. 14. *p. p. q. r. s. t.* Lafoſſe, Cours D'Hippiatrique, le gros et le moyen extenſeur. p. 117. Dict. 454. Bourgelat, Elem. Hipp. p. 282. triceps. Vitet. Med. Vet. La Portion anterieure et moyen du triceps crural. p. 182.

Compariſon with the human. On actually comparing this muſcle with thoſe of the human thigh, it is difficult to decide whether it moſt reſembles the ſhort or great head of the triceps, but it certainly is not much like either of them; therefore, to prevent confuſion, we have given it a different name, and left out the term triceps altogether; this muſcle, and the *ſacro-iſchio tibialis internus* both agree in ſome points with the great head of the triceps, and differ in others. Stubbs conſiders it one, and the French writers the other; in this confuſion I think it beſt, for diſtinctneſs, to avoid the compariſon, and give it a name that will not interfere with either.

Dog. This muſcle lies underneath the long head of the triceps, and is the largeſt of the extremity.

Cat. In this animal the artery perforates the tendon of the *adductor magnus*, as it does in the human body, to paſs to the gaſtrochemius, which ſerves to identify the muſcle in this animal.

Ox. No ſuch portion appears.

9. *Adductor brevis ſeu quadratus.* This muſcle lies immediately underneath the former, and is of a linear figure, being throughout of nearly equal ſize, riſing on the *os iſchium* near the edge of the *foramen ovale*; it takes an oblique direction, and terminates on the poſterior flat part of the thigh, on the back of the poſterior trocanter.

Ox. It exiſts of the ſame figure. Vitet. L'Iſchio-crural, p. 186.

The dog poſſeſſes it, and alſo a muſcle which exactly correſponds to the ſhort head of the triceps in the human.

Stubbs, Anat. Horſe, tab. 15, p. 47. Vitet. Le rond. p. 183. Lafoſſe, Cours D'Hippiatrique, p. 117. Le petit extenſeur. Dict. 454.

10. *Tenſorius*, or *M. faſciæ latæ.* This is conſidered by ſome a muſcle of the leg, others of the thigh; in this animal, however, it is common to both, and might be very well placed with the common muſcles before mentioned. This muſcle often varies in figure, but is generally of a triangular

ſhape, formed of two or three fleſhy bodies, the ſuperior point of the triangle is affixed to the *os ilium* on the external angle of its inferior ramus, its poſterior point is affixed to the *proceſſus recurvatus femoris* with the *gluteus externus*, with which it forms an intimate union, its inferior part terminates by *aponeuroſis* which covers all the muſcles of the inſide the thigh, and its anterior part, extending alſo over the patella and tibia.

Ox. This muſcle not ſo completely divided into two portions.

Dog. Beſides this muſcle there is another ſtrong muſcle above it, and which has been noticed by Douglas.

Cat. The ſame as in the dog.

Bourgelat, Elem. d'Hipp. abducteur de la cuiſſe.

Tenſor vaginæ femoris, Innes et aliis.

Douglas, Myolog. comp. 164.

Although the utmoſt brevity has been obſerved in the foregoing deſcriptions and remarks, and nothing introduced which was not of importance in eſtabliſhing this ſcience on a rational baſis, yet have we already paſſed the limits we had propoſed in treating of this article; if the remaining muſcles were conſidered as the ſubject at preſent demands, it would extend beyond the proper bounds for a communication of this ſort, we ſhall, therefore, confine ourſelves for the remainder of this extremity, to give only the names as we find them in our MSS. and conclude this article by a deſcription of a few of the moſt intereſting viſcera of the horſe.

Sainbel, Semimembranoſus.

Vitet, Med. Vet. p. 182. La Portion poſterieure du triceps.

Stubbs, Anat. Horſe, adductor magnus femoris. We have here an equal diviſion of opinions, whether it ſhould be conſidered as part of the triceps, or the ſemimembranoſus. Stubbs has alſo given a muſcle which he calls ſemimembranoſus. The writer of this article is at a loſs to underſtand what is there intended, but is diſpoſed from the figure to believe that the ſhort portion of the ſacrotibialis has been divided and taken for that purpoſe.

Theſe three immenſe muſcles evidently co-operate to one effect, and are better denoted and underſtood by conſidering them in this way, and by the above names than by the human names, even ſuppoſing their correſponding muſcles in the human body could be clearly aſcertained, as thoſe names would only ſerve to convey the confuſed and erroneous idea of a detached office to each of thoſe muſcles, and as though they were in no way connected; it was the conſideration of the three muſcles laſt mentioned that firſt gave us the idea of the real effect of abductor and adductor muſcles, in promoting animal locomotion. That ſuch vaſt maſſes of muſcle as theſe ſhould be carried about by the animal to perform ſuch trivial offices as abduction or adduction it would be highly abſurd to imagine; for it may be laid down as an axiom that the bulk of the muſcle always bears ſome proportion to the importance of its office, and purſuing this reaſoning a ſtep farther, we may conclude that even abduction and adduction itſelf are often performed by the co-operation of what are termed extenſor and flexor muſcles.

34. *Perforans minor*.

Of the lungs of the horſe. This viſcus in the horſe conſiſts of three lobes, two large ones which occupy the ſides of the cheſt, having at their anterior preſentation two elongated auriform appendages which cloſely envelope the heart; the third or central lobe is much ſmaller, lying between the other two, and preſents itſelf to the ſternum. It is not unfrequent in the lungs of horſes that ſmall red patches are obſervable that will not inflate like the other parts of the lungs, and are therefore, not improbably, obliterated cells from colds, inflammation, &c. the ſettling of the blood will alſo give an appearance of this kind, but this does not prevent the lungs from inflating.

The trachea of the horſe, where it paſſes into the cheſt, and previous to its entering the lungs, has a ſingular duplicature of the cartilaginous rings which is more flexile than the reſt of this tube, ſo as to admit by very ſlight preſſure, the ſides of the tube to be brought in contact, and the total obliteration of its cavity: this ſtructure may perhaps adapt the diameter of the trachea to any quantity of air that is paſſing through it to the lungs.

Of the liver. This viſcus in the horſe is large, deeply cleft into lobes, and poſſeſſing no gall bladder. The ductus venoſus of the human fœtal circulation is alſo wanting in the equine fœtus.

Of the ſtomach. The ſtomach of the horſe conſiſts of a pouch or bag of the uſual obcordate or reniform figure without, within, it is lined with membranes, which more reſemble the coats of the different ſtomachs of ruminating animals than the inſide of the generality of ſtomachs of this external figure.

There is diſtinguiſhable on the inſide a white rugoſe coat, (ſee *Plate* IV.) not vaſcular, which appears to be a continuation of the elaſtic inſenſible white tiſſue, which lines the œſophagus; this ſpreads over the upper part and broad end of the ſtomach, till it abruptly terminates about its middle; this part of the ſtomach correſponds very much to the paunch, or firſt ſtomach of ruminating animals.

The ſecond diviſion occupying the lower part or great arch of the ſtomach, extending high up the ſides, towards

the ſmall arch, and reaching nearly to the cardiac orifice is lined with a ſmooth red membrane, and is highly vaſcular, reſembling more the ſtomach of carnivorous quadrupeds; the reſt of the ſtomach extending from the termination of the former to the entrance into the duodenum conſiſts of a pale red membrane, extremely looſe, and thrown into longitudinal folds or duplicatures, intermixing with the former by almoſt imperceptible gradations of colour; this coat is thickly covered with a ſlimy mucus, not obſervable on the other coats; this part of the ſtomach has a ſtrong reſemblance to the fourth, or laſt ſtomach of ruminating quadrupeds.

The exact purpoſe of theſe three conſtructions of membrane in the ſame ſtomach is not eaſily aſſigned; whether they all unite in one common purpoſe, as though the ſtomach conſiſted of one common membrane for its lining, or whether the food is changed by the ſucceſſive operation of each of theſe membranes, we know not: we may obſerve on opening the ſtomach that the food makes pretty much the ſame appearance againſt whatever part of the ſtomach it may lie, that one ſhould be hardly led to conclude they have in the horſe diſtinct functions, but combine in one common effect, and are in reality the rudiments only of the ſtructure of the ſtomach, peculiar to the generality of graminivorous quadrupeds, without producing any preciſe effect here; for it ſeems difficult to imagine how the different operations ſhould take place in the ſame ſack without diſturbing each other. Nature ſeems to obſerve a connected ſyſtem, not only in the entire animal, but alſo in each particular organ, forming an inſulated ſyſtem of ſtructure and operations.

It is generally imagined there is ſome valvular apparatus to this viſcus, which prevents the horſe from vomiting, and much has been written on this ſubject; we never could diſcover any thing of the kind, and are diſpoſed at preſent to believe, that as the form of the horſe would render vomiting inconvenient, the power of receiving the impreſſion which excites this operation is withdrawn from the animal, as it would be idle to ſuppoſe a power given to vomit with a ſtructure of parts not admitting of it; it would be as inconſiſtent as placing the head of the lion on the ſhoulders of the hare, or giving the diſpoſition of the hare to the lion's form, by which the very purpoſes of nature would be defeated. It was, however, an opinion entertained with ſome confidence, at the Veterinary College of Copenhagen, that the root of the white hellebore (veratrum album) would occaſion a horſe to vomit, being placed under the ſkin!

In an aſs's ſtomach I have ſeen a valvular apparatus at the cardiac orifice, and the inſenſible white membrane extended into the inſide of the ſtomach, about one inch, forming a looſe fold, which ſerved to mark the diviſions of the ſtomach more ſtrongly, but could not in the ſmalleſt degree operate as a valve; this luſus is, however, not very frequent. The ſtomach of the hog alſo partakes of this ſort of ſtructure, though not ſo diſtinctly marked as in the horſe.

Of the chyle duct of the horſe. This duct in the horſe is not very difficult to find, both from its magnitude and ſituation, lying on the aorta, at the loins, very much expoſed as it paſſes forward towards the thorax, it dips lower beneath the ſurface paſſing nearly under the aorta, it is much ſmaller in the middle and enlarging to each end; about the 4, 5, 6 ribs, it is as large as a man's thumb, it becomes narrower again as it paſſes into the axilla, but enlarges again at its termination, where it enters the vena cava, or rather the veſſel formed by the union of the two jugular veins, and anterior to the ſubclavian, it there forms a large round head or cyſt, and is provided with a valvular apparatus to prevent the return of the chyle or the blood from entering the duct. Toward the loins it has a ſtrong adherence to the coats of the aorta, and lower down is ſtrongly embraced by the tendon of the diaphragm; it then enlarges, and paſſing upon and by the ſide of the lumbar veins, diſcharges itſelf by ſeveral openings into them, which openings are alſo provided with valves.

The openings of this duct into the lumbar veins which have never been before remarked, ſeem to point out a double circulation in this veſſel, *viz.* from the middle to each end as the ſmallneſs of it in the middle would alſo ſeem to indicate; we have, however, in ſome ſubjects found a valve opening anteriorly, or towards the jugular veins, within ſix inches of its poſterior termination; this duct, however, is ſubject to very great variation.

In another ſubject we found this duct terminate about the ſecond lumbar vertebra, where it divided one branch forming a ſharp curvature, circumſcribing a portion of the inſertion of the diaphragm, the other ſeemed to be loſt about the fourth or fifth lumbar vertebra in ſmaller ramifications. In another ſubject which we injected, the duct was diſcovered on the left ſide, about the ſituation of the laſt dorſal vertebra, it croſſed the aorta, and paſſed to the right ſide, immediately before and reſting againſt the ſuperior meſenteric artery; it then divides into ſeveral ſmall canals, which appeared to be paſſing to their termination in the lumbar veins.

Parts of generation. No animal whatſoever is more richly provided with the various apparatus belonging to theſe parts than the horſe, for nature here ſeems to have laviſhed with profuſion whatever can tend to perfect the generative act; there is no part of the human conſtruction of theſe parts but is found in the horſe; the moſt eſſential difference appears to us to conſiſt in the male, of the penis being ſuſpended from the integuments of the abdomen, and not immediately from the pubis as in the human; hence the acuteneſs of the angle where it paſſes the pubis, is ſuch as to render the paſſage of the catheter almoſt impracticable.

We have remarked that the penis of the horſe poſſeſſes a voluntary power of erection, not known to the human, or perhaps moſt other animals; this power is exerted on making water, and though the erection is not very conſiderable, it is yet ſufficient to bring the penis from its ſheath, which is effected apparently by its increaſed gravity from blood accumulating in the cavernous cells of this part. After ſtaleing this ſemi-erection of the penis ſubſides, and it again is retracted within the ſheath: this operation, though occurring daily to the ſight of every one, has not, it is apprehended, been noticed by any veterinary writer.

The urethra of the horſe is muſcular from one extremity to the other, being formed on the outſide of ſtrong tranverſe fleſhy fibres and ſupported by a ſtrong ligament.

Naturaliſts were long at a loſs to diſcover the *mammæ*, or teats of this animal; in the male they were at length detected by Buffon, on the ſheath of the penis. Mr. John Hunter alſo made the ſame remark without knowing that Buffon had previouſly noticed it; theſe teats are largeſt in the fœtus and young foal.

In the glans of the penis, immediately over the opening of the urethra externally, there is a large cell or cavity, ſmooth on the inſide, and lined with a membrane, which ſecretes a brown unctuous ſubſtance for the lubrication of the penis, and defending it from the corroſive effects of the urine; another cell of a ſimilar deſcription with the former is obſervable, on the ſide of the urethra, and nearly ſurrounding it, it is ſeparated from the former by a membranous partition.

The apparently unctuous ſecretion above deſcribed is miſcible with water; it burns, however, in the fire like an oily

oily ſubſtance, and is not ſoluble in ſpirits of wine or nitrous acid, nor does it dry on expoſure to the air during ſeveral weeks.

There is nothing reſembling a frænum to the penis of the horſe.

The cavernous body of the penis has no longitudinal ſeptum; its cells are divided by tranſverſe fibres, which are probably muſcular; it terminates in a point near the extremity of the glans, where it is ſurrounded on every ſide by the venous body, termed in the human corpus ſpongioſum.

Another ſingularity in the genital parts of this animal is, that there is an immenſe congeries of veins, lying on the back of the penis, which are filled during copulation, forming an elevation nearly as large as the penis itſelf; theſe veins communicate with both the cavernous and ſpongious bodies.

The *veſiculæ ſeminales*, and the bladders attached to them, are very large in the horſe, having integuments of conſiderable thickneſs.

There is a great peculiarity in the ſtructure of the *vas deferens* of the horſe, which in paſſing over the bladder, enlarges to the ſize of the human thumb; this amplification extends from its entrance into the urethra to the diſtance of five or ſix inches from this point, where it again becomes of its ordinary diameter.

The inſide of this enlargement is compoſed of cells, and ſomewhat reſembles in conſtruction the cells of the *corpus cavernoſum penis*, paſſing in a tranſverſe direction acroſs the tube. In the centre of this enlargement paſſes the ſmall canal of the *vas deferens*, each cell communicates by one, two, or more ſmall pores with the canal of the vas deferens, theſe cells diminiſh as they approach the neck of the bladder till they are loſt in a ſmooth paſſage entering the urethra.

What the purpoſe of this ſtructure is does not appear; it muſt retard the paſſage of the *ſemen*, and probably adds ſome fluid to it, ſecreted from the cells themſelves.

On a firſt view of the pudenda of the mare the poſition of the clitoris appears to be inverted, compared with the poſition of the ſame part in the human, being found on the lower part of the vagina; this apparent difference is removed when both are conſidered in the ſame poſition.

That the preſent article may not be too far extended we refer the conſideration of the other viſcera and parts of the horſe to be introduced under their proper heads.

ANATOMY is alſo uſed for an artificial repreſentation of the ſtructure and parts of the human body in metal, plaſter, wax, or the like. In this ſenſe we ſay, the wax-work *anatomy*. R. Dickenſon, ſtatuary, finiſhed an human *anatomy* in plaſter of Paris, repreſenting a man ſtanding upright with his ſkin flayed off.

There is likewiſe a wax-work *anatomy*, ſaid to have been invented by Gaetano Giulio Zumba, a Sicilian of Syracuſe. Yet M. des Noues, who learnt it of him, and probably made ſome improvements in it, bringing it to Paris, arrogated the chief honour of it to himſelf. Some prefer, above all the reſt, for public lectures and courſes, the uſe of real parts of dead bodies prepared by injection. Anatomical injections are either of mercury, or mixtures of equal parts of biſmuth, lead, and tin. Neumann. The inconveniencies that attend the diſſecting of dead carcaſes, have occaſioned the invention of another cleanlier and more durable kind of ſubjects. Reiſelius contrived a human ſtatue, wherein the circulation of the blood was repreſented to the ſight, and ſome thing of the like kind was ſhewn by M. Chovet; and more lately ſtill by Madame Bacheron, who has brought this art to great perfection. See her obſervations on the artificial anatomy, in the Memoirs of the Acad. des Scienc. an. 1759. Hiſt. 94.

ANATOMY is ſometimes uſed to denote the ſubject to be anatomized. Thus (by 39 Hen. VIII. cap. 42.) the company of barbers and ſurgeons may have and take yearly four perſons condemned, adjudged, and put to death for felony, for *anatomies*; and to make inciſion of the ſame dead bodies.

And by 25 Geo. II. cap. 37. the bodies of felons convicted of murder, in the county of Middleſex, or city of London, are, after execution, to be delivered to the hall of the ſurgeons company, to be diſſected and anatomized; and in caſe ſuch conviction and execution ſhall happen to be in any other county, or place, in Great Britain, then the body of ſuch murderer ſhall be delivered by the ſheriff, &c. to ſuch ſurgeon as the judge ſhall direct.

ANATOMY is alſo uſed, in an improper ſenſe, for the ANALYSIS of mixt bodies.

In this ſenſe the chemiſts ſometimes call their art *ſpagyrical anatomy*, *anatomia ſpagyrica*.

In which ſenſe we ſometimes ſay the *anatomy* of vitriol, the *anatomy* of ſulphur, the *anatomy* of Rheniſh wine, &c.

ANATOMY is alſo uſed in a leſs proper ſenſe, to denote the art of reſolving compound bodies into ſimple ones.

In this ſenſe any kind of compound body may be conſidered as the object of anatomy; that is, any body wherein there are divers parts joined together; even the taking aſunder an artificial, political, or moral being, may, in this ſenſe, come under anatomy.

ANATOMY is alſo uſed, *figuratively*, for an exact ſearch or examination of the parts of a diſcourſe, buſineſs, or the like: in which ſenſe, we ſay the *anatomy* of a book, a doctrine, or the like.

ANATORIA, in *Geography*, a ſmall town of Greece, anciently TANAGRA.

ANATRIPSIS, from ανα and τριβω, *I wear*, in the *Ancient Medicine*, denotes friction.

The word is ſometimes alſo written ſimply TRIPSIS.

ANATRON, or NATRON. See NATRON.

ANATRON is alſo uſed for GLASS *Gall.*

ANATROPE, ανατροπη, from ανατρεπω, *to ſubvert*; a ſubverſion literally, or relaxation of the ſtomach, attended with the loſs of appetite, vomiting and naufea.

ANATTOM, in *Geography*, an iſland in the ſouthern Pacific Ocean, and the moſt ſouthern of thoſe called New Hebrides. S. lat. 20° 3′. E. long. 170° 4′.

ANATZARTHON, in *Ancient Geography*, an archiepiſcopal ſee of Aſia, under the patriarchate of Antioch.

ANAUA, or ANAVA, a city placed by Herodotus in Phrygia, between the rivers Marſyas and Meander, but nearer their ſources than their confluences. To the ſouth-weſt of this city, and near it was a lake, from which they obtained ſalt.

ANAUDIA, among *Naturaliſts*, denotes dumbneſs, or a want of the uſe of ſpeech.

Anaudia is, by ſome, made to differ from *aphonia*, as the former is owing to a defect of the nerves of the tongue, the latter to that of the nerves of the larynx.

Infants and mutes are *anaudi*, αναυδοι, not *aphoni*, αφωνοι.

ANAUDOMA, or ANADOMA, in *Ancient Geography*, a town of Ethiopia, near Egypt.

ANAVINGA, in *Botany*, a genus of plants, with incomplete flowers, comprehending ſome trees of the Eaſt Indies, which are not much known to botaniſts. The generic characters, according to La Marck, are, that the flower has a calyx of five oval, concave leaves, opening in a roſe, and permanent; it has no corolla, but at the baſe of each foliola of the calyx are ſeen two pedicles ſhorter than the folioles of the calyx, and ſomewhat hairy; the ſtamina are ten, of the length

length of the calyx, and have their filaments inserted alternate, between the pedicles, upon the base of the folioles of the calyx; the anthers are small, ovate, and divided into two [illegible] or furrow; the ovary is superior, globular, or oval, [illegible] about style, and terminated by a stigma, with a spherical head. The fruit is an oval or globular berry, marked by five slight channels, and containing ovate and reddish seeds in a pulp. There are two species; 1. A. *lanceolata*, with alternate leaves, lanceolated, slightly serrated, subpubescent beneath, with oval berries longer than the peduncle. 2. A. *ovata*, with alternate leaves, ovate, acuminated, and serrulate, and globose berries equal to the peduncle. This is also called *talana* and *arabba*. The anavinga is a tree of middle size, that grows in the sandy soil of Malabar, in the East Indies, especially about Cochin. It is an evergreen, and its fruits or berries are ripe in August. Its leaves, bark, and fruit have a bitter taste.

The juice of the berries drank excites sweat, cures malignant distempers, and keeps the body soluble. A decoction of the leaves in water makes a fit bath for such as are afflicted with pains in the joints.

ANAUMACHION, from α, ναυς, *ship*, and μαχομαι, *I fight*, in *Antiquity*, the crime of refusing to serve in the fleet. The punishment assigned for this offence was infamy.

ANAURUS, in *Ancient Geography*, a river of Greece, in Thessaly: also a river of Syria; and a river of the Troas, near mount Ida.

ANAX, in *Ancient Writers*, denotes a hero or god. The word seems formed of the Hebrew *anacim*, or *enacim*, which signifies the same. Some will have it originally to import giants, called also γηγενεις, *earth-born*. Cicero assures us, that the three eldest sons of Jupiter, called Διοσκοροι, were also denominated *anaces*.

ANAXAGORAS, in *Biography*, one of the most illustrious philosophers of antiquity, was born at Clazomene, in Ionia, in the first year of the 70th Olympiad, or the 500th year before Christ. In the ardent pursuit of knowledge he left his native country, where he possessed a patrimony sufficient for securing him distinction and independence, and went to reside at Athens. Having surrendered his lands to his relations, "he devoted himself wholly," as Cicero says, (Tusc. Qu. lib. v.) "to the divine pleasure of learning and inquiry." At Athens he diligently applied himself to the study of eloquence and poetry, and was particularly conversant with the works of Homer, whom he admired as the best preceptor, not only in writing but in morals. From Athens he removed to Miletus, that he might attend upon the public instruction of Anaximenes. At the age of 20 years he left Miletus, and entered upon the study and profession of philosophy at Athens, where, according to Diogenes Laertius, he remained 30 years. As a teacher of philosophy he acquired high reputation, and his pupils were some of the illustrious men of the age in which he lived; such were Euripides the tragedian, Pericles the orator and statesman, to whom some add Socrates and Themistocles; but the date of the birth of the latter is several years prior to that of this philosopher. In process of time his reputation excited jealousy and envy, and exposed him to severe persecution. Cleo accused him with impiety for teaching that the sun was a burning mass of stone, and thus robbing it of its divinity; and Thucydides charged him with treasonable practices. But the chief offence of Anaxagoras was, probably, the propagation of new opinions concerning the gods. There can be no doubt that he contradicted and opposed the vulgar opinions and superstitions; accordingly, it is related, that he ridiculed the Athenian priests for predicting an unfortunate event from the unusual appearance of a ram which had but one horn; and, in order to convince the people that there was nothing preternatural in the phenomenon, he opened the head of the animal, and shewed them that it was so constructed, as necessarily to prevent the growth of the other horn. Anaxagoras, however, was thrown into prison, and condemned to death; and it was with difficulty that Pericles obtained from his judges the milder sentence of fine and banishment. Upon receiving his sentence of condemnation, he consoled himself by saying, "Nature long ago pronounced the same sentence against me;" and to one of his friends, who expressed regret on account of his banishment, he said, with a mixture of fortitude and vanity, "It is not I who have lost the Athenians, but the Athenians who have lost me." When news of the death of one of his sons was brought to him, as he was delivering a lecture of philosophy, he calmly said, "I knew that I begat him mortal."

After his banishment he passed the remainder of his days at Lampsacus, where he employed himself in instructing youth, and obtained great respect and influence among the magistrates and citizens. At length the infirmities of age terminated his labours in the year before Christ 428. Through his whole life he appears to have supported the character of a true philosopher. Superior to motives of avarice and ambition, he devoted himself to the pursuits of science; and, in the midst of the vicissitudes of fortune, preserved an equal mind. Being asked, just before his death, whether he wished to be carried for interment to Clazomene, his native city, he said, "It is unnecessary; the way to the regions below is every where alike open." In reply to a message sent him, at that time, by the senate of Lampsacus, requesting to be informed in what manner they might honour his memory after his decease, he said, "By ordaining that the day of my death be annually kept as a holiday in all the schools of Lampsacus." His request was complied with, and the custom remained in Lampsacus in the time of Diogenes Laertius. The festival Anaxagoria was instituted on this occasion. The inhabitants expressed their veneration for his memory, by erecting a tomb, and inscribing upon it the following epitaph:

"Ενθάδε, πλειστον αληθειας επι τερμα περησας,
Ουρανιε κοσμου κεῖται Ἀναξαγόρας.

"This tomb great Anaxagoras confines,
Whose mind explor'd the paths of heav'nly truth."

It is also said, that two altars were raised in honour of his memory, one dedicated to "Truth," and the other to "Mind," an appellation which was given him on account of the doctrine which he taught concerning the origin and formation of the world.

With the credible records of Anaxagoras many fabulous relations are intermixed; nevertheless, it is sufficiently attested, that this philosopher possessed a very extensive and accurate knowledge of nature, considering the age in which he lived, and allowing for the strange and erroneous conceptions which are blended with his more rational opinions. Of the heavens he seems to have had no other idea than that of a solid vault in which luminous bodies are fixed; and these bodies he conceived to be stones, raised from the earth by the rapid motion of the ambient æther, set on fire by its heat, and kept in their places by the swift circular motion of the heavens. On the other hand he is said to have taught, that wind was produced by the rarefaction of the air; that the rainbow is the effect of the reflection of the solar rays from a dense cloud placed opposite to it like a mirror; that the moon is an opaque body enlightened by the sun, and an habitable

habitable region, divided into hills, vales, and waters; that the comets are wandering ſtars; and that the fixed ſtars are in a region exterior to thoſe of the ſun and moon.

Of the opinion of Anaxagoras concerning the origin of the material world, the information tranſmitted to us is more correct. Having learned in the Ionic ſchool that bodies are compoſed of minute parts, and having obſerved in different bodies different and often contrary forms and qualities, he concluded, that the primary particles of which bodies conſiſt, are of different kinds; and that the peculiar form and properties of each body depend upon the nature of that claſs of particles, of which it is chiefly compoſed. A bone, for inſtance, he conceived to be compoſed of a great number of bony particles, a piece of gold of golden particles; and thus he ſuppoſed bodies of every kind to be generated from ſimilar particles, ὁμοιομερείαι, and to aſſume the character of thoſe particles. This ſyſtem is thus exhibited by Lucretius, lib. i. v. 380, &c.

"— Principium rerum quam dicit homœomeriam,
Oſſa videlicet è pauxillis atque minutis
Oſſibus: ſic et de pauxillis atque minutis
Viſceribus viſcus gigni; ſanguenque creari
Sanguinis inter ſe multis cöeuntibus guttis;
Ex aurique putat micis conſiſtere poſſe
Aurum; et de terris terram concreſcere parvis;
Ignibus ex ignem; humorem ex humoribus eſſe,
Cætera conſimili fingit ratione, putatque."

"With Anaxagoras, great Nature's law
Is ſimilarity; and every compound form
Conſiſts of parts minute, each like the whole;
And bone is made of bone, and fleſh of fleſh;
And blood, and fire, and earth, and maſſy gold,
Are, in their ſmalleſt portions, ſtill the ſame."

The abſurdity of this notion is evident; it admits of no ſimple, uncompounded principles; it makes no proviſion for production or diſſolution, the formation of any new body being, according to this doctrine, nothing more than the collecting together of a number of ſmall ſimilar bodies; and it gives no explanation of the original formation of the ſmall compound bodies of which the larger conſiſt. The invention of the ſyſtem, however, evinced the ingenuity of the author, who had recourſe to the notion of ſimilar particles, with a view of obviating the objections which lay againſt the doctrine of atoms, as he had received it from Anaximenes. But the moſt important improvement which Anaxagoras made upon the doctrine of his predeceſſors, was that of ſeparating, in his ſyſtem, the active principle in nature from the material maſs upon which it acts, and thus introducing a diſtinct intelligent cauſe of all things. The ſimilar particles of matter which he ſuppoſed to be the baſis of nature, being without life or motion, he concluded that there muſt have been, from eternity, an intelligent principle, or infinite mind, exiſting ſeparately from matter, which, having a power of motion within itſelf, firſt communicated motion to the material maſs, and, by uniting homogeneal particles, produced the various forms of nature. That Anaxagoras maintained an infinite mind to be the author of all motion and life, is atteſted by many ancient authorities. Plato (Phæd. Hippias major) expreſsly aſſerts, "that this philoſopher taught the exiſtence of a diſpoſing mind, the cauſe of all things." Ariſtotle ſays, (Metaph. lib. i. c. 3.) that Anaxagoras taught, that mind was "the cauſe of the world, and of all order," and that "while all things elſe are compounded, this alone is pure and unmixed; and that "he aſcribes to this principle two powers, to know and to move, ſaying, that mind put the univerſe into motion." Cicero (De Natura Deor. lib. i. c. 10, 11. tom. ii. p. 511. Tuſcul. Quæſt. lib. iii. c. 24. tom. ii. p. 404. De Orator. lib. iii. c. 34. tom. i. p. 351. ed. Olivet.) alſo aſſerts, though not without ſome inconſiſtency, with what he had before ſaid of Thales, that Anaxagoras was the *firſt* who taught that the arrangement and order of all things was contrived and accompliſhed by the underſtanding and power of an infinite mind. Plutarch (in Pericl. Oper. tom. i. p. 154. ed. Xylandri) confirms this account of the doctrine of Anaxagoras. "The Ionic philoſophers," ſays he, "who appeared before Anaxagoras, made fortune, or blind neceſſity, that is, the fortuitous or neceſſary motion of the particles of matter, the firſt principle in nature; but Anaxagoras affirmed, that a pure mind, perfectly free from all material concretions, governs the univerſe." To the ſame purpoſe Diogenes Laertius (lib. ii. n. 6. tom. i. p. 82.) repreſents Anaxagoras as teaching, that "the univerſe conſiſts of ſmall bodies compoſed of ſimilar parts, and that mind is the beginning of motion." "He was the firſt," ſays the ſame writer, "who ſuperadded mind to matter, opening his work in this pleaſing and ſublime language," "All things were confuſed, then came mind, and diſpoſed them in order." Dr. Davies in his note on the paſſage, in which Cicero ſeems to be charged with inconſiſtency, obſerves, that Thales ſuppoſed God to be the ſoul of the world, mixed and united with matter; whereas, Anaxagoras held him to be a pure mind, free from all material union and mixture. From theſe and other concurrent teſtimonies, it ſufficiently appears that Anaxagoras was the firſt among the Greeks who conceived mind as detached from matter, and as acting upon it with intelligence and deſign in the formation of the univerſe. The infinite mind or deity which his predeceſſors had confounded with matter, making them one univerſe, Anaxagoras ſuppoſed to have a ſeparate and independent exiſtence, and to be ſimple, pure intelligence, capable of forming the eternal maſs of matter according to his pleaſure. Thus he aſſigned an adequate cauſe for the exiſtence of the viſible world. Diogenes Laertius, lib. ii. in Anaxagor. Plutarch in Pericle, *ubi ſupra.* Suidas, Gen. Dict. Brucker's Hiſt. of Philoſ. by Enfield, vol. i. p. 148—153.

ANAXAGORIA, in *Antiquity*, a feſtival obſerved in honour of Anaxagoras.

ANAXANDRIDES, in *Biography*, a comic poet, was a native either of Rhodes or Colophon, and flouriſhed during the reign of Philip of Macedon, B. C. 370—80. Suidas ſays he was the firſt who introduced on the ſtage love-adventures, turning upon the miſhaps of young damſels. He was a perſonable man, and affected great magnificence in his dreſs and equipage, and he is ſaid to have once recited a piece at Athens on horſeback. His temper was moroſe and ſplenetic; and he was much chagrined at the ill ſucceſs of his performances, which were often incorrect, and which he would not take pains to amend and poliſh. Of 65 plays which he compoſed, ten only were crowned. The Athenians condemned him to die of a famine for a line in which their government was cenſured. An "Odyſſey" of this poet is mentioned by Athenæus. Caſaubon ſuggeſts, that Anaxandrides was the Alexandrides of other writers. Gen. Dict.

ANAXARCHUS, a Grecian philoſopher, was a native of Abdera, and belonged to the Eleatic ſect. He flouriſhed about the 110th Olympiad, or 340 years before Chriſt, and enjoyed the confidence of Alexander, whom he treated with the freedom of a friend in ſome inſtances, but with the ſervility of a ſycophant in others. On one occaſion, when Alexander aſpired at the honours of divinity, this philoſopher checked his vanity by pointing to his finger when it bled, ſaying,

ſaying, "See the blood of a mortal, not of a God;" and on another occaſion he recited a verſe from Euripides at a banquet, in order to admoniſh him of his mortality. For an inſtance of his miſapplied and unſeaſonable adulation, ſee ALEXANDER. Anaxarchus was addicted to pleaſure; and on this account, not from the apathy and tranquillity of his life, he obtained the appellation of Εὐδαιμονικός, "The Fortunate." Diogenes Laertius, lib. ix. tom. 1. p. 579. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 436.

ANAXILAUS, a native of Lariſſa, lived in the time of Auguſtus, and profeſſed himſelf a follower of Pythagoras. That his pretenſions to an intimate acquaintance with the myſteries of nature, and to the exerciſe of magical powers might obtain credit, Pliny (Nat. Hiſt. lib. xix. c. 1. lib. xxviii. c. 11. lib. xxxv. c. 15.) relates ſeveral curious arts by which he aſtoniſhed and alarmed the ignorant multitude; and of theſe one was that of giving a livid and ghaſtly hue to the countenance by means of ſulphureous flame. He was baniſhed from Italy in the 28th year before Chriſt, by order of Auguſtus, for the crime of magic. Brucker's Hiſt. Phil. vol. ii. p. 40.

ANAXIMANDER, a famous Greek philoſopher, was the diſciple and friend of Thales, and was, probably, born at Miletus, in the 3d year of the 42d Olympiad, or in the 610th year before Chriſt. An anecdote is related concerning him, from which it has been inferred, that he was employed in the inſtruction of youth. Being laughed at for ſinging or reciting his verſes ill, he ſaid, "We muſt endeavour to ſing better for the ſake of the boys." He was the firſt among the Greeks who taught philoſophy in a public ſchool; and is often ſpoken of as the founder of the Ionic ſchool, though this honour really belongs to Thales. The mathematical and aſtronomical ſciences are, without doubt, much indebted to Anaximander. He framed a connected ſeries of geometrical truths, and wrote a ſummary of his doctrine. He is ſaid to have been the firſt who delineated the ſurface of the earth, and marked the diviſions of land and water upon an artificial globe. The invention of the ſundial has been aſcribed to him; but Herodotus (lib. ii. c. 32.) with greater probability, aſcribes the origin of this inſtrument to the Babylonians. He might poſſibly have uſed a gnomon, in order to aſcertain more correctly than Thales had done, the meridian line, and the points of the ſolſtices. Pliny (lib. ii. c. 1.) refers to this philoſopher the diſcovery of the obliquity of the ecliptic; but if Thales was acquainted with the method of predicting eclipſes, he could not be ignorant of this obliquity. It is related of him that he predicted an earthquake; but we need not ſay, that, as this is impoſſible, the relation muſt be fabulous. Among the phyſical notions imputed to Anaximander are theſe: That the ſtars are globular collections of air and fire, borne about in the ſpheres in which they are placed; that they are gods, that is, inhabited and animated by portions of the divinity; that the ſun has the higheſt place in the heavens, the moon the next, and the planets and fixed ſtars the loweſt; that the earth is a globe, placed in the middle of the univerſe, and remains in its place; and that the ſun is 28 times larger than the earth.

The doctrine of this philoſopher concerning the firſt principles of things, and the origin of nature, is ſo obſcurely and variouſly related, that it cannot be well aſcertained. His general ſyſtem ſeems to have been, that infinity, τὸ ἄπειρον, is the firſt principle of all things; that the univerſe, though variable in its parts, is immutable as a whole; and that all things are produced from infinity, and terminate in it. What Anaximander meant by infinity, and whether he underſtood by it the material ſubject, or the efficient cauſe of nature, are ſubjects of controverſy. Plutarch aſſerts, (Plu. Phil. lib. i. c. 3. Oper. vol. ii. p. 875.) that the infinity of Anaximander was matter; and Ariſtotle (Nat. Auſc. lib. i. c. 5. lib. iii. c. 4. Oper. tom. i. p. 319—331.) explains it in the ſame manner; and ſeveral modern writers adopt the ſame idea. Others ſuppoſe that he uſed the term infinity to denote the humid maſs of Thales, together with the divine principle by which he ſuppoſed it to be animated. This opinion is ſupported by the authority of Hermias, who aſſerts (Irris. Gen. § 10. apud Tatian.) that Anaximander ſuppoſed an eternal mover or firſt cauſe of motion, prior to the humid maſs, or Τὸ ὑγρὸν of Thales. And Ariſtotle himſelf ſpeaks of the infinity of Anaximander, as comprehending and directing all things. Anaximander is ſaid to have been the firſt who laid aſide the defective method of oral tradition, and committed the principles of natural ſcience to writing. Anaximander lived 64 years. Diog. Laert. lib. ii. Strabo, lib. i. Pliny, lib. vii. c. 56. Suidas. Euſeb. Prap. Ev. lib. x. c. ult. Brucker, by Enfield, vol. i. p. 145—147.

ANAXIMANDRIANS, a name given by ſome writers to the followers of Anaximander. Theſe are otherwiſe denominated *hylopathii*; and ſtand oppoſed to the *atomiſts*. The *Anaximandrians* make the moſt ancient ſect of *philoſophical atheiſts*; they allow of nothing in nature but bodies. Theſe bodies, they aſſert, admit of qualities which produce and deſtroy each other, in a circle without beginning or end. See ANAXIMANDER.

ANAXIMENES, a philoſopher of Miletus, was born about the 56th Olympiad, or 556 years before Chriſt, and was a diſciple and companion of Anaximander. On his inquiring into the nature and origin of things, he traced the footſteps of his maſter, and endeavoured to throw new light upon his ſyſtem. According to him the firſt principle of all things is air, which is infinite or immenſe, and perpetually active. This air is a ſubtle æther, animated with a divine principle, whence it becomes the origin of all things, and is God. His doctrine, therefore, was a continuation of that of Thales and Anaximander, with this difference, that he ſuppoſed the divine energy to reſide in air or æther. He alſo taught, that all minds are air; that fire, water, and earth proceed from it by rareſaction or condenſation; that the ſun and moon are fiery bodies of a circular form; that the ſtars, which are fiery ſubſtances, are fixed in the heavens, like ſtuds in a cryſtal plane; and that the earth is a plane tablet reſting upon the air. Plut. Plac. Phil. lib. i. c. 36. lib. ii. c. 11. lib. iii. c. 10. Oper. tom. ii. p. 876—888—894. Cicer. de Nat. Deor. lib. i. c. 10. Oper. tom. ii. p. 511. Academ. lib. ii. c. 37. tom. ii. p. 64. Suidas. Diog. Laert. lib. ii. Brucker, by Enfield, vol. i. p. 147.

ANAXIMENES, a Greek rhetorician and hiſtorian, was the ſon of Ariſtocles, of Lampſacus, and the diſciple of Diogenes the Cynic, and of Zoilus of Amphipolis, who railed againſt Homer. He was born about 580 years before Chriſt; and employed by Philip of Macedon to inſtruct his ſon Alexander in the art of rhetoric. Some have aſcribed the treatiſe on rhetoric, which bears Ariſtotle's name, to Anaximenes. This learned man, with many others, accompanied Alexander in his expedition againſt the Perſians; and he contrived by a ſmart and ſeaſonable retort, mentioned under ALEXANDER, to preſerve the city of Lampſacus. On another occaſion having conceived a grudge againſt the hiſtorian Theopompus, he revenged himſelf by writing a ſevere ſatire againſt the Spartans and Thebans, exactly in the ſtyle of Theopompus, and addreſſing it, under his name, to the Athenians. By this deception, though not of the moſt honourable kind, he gratified his reſentment, and expoſed his adverſary to reproach and ill-will throughout almoſt all

Greece. Anaximenes wrote a hiſtory of the life and actions of Philip, and another of thoſe of Alexander; and he alſo wrote 12 books on the early hiſtory of Greece, beginning with the theogony, or fabulous hiſtory, and ending with the battle of Mantinea, which was fatal to Epaminondas. But none of theſe works are extant. Suidas. Pauſan. Eliac. lib. ii. c. 19. p. 495. ed. Kuhnii. Gen. Dict.

ANAZARBUM, in *Ancient Geography*, a city of Aſia, in Cilicia Proper, or Cilicia Campeſtris. It was ſituated on the river Pyramus, at ſome diſtance from the ſea. Suidas informs us that it was firſt called Cyinda, and afterwards Anazarbum, from its founder Anazarbus, who was ſent by the emperor Nerva to rebuild it, after it had been quite ruined by an earthquake; but he is certainly miſtaken, ſince Pliny, who died long before the reign of Nerva, calls the inhabitants of this city *Anazarbeni*. The etymology of Stephanus Byz. is therefore more probable, who derives its name from mount Anazarbus, at a ſmall diſtance from the place where this city ſtood. The territory adjacent to Anazarbum was very fertile, and produced abundance of grain and fruit. The ſymbols of this fertility were expreſſed on the coins of the city; ſuch as the cornu-copia, ears of corn, branches loaded with fruit, &c. This city is diſtinguiſhed by an æra, marked on its medals, called the æra of Anazarbum. The Abbè Belley, (Mem. de Lit. tom. xxx. p. 714.) proves that this æra ought to commence with the year of Rome 735, 19 years before the Chriſtian æra. By a decree of the ſenate it had permiſſion to aſſume the name of Cæſarea, in acknowledgment of the privileges conferred upon it by Auguſtus. It alſo took the name of Juſtinopolis and Juſtinianopolis, in honour of the emperors Juſtin and Juſtinian. When this city was nearly demoliſhed by an earthquake, it was repaired by Nerva; and after a ſimilar cataſtrophe, it was raiſed from its ruins under the reign of Juſtin or Juſtinian. The citizens of Anazarbum were divided into three claſſes or orders, comprehending the people, the council, and the ſenate. At the commencement of the fifth century Cilicia was divided into two provinces; and Anazarbum was the metropolis of the ſecond province. This diviſion contained nine cities, and Anazarbum exerciſed the juriſdiction of a metropolis, and its biſhops had the rank and juriſdiction of metropolitans. It poſſeſſed the diſtinguiſhing privilege of autonomia, *i. e.* of chuſing its own magiſtrates, and of being governed by its own laws. When the provinces of Aſia were divided under the emperors of Conſtantinople, after the reign of Heraclius, into *themes*, or military departments, Anazarbum was compriſed with Cilicia in the theme of Seleucia. When this city embraced the Chriſtian religion, it became dependant on the patriarch of Antioch; and it is ſaid to be ſtill the ſee of a Jacobite biſhop. The Turks call it *Ain-Zerbeh*. This city was the birth place of Dioſcorides, and of the poet Oppian.

ANAZEIA, in *Geography*, a town of Aſia, in Greater Armenia, near Mount Taurus. It is in the government of Van, not far from a lake which bears this name.

ANAZZO. See GNATIA.

ANBAR, in *Geography*, a town of the province of Chaldæa, or Irac-arabi, on the Euphrates, called alſo Anſchemiah.

ANBERTKEND, in the *Eaſtern Language*, a celebrated book of the Brachmans, containing the Indian philoſophy and religion. The word in its literal ſenſe denotes the ciſtern, wherein is the water of life. The ambertkend is divided into fifty beths, or diſcourſes, each of which conſiſts of ten chapters. It has been tranſlated from the original Indian into Arabic, under the title of *Morat al Muani*, q. d. "the marrow of intelligence."

ANBORD, in *Geography*, a town of Perſia, in the province of Khoraſan, 50 leagues north-eaſt of Meſhid.

ANBURY, in *Agriculture*, is a diſeaſe in the roots of turnips, which is deſcribed by Mr. Marſhall, in his Rural Economy of Norfolk, in the following manner: "It is a large excreſcence, which forms itſelf below the apple. It grows to the ſize of both the hands, and, as ſoon as the hard weather ſets in, or it is by its own nature brought to maturity, becomes putrid, and ſmells very offenſively. At preſent (ſays he) the ſtate of three ſpecimens which have been taken up and examined attentively, is this: the apples of the turnips are juſt forming (about the ſize of walnuts in the huſk), while the anberries are already as big as the egg of a gooſe. They are irregular and uncouth in their form, with inferior excreſcences (reſembling the races of ginger) hanging to them. On cutting them, their general appearance is that of a hard turnip; but on examining them through a magnifier, there are veins, or ſtring-like veſſels, diſperſed among the pulp. The ſmell and taſte ſomewhat reſemble thoſe of turnips, but without their mildneſs, having an auſtere and ſomewhat diſagreeable flavour, reſembling that of an old ſtringy turnip. The tops of thoſe which are much affected turn yellow, and flag with the heat of the ſun: ſo that in the day time they are obviouſly diſtinguiſhed from thoſe which are healthy. It ſeems to be an idea among farmers, that the cauſe of the anbury is the ſoil's being tired of turnips; owing to their having been too often ſown on the ſame land. This, however (he contends), is poſitively erroneous; for the piece from which theſe ſpecimens were drawn was an old orchard, and never before bore turnips in the memory of man."

The nature and cauſe of this *vegetable diſeaſe* do not appear to be yet fully explained; but it is probable that drought has much effect in producing it, as it is found to be the moſt prevalent in ſuch ſeaſons. The author juſt mentioned, however, ſeems to ſuſpect that it may be induced by ſome ſort of grub or other, wounding the veſſels of the tap-root, and thus diverting the courſe of the ſap-juice, by which means excreſcences of this kind are formed, inſtead of the apple of the turnip. Whatever may be the cauſes of the diſeaſe, experience has ſhewn, that the moſt effectual remedy is that of frequent hoeing, or ſtirring the ground about the plants, in order to admit air and moiſture more freely.

ANCA, in *Middle Age Writers*, denotes the thigh, or hind-leg.

In which ſenſe the word is alſo written ANCUS.

ANCÆUS, in *Entomology*, a ſpecies of PAPILIO found in India. The wings are entire, black, with a blue bar on the anterior pair, and a ferruginous one on the poſterior pair. Underſide green. Gmelin. This is the PAPILIO OBRINUS of Fabricius. Spec. Inſ.

ANCALE, or ACALE, in *Ancient Geography*, a town of Arabia Felix, according to Ptolemy.

ANCALITES, inhabitants of Britain, were ſeated near the Attrebatii, and were probably a clan of that nation. Mr. Baxter (Gloſſ. p. 14.) thinks they were the ceangi, or herdſmen and ſhepherds of the Attrebatii, and poſſeſſed thoſe parts of Oxfordſhire and Buckinghamſhire which were moſt proper for paſturage. After they were ſubdued by the Romans, the government of them, with that of ſome of their neighbouring ſtates, was beſtowed upon Cogidunus, the Britiſh king of the Dobuni, as a reward for his early ſubmiſſion, and great fidelity to the Romans.

ANCAMARES, or ANTAMARES, in *Geography*, a people of South America, who live near the banks of the river Madera, which diſcharges itſelf into the river of the Amazons.

ANCANICUM, in *Ancient Geography*, a diſtrict of Spain in Betica.

ANCAON, *Serra de*, in *Geography*, a chain of mountains in Beira, a province of Portugal, which joins to another called Serra d'Eſtrella.

ANCARA, in *Ancient Geography*, a town of Italy, mentioned by Stephanus Byz.

ANCARANO, Peter De, in *Biography*, a celebrated civilian of Bologna, flourished in the 15th century. He rivalled Baldus, his master, in the knowledge of the civil and canon law. In 1409 he defended the council of Pisa against the ambassadors of Robert duke of Bavaria, and evinced its right to proceed against Gregory XII. and Benedict XIII. in order to terminate the schism. He died at Bologna in 1417, and left behind him in Latin, "Commentaries on the Decretals and Clementines," printed at Lyons, Venice, Bologna, &c. On his tomb was inscribed an epitaph, in which he is called "the mirror of the canon law, and the anchor of the civil."

ANCARANO, in *Geography*, a town of Italy, in the marquisate of Ancona, situate on the Tronto, six miles east of Ascoli. N. lat. 42° 48'. E. long. 14° 54'.

ANCASTER, a village of England, in the county of Lincoln, was formerly a Roman station, of which many vestiges are now visible: 116 miles from London.

ANCENIS, a town of France, and principal place of a district, in the department of the Lower Loire. It is situated on the Loire, in a very agreeable and fertile country. It is the ancient *Ancanisium*, the capital of the Anmites, a people who lived about the mouth of the Loire. The place contains 2,923, and the canton 11,109 inhabitants. The territory includes 200 kiliometres and 7 communes. N. lat. 47° 22'. W. long. 1° 15'.

ANCEPS, in *Botany*, denotes two-edged.

Anceps, in *Conchology*, a species of Patella. It is solid, glossy, and rather pointed, outside pale chesnut, within white tinged with flesh-colour. Gmelin.

ANCERVILLE, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of Bar-le-duc; one league east of St. Dizier, and three leagues south-south-west of Bar-le-duc. The place contains 2,200, and the canton 9,699 inhabitants. The territory comprehends 220 kiliometres and 18 communes.

Ancerville is also a town of France, in the department of the Moselle, and chief place of a canton, in the district of Morhange, three leagues and a half west-north-west of Morhange, and three east-south-east of Metz.

ANCESTORS, *progenitors*, are those from whom a person is descended, exclusively of his immediate parents.

The word is derived from the Latin *ancessor*, written, by contraction, for *anteccessor*, q. d. *goer before*.

Most nations have paid honour to their ancestors. It was properly the departed souls of their fore-fathers that the Romans worshipped under the denomination of *lares*, *lemures*, and household gods. Hence the ancient tombs were a kind of temples, or rather altars, wherein oblations were made by the kindred of the deceased. The Russians have still their anniversary feasts in memory of their ancestors, which they call *roditoli sabot*, q. d. *kinsfolk's sabbath*, wherein they make formal visits to the dead in their graves, and carry them provisions, eatables, and presents of divers other kinds. They interrogate them with loud lamentable cries, What they are doing? how they spend their time? what it is they want? and the like.

The Quojas, a people of Africa, offer sacrifices of rice and wine to their ancestors, before they ever undertake any considerable action. The anniversaries of their deaths are always kept by their families with great solemnity. The king invokes the soul of his father and mother to make trade flourish, and the chace succeed.

The Chinese seem to have distinguished themselves above all other nations in the veneration they bear their ancestors. By the laws of Confucius, part of the duty which children owe their parents consists in worshipping them when dead. The service, which makes a considerable part of the national religion of the Chinese, is said to have been instituted by the emperor Kun, the fifth in order from the foundation of that ancient empire.

The Chinese have both a solemn and ordinary worship which they pay their ancestors. The former is held regularly twice a year, *viz.* in Spring and Autumn, with much pomp. A person who was present at it gives the following account of the ceremonies on that occasion.

The sacrifices were made in a chapel well adorned, where there were six altars furnished with censers, tapers, and flowers. There were three ministers, and behind them two young acolites; he that officiated was an aged man, and a new Christian. The three former went with a profound silence, and frequent genuflexions towards the five altars, pouring out wine; afterwards they drew near to the sixth, and when they came to the foot of the altar, half-bowed down, they said their prayers with a low voice. That being finished, the three ministers went to the altar, the priest took up a vessel full of wine, and drank; then he lifted up the head of a deer or goat; after which taking fire from the altar, they lighted a bit of paper; and the minister of the ceremonies turning towards the people, said, with a high voice, that he gave them thanks in the name of their ancestors for having so well honoured them; and in recompence he promised them, on their part, a plentiful harvest, a fruitful issue, good health and long life, and all those advantages that are most pleasing to men.

All the Chinese, Pagans as well as Christians, give their ancestors another simpler and more private worship. To this end they have in their houses a niche or hollow place, where they put the names of their deceased fathers, and make prayers and offerings of perfumes and spices to them at certain times, with bowing, &c. They do the like at their tombs.

It has been a question warmly agitated of late years, whether the worship which the Chinese pay their ancestors be religious, or only of a civil nature. The Jesuits, who not only allow their neophytes, or new converts, to join in it, but even assist in it themselves, are necessitated to maintain the latter, to screen themselves from the charge of idolatry; the Dominicans and other missionaries maintain the former, and prohibit the service as absolutely unlawful.

The Jesuits argue, that with relation to the first institution, those honours might be given to our ancestors, since at first they appear to have been only civil; even though they should since, through the superstitious disposition of the people, have degenerated into idolatry. But it is answered, that, by this argument, the most gross worship of idols might be authorised, because all idolatry appears at first only to have been civil worship, as is maintained in the book of Wisdom, chap. xiv. ver. 15.

The Jews settled in China are said to worship their ancestors like the heathens, and with the same ceremonies, except that they offer not swine's flesh. Near their synagogue they have a hall, or court of ancestors, wherein are niches for Abraham, Isaac, &c. The Jesuits also conformed, and were permitted by their general to conform to this, and many other superstitious customs of the Chinese. See the proof of this in Pascal's Provincial Letters, *passim*.

There is one peculiarity of another kind, wherein the Chinese shew their regard for their ancestors; in proportion as any of their descendants are preferred to a higher degree or dignity, their dead ancestors are at the same time preferred and ennobled with them. The kings Ven, Van, Veu, Van, Cheu, and Cum, who were descended from vassal kings, when they mounted the imperial throne, raised their ancestors from the

vaſſal or depending ſtate wherein theſe had lived, to the dignity of emperors; ſo that the ſame honours were for the future rendered them as if they had been emperors of China. The ſame example was followed by the ſubſequent kings, and now obtains among the grandees and literati: all now worſhip their anceſtors, according to the rank which they themſelves hold in the world. If the ſon be a mandarin, and the father only a doctor, the latter is buried as a doctor, but ſacrificed to as a mandarin. The like holds in degradations, where the condition of the fathers is that of their ſons.

The law diſtinguiſhes between *anceſtor* and *predeceſſor*; the former being applied to a natural perſon, as ſuch an one, and his *anceſtor*; and the latter to a body politic or corporate, as a biſhop, and his *predeceſſors*.

ANCESTOR, *diſability by the act of.* See DISABILITY.

ANCESTREL, in *Law*, ſomething relating to a man's anceſtors.—Thus,

ANCESTREL, *homage*, ſignifies homage that has been done or performed by one's anceſtors.

ANCESTREL, *action.* See ACTION.

ANCHA, in *Geography*, a town of Aſia, in Mingrelia, 120 miles north-eaſt of Trebiſond.

ANCHA is alſo a town of Aſia, in the country of Georgia, and province of Satabago, 68 miles ſouth weſt of Akelzika.

ANCHEDIA, an iſland near the weſtern coaſt of India.

ANCHESMUS, in *Ancient Geography*, *Aghios Georgeos*, or *Mount St. Georges*, a mountain of Attica, upon which was placed a ſtatue of Jupiter Anchemius. Pauſanias, in Attic. lib. i. c. 32. p. 78.

ANCHIALE, a town of Aſia, in Cilicia Campeſtris, ſituated near the ſea, to the ſouth-weſt of Tarſus. Some authors ſay, that it was built by Sardanapalus. Athenodorus pretends, that it was founded by Anchiale, the daughter of Japhet.

ANCHIALE was alſo a town of Illyria, built by the Parians.

ANCHIALEUS, a river of Cilicia, which watered the town of Anchiale.

ANCHIALOS, or ANCHIALUS, called by Pliny *Anchialum*, a town of Europe, in Thrace, ſituate upon the Euxine ſea, ſouth-weſt of Meſembria. It was an epiſcopal ſee, dependent upon the patriarchate of Conſtantinople.

ANCHIALOS was alſo a place in Greece, towards the Pelaſgic gulf, according to the Argonautics of Orpheus.

ANCHIALOS was alſo a town of Epirus, the inhabitants of which pretended that Anchiſes died in their town. Others refer it to Illyria.

ANCHILOPS, or ANCHYLOPS, in *Surgery*, from ἀγχι, *near*, and ὠψ, the *eye*; a tumor in the lacrymal ſac, near the inner angle of the eye, forming an incipient FISTULA LACRYMALIS. See that article, and ÆGILOPS. Theſe ſwellings are of different kinds. The moſt common kind is a tumor, ſituated in the cellular texture immediately ſurrounding the lacrymal ſac, and combined with redneſs, heat, and pain, which raiſes the external ſkin, and bears a conſiderable reſemblance to an inflamed fiſtula lacrymalis. This reſemblance frequently becomes more marked by the cutaneous inflammation acting upon the lacrymal duct in ſuch a manner, as to obſtruct the paſſage of the tears through it; the conſequence of which is a flow of tears from the eye, and a ſwelling of the lacrymal ſac.

The inflammatory tumor ſoon goes on to ſuppuration; an event which, provided we can do it early enough, we ſhould endeavour to prevent by the external application of a ſaturnine waſh, and other remedies that promote reſolution of the inflammation, as well as by cooling evacuants. When ſuppuration has already taken place, and produced an abſceſs at the inner canthus of the eye, we are ſtill more liable to be led into error, as we may eaſily miſtake the fluctuation of the pus for the motion of ſome fluid contained in the lacrymal ſac. This error, which might poſſibly induce us to make an inciſion into the ſound lacrymal ſac, may, however, be eaſily avoided, by recollecting that the lacrymal paſſage was not previouſly diſeaſed, that the tumor was at firſt hard, and that the lacrymation and fluctuation only ſupervened afterwards. Moreover, in this diſeaſe, the matter cannot be ſqueezed with the finger out of the tumor, through the puncta lacrymalia, or the noſe, (as it may when the lacrymal ſac is filled with matter) unleſs the matter has already corroded the lacrymal duct, ſo as to produce a communication between it and the abſceſs. We may alſo diſtinctly obſerve, that both the inflamed and the ſubſequent ſuppurating tumor lies flat under the ſkin, and that at firſt the collection of matter is ſurrounded with inflammatory hardneſs; whilſt, on the contrary, the lacrymal ſac, when filled with matter, is ſoft, and affords the ſenſe of fluctuation throughout its whole extent, from the very commencement of the diſorder. This complaint, however, may at times produce a real inflammation of the lacrymal ducts, and conſequently alſo a true fiſtula lacrymalis.

When, in an inflammatory tumor of the angle of the eye, ſymptoms of incipient ſuppuration make their appearance, the ſurgeon may apply, during the night, the Empl. Litharg. vel diachyl. comp. and, in the day time, emollient and ſomewhat ſtimulant poultices, in order to invite the matter towards the ſurface. Theſe muſt be applied warm and frequently; in doing which, care ſhould be taken that they do not come into contact with the eye, which, on that account, ſhould previouſly be covered with compreſſes dipped in roſe-water. As ſoon as there is the leaſt reaſon to ſuppoſe that pus has been formed, the tumor muſt be cut open; for, in theſe caſes, it is of great conſequence that the pus ſhould be diſcharged as ſoon as poſſible, as otherwiſe it eaſily makes its way downwards, by which not only the lacrymal ſac may be laid bare and corroded, but alſo the neighbouring bones, &c.

The inciſion is made with a lancet, but as remote as poſſible from the inner canthus of the eye, and proportionate to the magnitude of the tumor. The lancet muſt not be introduced in a perpendicular direction, but obliquely, for fear of injuring the lacrymal ſac. When the matter and blood have been diſcharged, we ſhould introduce ſome looſe lint into the orifice, and cover it with a ſimple plaſter. Over this we may lay a compreſs, dipped in roſe-water. The ulcer is afterwards to be cleanſed with mild digeſtive ointment, and ſuffered to heal up.

When the ſurgeon is not called in till the abſceſs has already been completely formed, he ſhould immediately lay it open, and examine the ſtate of the bone. When the bone is bare, ſome tincture of myrrh or aloes may be uſed, and dry dreſſings applied, in order that we may not increaſe the ulceration, which is generally already conſiderable. When the exfoliation of the bone, and the cleanſing of the ulcer have been completed, the healing of the ſore ſhould be promoted by the proper applications.

The anchilops may at times conſiſt in a hard tubercle or knot, from which a cancer may be produced. This diſeaſe is to be treated like other ſcirrhous tumors. See SCIRRHUS.

Sometimes the tumor is of the encyſted kind, moſt generally of the ſpecies of ATHEROMA. In this diſeaſe no pain is felt, the tumor is of an uniform colour, circumſcribed, ſmooth, and moveable. Such a tumor alſo, like every other

anchilops, may by its mere preſſure impede the functions of the lacrymal ducts, and occaſion an EPIPHORA, or watery eye. It may generally be ſoftened by means of Empl. diach. comp. and brought to ſuppuration; otherwiſe it is to be diſſected out with the knife.

This tumor may alſo ariſe from an accumulation of ſerous fluid between the lacrymal ſac and the external ſkin. Such a ſerous, uninflamed tumor ſeldom opens itſelf ſpontaneouſly outwards; it more commonly happens, that it is connected with one of the two PUNCTA LACRYMALIA, or lacrymal ducts, generally the lower; in which caſe the fluid may indeed be preſſed out through one of the puncta lacrymalia; but it may, nevertheleſs, be eaſily diſtinguiſhed from a ſwelling of the lacrymal ſac, by the circumſtance that the latter generally yields to the ſlighteſt preſſure, whilſt the former cannot be made to collapſe, unleſs by preſſing it from below upwards, and its tenſion cannot be diminiſhed except in a gradual manner. When the ſerous anchilops is not yet in communication with the lacrymal ducts, (as generally is the caſe,) it may readily be diſtinguiſhed from the diſtenſion of the lacrymal ſac, by the ſingle circumſtance of it; not being by any means practicable to ſqueeze out the fluid.

There are certain circumſtances under which the lacrymal tumor does not yield to preſſure; namely, when the lacrymal ducts are contracted or inflamed, ſo as to prevent the receſſion of the fluid contained in the lacrymal ſac. But when theſe paſſages are in a ſound condition, and when the tumor of the larger canthus does not yield to preſſure, there can be no doubt that the diſeaſe is ſituated without the lacrymal ſac.

When the reſolution of ſuch a ſerous tumor, which we may at firſt attempt to bring about, does not ſoon take place, the ſafeſt and moſt expeditious method is to open it, and diſcharge the matter by means of a lancet, which muſt here alſo be introduced in an oblique direction. The wound ſhould be filled up with dry lint, which, in the ſubſequent dreſſings, ought to be dipped in ſome detergent and drying ſolution, ſuch, for example, as a very weak ſolution of lapis infernalis, and ſecured by means of a plaſter.

Finally, in the venereal diſeaſe there is ſometimes produced, in the region of the larger canthus of the eye, an exoſtoſis from the os unguis coronale, or maxillare; by which a tumor is formed in this part that may eaſily be diſtinguiſhed from other kinds of anchilops, by its being hard, immoveable, and generally of an uneven ſurface. It occaſions a compreſſion of the lacrymal paſſages, which gives riſe to a conſtant EPIPHORA. We may, in ſuch caſes, employ internally mercurial remedies, and a decoction of Coſt. Mezerei, and, at the ſame time, rub mercurial ointment upon the tumor, apply mercurial plaſters, &c. by which a ſpeedy cure is frequently produced: but, for the treatment of venereal diſorders, ſee SYPHILIS and LUES VENEREA.

ANCHIROMACUS, in *Middle Age Writers*, denotes a kind of veſſel, which, on account of its nimble ſailing, was uſed for the conveyance of anchors, and other neceſſary utenſils of ſhips.

In this ſenſe, the word is alſo written *ancyromagus*, *anchiromachus*, *ancyromacus*, *angromagus*, *anquiromagus*, and *anguiromagus*.

ANCHISÆ PORTUS, a name given by the ancient Romans to the port of Onchesmus, in Epirus, to the eaſt of Corcyra.

ANCHISES, in *Entomology*, a ſpecies of PAPILIO (Eq. Tr.) that inhabits America; it is black both above and beneath, with ſeven ovate ſcarlet ſpots on each of the poſterior wings. Linnæus. The larva from which this butterfly is produced, is ſaid to be gregarious, ſpinous, brown with white rings, and yellow tentacula; the pupa brown, with four teeth at the anterior part. Vide. Fab. Gmel. Merian, &c.

ANCHISES, in *Fabulous Hiſtory*, a Trojan prince, deſcended from Dardanus, and the ſon of Capys. Venus appeared to him in the form of a beautiful nymph, and made love to him. Their intercourſe produced Æneas, the hero of Virgil's Æneid. It is ſaid that he lived to the age of 80, and was buried on Mount Ida, where ſhepherds paid honours to his monument. According to Virgil, Æneas took his father on his ſhoulders, and made his eſcape with him the night on which Troy was taken. See ÆNEAS. Some ſay, that Anchiſes lived till his ſon's arrival in Italy, that land of promiſe, which the deſtinies had ordered him to go in ſearch of, through a thouſand dangers. Cato, Dionyſius Halicarnaſſenſis, and Strabo, adopt this opinion. Gen. Dict.

ANCHISIUS, in *Ancient Geography*, a mountain of Peloponneſus, in Arcadia, to the north of Mantinæa.

ANCHITÆ, a people placed by Ptolemy in Arabia Felix, near mount Climax.

ANCHOA, a town of Greece, in Bœotia, placed by Pliny at the mouth of the Cephiſſus. Strabo mentions alſo a lake of the ſame name.

ANCHOR, ANCHORA, from the Latin *ancora*, or *anchora*, of the Greek ἄγκυρα, which comes from ἀγκύλος, *incurvus*, *crooked*, a large, ſtrong, and heavy piece of iron, compoſed of a long ſhank, having at one end a ring to which the cable is faſtened, and at the other two arms or flukes, with barbs or edges on each ſide, and uſed for fixing and retaining a veſſel in a harbour, road, or river.

The anchor is an inſtrument of very ancient uſe. Pliny (lib. viii. c. ult.) aſcribes the invention of it to the Tuſcans; and Pauſanias (Attic, lib. i. c. 4. p. 12.) refers it to Midas, the ſon of Gordius, who built the city Ancyra. The moſt ancient anchors were of ſtone, and ſometimes of wood, to which a quantity of lead was attached; in ſome places they uſed baſkets full of ſtones, and ſacks filled with ſand. Theſe were ſuſpended by cords, and their weight regulated the courſe of the ſhip. Afterwards anchors were conſtructed of iron, and furniſhed with teeth or flukes, which faſtening to the bottom of the ſea, kept the ſhip immoveable; hence ὀδόντες, teeth, are uſed for anchors. The firſt anchors had only a tooth or fluke, on one ſide; and on this account they were denominated ἑτεροστόμοι; the contrivance was completed, according to Pliny, (*ubi ſupra*,) by Eupalamus, who made them fluked both ways, or according to Strabo (lib. vii. ex Ephor, tom. p. 464.) the ſecond tooth or fluke was added by Anacharſis, the Scythian. The anchors with two teeth were called ἀμφίβολοι, or ἀμφίστομοι. Every ſhip had ſeveral anchors, the largeſt of which was called ἱερά, ſacred, and was never uſed but in extreme danger; whence the phraſe "ſacram anchoram ſolvere," is proverbially applied to ſuch as are reduced to their laſt refuge.

All anchors have now two arms; not but they might ſtill be uſed with only one arm, which ſtructure would have this advantage, that they would be lighter, and yet in fine weather would hold equally firm with the double kind. The reaſon of having two arms is, that the anchor may always take, in order to which it is neceſſary that it be very heavy; beſides, that anchors with a ſingle arm would require more preparation for ſervice.

Travellers tell us of people who make uſe of wooden anchors in their navigation. The inhabitants of the iſland of Ceylon, in lieu of anchors, uſe large round ſtones, and

in

in other places, their anchors are a kind of wooden machines, loaded with ſtones. Sometimes bags of ſand have been made uſe of, but theſe chiefly obtained in rocky places, where anchors would not take hold. In England, France, and Holland, anchors are made of forged iron; but in Spain, they are ſometimes made of copper, and likewiſe in ſeveral parts of the South ſea.

The anchors now made are ſo contrived as to ſink into the ground as ſoon as they reach it, and to hold a great ſtrain before they can be looſened or diſlodged from their ſtation. The parts of which an anchor is compoſed are the ring, into which the cable is faſtened, the beam, or ſhank, which is the longeſt part of the anchor, the two arms, at the end of which are the two hooks or flukes, by ſome called the palms, which with their barbs faſten into the ground, and the ſtock, which is a long piece of wood, faſtened acroſs the beam, near the ring, and ſerving to guide the flukes in a direction perpendicular to the ſurface of the ground; ſo that one of them ſinks into it by its own weight, as ſoon as it falls, and is ſtill preſerved ſteadily in that poſition by the ſtock, which, together with the ſhank, lies flat on the bottom. In this ſituation it muſt neceſſarily ſuſtain a great effort before it can be dragged through the earth horizontally. This, indeed, can only be effected by the wind or tide, or by both of them; the effect of which is ſometimes increaſed by the turbulency of the ſea, and acts upon the ſhip ſo as to ſtretch the cable to its utmoſt tenſion, and may thus diſlodge the anchor from its bed, eſpecially if the ground be ſoft, and oozy, or rocky. When the anchor is thus diſplaced, it is ſaid, in the ſea-phraſe, "to come home"

The ſeveral parts of the anchor, above enumerated, bear the following proportions. The length of the arm, from the inſide of the throat to the bill, is the diſtance marked on the ſhank for the trend, taken from the inſide of the throat; and three times that is the length of the ſhank from the tip of the crown; and the ſhank, from the tip of the crown to the centre of the ring, is the length of the iron ſtock; when made, the two arms, from the inſide of the throat to the extremity of the bill, ſhould form an arc of a circle, containing 120 degrees. See *Plate* XI. *Ships*.

Of anchors there are the ſheet, beſt bower, ſmall bower, and ſpare anchor. Theſe do not vary in form or weight from each other, in the navy. Stream and kedge anchors are ſmaller, and grapnels are only for boats. Ships of 110, 100, 98, and 90 guns, have ſeven anchors; from 80 to 20 guns incluſive, ſix anchors; ſhips of 300 tons, and ſloops have five; and brigs and cutters three anchors.

ANCHORS, *method of making*. The goodneſs of the anchor is a point of great importance; the ſafety and conſervation of the veſſel depending principally upon it. The ſhank, arms, and flukes, are firſt forged ſeparately; then the hole is made at one end of the ſhank for the ring, which being alſo previouſly forged, is put into the hole of the ſhank, and the two ends ſhut together. After which the arms are ſhut to the ſhank, one after the other, and the anchor is finiſhed.

The ſhank is made of many long bars of the beſt tough iron, well wrought together; and great care ſhould be taken, that the iron be neither too ſoft nor too brittle; the latter rendering it liable to break, and the former to ſtraiten. The number of bars ſufficient to make the ſhank of the intended ſize muſt be regulated by experience. Several parts of the anchor are governed by the ſize of the trend, which is marked on the ſhank at the ſame diſtance from the inſide of the throat as the arm meaſures from the inſide of the throat to the extremity of the bill. The ſhank is rounded to the ſquare of the upper part, and is there called the ſmall round, being the ſmalleſt part. The two ſides in the direction of the arms are flatted ſurfaces, about an inch leſs than the trend, in large anchors, and ſomething leſs in ſmaller ones. The ſquared part is of the ſame ſize as at the trend each way, and hanches into the ſmall round, one-ſixth of the length of the ſhank. The hole, or eye, for the ring, is punched through the ſquare part, or the flatted ſide, once and a half the thickneſs of the ring, from the upper extremity of the ſhank, which has its corners flatted or diamonded, on the ſame ſides nearly, in the middle. Between the hole for the ring and lower part of the ſquare are two ſmall prominences, raiſed acroſs from the ſolid, called nuts, for ſecuring the ſtock in its place. At the lower part of the ſhank is left a ſcarf, or flatted ſurface, with a ſhoulder on each ſide, for ſhutting on the arms.

In making every part of an anchor the niceſt attention ſhould be obſerved, as to its being ſmooth, fair, and even; and that the edges and angles are preſerved ſtraight in their direction, as well-made anchors ſhould poſſeſs beauty as well as ſtrength. The ring, being previouſly forged, is put through the fore-mentioned hole in the ſhank, and the two ends are well ſhut together. The arms are made of ſhorter bars than the ſhank, but as good in quality, and as well put together; they are rounded and flatted on the different ſides, to reſemble the ſhank, and are of the ſame ſize as the ſhank, at the throat and ſmall round. The rounding part is continued to the palm, which is nearly in the middle of the arm; from thence it is made with a ſquare tapering to the bill on the flatted ſide; and, on the inner rounded ſide, is made a ſquare ſeat for ſhutting on the palm, that the palm, when ſhut on, ſhould project its thickneſs at the baſe or inner part, the outer part making a ſtraight ſurface with the peek or bill. The back or outer ſide of the arm is made ſtraight from the rounded part, or hanch, to the ſnape, and there kept to half the ſubſtance of the inner part. The ſnape reſembles the bill of a duck, and is one-third the breadth of the palm in length. The thickneſs of the ring is to be half the diameter of the ſmall round. The diameter of the ring, including the thickneſs, reaches from the hole in the upper part of the ſhank to the hanch of the ſmall round. The inner part of the arm is moſtly made ſtraight, from the bill to the throat; and it is thought ſtronger for having a ſmall angle in its length, inclining to the ſhank. Shanks taper in their length, one and one-half inch in ſmall anchors to three inches in large, keeping their proper ſize at the trend; and three-fourths of an inch to two inches in the flatted way. The arm in its length inclines to the ſhank, and forms a ſmall angle, the touch or point thereof being in the middle. The throat-end of the arm is ſcarfed, or flatted, to anſwer the ſcarf in the ſhank, to which the two arms are united (after the palms are ſhut on) in the firmeſt manner poſſible; and it is elevated above the horizontal plane, or inclined to the ſhank, that each arm may ſpread at the peek or bill. The length of the arm, from the inſide of the throat to the extremity of its bill, is then taken, and that length from the inſide of the throat is ſet upon the ſhank, and called the trend: from the trend to the bill is formed an angle of about 60 degrees. The palms, or flukes, are two thick plates of iron, made of various pieces, well wrought together, in the form of an iſoſceles triangle; one and one-half inch to one and one-fourth inch longer than the breadth of the baſe, and curve about as much in their ſides. The baſe or lower part, is to be ſtraight; the inner flat ſurface curves a little in the breadth, but is ſtraight lengthways;

lengthways; the palms, being finiſhed thus far, are, laſtly ſhut firmly into the inner ſide of the arm, in the ſeat before mentioned, the baſe inclining inwards.

The ſtock is compoſed of two long beams of oak, ſtrongly bolted and tree-nailed together, and ſecured with four ſtrong iron hoops, two on each ſide of the middle, and one near each end. It is fixed on the upper end of the ſhank, tranſverſely with the flukes or palms; and the nuts are let into the middle of the ſtock. The length of the ſtock is the length of the ſhank and half the diameter of the ring; the depth and thickneſs in the middle are as many inches as the ſtock is feet in length. The ends are to be kept ſquare, half the depth or thickneſs in the middle. The upper ſide next the ring is always kept ſtraight, as is the lower ſide half the depth on each ſide the middle; and thence it tapers to each end in the above proportion. It is neceſſary to leave an opening in the middle of one and one-half inch, between the two pieces, that the hoops may be driven nearer the middle, in caſe the ſtock ſhould ſhrink. The making of anchors is a very laborious buſineſs, and has been much facilitated by the invention of two machines, called the HERCULES and the MONKEY.

Proof is made of anchors, by raiſing them to a great height, and then letting them fall again on a kind of iron block placed acroſs for the purpoſe. To try whether the flukes will turn to the bottom, and take hold of the ground, they place the anchor on an even ſurface, with the end of one of the flukes, and one of the ends of the ſtock reſting on the ſurface; in caſe the anchor turns, and the point of the fluke riſes upwards, the anchor is good.

For the proportions of anchors according to Manwaring, the ſhank is to be thrice the length of one of the flukes, and half the length of the beam. According to Aubin, the length of the anchor is to be four-tenths of the greateſt breadth of the ſhip; ſo that the ſhank, *e. gr.* of an anchor in a veſſel thirty feet wide, is to be twelve feet long. When the ſhank is, for inſtance, eight feet long, the two arms are to be ſeven feet long, meaſuring them according to their curvity. As to the degree of curvity given the arms, there is no rule for it; the workmen are here left to their own diſcretion.

Aubin, in his Marine Dictionary, gives a table from a Flemiſh writer, wherein the lengths of the ſhanks of anchors for veſſels of all widths, is computed, as well as the weights of the anchors, from a veſſel eight feet wide within, which requires an anchor three and one-half feet long, weighing thirty-three pounds, to a veſſel forty-five feet wide, which demands an anchor eighteen feet long, and weighing 5832 pounds. He likewiſe obſerves, that the anchor of a large heavy veſſel is ſmaller, in proportion, than that of a leſſer and lighter one. The reaſon he gives is, that though the ſea employs an equal force againſt a ſmall veſſel as againſt a great one, ſuppoſing the extent of wood upon which the water acts to be equal in both, yet the little veſſel, by reaſon of its ſuperior lightneſs, does not make ſo much reſiſtance as the greater; the defect whereof muſt be ſupplied by the weight of the anchor.

From theſe and other hydroſtatic principles, the following table has been formed; wherein is ſhewn, by means of the ſhip's breadth within, how many feet the beam or ſhank ought to be long, giving it $\frac{4}{10}$ or $\frac{2}{5}$ of the ſhip's breadth within; by which proportion may be regulated the length of the other parts of the anchor. In this table is repreſented likewiſe the weight an anchor ought to be for a ſhip from eight feet broad to 45, increaſing by one foot's breadth; ſuppoſing that all anchors are ſimilar, or that their weights are as the cubes of the lengths of the ſhanks.

Breadth of the Veſſel	Length of the Anchor	Weight
Feet	Feet.	Pounds.
8	$3\frac{1}{5}$	33

M. Bouguer directs to take the length of the ſhank in inches, and to divide the cube of it by 1160 for the weight. The reaſon is obvious; becauſe the quotient of the cube of 201 inches, which is the length of an anchor weighing 7000lb. divided by the weight is 1160, and therefore by the rule of three, this will be a common diviſor for the cube of any length, and a ſingle operation will ſuffice. The ſame author, in his Traite de Navire, gives the following dimenſions of the ſeveral parts of an anchor. The two arms generally form the arch of a circle, whoſe centre is three eighths of the ſhank from the vertex, or point where it is fixed, to the ſhank; and each arm is equal to the ſame length or the radius; ſo that the two arms together make an arch of 120 degrees: the flukes are half the length of the arms, and their breadths two-fifths of the ſaid length. With reſpect to the thickneſs, the circumference at the throat, or vertex of the ſhank, is generally made about the fifth part of its length, and the ſmall end two thirds of the throat, the ſmall end of the arms of the flukes, three fourths of the circumference of the ſhank at the throat. Theſe dimenſions ſhould be bigger, when the iron is of a bad quality, eſpecially if caſt iron is uſed inſtead of forged iron.

See Murray's Treatiſe on Ship-building, &c. Elements and Practice of Rigging and Seamanſhip, 4to. 1794, p. 77—82.

The diſtinctions of anchors are taken from their uſe, and the proportions they bear in the ſhip, where they are employed; for that which in one ſhip would be called but a *kedger*, or *kedge*-ANCHOR, in a leſſer would be a *ſheet*-ANCHOR.

ANCHOR, *kedge*, is the ſmalleſt, which, by reaſon of its lightneſs, is firſt to ſtop the ſhip in *kedging* a river.

This is what the Dutch ſailors call *werp*-ANCHOR, the French *ancre a touer*. It ought to weigh 450 pounds.

The *grapnel* is an anchor for a ſmall ſhip or boat. See KEDGE and GRAPNEL.

ANCHOR, *ſtream*, is a ſmall anchor faſtened to a ſtream-cable, wherewith to ride in rivers, and gentle ſtreams, and to ſtop a tide withal in fair weather.

ANCHOR *ſheat*, or *ſheet*, is the biggeſt and ſtrongeſt, being that which the ſeamen call their laſt hope; never to be uſed but in great extremity.

This is what the Romans call *anchora ſacra*; the Dutch *plegt-anker*, and *ſtop-anker*; the French *maitreſſe-ancre*, or *grand ancre*.

The other anchors are called by the name of the firſt, ſecond, and third anchor; by any of which the ſhip may ride in any ſeaſonable weather, ſea-gate, or tide.—Theſe are ſomething bigger one than another, and uſually when they ſail in any freights, or are near a port, they carry two of theſe at their bow; in which reſpect they are alſo called by the name of firſt and ſecond bowers.

ANCHOR, *ſecond*, called by the Dutch *borg-anker*, or *daugelyks-anker*, is that ordinarily made uſe of.

ANCHOR, *croſs*, called by the Dutch *tuy-anker*, or *vertuy-anker*, and by the French *ancre d'affourche*, is a middling anchor thrown acroſs or oppoſite to another.—This ought to weigh 1500 pounds, or nearly as much as the ſecond anchor.

ANCHOR, *floating*, is a ſimple machine, which is made to dive beneath the ſwell of the ſea, and retain the veſſel where there may be no other anchorage. It conſiſts of two flat bars of iron, each in length half the breadth of the midſhip beam of the veſſel for which it is uſed, and rivetted together in the middle by an iron ſaucer-headed bolt, clenched at its point, that they may be ſwung parallel to each other for eaſy ſtowage. At each end of the bars is a hole for a rope, or ſwifter to paſs through, which muſt be hove tight to extend the bars at right angles. To this ſwifter is marled a double or four-fold canvas cloth, ſo as to be on that ſide of the iron bars neareſt the veſſel when uſed. In each bar are two holes, at equal diſtances from the centre, and to theſe holes the ends of two pieces of rope are faſtened; the ropes are ſeized together in the middle ſo as to form a crow-foot, having an eye in the centre, which is well ſewed with ſpun-yarn, and to this is bent, when the anchor is uſed, a cable or hawſer, by which it is made to ſink and incline in the water. See *Plate* XI. *Ships*. In the end of one of the bars is fitted an iron ring to which a buoy is made faſt, by a rope about 12 fathoms long, to prevent the anchor from ſinking to the bottom. When it is thrown over-board, the cable and a rope made faſt to the head of a buoy, are carried away ſufficiently to ride the veſſel. To get it on board, haul upon the buoy-top, which will bring it to the water's ſurface ſo as to be eaſily drawn to the veſſel. Have the mizen ſtay-ſail ready to hoiſt, ſo as to keep the veſſel to the wind, till the anchor is hauled on board.

A *floating* or *ſwimming anchor* will ſerve to prevent a ſhip, in a ſtorm, from driving to leeward in deep water. Dr. Franklin ſuggeſts that an anchor, effectual for this purpoſe, ought to have the following properties. It ſhould have a ſurface ſo large as being at the end of a hauſer in the water, and placed perpendicularly, ſhould hold ſo much of it, as to bring the ſhip's head to the wind, in which ſituation the wind has leaſt power to drive her. It ſhould be able by its reſiſtance to prevent the ſhip's receiving way. It ſhould be capable of being ſituated below the heave of the ſea, but not below the undertow. It ſhould not take up too much room in the ſhip. It ſhould be eaſily thrown out, and put into its proper ſituation. And laſtly, it ſhould be eaſy to take in again, and ſtow away. Many contrivances have been ſuggeſted

ſuggeſted for this purpoſe. One for a large ſhip might have a ſtem of wood 25 feet long and four inches ſquare, with four boards, 18, 16, 14, and 12 feet in length, and one foot wide, with a hole in the middle of each, about four inches ſquare, ſo that it might be occaſionally ſlipt upon the ſtem at right angles with it; and when theſe boards are fixed at the diſtance of four feet from each other, the anchor would have the appearance of the old mathematical inſtrument called the foreſtaff. This thrown into the ſea, and held by a hawſer veered out to ſome length, would bring a veſſel up and prevent her driving, and when taken in it might be ſtowed away by ſeparating the boards from the ſtem. Such a ſwimming anchor would have ſome good effect, but as it lies on the ſurface of the ſea, it is liable to be hove forward by every wave, and then only give ſo much leave for the ſhip to drive. Dr. Franklin has propoſed two machines for this purpoſe, which he conceives, would be more effectual and more manageable. The firſt of theſe is to be formed, and uſed in the water on almoſt the ſame principles, with thoſe of a paper kite in the air; only that as the paper kite riſes in the air, this is to deſcend in the water; and its dimenſions muſt be different for ſhips of different ſizes. The other machine is to be made more in the form of an umbrella. See a particular deſcription of both theſe machines, with figures, in the Tranſactions of the American Philoſophical Society, vol. ii. p. 311—314.

ANCHOR, *to back an*, in *Sea-language*, is to let go a ſmall anchor a-head of a large one, to which it is faſtened, that it may partake of the ſtrain, and ſerve as a check upon it, ſhould it come home. The backing anchor is carried out in a long boat, to the buoy of that which is already down, whoſe buoy-rope is caſt off and bent to the cable or hawſer of the backing anchor; when that is done, the boat is rowed further a-head, till the buoy-rope and cable of the backing anchor become tight, when it is let go, the buoy that was taken from the large one being previouſly bent to it. In this ſituation, ſhould the large anchor come home, the ſcope of cable from it to the anchor a-head, participating of the ſtrain communicated to the innermoſt one, checks its progreſs, and enſures to the veſſel a greater ſecurity. Where there is more room to drive without danger, and it blows ſo hard, that the ſea runs too high for boats to work, an anchor is backed by clenching round that part of the cable next the hawſe-hole, the end of a cable bent to another anchor on board; this being done, the ſecond anchor is let go under foot; the ſhip is then ſuffered to drive, and the cable thus becomes tight from the ring of the anchor laſt down to its own anchor, which alſo, by the driving, is now become a cable's length a-head of the former anchor.

ANCHOR, *riding at*, the ſtate of a veſſel moored and fixed by her anchors at ſome proper ſtation.

Where a great number of veſſels are moored in the ſame port, care is to be taken by the pilots, or thoſe who have the command, that each ſhip be at a due diſtance from the reſt, to prevent their running foul of each other; alſo that they be neither too near, nor too far from land. The proper ſpace betwixt veſſels is, from two to three cables' length. See MOORING.

ANCHOR, *dropping, or let fall the*, otherwiſe called caſting anchor, imports the letting it down into the ſea.

In ſome caſes it is neceſſary to drop two anchors oppoſite to each other, one of them to keep the ſhip firm againſt the tide, or flow, the other againſt the ebb.

On approaching an anchorage, the anchor and buoy are got clear, and a range of cable, ſtretched along the deck, ſuitable to the depth of water. Care ſhould be taken that nothing is in the way to check the cable, or ſtop its running out; then, at a proper diſtance, a turn is taken round the bits with the cable, thus: firſt paſs the cable from the anchor underneath the croſs-piece, then take up a bight of the cable abaft the bits, and throw it over the bit-head. The end of the cable is clenched round the orlop beams in the royal navy, and round the main-maſt in the merchant ſervice. It is neceſſary to have water near the bits to prevent its firing by the friction. STOPPERS and RING-ROPES of all kinds ſhould be ready for uſe. The ſtock-laſhing being caſt off, and nothing but the anchor-ſtopper and ſhank-pointer retaining the anchor, men are ſtationed to ſtand by them, and let go at the moment when the order is given.

A ſhip ſhould generally be brought to anchor under an eaſy ſail, ſuch as the three top-ſails, jib, or fore topmaſt ſtayſail, and ſometimes the mizen, according as the veſſel has more or leſs inclination to fall off or come to the wind. An anchor ſhould never be dropped to leeward of the place you mean to bring up in; becauſe that would often render it neceſſary to caſt two anchors at once, for fear of dropping ſtill more to leeward. When the wind is ſo violent as to bring the anchor home, and make the veſſel drive, the cable is veered away; and in veering away, the turns of the ſtopper laniards are ſlackened, and a portion of the cable ſuffered to go out of the hawſe, to let the veſſel further a-ſtern of her anchor; in which ſituation ſhe bears leſs ſtrain on the flukes, and is leſs liable to drag the anchor; for, the more cable is out, the flukes become deeper buried, and the ſhip rides in greater ſafety. In letting go an anchor, care ſhould be taken that the water be not ſo ſhoal as to endanger the ſhip hurting herſelf upon it, and that the anchor be not fouled by the cables getting about the fluke or ſtock. Nor ſhould the water be too deep, becauſe the cable, when out, ſhould approach as nearly as poſſible to an horizontal direction. This principle is ſo true, that three cables ſpliced together on end of each other, are kept bent to the beſt bower anchor, to be uſed in caſes of neceſſity; and it is found, that one good anchor, with a long range of cable, is a ſafer anchorage than two anchors with ſhort cables. However, when the ſhip has not room to drive, and in a dark night, let fall a ſecond anchor under foot, with a range of cable above the deck. At all events, the deep-ſea lead ſhould be thrown over the gun-wale, and the line frequently handled, to be certain that the ſhip does not drive. In hard and rocky bottoms, where anchors cannot have much hold, cables are chafed and cut to pieces. When neceſſity requires anchoring in ſuch places, a chain ſhould be run up the cable from the ring of the anchor to a certain diſtance, in order to ſecure it from danger. When a chain is not to be had, empty caſks, well bunged, are good ſubſtitutes, ſlung and faſtened to the cable at equal diſtances, to ſupport and keep it from the bottom. When ground is ſoft and oozy, and anchors will not hold ſecurely, but come home with little wind, it is common to cover the flukes with a broad triangular piece of plank, much larger than the fluke. Sometimes the anchor is backed, or retained, by carrying out the ſtream, or kedge, a-head of the anchor by which the ſhip uſually rides. In this ſituation, the bower anchor is confined by the ſtream, or kedge, in the ſame manner as the ſhip is reſtrained by the bower anchor. In preparing to come to anchor, when the wind is not violent, the top-ſails ought always to be clued up at the maſt-heads; that is, let go the ſheets, and haul the clue-lines and bunt-lines cloſe up; lower away the top-ſails, and take in the ſlack of the braces as the yards come down. In this manner you run leſs riſk of ſplitting and tearing the ſails than by any other method. For the various methods of anchoring in different circumſtances, ſee Elements of Rigging, &c. vol. ii. p. 292—296.

ANCHOR, *weighing*, imports the act of withdrawing, or recovering the anchor into the veſſel, in order for ſailing. The anchor is ordinarily weighed, or recovered by means of a capſtan or windlaſs.

In large ſhips which have a main and jeer capſtan, and the ſtrain is thought too great for the meſſenger alone, the viol is uſed thus: three or four turns are taken round the jeer capſtan with one end, ſo as to leave that ſide clear on which the cable is coming in; and paſs the other end through the viol-block, which is laſhed round the mainmaſt on the lower deck. It is then carried forward, and paſſed round the rollers in the manger near the hawſe-holes; then brought aft, and ſpliced to the other end with a ſhort ſplice; and the ends marled down tight. That ſide of the viol on which the cable is coming in is faſtened to the cable by nippers; and thus the continued efforts of the capſtan are conveyed to the cable, until it is hove in. The nippers are clapt on in the manger, from one to two fathoms aſunder; and the viol is applied to the midſhip, or inſide of the cable. Nippers are clapt on by taking three or four turns round the viol, four turns round the cable and viol, and then three or four turns round the cable. This method is very ſuitable to quick heaving; but when the ſtrain is great, and the cable muddy, the nippers clapt on after this method will not nip ſufficiently; in which caſe recourſe is had to the following method: throw ſand or aſhes upon the cable, and take a long dry nipper, which middle, and paſs one half aft, racking it in and out round the cable and viol; then worm its end round the viol only. After this paſs the other half in the ſame manner forward, but worm its end round the cable only, and let each end of the nipper be held on. The advantages of this method are, that, as the ſtrain of the cable lies forward, and that of the viol aft, the nipper will be drawn ſo tight as effectually to hold the cable till ſomething give way. Beſides, they can never jamb, for both ends are clear for taking off.

Ships without a jeer capſtan heave in their cables by the meſſenger, which has an eye ſpliced in each end; one of which ends is paſſed with three or four turns round the capſtan on the upper deck, and the other end is paſſed forward round the rollers, at the forepart of the manger; then brought aft to the other end, and laſhed thus: ſeveral turns are paſſed through the eyes, croſſing each other in the middle, then a half hitch is taken round the parts, and the ends ſtopped with ſpun-yarn. What remains of the operation is performed as by the viol, excepting that the meſſenger is applied to the outſide of the cable, and when the nippers are inſufficient, the meſſenger may be hitched by faſtening its bight round the cable at the manger with a rolling hitch, and fiſhing the bight round the cable before the hitch.

When the ſtarboard anchor has been gotten up, and the cable of the ſecond anchor enters the larboard hawſe-hole, the operation of getting up this anchor is the ſame, obſerving only, that the meſſenger muſt be ſhifted, and the turns on the capſtan reverſed; and the men, who before held on the larboard ſide in the firſt operation, will hold on the ſtarboard ſide now; the motion of the capſtan is performed the contrary way, and the cable on the larboard ſide is fixed and hove in.

Moſt merchant ſhips and ſmall veſſels heave up their anchors by a windlaſs, round which are taken three turns of the cable, and held on by hand, or by a jigger, thus: the end of the rope which has the ſheave is paſſed round the cable, with a round turn, cloſe to the windlaſs, the leading part of the rope coming over the ſheave, and ſtretched aft, by means of the fall paſſing through the jigger block; the ſtanding part of the fall is made faſt round a ſtantion, at the fore part of the quarter-deck, and the leading part is bowſed upon, which jambs the turns taken round the cable; when the jigger arrives a-breaſt of the hitchway, it conſtantly removes forward, and the cable is jambed by a hand-ſpeck at the windlaſs, until the jigger is reſixed.

The anchor is weighed with the long boat, by taking the boat to the buoy of the anchor, and putting the buoy rope over the davit of the long boat, and a tackle on the buoy rope; by which, with the aſſiſtance of men on the fall, the anchor is weighed out of the ground. When this is done, the cable is hove in on-board; the buoy rope and tackle being ſecured in the boat, they approach the ſhip as the cable is hove in, and the anchor catted and ſtowed. Small anchors and grapnels are got up by the davit, hauling upon the cable or grapnel rope by hand.

An anchor is weighed by under-running, when the cable is placed over the davit-head, and it is under-run, till it is nearly a-peek, when it is tripped by means of tackles, as in the former caſe by the buoy rope. This method is troubleſome, and is only adopted when the buoy is gone, and a ſhip cannot get near her anchor for want of water. See Elements of Rigging, &c. vol. ii. p. 306, &c.

ANCHOR, *dragging*, is when the anchor gives way, or loſes its hold in the ground by the force of the wind, or ſea, and the veſſel drives from the place.

ANCHOR, *to cat the*, is to hook the cat-block to the ring of the anchor, and haul it up cloſe to the cat-head. See *Stowing of* ANCHORS.

ANCHOR, *clearing the*, ſignifies the getting of the cable off the fluke.

Generally alſo, when they let fall the anchor, they uſe this term, to ſee that neither the buoy rope, nor any other ropes, hang about it.

ANCHOR, *fetching*, or *bringing home the*, denotes the weighing it in the boat, and bringing it aboard the ſhip.

The anchor is ſaid to come home, when the ſhip drives away with the tide or ſea.—This may happen, either becauſe the anchor is too ſmall for the burden of the ſhip, or becauſe the ground is ſoft, and oozy; in ſuch places ſhoeing is uſed.

When a ſhip is compelled to anchor on a lee-ſhore, or in a narrow road where there is deep water, with an apprehenſion that the ground is either too hard or too light for good holding ground, drop the common riding bower, firſt keeping 25 or 30 fathoms of cable on board, and throw over the lead. If by this means, or by the land, it appears that the anchor drags, let fall the beſt bower, and at the ſame time veer out the reſt of the common bower cable, till the beſt bower gives her a check; after which bend a ſufficient rope or hawſer to the common bower, without the hawſe-hole, and paſs it through another hawſe-hole to the windlaſs, making it faſt. Then caſt off the common bower, and paſs the cable end through the hawſe-hole, and take a running clinch with it round the beſt bower cable, and let it go. As ſoon as you think the veſſel has dragged her beſt bower cable far enough to ſtraiten the common cable on the ground, veer out as much of the beſt bower as may be agreeable; when, however violent the weather, the veſſel will never drag them home. A ſmall veſſel, which rides hard in a head ſea, will be powerfully aſſiſted by faſtening an empty butt to the cable, about 10 fathoms from the veſſel; for that will firſt receive the motion of the ſea, and check it before it comes to the veſſel, ſo as to cauſe its riſing up to the ſwell, and effectually aiding it to reſiſt the violence.

Anchor, *to fiſh the*, is to draw up the flukes of it towards the top of the bow, in order to ſtow it, after having been catted.

Anchor, *gimbleting the*. See Gimbleting.

Anchor, *ſhoeing*, denotes putting boards on the flukes, in the form of flukes themſelves, to make it broader than before, uſed when they are obliged to anchor in bad ground to prevent the ſhip from driving. This is what the French mariners call *breder l'ancre*, and the Dutch *t'anker bekleeden*.

In ſome caſes they have been known to tallow the anchors, where the ground being ſoft, the ordinary would not hinder them from coming home. Manwaring ſaw an inſtance of tallowing the anchor in Porto Tareen by Tunis. The reaſon of the advantage is hard to aſſign; he ſuppoſes it to be that the tallow ſinks deeper into the ooze, and finds ſome harder ground at the bottom than the other.

Anchor, *to trip the*, is to looſen it from the ground, either by deſign or accident. See A-trip.

Anchor, *to ſweep an*, is to ſeek at the bottom for one loſt, by means of a rope called a ſweep. This rope has its two ends made faſt to two boats, abreaſt of each other, at a ſmall diſtance aſunder. On the bight of the ſweep is fixed a weight of ſhot, ballaſt, &c. to keep it at the bottom. The two boats row on toward the place where the anchor is ſuppoſed to be, and conſequently draw along the ſweep; which taking the bottom, hooks or entangles itſelf with the object of their ſearch. The boats then row acroſs each other twice, ſo as to take a round turn with the ſweep, which being a hawſer, both parts are brought into the hawſe-hole, and to the capſtan, or if ſmall, to the long boat; and hove in upon as before.

Other terms and words of command relating to the anchors are, the "anchor is a-peek," that is, when heaving up the anchor, the cable is drawn ſo tight as to bring the ſhip directly over it; "the anchor is cock-bill," when the anchor hangs right down from the cat-head, by the ſhip's ſide, ready to be ſunk at a moment's warning; this word is given by the maſters, when they are ready to bring the ſhip to an anchor; "the anchor is foul," that is, when the cable, by the turning of the ſhip, is hitched, or got about the fluke: which will not only cut the cable aſunder, but hinder the anchor from holding. On this account, when they come to an anchor where there is a tide, they lay out two anchors, by which means on the turning of the tide the ſhip winds up clear of either.

Anchors, *ſtowing of*. In fitting out ſhips, the anchors are brought in craft near the bows, being moſt convenient to the hawſe-holes, through which the cables paſs to be clenched. The bower anchors are firſt catted, which is performed by hooking the hook of the cat-block into the ring of the anchor, and bowſing upon the fall that leads in through a ſnatch-block on the fore caſtle; the cat-falls being previouſly reeved through the ſheaves of the cat-head and cat-block, keeping the hook of the cat-block downwards, and its point inwards. They are then fiſhed, by means of the half-davit, pendant, and tackle, thus: the davit is firſt ſtopped in the channel on the ſide wanted, and ſupported by guys; the maſt-head guy goes over the end of the davit, with an eye; the other end faſtens round the fore-maſt head, with a round turn and two half hitches. The fore-maſt guy goes over the end of the davit, the other end faſtens round the cat-head, with two half hitches, and ſecurely ſtopt. The after guy goes over the end of the davit, and makes faſt with two half-hitches through an eye-bolt in the after part of the fore channel. At the outer end of the davit is hung, by its ſtrap, a large ſingle block, through which is reeved the pendent, with a large iron hook ſpliced in the lower end, to hook the anchor within the flukes; then to the inner end of the pendent is made faſt a tackle, by thruſting a toggle through an eye in the block-ſtrap; after that has paſſed through an eye in the pendent, the other block of the tackle is hooked in an eye-bolt in the fore part of the quarter-deck; the effect of the tackle is communicated to the hook, by means of the pendent, by men's bowſing on the tackle fall. Thus, the flukes of the anchor are raiſed and placed on the gun-wale, where it is made faſt by the ſhank-painter chain. That the flukes may lie level, the ſtock is bowſed upon by the anchor-ſtock tackle, the double block of which is hooked to a ſelvage, faſtened round the ſtock of the anchor under the firſt hoop, and connected by its fall to a ſingle block, hooked to a ſelvage faſtened round the laniard of the main ſtay: the fall leads in upon the forecaſtle. The beſt bower is then placed forward near the bows on the ſtarboard ſide; the ſmall bower near the bows on the larboard ſide, a little abaft their reſpective cat-heads; and are ſecured by their ſtoppers, from the cat-heads and ſhank-painters. The ſtopper has one end clinched round the cat-head; the other end paſſes through the ring of the anchor, returns upwards, and leads over a large thumb cleat bolted to the cat-head, and is made faſt with ſeveral turns, and the end hitched round the head-rail and timber head, on the fore-ſide of the cat-head. The ſhank-painter hangs the ſhank and fluke of the anchor to the ſhip's ſide out-board; and when ſtowed, the ſhank-painter is paſſed under the inner fluke round the ſhank of the anchor, and made faſt with two or three turns, and the end ſtopt round timber-heads on the forecaſtle. With theſe two bower anchors ſhips are generally moored, when lying in a tide's way, or in a fleet.

The ſheet and ſpare anchors are hoiſted by runners and tackles, main-ſtay, and yard tackles, and are ſtowed ſecurely with ſtock and bill laſhings at the after part of the fore-ſhrouds, before the cheſs-trees on each ſide of the ſhip, with one of the arms reſting on a chock, bolted to the gun-wale; the ſtock being bowſed-to by the anchor-ſtock tackle. The ſheet-anchor is ſtowed on the larboard ſide, and is the firſt reſource in a gale of wind, after parting with either of the bowers; for which reaſon, when in port, the ſheet cable is kept bent, and the anchor is over the ſide, ſuſpended by the ſtopper and ſhank-painter, ready for cutting away in caſe of neceſſity. The ſpare anchor is ſtowed on the ſtarboard ſide, and is ſeldom uſed, but when one of the others is loſt.

The ſtream anchor is ſtowed on the ſpare anchor; and, when uſed, it is ſent in the long boat, or launch, with its cable bent, and let go at any particular ſpot, either for ſteadying the ſhip, when riding by only one bower, or to aſſiſt a ſhip when in-ſhore, or to warp her, &c.

The kedge is ſtowed on the ſtream and ſpare anchors, and is frequently uſed to ſtop a ſhip for a tide, in little winds; but, if the wind be too powerful for the kedge, the ſtream anchor is ſubſtituted. The kedge is ſometimes uſed in moderate weather to warp the ſhip, ſo as to ſhift her birth. Elem. of Rigging, &c. p. 287, &c.

Anchor, in *Architecture* and *Sculpture*, denotes an ornament in form of an anchor, or arrow's head; frequently carved on the ovolo of the capital, in the Tuſcan and Ionic orders, as well as in the bed-moulding of Ionic and Corinthian corniches.

The anchors are uſually intermixed with repreſentations of eggs; whence the *echinus* or ovolo itſelf is popularly called *eggs* and *anchors*.

Anchor, *anchora*, in *Literary Matters*, the figure of an

anchor, repreſented in ancient books; which is of two kinds, *ſuperior* and *inferior*. The *ſuperior*, &c. is where the crooked part is uppermoſt, uſed to denote a thing or paſſage ſtrongly expreſſed. The *inferior* is where the crooked part is at the bottom, to denote a thing poorly or meanly ſet forth.

ANCHOR is alſo uſed, in a leſs proper ſenſe, for any thing that holds another thing faſt, to prevent its driving.

In this ſenſe ſea-muſcles are ſaid to *ride at anchor*, by a ſort of threads the thickneſs of a large hair, which they emit out of their body, to the number ſometimes of a hundred and fifty, which faſtening to the ſtones and other adjacent bodies, keep them firm in their place. The ſame is done by the PINNA *marina*.

ANCHOR, in *Heraldry*, is the emblem of Hope; and is taken for ſuch in a *ſpiritual*, as well as in a *temporal* ſenſe.

ANCHOR, a meaſure. See ANKER.

ANCHOR *Iſland*, in *Geography*, an iſland in Duſky Bay, in New Zealand, viſited by Captain Cook in 1773, and by Captain Vancouver in 1791. The harbour was particularly ſurveyed by the latter navigator, who obſerves, that it appeared to be perfectly ſecure, and may be found convenient, when accidents prevent veſſels from getting into Facile harbour. It has two entrances; that to the north of the Petrel Iſlands is a fair, clear, and very deep channel; its general ſoundings were from 33 to 38 fathoms; in the narroweſt part it is about a cable's length wide, and free from danger; as the ſhores are ſteep, without any ſunken rocks or ſhoals, excepting within the paſſage cloſe under the ſouth ſide of large Petrel Iſland, where they are diſcoverable by the weeds growing upon them, and are quite out of the way of its navigation. The other paſſage is to the ſouthward of the Petrel Iſlands; and if a ſtrong northerly wind compels any perſon to make choice of this in preference to Facile harbour, the ſouth-weſt point of large Petrel Iſland ſhould be kept cloſe on board, in order to weather the rock that appears above water in the middle of the harbour, and to avoid a ſunken one, which does not appear, and over which there is no greater depth than 12 feet at low water. Anchor Iſland harbour, though a very ſecure port, is not very convenient to get to ſea from, on account of its narrow limits, great depth of water, and the above mentioned ſunken rock in its weſtern entrance. The mountains of Anchor Iſland, and others round the bay, which, on Vancouver's arrival in November, were perfectly free from ſnow, were, after a ſtorm which they experienced, covered with it. In a few days the greater part of it diſappeared; and it is probable that ſuch falls of ſnow are not frequent, as they do not check the luxuriance of vegetation. S. lat. 45° 45′ 36″. E. long. 166° 16′. E. variation, 15°. Vancouver's Voyage, vol. i. p. 68.

ANCHORA, in *Entomology*, a ſpecies of CIMEX, diſcovered by Profeſſor Thunberg in Japan. It is of a roundiſh form with ſix black ſpots on the thorax and wing-caſes, and a white anchor-ſhaped mark on the ſcutellum. Gmelin.

ANCHORA, in *Ancient Geography*, a ſmall iſland of Peloponneſus, which the ancients called Aſine, and ſometimes Fanaromini. It was ſituated near the gulf of Modon, or of Coron. It is mentioned both by Strabo and Ptolemy.

ANCHORAGE, in *Sea Language*, ground fit to hold a ſhip's anchor, ſo that ſhe may ride ſafely. The beſt ground for a ſhip to anchor in is ſtiff clay, or hard ſand; and the beſt riding at anchor is when a ſhip is land-locked, and out of the tide.

ANCHORAGE, in *Law*, denotes a duty taken of ſhips for the uſe of the haven where they caſt anchor. The ground in all ports and havens being the king's, no man can let an anchor fall in any port without paying for it to the king's officers.

ANCHORAGO, in *Entomology*, a ſpecies of the Fabrician genus BRENTUS, found in India. It is linear, wing-caſes ſtriated with yellow, and thorax elongated. Fabricius. This inſect is deſcribed by Linnæus as a ſpecies of CURCULIO, under the ſame ſpecific name as Fabricius has adopted: his deſcription is, beak long, thighs dentated, wing caſes ſtriated with yellow, and thorax elongated. Gmelin has removed this ſpecies from the CURCULIO to the BRENTUS genus in the laſt edition of the Syſtema Naturæ.

ANCHORAGO is likewiſe a ſpecies of CIMEX that inhabits North America; the general colour is blue, apex and baſe of the ſcutellum yelloviſh, margin of the abdomen yellow with black ſpots. Fabricius and Gmelin.

ANCHORED, ANKERED, in *Heraldry*. See ANCRÉE.

ANCHOVY, in *Ichthyology*, a little ſea-fiſh much uſed by way of ſauce or ſeaſoning; it is the Clupea maxilla ſuperiore longiore of Artedi, and CLUPEA ENCRASICOLUS of Linnæus. See ENCRASICOLUS.

The word anchovy is derived from the Spaniſh *anchova*, or rather from the Italian *anchioe*, which ſignifies the ſame.

The anchovy is caught in the months of May, June, and July, on the coaſts of Catalonia, Provence, &c. at which ſeaſon it conſtantly repairs up the ſtraits of Gibraltar into the Mediterranean, where they are taken in large quantities. The great fiſhery is at Gorgona, a ſmall iſle weſt of Leghorn. Collins ſays, they are alſo found in plenty on the weſtern coaſts of England and Wales. Near a century ago the anchovy was found at the mouth of the river Dee, by Mr. Ray; but ſince that time it has been found very rarely and only by Mr. Pennant, in 1769, on our coaſts.

The fiſhing for them is chiefly in the night-time; when a light being put on the ſtern of their little fiſhing-veſſels, the anchovies flock round, and are caught in the nets. But then it is aſſerted to have been found by experience, that anchovies taken thus by fire, are neither ſo good, ſo firm, nor ſo proper for keeping, as thoſe which are taken without fire.

When the fiſhery is over, they cut off the heads, take out their gall and guts, and then lay them in barrels, and ſalt them. The common way of eating anchovies is with oil, vinegar, &c. in order to which they are firſt boned, and the tails, fins, &c. ſlipped off. Being put on the fire, they diſſolve almoſt in any liquor; or they are made into ſauce by mincing them with pepper, &c.

Some alſo pickle anchovies in ſmall delf, or earthen pots, made on purpoſe, of two or three pounds weight, more or leſs, which they cover with plaſter, to keep them the better. Anchovies ſhould be choſen ſmall, freſh pickled, white on the outſide, and red within. They muſt have a round back; for thoſe which are flat or large are often nothing but ſardines. Beſides theſe qualities, the pickle, on opening the pots or barrels, muſt be of a good taſte, and not have loſt its flavour.

ANCHOVY *pear*, in *Botany*. See GRIAS.

ANCHUSA, "Αγχουσα, παρὰ τὸ ἄγχειν, *from its ſuppoſed conſtringent quality, or, as others ſay, becauſe it ſtrangles ſerpents*, in *Botany*, bugloſſum of Tournefort and Gærtner, a genus of the *pentandria monogynia* claſs and order; of the natural order of *aſperifoliæ*, and *borragineæ* of Juſſieu: its characters are, that the *calyx* is a perianthium five-parted, oblong, round, acute, and permanent; the *corolla* is monopetalous and funnel ſhaped, tube cylindrical, of the length of the calyx, limb ſemiquinquefid, from erect expanding and obtuſe; throat cloſed with five ſmall ſcales; convex, prominent, oblong, and converging; the ſtamina have very ſhort filaments, in the throat of the corolla, anthers oblong, incumbent,

incumbent, and covered; the *piſtillum* has four germs, ſtyle filiform, of the length of the ſtamina, ſtigma obtuſe and emarginate; no *pericarpium*, but the calyx, enlarged and erect, contains the ſeeds in its boſom; the *ſeeds* are four, oblongiſh, obtuſe, and gibboſe. Martyn enumerates ten, and Gmelin ſixteen ſpecies. 1. A. *officinalis*, bugloſa, bugloſſa italica, b. longifolia, b. vulgaris, echium italicum ſpinoſum, officinal, or common alkanet or bugloſs, with leaves lanceolate, ſecond ſpikes imbricate, and ovate bractes. This ſpecies is a perennial, and flowers in June and July. The ſtem is about two feet in height, erect angular, folioſe, ſomewhat branched and panicled, the root is fuſiform, and externally black; the herb is hairy and rough; the leaves are lanceolate, acute, and ſlightly decurrent; the upper ones, ſubovate at the baſe; the racemes are moſtly double, and revolute; the bractes ovate, and not as in the A. anguſtifolia, linear-lanceolate; the flowers purple and funnel-ſhaped. It grows wild in Italy, Spain, France, Germany, Sweden, Denmark and Siberia, by road ſides and in corn fields. It is found alſo with us amidſt rubbiſh or in marſhes; as on the links near Hartley Pans, in Northumberland. Miller cultivated it in 1748. When it is tender in the Spring, it is boiled and eaten in Upland. The tube of the corolla is melliferous, and the bees are very fond of it. This is not the anchuſa, but the bugloſs of officinal writers; but it does not appear that our bugloſs poſſeſſes the ſame properties with that of the ancients; for it has no claim to the title of euphroſynum given to theirs (ſee Pliny. Hiſt. Med. lib. 25. c. 8.), as it has no exhilarating quality, although its flowers have been long referred to the claſs of the four cordials. This plant, ſays Dr. Lewis (Mat. Med. p. 167.) appears to be nearly ſimilar to borage, in its medicinal qualities as well as in its external form. The principal difference ſeems to conſiſt in the leaves being ſomewhat leſs juicy, and the roots more mucilaginous. The roots, leaves, and flowers are ranked among the articles of the materia medica, but they are very ſeldom uſed. In China this plant is ſaid to be much eſteemed for gently promoting the eruption in the ſmall pox. 2. A. *anguſtifolia*, borago of Zan. hiſt. bugloſſum anguſtifolium of Allion. and Mor. bugloſſum foliis linguiformibus aſperis, &c. of Haller, echii facies bugloſſum of Lob.; narrow-leaved alkanet, with racemes almoſt naked in pairs. Haller thinks that this is not a diſtinct ſpecies from the firſt. In gardens it grows to the height of two feet, but in its wild ſtate does not attain more than a foot. The leaves are narrow, and not ſo hairy as the firſt; the ſpikes of flowers are double, and have no leaves; the flowers are ſmall, and of a red colour; the roots will continue three or four years in poor land. It is found wild in Italy, Germany, and Swiſſerland: flowers in July and Auguſt by way ſides, and in the borders of ploughed lands; cultivated here by Miller in 1759. Boerhaave recommended the juice in the pleuriſy and maniacal caſes. 3. A. *italica*, bugloſſum of Haller, Ray, and Bauhin, Italian alkanet, with leaves lucid and ſtrigoſe, racemes two-parted, two-leaved, flowers ſomewhat unequal, bearded at the throat. This differs from the firſt ſpecies in ſize, in that the flowers are equal and funnel-ſhaped; whereas in this they are ſalver-ſhaped; they are much more imbricate in that, the ſegments of the calyx being broader and ſhorter; thoſe of the corolla ovate; with the ſcales of the throat only ſlightly tomentoſe. 4. A. *undulata*, waved A. ſtrigoſe, leaves linear toothed, pedicels leſs than the bracte, fruit-bearing calyxes inflated. This plant is three feet high, with many ſtrong lateral branches, produced from the main ſtem near the ground; the leaves are ſtiff, rough, ſix or ſeven inches long, and about half an inch round at the top, cloſely embracing the branches at the baſe, and two inches broad, indented and waved on their edges, the upper ſurface beſet with hairs, and rough to the touch: ſpikes of flowers axillary, a foot or more in length, reflex: corollas fine blue; the root decays after the ſeeds are perfected, though ſometimes, in gravel, or the joints of ſtone walls, it will live three or four years; but ſuch plants are ſeldom more than a foot high, and have ſmall narrow leaves, ſo that they appear like a different ſpecies. It is a native of Spain and Portugal, and Gmelin found it in Siberia; cultivated in 1739 by Mr. Miller. 5. A. *tinctoria*, bugloſſum tinctorium of Allion. Dyer's A. downy, leaves lanceolate, obtuſe, and ſtamens ſhorter than the corollas. This ſpecies is perennial, and reſembles the firſt in its leaves and branches, only that they are more woolly; the root is red. It much reſembles the ſeventh ſpecies, and is entirely covered with a white down. It grows about Montpellier in France, in Sileſia, Spain, and Italy; and was cultivated here in 1683 by Mr. James Sutherland. The roots of this plant, when in perfection, are externally of a deep purpliſh red colour. The red cortical part, ſeparated from the whitiſh woody pith, imparts a fine deep red to oils, wax, and all unctuous ſubſtances and alſo to rectified ſpirit of wine; but to water it gives only a dull browniſh hue. The ſpirituous tincture, when inſpiſſated to the conſiſtence of an extract, changes its fine red to a dark brown. The root has little or no ſmell, and ſcarcely any taſte; extracts made from it, by water and by ſpirit, are bitteriſh and roughiſh, but in too low a degree to be regarded as medicines, though they were formerly in repute as aperient, for diſſolving coagulated blood, reſtraining diarrhœas, and drying inveterate ulcers. Its chief uſe at preſent is for colouring oils, plaſters, lip-ſalves, &c. which receive a fine deep red from one-fortieth their weight of the root. For this purpoſe the conſiſtent unctuous materials are to be liquefied in the heat of a water-bath, the powdered anchuſa added, the mixture ſtirred now and then till ſufficiently coloured, and then ſtrained through a linen cloth. The roots of bugloſs boiled in a decoction of Braſil wood are ſometimes ſubſtituted for thoſe of alkanet; but theſe will not dye oils red. Lewis and Murray. 6. A. *virginica*, lithoſpermum virginianum of Morriſon and Ray, virginian A. with flowers ſcattered, and ſtem ſmooth. This is perennial, and a native of North America, where it grows in the woods, covering the earth with bright yellow flowers, and known by the name of *puccoon*. 7. C. *lanata*, woolly A. with villoſe leaves, ſhaggy calyxes, and ſtamens longer than the corollas. This ſpecies was found by Brander near Algiers, and is very like the fifth. 8. A. *ſempervirens*, bugloſſum latifolium ſempervirens of Dillon in Ray's Synop. borago ſempervirens of Gerard, evergreen A. with ovate leaves, and axillary two-leaved and capitated peduncles. The root is thick, and externally black; the herb ſtem evergreen and hiſpid; the ſtems angulate round, and folioſe; the leaves alternate and ovate; the peduncles axillary, ſolitary, capitated, and two-leaved at the apex; the limb of the corolla blue, rather ſalver-ſhaped than funnel-ſhaped, ſegments rounded, tube at the baſe four-cornered; the germs imbedded in a hollow glandular receptacle; ſeeds one or two, generally abortive, rough, and very hard. In habit and character this plant approaches to myoſotis. It is found wild in Spain and Italy. With us it has been found by road-ſides, among rubbiſh, and in the joints of old walls, in ſeveral places about Norwich, at Haddiſcoe in Suffolk, near Birmingham, Worceſter, and Sidmouth, near Rocheſter and London, and in the ruins of Maes Glas monaſtery in Flintſhire. It is perennial, and flowers in May and June. Withering's Bot. Arr. vol. ii. p. 227. Smith's Flor. Brit. vol. i. p. 215. 9. A. *barrelieri*, bugloſſum barrelium of Allion.

bugloſſum ſylveſtre minus, &c. of Barr. with leaves ovate, lanceolate, erect ſtem, racemed peduncles, pointing one way. This ſpecies was found in Piedmont by Bellardi. 10. A. *paniculata*, panicled A. or bugloſs, with leaves lanceolate, ſtrigoſe, quite entire, panicle dichotomous and divaricate, flowers peduncled, calyxes five-parted, with ſubulate ſegments. It is biennial; flowers in May and June; a native of Madeira, where it was found by Mr. F. Maſſon, and introduced into Kew Garden in 1777. 11. A. *tuberculata* of Forſkahl, referred to this genus by Gmelin, with tuberculated nuts. This, ſays Mr. Dryander (Linn. Tranſ. vol. ii. p. 222.) is LITHOSPERMUM *orientale* of Gmelin. 12. A. *echinocarpos* of Forſk. with muricated nuts, and ſingle anther covered at the top. 13. A. *flava*, of Forſk. with rugoſe nuts, procumbent ſtems, and axillary, decurrent peduncles. This, ſays Mr. Dryander (*ubi ſupra*), is the ASPERUGO *Ægyptiaca* of Gmelin's Linnæus. 14. A. *hiſpida* of Forſk. with ſmooth nuts, ſhort axillary peduncles, ſtem hiſpid, and the lower leaves petiolate. 15. A. *ſaxatilis*, with leaves oblong, linear, on both ſides hairy, the floral leaves lanceolate, with flowers ſcattered, axillary and ſubſeſſile. 16. A. *amæna*, with undulated leaves and triquetrous nuts.

Culture. All the ten preceding ſpecies of anchuſa, enumerated by Martyn, may be eaſily propagated by ſeeds, ſown in the Autumn, upon a bed of light ſandy earth; and in the Spring, when the plants are ſtrong enough to be removed, they ſhould be planted in beds, at the diſtance of two feet, and, in a dry ſeaſon, watered till they have taken root; and afterwards they will only need to be kept clear from weeds. If the ſeeds of the common ſorts be allowed to ſcatter, the plants will riſe in plenty. Gmelin's Linnæus. Martyn's Miller.

ANCHUSA. See BARLERIA, BORAGO, LITHOSPERMUM, MYOSOTIS, ONOSMA, and PULMONARIA.

ANCHYLE, or ANCYLE, in *Surgery*. See ANCHYLOSIS.

ANCHYLOBLEPHARON. See ANCYLOBLEPHARON.

ANCHYLOPS. See ANCHILOPS.

ANCHYLOSIS, in *Surgery*, (from αγκυλοω, *curvo*) *Anchyle*, *Ancyle*, *Ankyloſe*, *Acineſia*, immobility of the joints. This term is uſed when any joint of the body becomes, whether from external or internal cauſes, ſtiff and inflexible. It is divided into the *true* and the *ſpurious* anchyloſis. By the true ancholyſis is underſtood that diſeaſe, in which the bones of the joints form ſuch a ſynoſtoſis with each other, that they appear to conſiſt of a ſingle piece. In the ſpurious anchyloſis, the motion between two bones at the joint is in ſome degree, though not entirely, loſt.

The mobility of a joint may be more or leſs interrupted by various cauſes, amongſt which are different diſeaſes of the bones, particularly a tumefaction of their extremities, caries, fracture, near to or within the joint, diſlocation, twiſting, and cruſhing of the bone; as well as ſeveral kinds of tumors, ſuch as fleſhy excreſcences, aneuriſms, hydropical accumulations, &c. The muſcles may alſo give riſe to the ſtiffneſs of a joint, when the flexors contract ſo ſtrongly that the extenſor muſcles loſe their force, in which caſe a CONTRACTION, as it is termed, is produced. This generally ariſes from internal cauſes; ſometimes, however, from external, or diſeaſes that have attacked the joints, in which caſes the ligaments and other ſurrounding parts of the joints are likewiſe affected. To the internal cauſes belong the ſwelling of the bones, the rickets, a metaſtatical depoſition of corrupted fluids in the joint, a deficiency of the ſynovia or mucus which lubricates the joints, a continued pain, under which the patient finds relief from a certain poſition of the limb, in which he conſequently keeps it for a long time, the colica ſaturnina, gout, chronic rheumatiſm, and paralyſis. Some indeed have aſſigned, as cauſes of impeded motion in joints, the inſpiſſation and accumulation of the mucus which lubricates their cavities; but even though we ſhould admit that this ſynovial mucus might become preternaturally thick by the limb being left too long without motion, it cannot, however, be proved that its inſpiſſation may increaſe to ſuch a degree, as entirely to prevent the motion of the joint, as even the thickeſt mucus is ſtill able to lubricate ſmooth ſurfaces, and facilitate their motion upon each other. On the contrary, a too long continued and violent exertion and motion of the body, as well as long continued repoſe, may deprive the fibres of their natural flexibility, as in both caſes more earthy particles are depoſited, and the fibres themſelves rendered more denſe, in conſequence of which the ligaments alſo reſiſt the extenſion and flexion of the joint.

The true anchyloſis may eaſily be known by the impoſſibility of moving the bones in their joints, by the inſurmountable difficulty which oppoſes their flexion or extenſion; but we may alſo with equal eaſe diſcover the falſe anchyloſis by both ſeeing and feeling that the part ſtill retains ſome power of motion at the joint. The prognoſis depends upon the knowledge of the true cauſe of the diſeaſe, according to which the cure is either perfect or imperfect. By the imperfect cure we can only alleviate the inconveniences of the true anchyl. namely, the incurable ſynoſtoſis of the bones; ſo that the perfect cure can only be ſucceſsfully accompliſhed in the ſpurious anchyloſis.

In general the method of cure is to be determined according to the different cauſes which have given riſe to the incurvation and impeded motion of the joint. When the proximate cauſe conſiſts in a contraction, we muſt endeavour to diſcover and remove the cauſe by which the contraction has been produced, and afterwards aſſiſt the cure by means of external applications; for frequently, even though the internal cauſes may have been removed, the contraction of the muſcles ſtill remains. The contraction may be diſcovered by the tendons of the muſcles, which keep the limb bent or extended, being very much ſtretched. Moreover, all that has been ſaid concerning the internal cauſes and diſeaſes, with a view to the cure of the immobility of the joints, applies alſo to the external cauſes and diſeaſes; ſuch as white ſwellings, ſuppuration of the joint, preternatural excreſcences in the joints, caries, dryneſs of the joints, burns, cicatrization, &c.

When now the internal or external cauſes have been removed, the ſurgeon muſt apply the proper remedies for reſtoring the motion of the joint itſelf. Theſe remedies conſiſt in endeavouring to ſoften the muſcles, tendons, adipoſe membrane and ligaments, afterwards ſlowly and gradually to extend them, and progreſſive efforts to move them to reſtore them by degrees to their former condition; for which, however, a long ſpace of time is generally required.

In an anchyloſis ariſing from a fracture of the bones of the joint, beſides preſcribing a light diet, we ſhould rub the diſeaſed parts about the joint with flannel, in order to attenuate the fluids, and increaſe the effect of the remedies peculiarly adapted for the cure of the diſeaſe. For, in order to reſtore the mobility, it is particularly neceſſary that the muſcles, ligaments, ſkin, and cellular texture ſhould be ſoftened and relaxed by emollient remedies, which ought to be employed very liberally, and perſiſted in for a great length of time. Contracted muſcles ſhould be rubbed, throughout their whole extent, with emollient applications, for the ſpace of half an hour or more at a time, and three times every day.

The limb itſelf ſhould conſtantly be kept moiſtened with the ſame applications, by wrapping it, every time after it has been rubbed, in flannel dipped in the emollient fluid.

Whilſt we are applying the frictions, we ſhould endeavour to extend the limb as much as the patient can bear, ſlowly, but with perſeverance.

When the contraction is ſituated in the knee-joint, we may make uſe of a machine, with the view of preventing the ſhortening of the muſcles. The extenſion ſhould by no means be performed too quickly, as pain and inflammation might eaſily be the conſequence. Mr. B. Bell, in his Syſtem of Surgery, has recommended a uſeful machine for this purpoſe; Mr. Koehler (Anleitungzum Verband, &c. Leipzig, 1796, 8. p. 168.) recommends a bench; and Mr. Trampel (Arnemaun's Magazin fuer die Wundarzneiwiſſonschaft. B. i. St. 1. p. 23. fig. 1.) a machine ſimilar to that of Mr. Koehler.

Amongſt the emollient remedies adapted for the cure of this diſeaſe are particularly to be enumerated all ſorts of animal oils, ſuch as the fat of ducks, geeſe, and hogs; the ſteam of warm water, warm baths; freſh expreſſed oils, the Ungt. althæ. Some recommend alſo an ointment made of the dripping of hares, turpentine, and oleum ovi; alſo baths and embrocations mixed with brandy; and finally, the vapour bath. When the ſubſtance of the fibres has become too denſe, repeated embrocations, with a warm ſolution of ſal ammoniac in water, are particularly uſeful. When theſe remedies are not found adequate to the removal of the ſtiffneſs, we may employ more powerful ones, ſuch as embrocations with the brine of herrings with vinegar, vitriol, and alum; alſo with a ſolution of the balſam. vitæ extern. the empl. de galbano & de ammoniaco; eſpecially the gumm. ammoniac. boiled in wine vinegar to the conſiſtence of a plaſter, ſpread thick upon leather, and applied to the diſeaſed part.

Previouſly to every uſe of the vapour-bath, we may rub the part with a ſolution of Venice ſoap, or alſo with ol. majoranæ, ol. tartari. fœtid. or ſome other ſimilar oil. In proportion to the effects which it produces on the patient, the vapour bath may be applied for the ſpace of half an hour or an hour, twice or thrice a day, or only every other day. The fluid employed for forming the vapour bath may contain, diſſolved in it, ſal ammoniac, balſamum vitæ externum, &c. In the intervals, the embrocations are to be applied. Fumigations, with volatile ſubſtances, have alſo been employed with great advantage.

Where the ſtiffneſs of the joint owes its origin to a diſlocation that has been reduced, and where the ſoft parts have been bruiſed, repeated blood-letting, with emollient and diſcutient poultices ſhould be uſed, till the tumor and ſwelling have diſappeared, after which the parts may gradually be moved. But when the diſlocation has not been reduced we muſt attend to the tumor, hardneſs, and inflammation, which are to be treated with general remedies. Where theſe obſtacles do not ſtand in our way, we may let blood, and attempt the reduction, provided the diſorder is not of too long ſtanding.

When ſymptoms of a deficiency of the ſynovia are obſerved, or the blood is inadequate to its ſecretion in the glands of the joints; we muſt not only put our patient upon a proper regimen, but alſo employ general remedies adapted to the complaint; ſuch as gentle evacuants, moderate frictions to the diſeaſed part, baths with decoctions of emollient herbs, or alſo emollient poultices, to which we may add a quantity of black ſoap. When, on the contrary, there is too great an abundance of ſynovia, particularly when the diſeaſed parts are affected with pain and ſwelling, we muſt let blood, and before uſing diſcutient poultices or baths, rub the diſeaſed parts with warm flannel, and, at the ſame time, gently move the joint. But ſhould this not be ſufficient, we may mix ſtimulating herbs with the poultices, and add to the baths a quantity of lime-water, kitchen-ſalt, or ſal ammoniac.

Diſtortion of the limbs is ſometimes a congenital diſeaſe, which moſt frequently occurs in the foot. See Vari & Valgi.

ANCI, in Greek γαλαξιαι, *weaſel-elbowed*, from γαλη, a *weaſel*, and αγκων, *an elbow*, a name given by Hippocrates to thoſe who, from ſlipping the head of the *os humeri* into the *ala*, have an arm ſhorter and ſmaller than it ought to be, and the cubit or elbow of a weaſel; whence they are called by ſome *muſtelani*, which fully expreſſes the Greek word, or barely *anci*. The diſorder that gives occaſion for the name, happens either in the womb, where the *os humeri* ſuffers a luxation, from too much moiſture; or in tender years by means of an abſceſs deeply ſeated about the head of the *os humeri*. See Dislocation and Luxation.

ANCIAO, in *Geography*, a ſmall town of Portugal, in Beira, containing one pariſh, and about 1200 inhabitants.

ANCIASMUS, in *Ancient Geography*, a town of Greece in Epirus, which was an epiſcopal ſee. It is thought to be the ſame with the *Onchesmus* of Ptolemy.

ANCIENT, or Antient, in its uſual ſenſe, denotes a thing which exiſted in times long ago; and thus it is oppoſed to *modern*.

We ſay ancient nations, ancient architecture, ſculpture, philoſophy, &c. ancient manners, ceremonies, poets, phyſicians, and the like.

Ancients, in *Church Diſcipline*. See Elders.

Ancients, in *Inns of Court*, imports a diſtinction of a certain degree. Thus, the ſociety of Gray's Inn conſiſts of benchers, ancients, barriſters, and ſtudents under the bar: here the ancients are the elder barriſters.

In the inns of chancery there are only ancients, and ſtudents, or clerks; and among the ancients one is yearly the principal, or treaſurer. In the Middle Temple ancients are ſuch as have gone through, or are paſt their reading.

Ancient is ſometimes alſo uſed, in a *military ſenſe*, for the colours, or an ensign.

Ancient, or Anshent, in the *Naval armament*, a ſmall flag or ſtreamer ſet upon the ſtern of a ſhip, or on a tent, ſimilar to the guidon uſed at funerals, which was called an anſhent.

Ancient *demeſne or domain*, in *Law*, is a tenure, whereby all manors belonging to the crown in William the Conqueror's and St. Edward's time were held.

The number of names of all manors, after a ſurvey made of them, were entered in a book called "Domeſday Book," yet remaining in the Exchequer; ſo that ſuch lands as by that book appeared to have belonged to the crown at that time, and are contained under the title "terra regis," are called ancient demeſne. The tenants in ancient demeſne are of two ſorts; one who hold their lands freely by charter; the other by copy of court-roll, or by the verge, at the will of the lord, according to the cuſtom of the manor. The advantages of this tenure are, 1. That tenants holding by charter cannot be rightfully impleaded out of their manor; and when they are, they may abate the writ by pleading the tenure. 2. They are free from toll for all things relating to their livelihood and huſbandry; nor can be impannelled on any inqueſt. Theſe tenants held originally by ploughing the king's lands, plaſhing his hedges, and the like ſervice, for the maintenance of his houſehold; and it was on this account that ſuch liberties were given them, for which they may

may have writs of *monſtraverunt* to ſuch as take the duties of toll, &c. No lands are to be accounted ancient demeſne, but ſuch as are held in ſocage. Whether land be ancient demeſne or not, ſhall be tried by the Book of Domesday.

Ancient *differences*, in *Heraldry*. See Bordures.

ANCIENTY, in ſome *Ancient Statutes*, is uſed for elderſhip or ſeniority. The elder ſiſter can demand no more than her other ſiſters, beſide the chief meſne, by reaſon of her ancienty. This word is uſed in the ſtatute of Ireland, 14 Hen. III.

ANCIGNE, in *Geography*, a town of France, in the department of the two Sevres, and chief place of a canton, in the diſtrict of Malle; five leagues and a half ſouth-ſouth-eaſt of Niort.

ANCILLA, in *Entomology*, a ſpecies of Phalæna, of the Bombyx tribe. The wings are brown, with three tranſparent white ſpots on the anterior pair: abdomen yellow, with a black ſtreak. Gmel. This is the ſame inſect as Fabricius deſcribes under the ſpecific name obscura. *ſpec. inſ.* and is likewiſe the Noctua Ancilla of Wien. Schmetterl. It inhabits Germany, according to Gmelin, and feeds on the lichen parictinus; Fabricius notes it in the cabinet of Dr. Allioni as a native of Italy. In ſome ſpecimens the poſterior wings are without ſpots, in others yellow, with a brown margin and curved mark.

This ſpecies muſt not be confounded with the Phalæna Ancilla of Cramer, Pap. t. 149, which is an Indian inſect, and the variety (γ) of the Noctua Fullonica of Gmelin, aud Noctua Dioscoreae of Fabricius.

ANCILLON, David, in *Biography*, a French Proteſtant divine, was born at Metz in 1617. In early life he applied to his ſtudies with ſuch diligence, that it was neceſſary, on ſome occaſions, to reſtrain, what his biographer calls, the exceſs and intemperance of his ſtudious diſpoſition. From the age of 10 years he purſued his courſe of learning at the college of the Jeſuits at Metz; and at this time many attempts were made by the directors of the inſtitution to gain him over to their religion and party; but all their efforts were ineffectual. Having determined to devote his life to the profeſſion of divinity, he removed in 1632 to Geneva; and, during a reſidence of ſeven or eight years in that place, he acquired an extenſive and accurate knowledge of philoſophy and theology. In 1641 he underwent an examination before the Synod of Charenton; and ſo far approved himſelf by the ſpecimens which he exhibited of his talents, learning, and modeſty, that he was appointed to the church of Meaux, which was one of the moſt conſiderable benefices then vacant among the reformed. Here he exerciſed his miniſtry with very great ſatisfaction both to himſelf and to thoſe with whom he was connected for 12 years; and ſuch was his reputation, that he was admired and eſteemed by perſons of all perſuaſions, both Catholic and Proteſtant. His popularity as a preacher recommended him to the attention of a wealthy perſon, who had one daughter, to whom he was affectionately attached, and he was induced by the reſpect which he entertained for him to declare to ſome of his friends, that if Ancillon would come and demand her of him in marriage, he would be happy in admitting him to an alliance in his family. In proceſs of time a negociation commenced, and it terminated in 1649 in an union, which was the ſource of much domeſtic felicity. Four years after his marriage, Ancillon availed himſelf of a vacant benefice in his native city to remove thither. Here he uniformly maintained the ſame character, and purſued his ſtudies with unabating ardour. The fortune he had acquired by marriage enabled him to indulge his favourite propenſity, which was that of the purchaſe of books, ſo that his library became both large and curious; and as it was one of the fineſt private collections in France, it was viſited as an object of curioſity by travellers who paſſed through Metz. Ancillon purchaſed the beſt editions of books, for which he gave theſe good reaſons: that the leſs the eye is fatigued in reading a book, the more is the mind at liberty to judge of it; and that as the beauties and faults of a work are more clearly ſeen in print than in manuſcript, ſo the ſame beauties and faults are more clearly ſeen when it is printed on good paper and in a fair character, than when the paper and type are bad. Ancillon was no leſs induſtrious in the uſe than curious in the choice of his books, and his reading was very various and extenſive; but he diſtinguiſhed between thoſe books which he read for amuſement or for general information, and ſuch others as were uſeful to him in his profeſſion. The former he read but once, curſorily, according to the Latin proverb, "ſicut canis ad Nilum bibens et fugiens," like the dog that drinks at the ſtream as it runs; the latter he read over ſeveral times with attention and care, and omitted no means of impreſſing their contents correctly upon his memory. He marked his books with a pen as he read them, and placed in the margin references to other authors. Ancillon, though he was uncommonly induſtrious in his purſuit of knowledge, did not allow his fondneſs for ſtudy to occaſion a neglect of the duties of his profeſſion; but in order to reconcile the one with the other, he addicted himſelf in too great a degree to a recluſe and ſedentary life; and he could never be prevailed upon more than three or four times to viſit a country-houſe which he had near the city. He ſcarcely ever left his own habitation, unleſs to go to church, or to perform the functions of his office; but he never neglected the ſervices of religion, nor diſregarded the calls of humanity. He diſcharged all the important and uſeful duties of a Chriſtian miniſter without oſtentation, without ambition, and without avarice.

After having enjoyed the ſweets of literary retirement for upwards of 40 years, and occupying the ſtation of miniſter to the Proteſtant church at Metz, with great reputation and uſefulneſs, for 22 years, Ancillon's repoſe was diſturbed by the demon of perſecution. Upon the revocation of the edict of Nantes, in 1685, this excellent perſon was reduced to the neceſſity of abandoning his library, his church, his friends, and his country, and of ſeeking refuge, from the phrenzy of religious bigotry, among ſtrangers. He fled into Germany; and his library, a few books which he had concealed excepted, fell in ſmall parcels, and for very inadequate payments, into the hands of the monks and clergy of Metz, and the adjacent towns. Thus deprived of the fruits of an attention beſtowed on his collection of books for 44 years, and of the pleaſure and benefit which he derived from them, he might well exclaim:

> "Impius hæc tam culta novalia miles habebit,
> Barbaras has ſegetes?" Virg. Eclog. i. v. 71.
>
> "Did we for theſe barbarians plant or ſow?
> On theſe, on theſe our happy fields beſtow?"

In the city of Hanau, Ancillon found an aſylum; and here he had an opportunity of exerciſing his miniſtry, at the requeſt of the French church, with great acceptance, till the jealouſy of the other two miniſters of the church, excited by his popularity, rendered his ſituation extremely uneaſy, and induced him to withdraw from Hanau, and to retire to Frankfort. With a view to the ſettlement of his family, he ſoon afterwards removed to Berlin, where he was favourably received by the elector of Brandenburg, aud obtained the

charge

charge of a French church. In this ſituation he remained, enjoying the comfort of ſeeing his children and other relations well eſtabliſhed, and ſupporting the character, which he had maintained through life, of a learned ſcholar, an excellent miniſter, and in all reſpects a truly worthy man, till death finiſhed his courſe in the year 1692. His literary works are few. In 1657 he publiſhed, at Sedan, in 4to. "A Relation of the Controverſy concerning Traditions, held between the Author and M. Bedacier, a Doctor of the Sorbonne." At Hanau he printed in 1666, "An Apology for Luther, Zuinglius, Calvin, and Beza." He alſo wrote, "The Life of William Farel, or the Idea of a faithful Miniſter of Chriſt," of which only a ſurreptitious copy was printed in Holland. Some of his learned converſations were publiſhed by his ſon in a miſcellany, mentioned in the next article. Gen. Dict.

ANCILLON, CHARLES, an advocate, the ſon of the ſubject of the laſt article, was born at Metz in 1659, and was a learned and zealous defender of the Proteſtant cauſe. After the revocation of the edict of Nantes, he was commiſſioned by the reformed at Metz to ſolicit at court an exemption in their favour; but he only ſucceeded in obtaining a mitigation of the treatment of his perſecuted brethren. At Berlin, whither he removed, he was appointed inſpector of the tribunal of juſtice, inſtituted for the French in Pruſſia, hiſtoriographer to the king, and ſuperintendant of the French ſchool In this city he died in 1715, at the age of 56 years. He wrote, in French, "An Hiſtory of the Eſtabliſhment of the French Refugees in the States of Brandenburg," printed in 8vo. at Berlin, in 1690; "A critical Miſcellany of Literature, collected from the Converſations of his father, Miniſter of Metz," 3 vols. 8vo. 1698; "The Life of Soliman II.," 4to. 1706; "A Treatiſe on Eunuchs," 4to. 1707; "Memoirs of many literary Charaters," 12mo. 1709. Gen. Dict.

ANCINALE, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra; ſeven miles ſouth-ſouth-eaſt of Squillace.

ANCISA, one of the chief places in the Val di Arno in Tuſcany.

ANCISTRUM, from *αγκιστρον*, a *hook*, in *Botany*, a genus of the *diandria monogynia* claſs and order, and of the natural order of *roſaceæ*, Juſſ. Its characters are, that the *calyx* is a perianthium one-leafed, (four-leafed, H. K.) turbinate, truncate, four-toothed, teeth cylindric, awned, erect, terminating in four-reverſed hooks; *corolla* (none, H. K.) ſuperior, one-petalled, funnel-ſhaped with a very ſhort tube, and a ſpreading quadrifid border; the diviſions nearly equal, obtuſe, of the length of the tube; the *ſtamina* have filaments faſtened to the baſe of the tube, longer than the corolla, capillary; anthers roundiſh; the *piſtillum* has an oblong germ, filiform ſtyle of the length of the corolla; ſtigma pencil-ſhaped; *pericarpium* none, but the calyx, in the bottom of which is the fruit (a drupe, dry, hiſpid, one-celled, H. K.), the *ſeed* ſingle and oblong. Martyn reckons three, and Gmelin two ſpecies. 1. A. *decumbens*, (A. anſerinæfolium of Forſt. Gen. A. diandrum of Forſt. fl. Auſtr. A. ſanguiſorbæ of Linn. Suppl.) "with ſtems decumbent, peduncle ſcape-form ſolitary, flowers in a globular head, leaflets wedge-form, deeply ſerrate, hoary beneath, ſeed covered with the thickened calyx." It reſembles burnet in the herb and manner of flowering, and is remarkable for the yellow awns to the calyx, like fox's nails; a native of New Zealand. 2. A. *lucidum*, ſhining A., "with ſtems ſubdemerged, peduncles ſcape-form, ſpikes ovate, and leaflets oblong, quite entire, acute, and ſubfaſcicled." This ſpecies is a native of Falkland Iſlands, and introduced in 1777 by Dr. J. Fothergill. It flowers in May and June. 3. A. *latebroſum*, (agrimonia decumbens of Linn. Suppl.) hairy A. "with ſtems demerged, duncles ſcape-form, ſpikes elongate, leaflets oblong, gaſhed, and villoſe, and fruits armed on every ſide." The calyx cloſes as the ſeed ripens, and thickens into an ovate globoſe, ſuberoſe, white-tomentoſe bark, armed every way with ſhort briſtles, thickening outwardly, and having four reverſed barbed little prickles. The ſeed ſingle, ovate-globoſe, produced at top into a boſs, ſmooth and pale; covered with a thin membranaceous ſkin, and on the outſide of that with a coriaceous, hard, thick, integument, reſembling a ſhell. Martyn's Miller.

ANCIZAN, in *Geography*, a town of France, in the department of the Higher Pyrenees, and chief place of a canton in the diſtrict of La Barthe de Neſte, five leagues ſouth-ſouth-eaſt of Bagneres.

ANCLABRIS, in the *Religion of the ancient Romans*, denoted a table in temples, whereon the prieſts eat their portion of the ſacrifices and oblations.

ANCLACÆ, in *Ancient Geography*, a people placed by Ptolemy in Aſiatic Sarmatia.

ANCLAM, in *Geography*, a town of Germany, in the Circle of Upper Saxony and duchy of Pomerania, ſituate on the river Peene, in a fertile country. On one ſide of it are ſwamps and meadows, with a ſtone-dyke, a quarter of a German mile in length, and on the other deep moats and walls. It has two pariſh churches, has a good trade both by land and water, and has thriven under the Pruſſian government. It is the capital of the circle to which it gives name, and the territory belonging to the town is near three German miles long, and contains 17 villages and two farms. It is eight leagues ſouth of Gripſwald, and 14 north weſt of Stettin. N. lat. 54°. E. long. 14° 9'.

ANCLE. See ANKLE.

ANCLOTE *Point*, in *Geography*, on the peninſula of California, coaſt of the North Pacific Ocean, lies in N. lat. 30°. and W. long. 116°, ſoutherly from the town of Velicета, and north-eaſt from the ſmall iſland of Guadaloupe.

ANCOBARITIS, in *Ancient Geography*, a country of Meſopotamia, known to Ptolemy, and placed by Strabo in Arabia Deſerta.

ANCOBER, ANKOBAR, COBRE, or GOLD RIVER, in *Geography*, a river of Africa, which runs into the Atlantic, between the Gold Coaſt and the country of Axim. At its mouth is a good harbour. N. lat. 4° 48'. W. long. 40'.

ANCOBER, or ANKOBAR, a town and diſtrict of the Gold Coaſt, extending from north to ſouth about 18 or 20 leagues along the river of this name. In this ſmall kingdom there are women who never marry, but devote themſelves, by certain ceremonies of an infamous kind, to public proſtitution.

ANCOCUS *Creek*, in *Geography*, lies in New Jerſey, being a water of the Delaware, ſix miles ſouth-weſt from Burlington. It is navigable 56 miles, and conſiderable quantities of lumber are exported from it.

ANCOE, a ſmall town of South America, three leagues from the city of Guamanga.

ANCON, in *Anatomy*, denotes the curvation or flexure of the arm, whereon we reſt in leaning.

This is otherwiſe called OLECRANUM.

ANCON, in *Architecture*, is uſed to denote the corners or quoins of walls, croſs beams, or rafters.

ANCON is alſo uſed in the *Ancient Architecture*, to denote the two parts or branches of a ſquare, which meet in an angle reſembling the letter L.

ANCON is alſo uſed by Vitruvius, to denote a kind of *menſulæ*, or tables before doors, bent ſomewhat after the manner of *volutes*, ſo as to reſemble the letter S.

In this ſenſe *anconet* amount to the ſame with what the Greeks call προθυρίδες, *prothyrides*.

ANCON is particularly applied in the *Ancient Architecture* to the brackets, or ſhouldering-pieces, called CONSOLES and CORBELS by the moderns.

ANCON was alſo uſed by the Carthaginians, to denote a dark priſon or dungeon. Suidas mentions one of this kind, in which Gelimer uſed to put all who diſpleaſed him; from which Belisarius delivered many merchants of the eaſt, whom the tyrant intended to put to death.

ANCON is alſo applied to the angles or flexures of rivers; ſometimes alſo to the tops of mountains.

ANCON, in *Ancient Geography*, a town of the Leuco-Syrians, in Cappadocia. M. d'Anville places it upon the Euxine Sea, between Amiſus to the weſt, and the Promontorium Heracleum to the north-eaſt.

ANCONA, a town of Italy, in Picenum to the north, ſituate on a ſmall iſthmus, which joins the promontory of Cumerium to the continent. As ἀγκὼν denotes curvature, its name is probably deduced from its ſituation. Some ſay that it was firſt built by the Syracuſans, when they fled from the tyranny of Dionyſius, towards the year 405 before Chriſt. It was famous for the beauty of its dyeing, and the purple of Ancona was only inferior in eſtimation to that of Phœnicia. It became a Roman colony probably after the war of Tarentum, about the year of Rome 485, when the conſul P. Sempronius conquered the Picentines, and extended the frontiers of the Roman poſſeſſions as far as Æſis. The emperor Trajan conſtructed a good port, in commemoration of which a triumphal arch of fine veined marble was erected to him on the mole, which ſtills makes a beautiful appearance. Ancona was ineffectually beſieged by the Goths under Totila, A.D. 551; but it was taken by Ariulf, king of the Lombards, and duke of Spoleto, in 592. In 839 it was taken and pillaged by the Saracens. It is now the capital of a country of the ſame name; a free port, with a convenient harbour, ſecured by a ſtrong mole, on which are generally mounted 8 or 10 guns; and its chief exports are grain, wool, and ſilk. It is the ſee of a biſhop, immediately under the pope. The Jews are very numerous in Ancona; however they live in a particular quarter of the town, and are obliged, by way of diſtinction, to wear a bit of red cloth in their hats. The exchange in Ancona has a beautiful front, and over the entrance an equeſtrian ſtatue; and within it is a lofty ſpacious apartment, in which, among other ſtatues, are thoſe of Faith, Hope, Charity, and Religion. The inhabitants of Ancona, ſays Keyſler (vol. iii. p. 209.), eſpecially the female ſex, ſo far excel thoſe of the other parts of Italy, in ſhape and complexion, that they ſeem to be a different race of mankind. In the ſhallows near Monte Comero, or Conaro, about 10 Italian miles from Ancona, there is a ſingular ſpecies of teſtaceous fiſh, called ballani, or ballari, which are found alive in large ſtones. The ſhell of this fiſh is thin, rough, and of an oblong figure, reſembling a date; and hence they are called Dattili del Mare, or ſea dates. Theſe ballari are laid within the mole, and come to perfection. In fiſhing for them, ſuch ſtones are ſelected as have the ſurface full of little holes, which indicate that theſe fiſhes have inſinuated themſelves into them. When the ſtones into which the ſpawn has penetrated are taken, ſeveral of theſe fiſhes are found in them. Both the fiſh and its juices are ſo luminous in the dark, that one may ſee to read by the light they afford; and even the water in which this fiſh has been ſqueezed, when put in a glaſs, emits an effulgence which laſts from eight to twelve hours. Great quantities of the ballari are brought to Rome, where they are reckoned "beccone di cardinale," or, dainties fit for a cardinal. Oyſters are preſerved here alive in ſea-water for ſeveral years; but the oyſters of Ancona, though large, are flabby and unpalatable. Here is alſo a kind of ſea-craw fiſh, called nocchia, reſembling our lobſters, but of a more delicate flavour. In the harbour of Ancona there is alſo a fiſh called the ſepi, which has a longiſh white ſhell on its head: theſe ſhells are often found along the ſhore, and, when pulverized, are uſed for cleaning plate. Ancona is 107 miles north-north-eaſt of Rome. N. lat. 43° 38'. E. long. 13° 30'.

ANCONA, *Marquiſate of*, a province of Italy, in the pope's territories. It is bounded on the north and eaſt by the Adriatic, on the ſouth by Umbria and Abruzzo Ultra, and on the weſt by the duchy of Urbino. The air is indifferent, but the ſoil is fertile, particularly in hemp and flax, and there is plenty of wax and honey. The province is about 22 leagues in length, and 16 in breadth: and along the coaſts towers are erected, and furniſhed with cannon, in order to keep off the corſairs. The chief rivers are the Fiumelino, Aſpido, Tingo, or Tenna, Ragnola, and Tronto. The principal towns are Ancona, Aſcoli, Camerino, Fermo, Jeſi, Loretto, Macerata, Montalto, Oſimo, &c.

ANCONÆUS, or ANCONEUS *Muſculus*, in *Anatomy*, ariſes tendinous from the back part of the external condyle of the os brachii; it becomes fleſhy, and terminates by a thin fleſhy attachment in a ridge on the outer and back part of the ulna. Its uſe is to aſſiſt in extending the forearm. Formerly all the extenſor muſcles of the elbow were called anconei, and that which now excluſively bears the title was the anconeus quartus, or minor.

ANCONY. See IRON, *Manufacture of*.

ANCORARIUS MONS, in *Ancient Geography*, a mountain of Africa, in the Hither Mauritania. According to Pliny the wood which grew upon it had the ſmell of citron, and was called citrus.

ANCOURT, FLORENT CARTON D', in *Biography*, an eminent actor and comic writer, was born at Fontainbleau, in 1661, and educated at the Jeſuits' college in Paris. Deſtined for the law, he became an advocate at the age of 17 years; but falling in love with an actreſs, whom he married in 1680, he then devoted himſelf to the ſtage as an actor; he excelled in the graver comic parts; and, as a dramatic writer, his particular line was humorous farce. He was diſtinguiſhed by his exhibition of ruſtic characters; his dialogue, though filled with the jargon of the peaſantry, was gay and lively, and abounded with ſmart ſallies; and his plots generally conſiſted of little incidents, contrived to ridicule the follies of the day. His pieces were popular, and attracted numerous auditors. His proſe was much better than his verſe. His company was much ſought by the gay and great, and Louis XIV. was fond of him. In 1718 he quitted the theatre, and retired to an eſtate in Berry, where he employed himſelf in thoſe religious duties, pertaining to his ſpiritual ſafety and welfare, with which, according to the maxims of the Roman Catholic religion, the profeſſion of a player is incompatible. He died in 1726, and left two married daughters. His works were printed in 1729, in nine vols. 12mo. A ſelection of the beſt of them has been publiſhed in three vols. 12mo. Gen. Dict.

ANCRE, in *Geography*, a ſmall town in France, in the province of Picardy, upon a ſmall river of the ſame name, five leagues north-eaſt of Amiens. N. lat. 49° 59'. E. long. 2° 45'.

ANCRE'E, ANCRED, or ANCHORED, in *Heraldry*, is ſaid of a croſs where its extremities turn back like the flukes of an anchor, or terminate like the *croſs patonce*, but in a ſharper turn. Care muſt be taken not to miſtake the croſs ancrée for the croſs moline, which is of the ſame form, and by ſome of the old heralds called a croſs ancrée, or anchored.

ANCRINA,

ANCRINA, in *Ancient Geography*, a town of Sicily, according to Ptolemy, at ſome diſtance from the ſea coaſt.

ANCTERES, in the *Ancient Medicine*, ſeem to have been the ſame, at leaſt to have anſwered the ſame uſes as our SUTURES.

Some alſo ſpeak of a ſtrong kind of ſticking plaſter under this denomination.

ANCTERIASMUS, in *Medicine*, the operation of applying a *fibula* to cloſe the two patent lips of wounds.

This is alſo called by Latin writers, *infibulatio*.

ANCTERIASMUS is more particularly uſed to denote the paſſing a *fibula* through the prepuce of the ancient ſtage-players and buffoons.

ANCUAH, in *Geography*, a town of the province of Alovahat, to the north of Egypt and of the Thebaid.

ANCUBITUS, among *Ancient Phyſicians*, denotes a diſeaſe of the eyes, wherein there is an appearance of ſand, or little ſtones ſprinkled on them.

This is otherwiſe called PETRIFICATION.

ANCUD, in *Geography*, an archipelago or cluſter of iſlands in a part of the Pacific Ocean, between the coaſt of Ancud, that of Chili, and the iſland of Chiloe.

ANCUD is a name given to a coaſt of South America in the province of Chili, between the archipelago of Ancud to the weſt, the Andes to the eaſt, the country of Oſorno to the north, and the Terra Tagellanica to the ſouth.

ANCUROPOLIS, or the city of Anchors, in *Ancient Geography*, was one of the cities of the Heptanomis in Egypt, mentioned by Ptolemy, and ſo called from a neighbouring quarry, out of which ſtone anchors were cut.

ANCUS, a name for ſuch as have an arm bent crooked, ſo that they cannot extend it. See ANCI.

ANCUS MARTIUS, in *Biography*, the fourth king of Rome, was grandſon of Numa Pompilius by his daughter Pompilia and Marcus his relation, the ſon of that Marcus who perſuaded Numa to accept of the kingdom, and who afterwards killed himſelf, becauſe he was not choſen in his room. His name Ancus was derived from the Greek word αγκων becauſe he had a crooked arm, which he could not ſtretch out to its full length. He ſucceeded Tullus Hoſtilius, according to the common computation, in the year before Chriſt 634. He began his reign by endeavouring to reſtore the religious ceremonies, which had been neglected in the time of his predeceſſor, to their former uſe, to revive huſbandry, and to promote the arts of peace. Nevertheleſs his natural diſpoſition was martial, and he gained various advantages for his country by his arms. The Latins gave him an early opportunity of exerciſing his military talents. Having violated the treaty which had been made with Tullus, by invading the Roman territories, Ancus declared war againſt them with all the religious ſolemnity enjoined by Numa, and took the field with an army conſiſting entirely of new-raiſed troops. After having taken ſeveral cities, he defeated them in a pitched battle, obliged them to ſue for peace, and obtained a triumph at Rome for the advantages which he had gained. He alſo recovered Fidenæ, which had revolted; defeated the Sabines, and obtained victories over the Veientes, for which a ſecond triumph was decreed him by the ſenate. During his reign Rome was greatly enlarged, by carrying the walls round the Aventine Hill, and incloſing the hill Janiculum, which was on the other ſide of the Tiber, and which was now made a fort of citadel for Rome. A communication was alſo opened between this citadel and the city, by means of the bridge Sublicius, which Ancus erected over the Tiber, and that part of the river which waſhes the foot of the Aventine Hill. He alſo built a large priſon in the Roman forum. Ancus likewiſe extended the territories of Rome as far as the ſea, and eſtabliſhed the port and city of Oſtia, in order to ſecure to his ſubjects the advantages of trade. About this town he cauſed many ſalt-pits to be dug, and diſtributed ſalt among the more indigent claſſes of his ſubjects. He rebuilt the temple of Jupiter Feretrius in a very magnificent manner; and having ſpent the latter years of his reign in improving the city, and enriching its inhabitants, he died, after a proſperous reign of 24 years. Livy, lib. i. c. 32, 33. t. i. p. 134—144. Dion. Hal. lib. iii. t. i. p. 170, &c. ed. Oxon.

ANCY, in *Geography*, a ſmall town of South America, three leagues from the city of Guamanga.

ANCY LE DUC, a town of France, in the department of the Saone and Loire, one league north of Marcigny les Nonains.

ANCY LE FRANC, or ENCRE, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Tonnerre, eight leagues eaſt of Auxerre, and three ſouth-eaſt of Tonnere.

ANCYLE, in *Antiquity*, denotes a ſmall kind of brazen ſhield, ſuppoſed to be the ſhield of Mars, and ſaid to have fallen from heaven into the hands of Numa Pompilius, at the ſame time that a voice was heard, that Rome ſhould be miſtreſs of the world while ſhe preſerved that ſhield. Though there was but one ancyle that fell from heaven, yet there were twelve preſerved; Numa, by the advice, as it is ſaid, of the nymph Egeria, having ordered eleven others, perfectly like the firſt, to be made by Veturius Mamurius, ſo that if any ſhould attempt to ſteal it, as Ulyſſes did the Palladium, they might not be able to diſtinguiſh the true ancyle from the falſe ones. Theſe ancylia were preſerved in the temple of Mars; and were committed to the care of 12 prieſts or *ſalii*, inſtituted for that purpoſe. They were carried every year, in the month of March, in proceſſion all round Rome; and the 30th day of that month they were again depoſited in their place.

ANCYLE, ſee ANCHYLOSIS.

ANCYLOBLEPHARON, or ANCHYLOBLEPHARUM, (from αγκυλη, *hamus*, and βλεφαρον, *palpebra*) in *Surgery*, an adheſion of the eye-lids. This may either be a natural or a congenite defect, or it may be produced by accidents, ſuch as burns, violent inflammations, and ulcers. The eye-lids may either adhere to each other only, or they may adhere to the eye-ball itſelf; and ſometimes both kinds of adheſions are preſent together.

There are properly three degrees of this diſeaſe. The *firſt* is, when the eye-lids are only glued together by means of pus or thick mucus, as happens in many inflammations of the eye, particularly in the ſuppurating inflammation, whilſt the patient is aſleep; alſo in the ſmall-pox, when the eye-lids have been kept cloſe for ſeveral days in conſequence of the general ſwelling of the face; in ſuch caſes, therefore, it is alſo termed the *ſpurious* ſpecies of the diſeaſe. The *ſecond* degree is when the edges of the eye-lids not only adhere together, but are even connected by means of a cicatrix. The *third* degree is where the eye-lids have alſo formed an adheſion with the conjunctive coat, or the ball of the eye. This third degree is alſo particularly termed SYMBLEPHARON. Theſe two laſt degrees are accounted the *genuine* ſpecies of the diſeaſe.

In the firſt degree, when the eye-lids are glued together by a purulent or tough mucous matter, we muſt employ emollient applications. The eye-lids ſhould be moiſtened with a luke-warm mixture of milk and water, or with an infuſion of rad. altheæ, or with an emollient decoction, applied upon a piece of linen, till they ſpontaneouſly ſeparate from each other. We may alſo rub them gently with an ointment conſiſting of ſyr. papav. ol. amygd. and camphor, and after-

wards apply an emollient poultice of hb. falv. f. m. lini and milk. Should theſe remedies not produce the deſired effect, we may cautiouſly introduce a probe with a knob between the eye-lids, and thereby prevent their adheſion.

In the ſecond degree the edges of the eye-lids either adhere together at all points from one canthus to the other, ſo as to form a perfect concretion, or they are only more or leſs connected together at one or the other angle of the eye. In the firſt caſe, the patient is entirely deprived of ſight; in the ſecond he can ſee by turning the ball of his eye ſideways, ſo that if the diſeaſe be not ſpeedily removed, ſquinting may eaſily be the conſequence. The method of cure in this diſeaſe is to ſeparate the eye-lids from each other by means of an inciſion.

In this operation the ſurgeon muſt uſe great caution in directing his inſtrument, ſo as to avoid the ball of the eye, and prevent its injuring the eye-lid in ſuch a manner as to lay bare the tarſus, the conſequence of which might be a very troubleſome ulceration. This may be accompliſhed without difficulty, when the eye-lids do not entirely adhere together, but are ſtill ſeparate at ſome point; as for example, when there ſtill remains an opening at the internal canthus. Some uſe for this purpoſe a ſmall grooved probe, which they introduce between the eye-lids, and then carry along the groove a thin and ſomewhat crooked-bladed knife, or a ſmall pair of ſciſſars, or only a lancet. But in preference to the probe we may uſe, as a more convenient and ſafe inſtrument, a ſmall knife, with a ſtraight back, but ſomewhat curved at the edge, and terminating at the point in a very ſmall probe with a knob, about two lines in length.

For performing the operation the patient is placed upon a chair, in a convenient poſture; an aſſiſtant ſecures his head, and, at the ſame time, draws the ſuperior eye-lid upwards, whilſt the ſurgeon draws the inferior downwards with two fingers, or elſe draws it with a ſmall forceps downwards, and, at the ſame time, off from the eye. Sometimes the ſurgeon himſelf may ſtretch both eye-lids from each other with the fingers of one of his hands. With the other hand he introduces the ſcalpel abovementioned under the eye-lids, in ſuch a manner, that the back is directed towards the ball of the eye, and the edge to the place where the preternatural adheſion is ſituated; that is, to the interval between the two edges of the eye-lids, or between both rows of eye-laſhes, which frequently remain uninjured by the diſeaſe, puſhes it forwards, and thus divides the preternatural adheſion. In caſe of neceſſity he may alſo uſe a ſmall pair of eye-ſciſſars, though this inſtrument is not ſo ſafe and convenient as the blunt-pointed ſcalpel.

When the eye-lids are entirely cloſed they muſt firſt be opened at ſome external point, by drawing out the ſkin into a croſs fold, and introducing a lancet into it, ſo as to form an aperture through which a ſcalpel or probe may be introduced; which being done, the reſt of the operation is performed after the manner already deſcribed. But leſt the ball of the eye might be injured, the firſt aperture ſhould be made with caution, and always either at the inner or outer canthus of the eye, for fear of wounding the tranſparent cornea, which might thereby be rendered opaque. The ſafeſt method of proceeding will therefore be to draw at the ſame time the eye-lids from each other. This inciſion, however, but ſeldom becomes neceſſary; for even in a complete adheſion an opening may always be perceived at the inner canthus of the eye, through which a ſcalpel or probe may be introduced. When the puncta lacrymalia are likewiſe obſtructed, a ſpecies of fiſtula lacrymalis remains after the operation, unleſs the puncta can be opened. See FISTULA LACRYMALIS.

When the diviſion of the preternatural adheſion has been performed, we ſhould apply to the eye a piece of very fine ſoft linen ſpread with Goulard's cerate, or ſome other cooling ointment; and after the firſt dreſſing we ſhould daily rub between the eye-lids a quantity of ointment made with freſh butter and *flor. zinci.* or *tutia*, either with or without balſ. Peruv. or elſe ſome ſaturnine ointment. The patient ſhould likewiſe repeatedly open and move his eye-lids during the day; and in the firſt night after the operation he ſhould let himſelf be frequently awakened, in order to prevent the formation of a new adheſion. In this, as in all other operations on the eye, we ſhould do all that is in our power to prevent inflammation, and to relieve any that may have taken place.

But, before we operate upon a complete adheſion, we ſhould carefully examine whether the ball of the eye be perfectly ſound, and whether the eye-lids have not formed adheſions with the ball of the eye alſo; which may happen in caſes of burns, or when quicklime has fallen into the eye, in which caſes not only the edges of the eye lids, but the ball of the eye itſelf is generally injured, and often the cornea rendered entirely opaque. For when the cornea is entirely opaque, and the eye-lids adhere not only with each other, but alſo with the ball of the eye; when the patient perceives no ſenſation of light while a candle is held cloſe to his eye in a dark room, and in general cannot diſtinguiſh light from darkneſs; when the eye-ball is felt under the eye-lids ſmall and collapſed; and when from the cauſe, by which the diſeaſe has been occaſioned, there is reaſon to ſuſpect that the cornea has been rendered opaque—the patient's ſight cannot be reſtored by an operation, which conſequently will be ſuperfluous. We may conclude that the eye-lid adheres to the ball, and that an operation will conſequently be difficult, if not impracticable, when the eye-lid cannot be moved backwards and forwards upon the ball, or when we feel that the patient cannot move the ball of his eye, or when, in moving it, the eye-lid contracts itſelf into wrinkles. However, when the eye-lid does not adhere throughout, but only at particular points, and not on the cornea, to the ball, it is worth our while to attempt the operation, for which purpoſe we muſt firſt draw the eye-lid aſunder, and then ſeparate the adhering lid from the ball.

In the third degree, which conſiſts in a preternatural adheſion of the eye-lids with the ball of the eye, there ſometimes alſo exiſts an adheſion of the edges of the eye-lids with each other; in many caſes, however, the adheſion ſubſiſts only between the eye-lids and the ball, forming what is termed SYMBLEPHARON. Of ſuch adheſions ſeveral varieties are obſerved; they are ſometimes firm, or fleſhy; at others, looſe or membranous. Either the whole ſurface, or a ſingle part of one or the other eye-lid adheres to the ball. In the firſt caſe, which is very rare, the patient is altogether unable to open his eye; in the ſecond he can only open his eye-lids partially, and ſee when he turns the ball of the eye to the aperture; in which caſe he may eaſily become ſubject to STRABISMUS by habit. The adheſion of the upper eye-lid occurs far more frequently than that of the lower.

The ſeparation of the preternaturally united parts can here be performed only by the knife. A ſmall crooked knife, formed like a probe at the point, has been propoſed for this purpoſe. In performing this operation, we muſt take care that we may not injure either the eye-lid or the ball of the eye, which it is the more difficult to avoid, as we frequently cannot ſee how we carry the knife, on account of the hæmorrhage. By preſſing the ball of the eye with the blade of our inſtrument backwards from the eye-lid, and at the ſame time drawing, or letting an aſſiſtant draw the eye-lid forwards from the ball, we may in many caſes not only perform a part of the ſeparation without cutting; but alſo, if in-

ciſion ſhould be neceſſary, we may uſe our inſtrument with greater ſafety, and without injuring any of the parts. With this view Mr. Kaltſchmidt has recommended to uſe a ſmall lancet in ſuch a manner, that its ſurface lies firm upon the ſurface of the eye, the edge being ſteadily directed againſt the fibres which form the adheſion, ſo as to divide them more by preſſure than by moving the lancet to and fro. Moreover, we ought, in performing this operation, to be particularly cautious not to injure the inner ſurface of the eye-lid, it being better to cut away a part of the conjunctiva of the eye, than to injure the eye-lid itſelf. But when the eye-lid adheres to the cornea we muſt ſpare the latter, and preſs the knife more upon the eye-lid. For performing this operation a ſteady and experienced hand is particularly neceſſary.

This operation, however, is always very difficult, and it will be attended with no benefit when the cicatriſation is firm and fleſhy, and when the eye-lid adheres cloſely to the ball. Neither will it be productive of any benefit when the eye-lid, though adhering only at one part, is connected with the cornea, and the adheſion is of a muſcular nature; ſo that it is highly probable the cornea will be rendered opaque, unleſs we can hope afterwards to reſtore its tranſparency. In this caſe, however, as in every caſe where the adheſion is muſcular and cicatriſed, it is very difficult to prevent the parts from forming new adheſions with each other. It is, therefore, only in thoſe caſes where the adheſion is looſe and membranous, and only a ſmall part of the ball connected with the eye-lid, and that at the ſide, that the operation can be performed with facility, and with a ſure hope of a fortunate event; though even here it is often very difficult to prevent a new adheſion from taking place. When the adheſion is very looſe, we may frequently diſpenſe with cutting inſtruments, and effect the ſeparation by means of a ſmall blunt knife, ſhaped like a SPATULA.

In order to prevent the formation of a new adheſion, after the operation, ſome introduce lint into the eye, others a piece of linen or fine leather in the form of a creſcent, others a thin, ſmooth plate of ivory, lead, or horn, ſhaped ſo as to correſpond with the form of the eye, or only a thin, flat piece of wax. All theſe foreign ſubſtances, however, when introduced between the ball and lid of the eye, irritate, preſs, and inflame the eye; neither do they keep their ſituation. It is therefore better to direct the patient frequently to roll the ball of his eye, and not to ſleep too long at a time; and when the hæmorrhage has ceaſed, frequently to introduce upon the inner ſurface of the eye, with a hair pencil, a little cream, oil of almonds, ſaturnine or tutty-ointment; or to drop, into the ſpace, between the lid and the ball, ſome gently aſtringent and drying collyrium. We may alſo (as Heiſter adviſes) introduce repeatedly towards the termination of the cure a blunt probe between the lid and ball of the eye, and move it gently backwards and forwards; but this muſt be done with the utmoſt caution. Any remaining opacity of the cornea muſt be treated with the proper remedies.

The method of treatment, practiſed by Fabricius Hildanus (Obſervat. Centur. v. Obſ. 7.) might alſo in ſome caſes be attempted. His method was gently to introduce a crooked probe at the inner angle of the eye, under the upper eye-lid, between the lid and ball of the eye, till its point projected out of the outer canthus. He then faſtened a fine ſilk thread to the point of the probe, and introduced the probe again in the ſame manner as before; the ends of the thread he tied together under the eye, and faſtened a ſmall lump of lead to them. During the day time the lead was ſuffered to hang to the thread, but it was taken off when the patient went to bed. By means of this thread, and the weight ſuſpended to it, the adheſion was ſeparated in the ſpace of nine days, the eye-lid and ball of the eye completely recovered their motion, and nothing of the diſeaſe remained behind except a ſmall ſpeck upon the cornea.

Vide C. F. Kaltſchmidt, Diſſ. de puero xii. annorum anchyloblepharo laborante curato. Jen. 1764. Reſp. C. G. Barchewitz.—G. I. Badendyk, Diſſ. de Ancyloblepharo. Jen. 1785.

ANCYLOGLOSSUM, or ANCHYLOGLOSSUM, in *Surgery*, (from ἀγκύλη, *hamus*, and γλῶσσα, *lingua*) *Ancyloglaſſe*, *Ancylion*, and adheſion of the tongue, or the being TONGUE-TIED. This term is applied to that mal formation of the parts, in which the frenulum of the tongue confines its apex too much, and impedes its motion, either by its being continued too far forwards towards the extremity of the tongue, or by its being too ſhort, conſidered in its perpendicular direction. Both theſe defects are generally natural ones, and are therefore moſt commonly obſerved in new-born infants. However, even in adults, the frenulum may ſometimes be ſhortened, and the motion of the tongue impeded in conſequence of a wound, ulcer, &c. We diſcover the exiſtence of this defect, when we find that we cannot introduce the finger under the tongue, and raiſe it up; when the infant neither ſucks the finger, when it is introduced into its mouth, nor the nipple of the mother; when the child, after it has begun to ſpeak, cannot properly pronounce the letters which are principally articulated with the apex of the tongue, namely, *ſ*, *l*, *r*, (a very complete adheſion of the tongue, whether by means of the frenulum, or any other preternatural connecting ſubſtance, may even occaſion complete dumbneſs); and when the apex of the tongue cannot be drawn forwards, beyond the teeth, to the gums or lips.

The cure of this defect conſiſts in the operation of dividing the frenulum, which, however, is very frequently performed without neceſſity, and to the very great detriment of the infant. (Fabricius ab Aquapendente) Chirurg. Operat. cap. xxxvi.) aſſerted, that among a 100,000 children that were born, ſcarce one actually required this operation. See alſo Jourdain on the diſeaſes of the Mouth, vol. ii. p. 594. and 602.) For only in that very rare caſe, in which the infant is unable to ſuck, in conſequence of the immobility of the tongue, are we authorized and obliged to perform the operation. Should even the frenulum be ſomething too ſhort, and the apex of the tongue not ſufficiently moveable, ſo that there is cauſe to apprehend that the child, when he learns to ſpeak, will not be able properly to articulate the lingual letters, we ought, provided he be not prevented from ſucking by that defect, to defer the operation to a future period, for it is unneceſſary to perform it at preſent; and ſhould it afterwards become neceſſary, for the purpoſe of enabling the child to articulate his words properly, it may then be performed with greater facility, ſafety, and accuracy; beſides, that the frenulum often becomes ſpontaneouſly elongated, and ſufficiently extended in conſequence of the mere motion of the tongue. As there are various other cauſes, which may be impediments to the infant in ſucking, we muſt not always look for the fault in the ſtate of the frenulum. Nay, though we ſhould even find the tongue actually immoveable in an infant that either cannot or will not ſuck, we are not authoriſed immediately to ſuppoſe that the defect of the frenulum is the cauſe of it, and ſo undertake the operation without farther examination. For we ſometimes find that preternatural membranes and ligaments, which proceed from the lateral edges of the tongue, and connect it with the gums, were the cauſe of the impeded motion of the tongue; and that, after theſe have been divided, the infant is able to ſuck. In new-born infants the tongue ſometimes adheres ſo ſtrongly to the gums, by means of a viſcid mucus,

that

that the patient cannot ſuck, nay, ſcarcely draw breath; this mucus may eaſily be removed by means of a ſpatula.

In performing the operation, we have principally to take care to make the inciſion into the frenulum of the proper length; for if we make it too long, that is too far on towards the root of the tongue, the tongue becomes too moveable, and another defect, of which we ſhall treat hereafter, is produced; whilſt, if we do not make it long enough, the tongue does not acquire ſufficient mobility, and the intention of the operation is not completely anſwered. However, it is always better rather to make the inciſion too ſhort than too long, as in the former caſe the operation may be repeated, and the diviſion made longer, whilſt, in the latter, the fault cannot be remedied. Moreover, we ought always to make the inciſion as much as poſſible in the middle, between the tongue and the ſubjacent ſoft parts, and avoid the blood-veſſels, nerves, and ſalivary ducts.

When it is determined to perform the operation, we proceed in the following manner: The patient being properly ſecured, and his mouth opened, we introduce the common mouth-ſpatula under the apex of the tongue, in ſuch a manner that the frenulum lies in the ſlit of the ſpatula. Inſtead of this ſpatula we may alſo uſe a grooved probe, with a flat and ſlit handle. Some recommend, inſtead of the ſpatula, to uſe a ſmall two-pronged fork, with knobs at the points. With one or other of theſe inſtruments, which we hold in the left hand, we raiſe the apex as much as poſſible, and ſtretch the frenulum. This manœuvre, as well as the reſt of the operation, may be facilitated by applying external preſſure under and behind the chin, by which means the ſoft parts under the tongue are elevated. We then divide the frenulum with a round-pointed pair of ſciſſars, which we hold in our right hand. The crying of the child greatly facilitates the operation; in performing which we may alſo compreſs his noſtrils, which will compel him to keep his mouth open.

Various other complicated inſtruments have been propoſed for performing this operation, but they may all be diſpenſed with, as none of them have any advantage over the more ſimple ones, the ſpatula, and ſciſſars: indeed we have often performed the operation with no other inſtrument than the ſciſſars. When the frenulum has been properly divided, there is ſeldom any neceſſity for employing any peculiar treatment; it may, however, be uſeful, during the firſt period after the operation, to draw a linen rag, neatly ſpread with fine-pounded ſugar or honey, ſeveral times a day under the tongue, in order to prevent the formation of a new adheſion. Sometimes alſo it happens, eſpecially when the frenulum is uncommonly fleſhy, or has been divided too far back, that a hæmorrhage enſues, which, though of itſelf inſignificant, may frequently be rendered dangerous, nay, even fatal in conſequence of the ſucking uſual with new-born infants, upon awaking, when the breaſt is not ſoon given them. This accident may be prevented by attending to the infant for the firſt twenty-four hours after the operation, and as ſoon as it awakes, taking it up, and laying it to the breaſt till it falls again aſleep. But there is ſtill greater cauſe to apprehend a dangerous hæmorrhage, when, through want of the proper caution, any conſiderable blood-veſſel under the tongue has been injured. This muſt immediately be ſtopped by ſtrong aſtringent remedies, *e. g.* concentrated vinegar, ſpir. vin. rectif. or Theden's aq. vuln. with which ſmall compreſſes ſhould be wetted, and laid under the tongue; or with blue vitriol, or agaric, preſſure being at the ſame time applied. In order to prevent the fatal hæmorrhage, which might afterwards ſupervene, it is neceſſary that the child ſhould be attended to during the firſt days after the operation, that we may ſee whether it moves its lips or appears to ſuck or ſwallow any thing; and when it does ſo, we muſt immediately examine whether any blood is diſcharged, in order that we may be able immediately to ſtop the hæmorrhage. We have known a very troubleſome excreſcence ariſe under the tongue of an infant, after it had been cut too deeply by an officious nurſe.

The frenulum may alſo, in ſome caſes, poſſeſs too great a facility of motion; namely, when, by a fault of the original conformation it is too long in its perpendicular direction, or when it does not extend far enough from the root towards the apex of the tongue. This fault is not to be diſcovered till the child begins to ſpeak. Little or nothing can be done to remedy it, though it ſometimes ſpontaneouſly diſappears as the child grows older. A ſimilar defect is produced when the frenulum has been divided without neceſſity, or when, in performing the operation from proper indications, the inciſion has been made too long. When either this or the preceding defect is preſent in a high degree, it ſometimes happens that the infant, which is in the habit of ſucking as ſoon as it awakes, ſucks down the apex of its tongue, and is ſuffocated. If we diſcover the accident in time, and extricate the tongue with our finger, the infant immediately recovers: it will, however, be neceſſary that we ſhould prevent the recurrence of a ſimilar accident. This we may do by two different means. As ſoon as the infant awakes, and begins to ſuck, we muſt either let it have the breaſt immediately, or we muſt put a finger or ſome other ſubſtance into its mouth till the breaſt can be given it. When it has been weaned it gradually loſes the habit of ſucking its tongue, and then there is no more danger to be apprehended. When circumſtances do not admit of ſuch attention being paid to the infant, or when the child, after it has been weaned, ſtill retains the habit of ſucking its tongue, we may prevent the tongue from being drawn down into the throat, by applying an ivory ſtick between the jaws of the child, which is to be faſtened behind the neck and under the chin with ſtrings. With adults, whoſe frenulum is either too looſe, or does not extend far enough towards the tip of the tongue, we may employ the tongue-bandage of M. Petit or Pibrac, of which we ſhall take notice under the article Wounds *of the Tongue*.

Finally, by frequent and forcible ſuction of the retroverted tip of the tongue, adults may ſometimes ſtretch, elongate, and relax their frenulum, which before was quite perfect, in ſuch a manner as to produce all the defects abovementioned.

Inſtead of a frenulum we ſometimes find, in infants, a fleſhy excreſcence under the apex of the tongue, which frequently is ſo large as to prevent both ſuction and deglutition, and can only be removed by exciſion. In this operation we have chiefly to apprehend the hæmorrhage, which ſometimes is ſo profuſe as to occaſion the death of the patient. As the remedies abovementioned are not applicable in ſuch caſes, we ought to employ the actual cautery, or ſometimes we may ſucceed with compreſſion. It might, perhaps, be adviſeable to cut out, at firſt, only a part of the excreſcence, ſo as to enable the infant to ſuck and ſwallow; after which, as he grows older, the reſt of it may be extirpated with greater eaſe and ſafety, if it produce any inconvenience. Both in children and adults, ſuction, deglutition, ſpeech, and maſtication are ſometimes impeded by painful excreſcences on the frenum, which ought to be removed by cutting, tying, or cauſtic. Ulcers, fiſtulas, and encyſted tumors, which are frequently found on the frenulum, muſt be treated in the ſame manner as when ſituated in other parts of the body.

Vide Chr. Car. Lang. Diſſ. de frenulo linguæ, ejuſq. inciſione—Præſ. Juſt. Chr. Loder. Jenæ, 1785. I. F.

Schweighaufer Diſſ. de Affectib. linguæ. Argentor, 1789.

ANCYLOMELE, αγκυλομηλη, from αγκυλος, *crooked*, and μηλη, a *probe*: a ſurgeon's crooked probe, or a probe with a hook.

ANCYLOSIS. See ANCHYLOSIS

ANCYLOTOMUS, (from αγκυλος, *crooked*, and τεμνω) Fr. Ancylotome. A knife for looſening the tongue. This inſtrument is no more in uſe. The term is alſo applied in general to all crooked-bladed knives.

ANCYLUS, in *Conchology*, a name given by Geoffroy to the PATELLA LACUSTRIS of Linnæus. See LACUSTRIS.

ANCYRA, now called by the Turks ANGOURI, in *Ancient Geography*, a city of Aſia Minor, and formerly the capital of Galatia, ſituate near the ſmall lake Cenaxis, and not far from the river Halys, and belonging to the Tectoſagi. Pauſanias (Attic. c. iv. p. 12.) intimates that it was founded by Midas, and that it derived its name from an anchor which was found there, and which was preſerved in the temple of Jupiter. It was afterwards greatly enlarged and adorned by Auguſtus, who, on this account, might be deemed the founder of it. In the time of Nero this noble city received the title of the metropolis of Galatia; and it is ſtill populous. Its inhabitants, according to Suidas, were denominated Hellenogalatæ, or Græco-Galli. See ANGORA.

ANCYRA, *Ancyra Abaſitidis* of Strabo, a town of Phrygia, mentioned by Pliny (l. v. c. ult.) and confounded by Steph. Byz. with the Ancyra of Gallo-Græcia of the preceding article.

ANCYRÆ, a town of Sicily, mentioned by Diodorus Siculus, lib. xiv. c. 49.

ANCYREUM, a promontory of Aſia Minor, noticed by Dionyſius Periegetes, as ſituated where the Euxine Sea terminated, and where the Boſphorus commenced.

ANCYROIDES, αγκυροειδης, is uſed by ſome writers in *Anatomy* for the proceſs or ſhooting forth of the ſhoulder-bone, in form of a beak; otherwiſe called *coracoides*.

ANCZAKRISH, in *Geography*, a river of Podolia, which diſcharges itſelf into the Black Sea, near Oczakow.

ANDA, in *Botany*, is a tree of Braſil, found, according to Piſon (Hiſt. Nat. Racened.), in the foreſts, at a ſmall diſtance from the ſea-coaſt; the wood of which is ſpungy and light; the leaf longiſh, fibrous, and pointed; the flower large and yellow; and the fruit a grey nut, which incloſes, under a double rind, two kernels of the taſte of cheſnuts. The fruit is ſaid to be purgative, and a little emetic: two or three of the kernels are a doſe. The Indians extract oil by expreſſion from theſe kernels, with which the natives anoint their limbs. The rinds of the fruit are eſteemed proper to ſtop a looſeneſs; thrown into ponds they kill the fiſh.

ANDA, in *Ancient Geography*, a town of Africa, according to Appian.

ANDABATÆ, in *Antiquity*, a kind of GLADIATORS, who fought hookwinked; having a ſort of helmet that covered the eyes and even the face.

They were called *andabatæ*, *quaſi* αναβαται, *aſcenſores*, becauſe they fought mounted on horſeback, or out of chariots. Others derive the word from ανα, *againſt*, and βαινω, *I go*.

Some ſay, the *andabatæ* fought in the dark, or late at night, after the *circenſia* were over. There were two men in the chariot, *viz.* the driver, or *auriga*, and the παραβατης, who was alſo called αναβατης, q. d. *adſcenſor*, or *mounter*; whence by corruption the Latins formed the andabata.

It has been diſputed among critics whether the andabatæ were a people who actually fought blindfold in their wars, or a ſet of combatants who only practiſed this method of fighting for the ſake of exerciſe.

ANDABATIS, in *Ancient Geography*, a town of Cappadocia, according to Antonine.

ANDACA, a town of India, which ſurrendered to Alexander, but its ſituation is unknown.

ANDAGUAYLAS, in *Geography*, a juriſdiction of the empire of Peru, in South America, ſubject to the archbiſhop of Lima: ſituate eaſt by ſouth of the city of Guamanga, extending between two branches of the Cordillera above 20 miles, and watered by ſeveral ſmall rivers. It abounds in ſugar plantations, grain of moſt ſorts, and fruits. This province is one of the moſt populous in theſe parts; and its climate is partly hot, and partly temperate.

ANDAGYRI, or ANDIGRI, a diſtrict of the iſland of Sumatra, with a populous town of the ſame name, ſituate on a river commodious for trade; the chief article with which this diſtrict abounds is pepper.

ANDAJA, a river of Spain, in Old Caſtile, which joins the Duero.

ANDALUSIA, a province of Spain, which formerly comprehended the kingdom of Granada, then called Upper Andaluſia; but the name is now appropriated to Lower Andaluſia, which is the moſt weſterly province of the ſouthern part of Spain. It is ſeparated, on the north, from Eſtramadura and New Caſtile by the Sierra Morena Mountains; on the eaſt, from Portugal by the river Chanca, and on the weſt, from Algarve by the Guadiana; on the ſouth, it has the ocean, the Straits of Gibraltar, and part of the Mediterranean; and along the ſouth-eaſt it has the kingdom of Granada. Its utmoſt length from Ubeda to Ayamente, is ninety leagues, and its breadth about ſixty. Its chief cities and towns are Seville, the capital, Baeza, Gibraltar, Corduba, Cadiz, Medina Sidonia, Jaen, Port St. Mary, &c. Its principal rivers are, the Guadalquivir, Xenil, Odier, or Odiel, Guadalate, and Tinto, or Azeche. Andaluſia is reckoned the richeſt and moſt fertile province of Spain; abounding in exquiſite fruits of all kinds, honey, excellent wine, grain, ſilk, ſugar, fine oil, numerous herds of cattle, particularly horſes, metals, cinnabar, and a ſpecies of quickſilver. The air, though warm, is refreſhed by cooling breezes, and the great extent of ſea coaſt is favourable to commerce. The wool of Andaluſia, ſays Keyſler, (Travels, vol. iii. p. 20.) is known to ſurpaſs all other; though the ſheep on which it grows were originally natives of England. The name of Andaluſia is applied by the Arabs not only to the modern province, but to the whole peninſula of Spain. Some have derived the name from Vandaluſia, the country of the Vandals; but the Handaluſia of Caſiri, which ſignifies in Arabic the region of the evening, or of the weſt, or the Heſperia of the Greeks, is perfectly appoſite. Gibbon's Hiſt. vol. ix. p. 467.

ANDALUSIA, NEW, a diſtrict of South America, in the eaſtern part of the province of Terra Firma, ſituate on the coaſt of the Atlantic, oppoſite to the Leeward Iſlands. The boundaries of this territory are indefinite, as the Spaniards pretend a right to countries in which they have never eſtabliſhed any ſettlements. If the diſtricts of Camana and Paria are included, it extends, according to the moſt reaſonable limits, 500 miles from north to ſouth, and about 270 from eaſt to weſt. The interior country is woody and mountainous, variegated with fine vallies that yield corn and paſturage. The produce of the country conſiſts chiefly in dyeing drugs, gums, medicinal roots, Brazil wood, ſugar, tobacco, and ſome valuable timber; to which may be added pearls, for which the Spaniards uſed to fiſh along this coaſt to Carthagena. The capital of Andaluſia is Camana, Cumana,

mana, or as fome writers call it, New Corduba, fituate in N. lat. 9° 55', about nine miles from the North fea. As the place was naturally ftrong, the Spaniards laid the foundation of a town in 1520, and fortified it with a caftle, which was capable of making a vigorous defence; and this was actually the cafe in 1670, when the Buccaneers affaulted it, and were repulfed with great flaughter. Mod. Un. Hift. vol. xxxv. p. 176.

ANDALUSICUS, in *Ornithology*, a fpecies of TETRAO that inhabits Andalufia. It is rufous, variegated with black: underfide reddifh white: legs and bill flefh coloured. Gmelin. The black marks on the plumage are irregular, but partly difpofed in bars; the neck and breaft are flightly tinged with yellow; the quills dufky. It has only three toes, which are all placed forwards. Latham. This is the ANDALUSIAN QUAIL of the latter author.

ANDAMANS, two iflands in the Gulf of Bengal, oppofite to the coaft of Malacca, though at a confiderable diftance. They are denominated the Great and the Little Andaman, which is about eight leagues in length, and five in breadth. The former is about 140 miles long, and its greateft breadth about 20; its deep bays afford excellent harbours, and one of its numerous creeks paffes through the ifland, and is navigable by fmall veffels. The foil is chiefly black mould, and the cliffs are compofed of a white arenaceous ftone. The forefts, which are extenfive, afford fome valuable trees, as ebony, and the Mellori, or Nicobar bread fruit. The only quadrupeds are wild hogs, monkies, and rats. The fifh, fupplied by the fea, are, for the moft part, mullets, foles, and good oyfters. The conduct of the inhabitants manifefts very little civilization; they are brutal, deceitful, and ferocious; and they are probably cannibals. They have woolly heads, and perfectly refemble negroes. As to their origin, report fays, that they are defcended from a crew of African flaves. Soon after the Portuguefe had difcovered the paffage to India round the Cape of Good Hope, one of their fhips, having on board a number of Mozambique negroes, was loft on the Andaman iflands, which, it is faid, were till then uninhabited. The blacks remained in the ifland, and fettled it; whereas the Europeans made a fmall fhallop, in which they failed to Pegu. But this account is not compatible with the defcription given of thefe iflanders by the Mahometan travellers in the ninth century. Canoes, however, might have been driven from the African coafts by a fouth-weft monfoon; and this defert ifle might have been thus occupied. A Britifh fettlement has been lately formed on the Greater Andaman, and fome convicts have been fent thither from Bengal. The natives are about 2000, and are now profiting by the example of Englifh induftry. The limits of thefe iflands are in N. lat. 14° 0'. 10° 8' E. long. 93° 3'. 93° 35'. Afiatic Refearches, v. ii. and iv.

ANDAMAS, a town of Perfia, in the province of Kuziftan, 45 leagues weft of Ifpahan.

ANDAMENTO, in *Mufic*, the *motivo*, or movement in giving out the fubject of a fugue; a theme, longer and more important than a POINT, which fee.

ANDANASAR, in *Geography*, a town of India, on this fide the Ganges, in Decan.

ANDANCE, a town of France, in the department of the Ardeche, and chief place of a canton, in the diftrict of Mezen, on the Rhone, 20 miles north of Valence, and 12 north of Tournon.

ANDANIA, in *Ancient Geography*, a town of Meffenia, fouth-weft of Meffene. It was one of the moft ancient cities, and had probably been the capital of the country. Paufanias (Meffenica. c. i. p. 282. 323.) has given a particular account of its origin, and of its decline and defertion.

ANDANIS, a river of Carmania, fo called by Pliny and Ptolemy, but denominated by Arrian, Anamis.

ANDANTE, in *Mufic*, from *andare*, Ital. *to walk*, &c. neither to run nor to creep, but the medium between both thofe motions. *Andantino*, the diminutive of *andante*, is applied to movements fomewhat quicker, and bordering on *allegretto*, or rather *graziofo*.

ANDARÆ, a people of India, on the other fide of the Ganges, who formed, according to Pliny, a very powerful nation. Hardouin is of opinion, that the country which Pliny meant to defcribe was the kingdom of Pegu.

ANDARAX, in *Geography*, a town of Spain, in the country of Granada, fix miles north-weft of Almeria.

ANDARBA, in *Ancient Geography*, a town placed by Antonine in Dalmatia.

ANDARGE, in *Geography*, a river of France, which rifes in the vallies of Unflan, and joins the Arron near Verneuil.

ANDARIACA, a town of Afia Minor, which was fituated, according to Ptolemy, in Lycia.

ANDARINI, a pafte of vermicelli, reduced into fine grains, like anifeed.

ANDARISTUS, in *Ancient Geography*, a town of Europe, in Macedonia. Ptolemy refers it to the Pelagonians.

ANDARO *Ifland*, in *Geography*, lies on the weftern coaft of the peninfula of India. N. lat. 10°. and E. long. 73° 35'.

ANDASTES, an Indian nation, in Canada.

ANDATE, in *Mythology*, the goddefs of Victory, was one of the principal deites of the ancient Britons; fhe had a famous temple at Camelodunum.

ANDATIS, in *Ancient Geography*, a town of Ethiopia, on the banks of the Nile, according to Pliny.

ANDAUTONIUM, a town of Higher Pannonia, upon the river Savus, north-eaft of Sifcia.

ANDAYE, in *Geography*, a fea-port town of France, in the department of the Lower Pyrenees, near the mouth of the Bidaffoa, on the borders of Spain, with ftrong fortifications, and a good trade; five miles fouth weft of St. Jean de Luz. N. lat. 43° 25'. W. long. 1° 45'.

ANDEAH, a town of Hindoftan, in the circar of Bilfah, 30 miles eaft-north-eaft of Biltah, and 120 fouth of Agra.

ANDECRIUM, or ANDETRIUM, in *Ancient Geography*, a town of Dalmatia.

ANDEB, or AINTAB, in *Geography*, a town of Turkey in Afia, in the government of Aleppo, fituate on the road that leads from Aleppo to Erzerum, near the river Sefchar, in a valley that abounds with vines, various kinds of fruits and apples of a large fize. This was ancintly *Antiocha ad Taurum*.

ANDEGAN, the capital of Fergana, one of the provinces of great Bucharia.

ANDEGAVI. See ANDES.

ANDEIRA, in *Ancient Geography*, a town of Afia Minor, in Thebaic Cilicia, at fome diftance to the north of the fmall river Scilleus. Near this town there was a chapel confecrated to the mother of the gods, and a fubterraneous grotto, which extended as far as Palœa.

ANDEL, in *Geography*, a town of Franee, in the department of the northern coaft, and chief place of a canton, in the diftrict of Lamballe, feven miles eaft of St. Brieuc.

ANDELANGA, in *Midddle Age Writers*, occurs as part of the *formula* of divers donations.

In this fenfe we meet with *donare per* andelangam & *feftucam*, *vendere* & *tradere per* andelangam. &c. Some will have the term properly to denote what we call an *andiron*;

iron; others a long ſtaff, or rod, which it is known was much uſed in the act of putting into poſſeſſion.

The word is ſometimes alſo written *andelangus*, *andelago*, *andilago*, or *andalagus*, &c.

ANDELINGEN, or ANDELFINGEN, in *Geography*, a town of Swiſſerland, in the canton of Zurich; ſeated on an eminence in a vogtey of the ſame name, and near the river Thur; 17 miles north-north-eaſt of Zurich.

ANDELLE, a river of France, in the province of Normandy, which riſes near Ferté-en-Bray, paſſes by Vexin-Normand, and diſcharges itſelf into the Seine, about four leagues above Rouen.

ANDELOT, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Chaumont, on the river Rougnon; 10 miles north-north-eaſt of Chaumont.

ANDELSPACH, a river of Germany, which runs into the Danube, near Scheir.

ANDELUS, in *Ancient Geography*, a town of Spain, placed by Ptolemy among the Vaſcones.

ANDELY, in *Geography*, a town of France, and principal place of a diſtrict, in the department of Eure. It is divided into two by a paved cauſeway; one of the parts is called *Le Grand Andely*, and the other *Le Petit Andely;* the one is upon the Seine, the other upon the river Gambon. It is 20 miles ſouth-eaſt of Rouen. N. lat. 49° 15′. E. long. 1° 14′.

ANDENA, in *Ancient Writers*, denotes a ſwath in mowing. The word is likewiſe uſed to ſignify as much ground as a man can ſtride over at once.

ANDENAS, in *Geography*, a ſmall iſland of Norway, in the North Sea, with a town of the ſame name. N. lat. 69° 30′. E. long. 14° 54′.

ANDEOL, or ANDIOL, a ſmall town of France, in the Vivarais, at the junction of the Ardeche with the Rhone. It is four leagues from Viviers. N. lat. 44° 24′. E. long. 2° 50′.

ANDERA, a beautiful village of Egypt, on the Nile, in which are found ſeveral monuments that indicate its former grandeur.

ANDERAB, the chief city of the province of Tokareſtan, in Great Bucharia, ſituate near a paſs through the mountains of Hindooh Koh, which ſeparate India and Perſia from Bucharia, and poſſeſſed by the Uſbeck Tartars. As there is no other way of croſſing the mountains towards India with beaſts of carriage, except through this city, all travellers and goods from Bucharia are obliged to pay four per cent. On this account the khan of Balk maintains a conſiderable number of ſoldiers in this place, which is otherwiſe of no great ſtrength. Anderab, though ſmall, is very rich and populous. The neighbouring mountains yield quarries of lapis lazuli, which furniſh a conſiderable trade between the Buchari and Perſia and India.

ANDER-ESCH, a town of the duchy of Luxemburg, two leagues and a half ſouth of Luxemburg.

ANDERITUM, or ANDERIDUM, in *Ancient Geography*, afterwards called *Gabali*, the capital of the Gabali, in Aquitania Prima. It was an epiſcopal ſee; but the city was ruined by an incurſion of the Alemanni, and the ſee was transferred to Mende.

ANDERLECH, in *Geography*, a town of Brabant, three miles ſouth-weſt from Bruſſels.

ANDERNACH, a town of Germany, in the circle of the Lower Rhine; in the archbiſhopric of Cologn, and in a prefecturate of the ſame name. It was anciently called *Antoniacum*, *Antunacum*, and *Antonacenſe caſtellum*, and was a free imperial city. In the year 1496 it was by force of arms rendered municipal by the elector of Cologn, to whom it now belongs. It is ſeated on the Rhine, and a toll is levied on travellers for the ſupport of its walls. Its trade, for which it is advantageouſly ſituated, conſiſts principally of ſtone ware, tiles, timber, and the ſoriff, a ſtone uſed in conſtructing dykes, which are conveyed to Holland by the Rhine. It is alſo remarkable on account of the large rafts which are here built upon the borders of the Rhine, the ſmaller ones being brought down the rivers Mayn and Rhine from Franconia and the country about Mentz, which are here united with thoſe of Andernach. One of theſe rafts, when it arrives in Holland, whither they paſs from the month of May to the end of Auguſt, is calculated to be worth about 80,000 guilders. They frequently require from 2 to 300 men to guide them. An irreconcileable animoſity ſubſiſts between the inhabitants of Andernach and thoſe of Lintz, and it is kept up by an annual ſermon preached againſt the latter in the open market-place of Andernach. There are three medicinal ſprings in its vicinity. It is ſituated on the confines of the electorate of Treves, three leagues north-weſt from Coblentz, and eight and a half ſouth-ſouth-eaſt from Cologn. N. lat. 50° 29′. E. long. 17° 9′. Render's Tour, vol. i. p. 316.

ANDERNO *Port* lies on the eaſt ſide of Scarpante, near the Archipelago Iſlands, nearly in the courſe from the eaſt end of Candia Iſland to Rhodes, to the north-eaſt.

ANDERO, ST. a ſea-port town in the Bay of Biſcay, in Old Caſtile, ſeated on a ſmall peninſula. It is a trading town, and contains about 700 houſes, 2 pariſh churches, and 4 monaſteries. Here the Spaniards build and lay up ſome of their men of war. N. lat. 43° 20′. W. long. 4° 30′.

ANDERO *Iſland*, ST. See ANDRES.

ANDERSKOW, a town of Denmark, in the Iſland of Zealand, one mile ſouth-eaſt of Slageliſe.

ANDERSON, ALEXANDER, in *Biography*, an eminent mathematician, was born at Aberdeen, in Scotland, and flouriſhed at the latter end of the 16th, and beginning of the 17th centuries. He was profeſſor of mathematics at Paris, where he publiſhed ſeveral ingenious works in geometry and algebra, both thoſe of his own and of other perſons. In 1612 was publiſhed in 4to. a ſupplement to Apollonius, written by Ghetaldus, under the title of "Supplementum Apollonii redivivi." His "Antilogia," treating of the analytic method of reaſoning, and containing farther obſervations on the former work, was publiſhed at Paris in 4to. in 1615. About the ſame time he publiſhed two treatiſes of Vieta, "On Equations," with a dedication, preface, and appendix, and Vieta's tract of "Angular Sections," with demonſtrations. A couſin of this gentleman, whoſe name was David Anderſon, was alſo diſtinguiſhed for his acquaintance with mathematical and mechanical ſcience. His daughter was the mother of the celebrated James Gregory, and as ſoon as ſhe diſcovered his propenſity to theſe ſciences, ſhe took pains in giving him neceſſary inſtructions in the elements of mathematics. Hutton's Math. Dict.

ANDERSON, SIR EDMUND, an Engliſh lawyer, was deſcended from a Scots family, ſettled in Lincolnſhire, and proſecuted his ſtudies, firſt at Oxford, and afterwards in the Inner Temple, where in due time he became a barriſter. In the 19th year of Queen Elizabeth, he was appointed the queen's ſerjeant at law, and ſoon after one of the juſtices of aſſize. In 1581 he went the Norfolk circuit, and diſtinguiſhed himſelf by his zeal againſt Browne, who was the founder of the ſect denominated Browniſts. His continued zeal in ſupport of the eſtabliſhed church recommended him to the queen; and in 1582 he was advanced to

the dignity of lord chief juſtice of the common pleas. In the following year he received the honour of knighthood. In 1580 he was appointed one of the commiſſioners for trying Mary, queen of Scots, and he ſat in the ſtar-chamber when ſentence was pronounced againſt her. He afterwards, viz. in 1587, ſat in the ſame court, when Davidſon, the queen's ſecretary, was charged with iſſuing the warrant for the execution of Mary, contrary to queen Elizabeth's command, and without her knowledge; and it was his opinion that the ſecretary had done "juſtum non juſtè," what was right but not in a due manner; upon which Mr. Granger very properly obſerves, that this diſtinction was "excellent logic for finding an innocent man guilty, and drawn from the ſame mood and figure with the queen's order and no order for Davidſon's ſigning the warrant." The diſtinction, however, was admitted; and the ſecretary was ſentenced to pay a fine of 10,000 pounds, and to be impriſoned during the queen's pleaſure. Judge Anderſon ſeems to have imbibed, in connection with this ſubſerviency to the will of the court, an intolerant and perſecuting ſpirit; and he has been reproached on this account, and not unjuſtly, by the Puritan writers. Mr. Pierce, in his "Vindication of the Diſſenters," p. 129, (ed. Lond., 8vo., 1717,) charges him with very unjuſtifiable conduct with regard to Udal, a Puritan miniſter, who was confined in 1589, and tried and condemned the year following, and with endeavouring to trick him out of his life. Upon an examination of Udal, at the houſe of Lord Cobham, in January, 1589—90, the lord chief juſtice endeavoured to draw from him a confeſſion that he was the author of certain books, which furniſhed the charges againſt him; though a law, 42 Edw. III. c. 3. to which Udal referred, ſays generally, that no man ſhall be put to anſwer without preſentment before juſtices, or matter of record, or by due proceſs, and writ original, &c. Udal, indeed, was not tried till July following; nevertheleſs the judge muſt know that, conſidering the diſpoſition of government towards ſeparatiſts, ſuch a confeſſion might endanger his life. He manifeſted a ſimilar ſpirit in 1596; when he declared in his charges, in the northern circuit, that thoſe who oppoſed the eſtabliſhed church, oppoſed her majeſty's authority, who was ſupreme in all caſes eccleſiaſtical as well as civil, and on this account they were enemies to the ſtate, and diſturbers of the public peace; and he directed the grand juries to inquire concerning perſons of this deſcription, that they might be puniſhed. At Lincoln, in his firſt and ſecond charge, as we are informed by the letter of a clergyman, preſerved in Strype's Annals, vol. iv. p. 267, he inſinuated with wonderful vehemency, that the country is troubled with Browniſts, with diſciplinarians as he called them, and erectors of Preſbyteries. He alſo called the preachers knaves; ſaying, that they would ſtart up in the pulpit, and ſpeak againſt every body; he urged the grand jury to ſuppreſs, by the ſtatute againſt Conventicles, a meeting held even with the biſhop's allowance, at Lowth; and declared that he would complain to her majeſty of any, though never ſo great, who ſhould ſhow themſelves diſcontented with the jury for any ſuch matter; in ſhort, he conducted himſelf with ſo much wrath, ſo many oaths, and ſuch reproachful revilings, upon the bench, that offence was taken at it by perſons of principal credit and note, throughout all the circuits.

He was nevertheleſs an able lawyer, and adhered with rigorous exactneſs to the ſtatutes; nor does it appear, that his obedience to the will of the ſovereign proceeded, like that of others, from view of perſonal intereſt, or from a fear of loſing his office, but from reſpect for what he deemed the conſtitutional right of the crown. In a caſe, when the queen would have ſtretched her prerogative beyond the limit of the law, the lord chief juſtice and his brethren reſiſted, and by their ſteadineſs obliged the queen to relinquiſh her claim. He alſo, together with the other judges, ſigned a remonſtrance againſt the arbitrary proceedings of the court, by which at the command of a counſellor, or nobleman, ſubjects were frequently committed to priſon, and detained without good cauſe, and contrary to the laws of the realm; a ſpirited meaſure which produced conſiderable effect; for we are told in Sir William Anderſon's reports (Reports, part ii. p. 297,) that "after this there did follow more quietneſs than before." Upon the acceſſion of James I., the lord chief juſtice was continued in his office; and he retained it till his death in 1605. "With a harſh and ſevere temper, and intolerant principles, which rendered him hoſtile to ſectaries, and with notions of arbitrary power, which made him, in ſome caſes, an inſtrument of tyranny, he appears to have poſſeſſed great firmneſs of temper, and independence of character. If his principles would not ſuffer him to be always an equitable judge, he was a great lawyer, and, on the whole, an honeſt man." His works are "Reports of Caſes, adjudged in the time of queen Elizabeth, in the common bench," in folio, London, 1644; "Reſolutions and Judgments in the Courts of Weſtminſter, in the latter end of the reign of queen Elizabeth," publiſhed by John Goldeſborough, Eſq. 1653. The title is now extinct. Biog. Brit.

Anderson, John, the ſon of a rich merchant, was born at Hamburgh, in 1674. Having made great proficiency in canon law, natural hiſtory, and the languages, he was made ſyndic of the city of Hamburgh, and he was employed in various negociations in the principal courts of Europe. In the proſecution of his ſtudy and reſearch, he directed a particular attention to the northern nations, and both by reading and converſation obtained a very conſiderable degree of information concerning them. By means of the Daniſh colonies eſtabliſhed in Davis's Straits, he gained an accurate knowledge of thoſe ſequeſtered parts, and he was enabled to correct many erroneous and fabulous accounts, concerning the ſtate of Iceland. The reſult of his inquiries was communicated to the public in a German work, entitled, "The natural hiſtory of Iceland, Greenland, Davis's Straits, and other northern regions;" ſince tranſlated into other languages. Mr. Anderſon died in 1743; and left behind him MS. pieces, that have not been publiſhed. Moreri.

Anderson, Adam, a native of Scotland, was brother to Rev. James Anderſon, D. D. editor of the "Diplomata Scotiæ," and "Royal Genealogies," miniſter of the Scots church, in Swallow-ſtreet, Piccadilly, and known in London, among his connections, by the name of biſhop Anderſon; a learned but imprudent man, who loſt a great part of his property in the year 1720. Adam Anderſon was for 40 years a clerk in the South Sea Houſe; one of the truſtees for eſtabliſhing the colony of Georgia, in America; and one of the court of aſſiſtants of the Scots corporation, in London. His well known work, entitled, "An Hiſtorical and Chronological Deduction of the Origin of Commerce," was firſt printed in two volumes, fol., in 1764; and a new edition of it, with conſiderable additions, was publiſhed in four volumes, 4to., in 1789. Mr. Anderſon died in Red Lion-ſtreet, Clerkenwell, Jan. 10, 1755.

Anderson's *Iſland*, in *Geography*, a ſmall iſland in the North Pacific ocean, diſcovered ſoon after Mr. Anderſon, the ſurgeon of the Reſolution, had breathed his laſt, and ſo called after his name. It was ſeen at ſome diſtance from a rocky point called Cape Newnham, ſituated in N. lat. 58° 42′. E. long. 197° 36′.

ANDES, in *Ancient Geography*, a ſmall place of Italy, near Mantua, celebrated as the birth-place of Virgil; hence he

he is called *Andinus*, according to ſome copies of Silius Italicus, lib. viii. v. 596; whilſt others read *Aonius*. It is now the village of Bandes, ſituate where the Veroneſe hills imperceptibly ſlope down into the plain of Mantua.

Andes, Andegavi, or Andicavi, a people of Gaul, to the eaſt of the Namnetes or Nannetes, and to the north of the river Liger. Pliny (lib. iv. c. 18.) calls them Andegavi, and they are denominated by Tacitus (Annal. iii. c. 41.) Andecavi, which Ptolemy has corrupted into Ondicavæ. Their chief city was called Juliomagus or Civitas Andicavorum. It is now Angers, and the territory of the Andes was the preſent Anjou. The Andes, or Andecavi, were valiant, and fought bravely in defence of their liberty; they entered into the conſpiracy of Vercingetorix, under the conduct of Dumnacus; and under the empire of Tiberius, when they were grievouſly oppreſſed with taxes, they raiſed the ſtandard of rebellion.

Andes, a chain of mountains in South America, called by the Spaniards Cordillera de los Andes, or great chain of Andes, which commences near the capes of Iſidro and Pilares, in the ſouthern extremity of the continent, and ſtretches along the Pacific ocean, at the mean diſtance of about 100 miles, traverſing the kingdom of Chili, and the provinces of Buenos Ayres, Peru, and Quito, to the weſt ſide of the gulf of Darien, through an interval of not leſs than 4600 miles. From thence they continue their courſe through the extenſive kingdom of New Spain, till they loſe themſelves in the unexplored countries of the north. The chief ſummits of this range of mountains are near the Equator, not far from the city of Quito. The higheſt of them is Chimborazo, about 100 miles ſouth of Quito, and about 10 miles north of Riobamba; and its height was computed by the French mathematicians, who were employed from 1735 to 1743, in meaſuring a degree of the equator, to be about 3217 French toiſes, or 20,280 feet, above the level of the ſea; that is about 5000 feet higher than Mont Blanc. But as theſe mountains are elevated on the high plain of Quito, which is elevated farther above the ſea than the top of the Pyrenées, and conſtitutes more than one-third of the computed height, they are inferior in actual elevation to Mont Blanc. That part of Chimborazo, which is covered with perpetual ſnow, is about 2400 feet from the ſummit. The mountain next in height is ſuppoſed to be the volcano of Cotopaſhi, which is eſtimated at about 18,600 feet, and is ſituated about 25 miles ſouth-eaſt of Quito. Other elevated ſummits are Pachincha, a few miles north-eaſt of Quito; and the Altar and Sanga, ſouth-eaſt of Chimborazo. In the province of Quito, the Andes form a double chain, including the plain of Quito. The weſtern ridge comprehends Pachincha, Iliniſſa, Chimborazo, &c.; and the eaſtern is compoſed of Cotopaſhi, the Altar, Sanga, &c.; and this double ridge is extended for about 500 miles from the ſouth of Cuenza to the north of Popayan. The higheſt of theſe ridges is barren, and covered with ſnow, although it lies in the torrid zone; the other, which is lower, is fruitful in woods, groves, &c. and abounds with wild hogs and ſheep, called guanacos, which reſemble a camel in ſhape, but of a ſmaller ſize, and bearing hair for ſoftneſs, firmneſs, and colour, preferred to ſilk.

There are ſeveral arms, or ramifications, which proceed from the Andes, and which ſerve to conſolidate the union of the ſouthern with the northern parts of America. The moſt northern of theſe, or that of the coaſt of Venezuela, lying between nine and ten degrees of N. latitude, is the moſt lofty and narrow. This great chain of the Andes extends from the high plain of Quito, by Popayan and Choco, on the weſt of the river Atrato, towards the iſthmus, where, on the banks of the Chagré, it forms mountainous land only about 1200 feet high. From the ſame Andes proceed ſeveral branches, one called the Sierra de Abibe, towards the province of St. Marta, covered with ſnow, and viſible from the ſea. This chain is reſtricted, as it approaches the gulf of Mexico, and cape of Vela, and afterwards runs due eaſt towards the mountain of Paria, or even to the iſle of Trinidad. The greateſt height is in the two Sierras Nevadas of St. Marta, and of Merida; the firſt being near 5000 varas, and the ſecond 5400 varas, about 2350 toiſes, or 14,000 Engliſh feet above the ſea. Several mountains of this chain are perhaps equal in height to Mont Blanc; they are perpetually covered with ſnow, and frequently pour from their ſides ſtreams of boiling ſulphureous water; and the higheſt peaks are elevated amidſt mountains of little height, that of Meridan being near the plain of Caracas, which is only 260 feet above the ſea. The general height of the chain of the coaſt is from ſix to 800 toiſes; the Nevada of Merida is 2350, and the Silla de Caracas 1316, lowering towards the eaſt, ſo that cape Codera is only 176 toiſes. This depreſſion, however, is only of the primitive rock; for there are ſecondary calcareous mountains from cape Unara, which are higher than the gneiſs, or foliated granite, and the micaceous ſchiſtus. Theſe calcareous mountains, covered with calcareous free-ſtone, follow this chain on its ſouthern ſide, and increaſe in height towards the eaſtern point of the continent. The chain of the coaſt is more ſteep towards the north than the ſouth; and there is a dreadful perpendicular precipice of 1300 toiſes in the Silla de Caracas, above Caravelledo, the northern part of this chain being perhaps broken by the gulf of Mexico.

The ſecond chain, which is that of Parima, or of the cataracts of Orinoco, was ſcarcely deemed paſſable till within 30 years, ſince the expedition of Ituriaga and Solano. It leaves the Andes near Popayan, and ſtretching from weſt to eaſt, from the ſources of the Guaviari, appears to extend to the north-eaſt of that river, forming the cataracts of Maypura and Atures, in the Orinoco, lat. 5°, which are truly dreadful, and nevertheleſs afford the only paſſage yet opened towards the vale of the Amazons. Thence this chain continues its courſe, with a breadth ſometimes of 120 leagues, north-eaſt to the river Caronis, but further to the eaſt its continuation is little known. It has, however, been diſcloſed by Don Antonio Santos, who, under the diſguiſe of an Indian, paſſed from the mouth of the river Caronis, to the little lake of Parima, and obſerved this range between 4° and 5° N. lat., where it is about 60 leagues broad, and divides the waters which fall into the Orinoco and Eſquibo, from thoſe that fall into the river of Amazons. Further to the eaſt, this range becomes ſtill wider, deſcending ſouth along the Mao, where the Dutch call a part of it Dorado, or the mountain of gold; as it is compoſed of bright micaceous ſchiſtus, which gives a ſimilar character to a ſmall iſle in the lake of Parima. To the eaſt of the Eſquibo this range takes a ſouth-eaſt direction, and joins the granitic mountains of Guiana, in which is the ſource of the river of Surinam, and alſo of other rivers. This laſt group of mountains is very extenſive, the ſame gneiſs being found at 8° 20′ and 2° 14′. This wide range is inhabited by a number of ſavage tribes, which are not much known in Europe. It no where ſeems to riſe to an equal height with the northern range of the coaſt; the mountain of Duida, whoſe volcano is in lat. 3° 13′, not far from Eſmeralda, being deemed the higheſt, and, by the meaſure of Humboldt, found 1323 toiſes above the ſea. This is a picturesque and majeſtic mountain, ejecting flames towards the cloſe of the rainy ſeaſon, and ſituate near a beautiful plain, covered with palm-

trees and ananas. Towards the eaſt it ſeems to terminate in broken rocks; but without any appearance of any ſecondary ſtrata, the rocks being granite, gneiſs, micaceous ſchiſtus, and hornblende ſlate.

The third chain of primitive mountains, or that of Chiquitos, unites the Andes of Peru and Chili with the mountains of Brazil and Paraguay, and ſtretches from La Paz, Potoſi, and Tucuman, through the provinces of Moxos, Chiquitos, and Chaco, towards the government of the Mines, and of St. Paul, in Brazil. The higheſt ſummits appear to be between 15° and 20°; the rivers there paſſing to that of Amazons, or that of La Plata.

Between theſe three great ridges are three immenſe vallies; that of Orinoco, that of the river of Amazons, and that of the Pampas of Buenos Ayres, from 19° to 52° ſouth lat. all opening to the eaſt, but ſhut on the weſt by the Andes. The middle valley, or that of the Amazons, is covered with foreſts ſo thick, that the rivers alone form roads; while thoſe of Orinoco and Pampas are ſavannahs or graſſy plains, with a few ſcattered palms; and ſo level, that ſometimes for 800 ſquare leagues there is no elevation exceeding eight or ten inches. In the northern plain the primitive rock is covered with limeſtone, gypſum, and freeſtone, while in that of the Amazons the granite every where appears. The general inclination is to the north-weſt, which, according to Humboldt, is the uſual arrangement of primitive rocks. In the Andes petrifactions are uncommon, but there are ſometimes patches of gypſum, and ſecondary limeſtone; while the range of Parima conſiſts entirely of granite and other primitive rocks. But in the calcareous freeſtone of the northern ridges of the coaſt, Humboldt found many ſhells, ſeemingly of recent petrifaction, as they are thoſe of the ſea, now at the diſtance of nine leagues. In the plain of Orinoco are found petrified trees, in a coarſe breccia. Granite forms the chain of Parima; but in that of the coaſt it is covered, or mingled with gneiſs and micaceous ſchiſtus. It is ſometimes ſtratified in beds from two to three feet thick, and ſometimes contains large cryſtals of felſpar. The micaceous ſchiſtus ſometimes preſents red garnets, and ſapphare; and in the gneiſs of the mountain of Avila green garnets appear. In the range of Parima there occur large maſſes of moſt brilliant talc, formerly imparting ſuch reputation to the Dorado, ſituate between the rivers Eſquibo and Mao, and other mountains, which like burniſhed gold, reflect the light of the ſun, and have hence been denominated the ſhining mountains. Smectite, or ſoft jad, is formed into idols: and Condamine diſcovered that hard jad, called Amazon ſtone. Schiſtoſe chlorite alſo occurs; and beautiful hornblende ſlate riſes through the ſtreets of Guaiana, or S. Thome. Other ſubſtances are decompoſed felſpar or kaolin, primitive limeſtone and plumbago; and there are veins of quartz, which contain auriferous pyrites, and antimony, native gold, grey copper, and malachite. The copper mines of Aroa are alone wrought, and produce about 1500 quintals yearly. Slate is rare, but ſometimes covers the micaceous ſchiſtus; and in the northern chain there are rocks of ſerpentine, veined with bluiſh ſteatite. The grunſtein of Werner ſometimes occurs in that ridge. Among the rocks called tranſitive by Werner, as connecting the primitive with the ſecondary, are trap, green ſlate, amygdaloid, and the ſchiſtoſe porphyry of that author, green with cryſtals of felſpar. The ſecondary rocks are limeſtone, gypſum, argillaceous ſchiſtus, and freeſtone, or calcareous ſandſtone, with coarſe breccia.

The eaſtern ſpurs of the Andes, according to Helms, a practical German mineralogiſt, who was employed for ſome years in the mines of Peru, ſometimes preſent red and green granite, and gneiſs, as towards Cordova, and Tucuman, but the grand chain conſiſts chiefly of argillaceous ſchiſtus, or various kinds of thick ſlate, bluiſh, dark red, fleſh colour, grey and yellow; on which, in many places, are incumbent ſtrata of limeſtone, and large maſſes of ferruginous ſandſtone. No mountains, ſays this author, have been obſerved by him in Hungary, Saxony, or the Pyrenées, which are ſo irregular as the Andes, or broken into ſuch alternate ſubſtances, manifeſting ſuch prodigious revolution of nature. Amid the argillaceous ſchiſtus the metals ſometimes occur in veins of quartz, ſometimes in alluvial layers of ſandſtone, and iron ſand. Near Potoſi are irregular beds of large bullets of granite; and the celebrated mountain, ſo rich in ſilver ore, is chiefly compoſed of a firm yellow argillaceous ſlate, full of veins of ferruginous quartz, in which are found ſome of the beſt ores. In paſſing the higheſt ridge of the Andes, between Potoſi and Lima, Helms ſtill found argillaceous ſchiſtus, the predominant ſubſtance; ſometimes with ſtrata of ſandſtone, ſometimes with long extents of granite. Near the lake of Titicaca the Andes are of prodigious height, this being the centre of the chain, and perhaps equalling the ſummits near Quito; and Helms obſerved in ſome places the baſis of argillaceous ſchiſtus covered with alluvial layers of marl, gypſum, limeſtone, ſand, fragments of porphyry, and even rock ſalt; and yet rich ſilver occurs in abundance. Near Guancavelica, the mountains are chiefly ſand-ſtone or limeſtone; but ſtill equally high and equally rich. To the north of this place the ridge for 100 miles is ſaid to be calcareous, yet fertile in metallic ores. According to Helms, the ſummits near La Paz are the higheſt of the Andes; but he did not travel ſo far as Quito.

It is ſaid that the Andes have 16 volcanoes, which break out in various places, and by melting the ſnow occaſion ſuch torrents of water, that numbers of men and cattle have periſhed. Argillaceous ſchiſtus, that predominates in a range ſo lofty and extenſive as the Andes, where upon the common theories granite might have been expected, is probably the work of that prodigious ſubterranean fire that iſſues from ſo many volcanoes, and of the eruptions of mud, combined with ſubterranean waters; for this mud is the very matter of argillaceous ſchiſtus, and thus ejected during thouſands of years, has become ſuperincumbent on the granite, which is perhaps the principal ſubſtance in ſuch parts as are not volcanic.

The French mathematicians, who viſited the Andes, for meaſuring a degree of the meridian, have given a particular account of the occurrences that befel them on this occaſion. Having divided themſelves into two bodies, Don George Juan and M. Godin, at the head of one party, went to the mountain of Pambamaria; and M. Bouguer de la Condamine, and Don Ulloa, with their aſſiſtants, aſcended the higheſt ſummit of Pachincha. Both parties ſuffered from the extremity of the cold, and the impetuoſity of the winds, which on theſe heights blow with inceſſant violence. They had commonly, in other uncomfortable ſituations, pitched a field-tent for each company; but on the top of Pachincha this was impracticable, and they were under the neceſſity of contenting themſelves with a very ſmall hut, which, like all the other adjacent parts, was ſoon covered with ice and ſnow. The air on this ſummit was alſo ſo ſubtile, as to render reſpiration very difficult. They generally kept within their hut; which they were obliged to do, on account of the intenſeneſs of the cold, the violence of the wind, and the darkneſs occaſioned by a thick fog. When the fog cleared up, the clouds deſcended towards the earth; and ſurrounded the mountain in ſuch a manner

manner as to repreſent the ſea, with the rock on which they were ſituated like an iſland in the centre of it. When this happened, they heard the horrid noiſes of the tempeſts, which then diſcharged themſelves on Quito, and the neighbouring country. They ſaw the lightnings iſſuing from the clouds, and heard the thunder rolling far beneath them; and whilſt the lower parts were involved in tempeſts of thunder and rain, they enjoyed a delightful ſerenity; the wind abated, the ſky was clear, and the enlivening rays of the ſun moderated the ſeverity of the cold. But when the clouds roſe, reſpiration became difficult, and ſnow and hail fell continually, and the wind reſumed its former violence; ſo that they were apprehenſive, leſt their hut ſhould be overturned, and blown down the precipice, on the edge of which it was built, or that they ſhould be buried under it by the accumulation of ice and ſnow. Their fears were increaſed by the dreadful concuſſions occaſioned by the fall of enormous fragments of rocks, and the velocity with which the wind moved dazzled their ſight. For their greater ſecurity they faſtened the door of their hut with thongs of leather, and ſtopped every crevice on the inſide; and they alſo completely covered it with ſtraw; but all this precaution was not ſufficient to prevent the wind from penetrating. They had no other light in this confined ſtate, but that of a lamp or two, which they kept burning; but notwithſtanding the ſmallneſs of their habitation, and the heat of the lamps, the cold was ſo intenſe, that each of them was obliged to have a chaffing-diſh of coals. Such were the effects of the aſperity of the climate, that their feet were ſwelled and ſo tender, that they could not even bear the heat, and walking was attended with great pain. Their hands were covered with chilblains; their lips were ſwelled and chopped; ſo that every motion, in ſpeaking or the like, drew blood. Their common food in this inhoſpitable region was a little rice boiled with ſome fleſh or fowl, which was procured from Quito; and inſtead of water, their pot was filled with ice; and whilſt they were eating, every one of them was obliged to keep his plate over a chaffing-diſh of coals, to prevent his proviſions from freezing. When they attempted to augment their inward heat by drinking ſtrong liquors, they felt no ſtrength in them, nor were they any greater preſervative againſt the cold than common water. The Indians, who attended them, could not by any encouragement, or threat of puniſhment, be prevailed upon to continue with them. Upon their firſt feeling the rigour of the climate, they immediately prepared for deſertion; and ſuch was the inconvenience reſulting from this circumſtance, that they were in danger of being confined in their hut, by the maſſes of ſnow, which it was the buſineſs of theſe Indians every morning to remove. Such, and ſimilar to theſe, were the difficulties and inconveniences with which they encountered during the whole progreſs of their occupation in forming triangles for meaſuring degrees of the meridian. Don Juan Don Ulloa's Voyage to South America, by Adams, vol. i. p. 214, &c. Journal de Phyſique, Meſſidor An. ix. July, 1801. Helms's Tagebuch, &c.; or Journal of a Journey through Peru, from Buenos Ayres to the great river La Plata, by Potoſi to Lima, &c. 8vo. Dreſden, 1798. Pinkerton's Modern Geography, vol. ii. p. 673, &c.

ANDESAGE, a town of France in the department of the Lot and Garronne, and chief place of a canton, in the diſtrict of Villeneuve d'Agen, 10 miles north-eaſt of Agen.

ANDETHANA, in *Ancient Geography*, *Epternach*, a town of Gaul, belonging to the Treveri, in Belgia prima, between Auguſta Treverorum to the eaſt, and Orobannum to the weſt.

ANDETRIUM, (Pliny), ANDRETIUM, (Strabo), ANDERION, (Dion Caſſius), and ANDRETRIUM, (Ptolemy), a town of Dalmatia, ſituate on an almoſt inacceſſible rock, ſurrounded with deep vallies and rapid torrents; whence it appears to be the citadel now called *Cliſſa*. N. lat. 43° 20'. E. long. 17° 46'.

ANDEVALLO, in *Geography*, a ſmall country of Spain, in Andaluſia, on the frontiers of Portugal and Spaniſh Eſtremadura.

ANDEZEIOW, or DEDERZEIOW, a town of Poland, in the palatinate of Cracow, 52 miles ſouth ſouth-weſt of Cracow.

ANDIANTES, a people, according to Ptolemy, of Lower Panponia.

ANDIATOROQUE, a lake of Canada, in North America, near New England.

ANDILLA, a town of Spain, in the province of Valencia, ſix leagues from Alicant.

ANDIRA, or ANGELIN, in *Botany*, *G. Piſon*; a tree in Brazil, the wood of which is hard and proper for building. Its bark is of an aſh colour; its fruit is of the ſhape and ſize of an egg, green at firſt, but growing blacker by degrees. It is covered with a hard rind, incloſing a grain, or yelloviſh kernel, of a bitteriſh, aſtringent taſte. They pulverize this nut, and give it for worms; but not more than one ſcruple; for more than this is ſaid to be poiſonous. In the Linnæan ſyſtem by Gmelin, *andira* is a genus of the *diadelphia decandria* claſs and order; the characters of which are, that the *calyx* is urceolated almoſt entire, or quindentated; the *corolla* has two petals: and the fruit is a fleſhy pod, ovate, furrowed, and containing a ſingle ſeed.

ANDIRA, in *Zoology*, is an animal called alſo *andira-guacu*, a kind of bat in Brazil: the largeſt of which are as big as our pigeons: they call them horned bats, from a ſort of excreſcence, or pliant body, above their beak. Some of theſe are very dangerous; for they get into chambers in the night, and ſo ſubtilly open the veins in the feet of thoſe who are in bed, that they are not perceived but by the flowing of the blood, which is difficult to be ſtopped. The inhabitants reckon the tongue and heart of that animal among poiſons. The andira is the VESPERTILIO SPECTRUM of Linnæus. See SPECTRE.

ANDIRIAR, in *Botany*, the name by which Rhaſes, and ſome others, expreſs the FABAGO.

ANDLAU, in *Geography*, a town of France, in the department of the Lower Rhine, ſituate on a mountain, and defended by a caſtle. It was formerly an imperial free city, and has a nunnery, inſtituted for ladies of noble extraction. It is 18 miles ſouth-ſouth-weſt of Straſburg. N. lat. 48° 24'. E. long. 7° 24'.

ANDLAU is alſo a river of France, which riſes near the town of the ſame name, and diſcharges itſelf into the Ill, near Fegerſheim, in the department of the Lower Rhine.

ANDOCIDES, in *Biography*, an Athenian orator, was born at Athens, the firſt year of the 78th olympiad, or 468 years before Chriſt. He was attached to oligarchy, and not to popular government. When Alcibiades was tried for demoliſhing the ſtatues of Mercury, Andocides was ſuſpected, and he eſcaped by acknowledging the crime, and accuſing his accomplices. The ſtyle of his orations is plain and ſimple, and almoſt entirely deſtitute of ornament. Four are extant, of which the two firſt are vindications of himſelf; the third is on the ſubject of peace with the Lacedæmonians; and the fourth againſt Alcibiades, who had ſent him into exile. They were firſt publiſhed with thoſe of Antiphon, Æſchines, &c. by Aldus Manutius, in folio, at Rome, in 1513; and afterwards in a more ſplendid manner, in 1575, by Henry Stephens. The orations of Antiphon, Andocides,

des, and Hiero, were published in 8vo, with a Latin version, at Hanau, in 1619. Plut. Alcibiades apud opera, tom. i. p. 201. Fabr. Bib. Græc. lib. ii. c. 26. § 3. tom. i. p. [illegible].

ANDOLOGENSES, in *Ancient Geography*, a people of Spain, according to Pliny.

ANDOMADUNUM, Andomatunum, (Ptolemy), Antematunum, (Antonine), Civitas Lingonum, (Tacitus), now *Langres*, a city of Gallia Belgica, was a Roman colony, and appears, by many remains of antiquity, to have been considerable. It was situated on an eminence as the termination *dunum* imports. N. lat. 48°. E. long. 5° 22′.

ANDONY River, in *Geography*, lies on the coast of Benin, in Africa, east from Cape Formosa, between the new and old Calabar rivers, in about N. lat. 4° 30′, and E. long. 9° 55′.

ANDORA, a town of Italy, in Genoa, whose neighbourhood produces good wine; two miles north-east of Oneglia.

ANDORINHA, in *Ornithology*, a name by which the Portuguese in the Brasils call the Brasilian swallow, more usually known by its Brasilian name *tapera*.

ANDORISIPPO, in *Ancient Geography*, a town placed by Pliny in Bætica. Hardouin calls it *Andorisæ*.

ANDORNO, in *Geography*, a town of Italy, in the principality of Piedmont, and lordship of Vercelli, 25 miles north-west of Vercelli.

ANDORRA, a town of Spain, in Catalonia, situate in a valley of the same name, which is surrounded by the Pyrenees, and formerly made a part of the county of Foix, with which it joins; the valley is fertile, and watered by a small river, called Belira, that runs into the Segra, three leagues north of Urgel.

ANDOSILLA, a town of Spain, in Navarre; two leagues from Calahorra.

ANDOSINI, in *Ancient Geography*, a people placed by Polybius, in Spain, towards the Pyrenees.

ANDOVER, in *Geography*, a borough town of England, in the county of Hampshire, pleasantly situate near the river Ande. It has a manufacture of shalloons, and a considerable trade in malting. Its market is on Saturday. It is governed by a bailiff, steward, recorder, ten other persons of approved reputation, and 24 burgesses. It sends two members to parliament. A navigable canal is making from this town to Southampton; it is 63½ miles from London, and 17½ from Salisbury. N. lat. 51° 20′. W. long. 0° 56′.

Andover is also a large and thriving town of North-America, in Essex county, Massachusets, containing two parishes, and 2863 inhabitants. It has a paper mill and powder mill and an excellent academy, called "Phillips Academy," from the name of its founders. This town lies about 20 miles west of Newbury port, and about 22 north of Boston.

Andover is also a town of Hillsborough, in New Hampshire, incorporated in 1779, and containing 645 inhabitants.

Andover is also the south-westernmost township in Windsor county, Vermont, situate 32 miles north east of Bennington, and containing 275 inhabitants.

Andover is also a place in Sussex county, New Jersey, near the source of Pequest river, five miles south-south-east from New-Town, and 16 in the same direction from Walpack.

ANDOVILLE, a town of France, in the department of the Mayenne, a chief place of a canton, in the district of Laval, near the river Ernée, six miles north of Laval.

ANDRAÆ, in *Ancient Geography*, a town of Asia Minor, placed by Ptolemy in Cappadocia, in the prefecture of Chamanes.

ANDRACHNE, in *Botany*, *Telephoides* of Tournefort, a genus of the *monoecia gynandria* (*pentandria trigynia*, Gmelin's Linnæus) class and order; of the natural order of *tricoccæ* and *euphorbiæ* of Jussieu; the characters of which are, that it has male and female flowers; in the former the *calyx* is a five-leaved, equal, marcescent perianthium; the *corolla* has five petals, emarginate, slender, and shorter than the calyx, the nectary has five leaflets, semibifid, herbaceous, one within each petal, and less than it; the *stamina* have five filaments, small, inserted into the rudiment of each style, and simple anthers; in the latter the *calyx* is a five-leaved, equal, permanent perianthium; the *corolla* has no petals, the nectary as in the male; the *pistillum* is a germ superior and globose, styles three, filiform, and two-parted, the stigmas globose; the *pericarpium* is a capsule globose-trilobate, three-celled, cells bivalved, of the size of the calyx, (tricoccous elastic, G.); the *seeds* are in pairs, rounded on one side, triangular and obtuse on the other. Obs. It is related to *clutia*.

Martyn enumerates three, and Gmelin two species. 1. A. *telephoides*, telephoides of Dill. and Buxb. glaux of Bocc. procumbent and herbaceous. This is a low plant, with its branches trailing on the ground; the leaves are small, oval, and of a sea-green colour; found wild in some parts of Italy, and in the Archipelago, whence its seeds were sent by Tournefort to the royal garden at Paris; and cultivated in Kew garden by Dr. Sherard, in 1732. As it has no great beauty, it is only preserved in botanic gardens for the sake of variety. 2. A. *fruticosa*, β clutia androgyna of Linn. Mantiss. erect and shrubby. It rises 12 or 14 feet high, with branches bearing spear-shaped, pointed, smooth leaves; the flowers are small, and of an herbaceous white colour; some flowers are male, with a one-leafed round flat obtuse calyx, a little quinquefid, others on the same plant female, five-parted; a native of the East Indies, in China, and also of La Vera Cruz, in New Spain. 3. A. *arborea* of Miller, with arborescent stem, and leaves ovate, obtuse, hoary underneath. This has a strong woody stem, which rises more than 20 feet high, with branches from which proceed oval blunt leaves hoary on the under side, and furrowed on the upper, and placed alternately on the branches. This species grows naturally at Campeachy, and the seeds were sent from thence to England by Dr. Houstoun. There is another sort, raised from seeds, sent from Jamaica; the leaves of which resemble those of the laurel, except that they are much larger; this has not yet flowered in Europe.

Culture. The seeds of the first species may be sown on a moderate hot bed in March; and the plants, which spring up in about a month, may be removed, each into a small pot, and plunged into another moderate hot bed; in mild weather they should have plenty of air and be often watered; in June they will produce flowers, and the seeds will ripen in August and September, after which the plants decay. The second and third species are very tender plants; their seeds should be sown in pots, which must be plunged in a hot bed of tanner's bark, and watered; when the plants come up, each of them should be planted in a small pot, plunged into a tan-bed, and they should be shaded till they have taken fresh root, and afterwards in warm weather exposed to the air, but constantly kept in the bark stove.

Andrachne. See Arbutus.

ANDRADA, Diego De Payva D' or Andradius, in *Biography*, a learned Portuguese divine of the 16th century, was born at Coimbra, distinguished in that University, and sent by Sebastian, king of Portugal, to the council of Trent, where he was celebrated for the understanding of a deep

deep theologian, and for the tongue of an eloquent orator. During the ſeſſion of the council he wrote a treatiſe, entitled, "Orthodoxarum Explicationum Libri Decem," in anſwer to an attack upon the Jeſuits by Chemnitius. This was anſwered by Chemnitius. Andrada prepared an elaborate rejoinder under the title of "Defenſio Tridentinæ fidei," or a defence of the Catholic faith, &c. firſt publiſhed in 4to. at Liſbon, in 1578, and afterwards at Ingolſtadt, in 8vo. in 1580. Andrada publiſhed alſo ſeven volumes of ſermons, Although a champion for orthodoxy, he had the candour to allow that the heathen philoſophers might be ſaved. Gen. Dict.

Andrada, Francis, hiſtoriographer to Philip III. king of Spain, was the brother of the preceding Andrada. He wrote "The Hiſtory of John III. king of Portugal," in the Portugueſe language; which was publiſhed, in 4to., at Liſbon, in 1533.

ANDRAGATHIA, in *Ancient Geography*, a town of Italy, in the vicinity of Poſidonium.

ANDRAGIRI, or Gudaviri, in *Geography*, a province and town in the iſland of Sumatra. The town is in the middle of the iſland, and belongs to the Dutch, who have built a fort for its ſecurity.

ANDRAMIT, Adramit, or Andramiti, a town of Natolia, in Turkey, in Aſia. The Turks call it Palament. See Adramyttium.

ANDRAPANA, in *Ancient Geography*, a town of Aſia, in India, aſcribed by Ptolemy to the Indoſcythians.

ANDRAPODISMUS, in *Ancient Writers*, the ſelling of perſons for ſlaves.

Hence alſo *andrapodiſtes*, ανδραποδιστης, a *dealer in ſlaves*, more particularly a *kidnapper*, who ſteals men or children, to ſell them; a crime for which the Theſſalians were noted.

ANDRAPODOCAPELI, Mancipiorum Vindictores, in *Antiquity*, dealers in ſlaves. They cleanſed the ſkins of the ſlaves with baths prepared with barley and other kinds of meal, to which nitre, according to Galen, was occaſionally added, they whipped them lightly with cords, and then ſmeared them with oil, and uſed various other acts to make them ſleek and plump, and to give them an appearance of health. They were alſo called Mangones, and the art Mangoneiam. Caſtelli Lexicon.

At Athens, ſeveral places in the forum were appointed for the ſale of ſlaves. Upon the firſt day of every month, the merchants brought them into the market, and expoſed them to ſale, whilſt the crier, ſtanding upon a ſtone erected for that purpoſe, called the people together.

ANDRARUM, or Anderum, in *Geography*, a town of Sweden, in the province of Schonen; 14 miles [illegible] Chriſtianſtadt.

ANDRASTE, in *Antiquity*, one of the female divinities of the ancient Britons, ſuppoſed to have been the ſame with Venus or Diana.

ANDRE, St., in *Geography*, a town in the kingdom of Leon, in North America, near the mouth of Naſſas river, which falls into the gulf of Mexico.

Andre, a ſmall river of France, in Britany, which runs into the Loire, at Nantes.

Andre, a town of Phrygia in Aſia Minor.

André, St., in *Biography*, born at Dijon, the 15th of February, 1704, received his education at Montpellier, and in 1729 was admitted member of the company of ſurgeons, at Verſailles, and appointed one of the ſurgeons to the king. He applied himſelf particularly to the ſtudy of the diſeaſes of the urethra, and was expert in the application of bougies, on which he placed his principal dependence in theſe complaints, varying the ingredients of which they were compoſed, to make them more or leſs ſtimulating and eroding, as the circumſtances of the caſes required. In 1751, he publiſhed his "Diſſertations ſur les maladies de l'uretre, qui ont beſoin de bougies," 12mo. Paris, and in 1758; "Maniere de faire uſage des bougies antivenereiennes," 8vo. alſo at Paris. For an account of other publications by this writer, ſee Eloy. Dict. Hiſt.

ANDREA, in *Geography*, a town of Africa, in Upper Guinea, about a quarter of a mile from the river Meſurado, and eight miles from its mouth; it contains about 40 or 50 houſes; its chief riches are palm, wine, and rice; a trade is alſo carried on in ivory and ſlaves.

Andrea Andreani, in *Biography*, an eminent engraver, was born at Mantua, and died A. D. 1623, at a very advanced age. Beſides his own engravings, he procured many performed by other perſons, and ſold the impreſſions under his own name. He engraved only on wood, in a peculiar ſtyle, diſtinguiſhed by the name of "Chiaro-ſcuro," which is performed with two, three, or more blocks of wood, according to the number of tints required, which are ſtamped upon paper, one after another, ſo as to produce the effect of a waſhed drawing. The invention of this ſpecies of engraving was much prior to the æra of this artiſt. His great merit as an artiſt, is acknowledged by all who are converſant with his prints. His drawing is excellent, executed with great ſpirit, and in a very maſterly ſtyle. The heads of his figures are characteriſtic and expreſſive, and he has diſplayed great judgment in the management of his various tints. His works are conſidered as admirable tranſcripts from the ſketches of many of the greateſt painters. Among his moſt finiſhed prints may be reckoned, "Chriſt departing from Pilate," who is waſhing his hands; a large print lengthways, on two blocks, engraved from a bas relief of Giovan. Bologna; "An emblematical Print," repreſenting the Chriſtian, after his ſpiritual warfare in the preſent life, received as victorious into heaven, and crowned by Chriſt;" "The triumph of Julius Cæſar," from Andrea Mantegna, the original of which is at Hampton Court; it is cut on 10 blocks of wood, dated 1598; "The entombing of Chriſt," from Raphael de Reggio; "The rape of the Sabines," from a group by Giovan. Bologna. The ſcarceſt of all his works is ſaid to be "The pavement of Sienna," after a drawing of Franceſco Vanni. Strutt.

Andrea, da Pisa, a ſculptor and architect, was born at Pi[illegible] in 1270. He built ſeveral caſtles, and the church of St. John, at Pittoia; but his ſkill in architecture was principally diſplayed at Florence, where he enlarged and fortified the palace of the duke, by erecting many manſions in it and ſurrounding it with magnificent towers and gates. On this account he obtained the right of citizenſhip. At the requeſt of the duke of Athens, he made a model of a citadel, which he intended to erect for reſtraining the Florentines; upon which they took the alarm, and expelled the duke; but Andrea paſſed the remainder of his days at Florence, cultivating the fine arts, ſuch as painting, poetry and muſic, beſides thoſe which were profeſſionally his own, and died in 1345, aged 75.

Andrea Del Sarto. See Sarto.

Andrea Mantegna. See Mantegna.

Andrea, in *Geography*. See Andros, and Andrew's *Cape*.

ANDREÆ, John Gerhard Reinhard, in *Biography*, an apothecary at Hanover, was born 17th December, 1724. By the attention of his mother he was well educated in the languages and ſciences; and in 1744 he viſited Berlin, where

where he attended lectures on chemiſtry, anatomy, botany, and natural hiſtory. In the following year he inſpected the various mines in Saxony, and proceeded through Leipſick, Halle, the Hartz, and Caſſel to Frankfort, where he reſided till the Spring of the year 1746. From hence he removed to the univerſity of Leyden, and ſtudied chemiſtry under Gaubius, botany under Royen, and natural philoſophy under Muſchenbrock. In the year 1747, he viſited England, and returned to Hanover where he ſucceeded to his father's buſineſs, in 1751, and diſtinguiſhed himſelf by his ſkill and diligence. He wrote many uſeful papers in the Hanoverian Magazine, and other periodical works, by which he gained conſiderable reputation and eſteem; in 1763 he made a tour to Switzerland, the original of which was publiſhed in 1776, in a 4to. volume, with engravings; and in 1765 he was charged by government to examine the principal kinds of earth and marl in the electorate, and to publiſh a work on their nature and uſe, for the benefit of farmers, which appeared in 1789, under the title of "A Treatiſe on various kinds of earth in his Britannic Majeſty's dominions, &c. and their uſes in agriculture." In December 1791, he was attacked by an inflammation of the urethra, which at length terminated in his death, on the firſt of May, 1793. His writings and collection of natural hiſtory procured for him an extenſive acquaintance with men of literature and ſcience, and an admiſſion into many learned ſocieties. Gen. Biog.

Andreæ, in *Entomology*, a ſpecies of Carabus. The thorax orbicular, black, and gloſſy; wing-caſes pale, with a black band in the middle. Fabricius. Inhabits Italy.

Andreæ, is likewiſe a ſpecies of Cimex, that inhabits the Weſt Indies. It is red, except the antennæ, ſhank of the legs, beak and wings, which are black. Linnæus. The cimex ruficollis of Muſ. Lud. Ulr., and cimex thorace nigro of Thunberg are ſuppoſed to be varieties of this ſpecies.

Andreanofskie-Ostrova, or Andrenovian *iſles*, in *Geography*, a cluſter of iſlands, between Aſia and America, which in a general view may be regarded as the ſame with the Fox iſlands, being the weſtern part of the ſame range; or the Andrenovian iſles, in a more limited ſenſe, may be conſidered as forming a groupe of ſix or more iſles, about 500 miles to the ſouth-eaſt of Beering's iſland. Theſe, in both reſpects, are a kind of elongation of the American promontory of Alaſka, and in the moſt recent maps of Ruſſia they are comprehended under one general name of Aleutian iſles.

Andreas, John Valentine, in *Biography*, a Lutheran clergyman, was born in the year 1586; became dean of Vayhingen, chaplain to Everhard III. duke of Wurtemberg, abbot of Bebenhauſen, and laſtly of Adelberg; and died June 27th, 1654. His principal works are "Mythologia Chriſtiana;" "De curioſitatis pernicie:" "De reſtitutione reipublicæ Chriſti, in Germania;" "Subſidia rei chriſtianæ et literariæ;" "Theophilus, five de religione chriſtiana colenda;" "Menippus prior et poſterior;" "Peregrinus in Patria;" "Fama Andreana refloreſcens," which contains the life of his grandfather; and various poems in honour of Auguſtus, duke of Wolfenbuttle, inſerted in a book, entitled "Selenelia Auguſtalia." Some have repreſented John Valentine Andreas, as the founder of the Roſicrucians. Gen. Biog.

Andreas, Valerius, a learned Brabanter, was born at the village of Deſſchel, November 25th, 1588. He ſtudied the Greek language at Antwerp, under Andreas Schottus, and the Hebrew under John Hay, a Scots Jeſuit; and his proficiency in the latter language was ſuch that he was invited to be profeſſor of it at Louvain. He afterwards applied to the ſtudy of the law, and in 1621 obtained the degree of doctor. In 1628 he was appointed profeſſor of the "Inſtituta," and in 1638 librarian to the academy. His works are "Orthographiæ Ratio, ab Aldo Manutio collecta, nunc multis aucta; cum libello de ratione interpungendi ac diſtinctis notis;" "De Initiis Collegiæ Buſlidiani, deque vita et ſcriptis profeſſorum ejuſdem collegii;" "De Linguæ Hebraicæ Laudibus, antiquitate, dignitate, neceſſitate;" "Diſſertatio de Toga et Sago;" "Topographia Belgica." His principal work was "Bibliotheca Belgica, de Belgis vita Scriptiſque claris;" firſt printed in 1623, and afterwards with conſiderable additions in 1643. Gen. Biog.

Andreas, John, a famous canoniſt of the 14th century, was the natural ſon of a prieſt, and born at Mugello, near Florence. He proſecuted his ſtudies at Bologna, and particularly that of the canon law, under the profeſſor Guy de Baiſ, who procured for him the degree of doctor, gratis. He was a profeſſor at Padua, about the year 1330, and alſo at Piſa; but he acquired the greateſt reputation at Bologna. He is ſaid to have led a very auſtere life, macerating his body with prayer and faſting, and lying upon the bare ground for 24 years ſucceſſively, under a covering of bear-ſkin. He married a woman named Milantia, by whom he had a beautiful daughter, whom he called Novella, after the name of his mother, and who is ſaid to have read lectures for him when he wanted leiſure. Reſpect for his mother and affection for his daughter induced him to entitle his "Commentary upon the Decretals of Gregory IXth," the "Novellæ." Having loſt his natural ſon Banicontius, who publiſhed ſeveral books, he adopted a learned canoniſt, whoſe name was John Calderinus, and gave him his daughter in marriage. Andreas died of the plague at Bologna in 1348, after having been profeſſor 45 years, and was buried in the church of the Dominicans. He was the author of ſeveral books, ſuch as "A gloſs upon the ſixth book of Decretals;" "Gloſſes upon the Clementines;" "A Commentary in Regulas Sexti," entitled "Mercuriales," either becauſe it was written on Wedneſdays, (dies Mercurii), or becauſe it contained his Wedneſday's diſputations. He alſo enlarged the "Speculum of Durant," in 1347. However he has been accuſed of great plagiariſm. Gen. Dict.

Andreas, John, was born a Mahometan at Xativa, in the kingdom of Valencia, and ſucceeded his father as Alfaqui in that city. He was converted to Chriſtianity by a ſermon preached in the great church of Valencia, in 1487, and profeſſing his faith was baptized, in memory of the calling of St. John and St. Andrew, by the name of John Andreas. Soon after his converſion, he became a prieſt and a public teacher, and was employed by king Ferdinand and queen Iſabella, on a miſſion to the Moors of Grenada, many of whom he induced to abjure Mahomet, and to aſſume the profeſſion of chriſtianity. He was afterwards made a canon, and appointed to undertake the converſion of the Moors of Arragon; but the queen's death prevented the execution of this undertaking. However, he tranſlated from the Arabick into the language of Arragon, the whole law of the Moors, that is, the alcoran and its gloſſes, and the ſeven books of the Suni. He alſo wrote a work, entitled "The Confuſion of the ſect of Mahumed," for the purpoſe of expoſing the follies of Mahometaniſm, which was publiſhed firſt in Spaniſh, has been tranſlated into many languages, and is often cited by thoſe who have occaſion to write againſt the Mahometans, as Hoornbeck, Hottinger, and Schultetus. Gen. Dict.

ANDREAS, TOBIAS, profeſſor of Hiſtory and Greek at Groningen, was born at Braunfels in the county of Solms, in 1604. He ſtudied at Herborn under Alſtedius and his uncle Piſcator, and afterwards reſided ſeven years at Bremen. After his return to his own country, in 1628, he removed to Groningen, where he read lectures on all parts of philoſophy, and obtained the appointment of tutor to the ſons of Henry Alting, his patron, and afterwards in the family of the Prince Palatine. In 1634 he ſucceeded James Gebhardus, as profeſſor of Hiſtory and Greek at Groningen, which office he retained till his death in 1676. He was diſtinguiſhed by his attachment to Des Cartes, whom he vindicated by his writings, both during the life and after the death of that eminent philoſopher. He inſtituted a proſecution againſt Martin Schookius, profeſſor of philoſophy at Groningen, for accuſing Des Cartes of atheiſm. The reſult was, that the accuſer acknowledged Des Cartes's innocence, but was himſelf acquitted. His "Methodi Carteſianæ Aſſertio," was publiſhed in the year 1653. Gen. Dict.

ANDREAS, JAMES, a famous Lutheran divine, was born at Waibling, in the dutchy of Wirtemberg, in 1528, and though of mean parentage, was encouraged in the proſecution of his ſtudies firſt at Stutgard and afterwards at Tubingen, where he connected theology and Hebrew with philoſophy, and took the degrees of bachelor and maſter of arts; and in 1546 he was appointed miniſter of the church of Stutgard; but upon the publication of the "Interim" he was obliged to retire to Tubingen, where he officiated as miniſter. In 1553 he took the degree of doctor of divinity, and was appointed paſtor of the church of Gopping, and ſuperintendant of the neighbouring churches. After performing ſeveral truſts that were devolved upon him, in order to promote the reformation from popery, he attended the diet of Worms in 1557, and was appointed one of the ſecretaries at the conference at Worms between the papiſts and the divines of the Auguſtan confeſſion. In 1559 he attended the diet of the empire at Augſburg; and after his return from Paris, in 1561, he was made chancellor and rector of the univerſity of Tubingen. In 1565 he eſtabliſhed a church at Hagenaw, an imperial city, where he preached many ſermons on the principal points of the Chriſtian religion, which were afterwards printed. He took ſeveral journies, in order to effect an union of the churches of the Auguſtan confeſſion, and engaged in ineffectual conferences with Beza and others, with a view of terminating theological diſputes. His laſt public act was a conference at Baden, in 1589, with John Piſtorius, who then inclined to Calviniſm, but afterwards revolted to popery. He had a preſentiment of his death for ſome time before it happened; and upon its approach he expreſſed his conſtancy in the faith which he had aſſerted, and in the exerciſe of a lively devotion he expired in 1590, in the 62d year of his age. His character and learning were held in high eſtimation; and the books which he wrote were ſo numerous, that it was ſaid that he left 150 works upon various ſubjects. Gen. Dict.

ANDREAS, ST. in *Geography*, a town of Germany, in the circle of Auſtria and dutchy of Carinthia, upon the river Lavant, with a biſhopric ſuffragan of Saltzburg; 16 leagues eaſt of Clagenfurt.

ANDREASBERG, a town of Germany, in the circle of Lower Saxony, and principality of Grubenhagen, having in its environs ſome conſiderable iron-mines, 12 miles from Goſlar, and 12 from Northauſen.

ANDREE, YVES-MARY, in *Biography*, a French Jeſuit, was born in 1675, at Chateaulin, in the county of Cornouailles. Having occupied the chair of profeſſor royal of mathematics at Caen, from 1726 to 1759, when he was 84 years of age, and enjoyed a repoſe of four years, he finiſhed his laborious life in 1764. He was not only a good mathematician, but well acquainted with other branches of learning; and he alſo wrote elegant verſes. Of his "Eſſay on the Beautiful," written in French, a new edition was given in a collection of his works, publiſhed in three volumes, 12mo. in 1766. The ſubject is treated with perſpicuity of method, ſtrength of argument, and dignity of ſtyle. Gen. Biog.

ANDREDCHESTER, a town of ancient Britain, ſuppoſed by Camden to be Newenden, in Kent, but by Somner to be Pevenſey, or Haſtings. It was beſieged by the Saxons, under Ella, but relieved by the Britons. The town was afterwards taken and levelled with the ground, and the inhabitants were maſſacred without diſtinction of age or ſex.

ANDREEVNA, in *Geography*, a town of Ruſſia, in the government of Ekaterinoſlav, 48 miles ſouth-ſouth-eaſt of Ekaterinoſlav. N. lat. 47° 50'. E. long. 32° 14'.

ANDREINI, ISABELLA, in *Biography*, a native of Padua, was one of the moſt celebrated actreſſes who appeared in Italy in the cloſe of the 16th and beginning of the 17th century. Her perſon recommended her action: and ſhe not only ſung and played well, but poſſeſſed an excellent talent for poetry, ſo that ſhe was univerſally admired. She was enrolled in the ſociety of "Intenti" at Pavia; and Cinthio Aldobrandini, nephew of pope Clement VIII. wrote many verſes in her praiſe. In France ſhe was honourably received by the king and queen, and principal perſons of the court, and in honour of them ſhe compoſed ſeveral ſonnets. She died in 1604 at Lyons, in the 42d year of her age, and was buried with diſtinguiſhing marks of attention. Her huſband wrote an epitaph which bears teſtimony both to her morals and to her talents. An edition of her poems, conſiſting of ſonnets, madrigals, ſongs, and eclogues, and a paſtoral, intituled "Mirtilla," was publiſhed at Milan in 1605; and prefixed to it are many elegiac verſes in Latin and Italian, written on occaſion of her death. Some letters of hers were publiſhed at Venice in 1610. To her other qualifications were added ſome knowledge of philoſophy, and an acquaintance with the French and Spaniſh languages.

Her huſband, Francis Andreini, was a player, famous for rhodomontade parts; after his wife's death he left the ſtage, and became a writer of the ſame caſt with that of his acting. Their ſon, John Baptiſt Andreini, was alſo an actor and a dramatic writer. A piece of his, called "Adamo," has been an object of curioſity, becauſe it has been ſuppoſed to have afforded a hint to Milton in his Paradiſe Loſt. See Hayley's Life of Milton. Gen. Dict.

ANDREJOF, in *Geography*, a town ſituate near the Boriſthenes, between Muſcovy and Poland.

ANDRELINUS, PUBLIUS FAUSTUS, in *Biography*, a modern Latin poet, was born at Forli, in Italy, about the middle of the 15th century. His taſte for poetry was manifeſted in early life; for his four books "De Amoribus," written when he was only 22, were ſo well received, that he was ſolemnly crowned at Rome by the Roman academy. Here he became known to Ludovico Gonzaga, duke of Mantua, who patronized him, in 1484, as his own poet. In 1488 he was recommended by Gonzaga to the dauphin of France, and in the next year appointed public profeſſor of belles lettres in Paris, an office which he held 30 years. To his public lectures he added private inſtructions; and he united with rhetoric and poetry the explanation of the ſphere. He obtained honours and lucrative appointments from the kings, Charles VIII, Lewis XII, and Francis I;

and he was alſo penſioned by Queen Anne, of Bretagne, whence he ſtyled himſelf, "Poeta regius ac reginæus." Andrelinus was celebrated by many of his contemporaries as the firſt poet of the age, and as having contributed in an eminent degree, to promote literature in France. Eraſmus, however, though he praiſed him when alive, gives an unfavourable account both of his talents and morals after his death. He charges him with licentiouſneſs of manners, and with a tumultuous and quarrelſome diſpoſition. Nevertheleſs he obtained a high degree of reputation as a profeſſor and writer till the time of his death, which happened at Paris, in February, 1518; and his memory was honoured with elegies, inſcriptions, &c. Voſſius compares the poetry of Andrelinus, which conſiſted of ſonorous verſes and pompous expreſſions, without much meaning, to a river of words with a drop of ſenſe, and Eraſmus conteſts the grant of this drop. Moſt of his poems have been inſerted in the firſt volume of the "Deliciæ Poetarum Ital." They chiefly conſiſt of elegies, eclogues, and panegyrical pieces on various occaſions. He alſo wrote moral and proverbial epiſtles in proſe. Gen. Dict.

ANDRENA, in *Entomology*, one of the new genera in the Fabrician arrangement, conſiſting, for the moſt part, of ſuch inſects as belong to the APIS genus in the ſyſtem of Linnæus. The tongue is trifid, or three-cleft, lip cylindrical, and on each ſide two membranaceous briſtles; antennæ filiform. Fabricius. In the Entomologia Syſtematica of Fab. are thirty-one ſpecies of this genus, *viz.* cœruleſcens, ruſipes, ſpiralis, cornuta, labieta, florea, metallica, ænea, cyanea, marginata, helvola, bicolor, tricolor, curvipes, cincta, ſtrigata, nigrita, faſciata, zonata, circulata, pilipes, carbonaria, hirſuta, hirtipes, hæmorrhoidalis, guloſa, bidentata, nigricornis, vireſcens, cingulata, and ſuccincta, which ſee reſpectively.

ANDRENEH, in *Geography*. See ANDRONA.

ANDRENOVIAN ISLES. See ANDREANOFSKIE-OSTROVA.

ANDRES, or ANDERO *Iſland*, is ſituated ſouth-eaſt by eaſt from Cape Gracias a Dios, the fartheſt point eaſtward of the province of Honduras, not far from St. Catherine's, or Providence iſland, to the weſt-ſouth-weſt, in N. lat. 12° 30′, and W. long. 81° 40′.

ANDRES, a town of Aſiatic Turkey, 60 miles eaſt from Angura.

ANDRETTA, a town of Italy, in the kingdom of Naples, and Principato Ultra, ſix miles north of Conza.

ANDREW, in *Biography*, an apoſtle of Chriſt, was born of Jewiſh parents at Bethſaida, in Galilee. The name of his father, who was a fiſherman of that town, was Jonas; and both he and his brother Peter followed that occupation. John Baptiſt, who was the herald of Chriſt, and who introduced him to the notice of the Jewiſh people as the promiſed Meſſiah, pointed him out to Andrew and Simon Peter, under the emblematic appellation of the Lamb of God; upon which they accompanied him to the place of his reſidence. Andrew ſeems to have been the firſt diſciple of Chriſt; for he underſtood the ſacrifical alluſion of John, and ſaid to his brother, "We have found the Meſſiah." John i. 35—41. He was afterwards choſen by Chriſt as one of his twelve apoſtles. To the brief account given by the evangelical writers of this apoſtle (Matt. iv. 18—20. Mark i. 16—18. i. 29. xiii. 4. John vi. 7. xii. 20—22.) tradition has added ſeveral particulars of leſs certain authenticity. Euſebius relates, (Eccl. Hiſt. lib. iii. c. i. p. 71.) that, when the apoſtles arranged the objects of their miſſion for the propagation of Chriſtianity, Andrew made choice of Scythia. Other accounts are leſs worthy of credit than this. "The Acts of the paſſion of St. Andrew," which mention his martyrdom at Patræ, in Achaia, and ſaid to be written by the prieſts of Achaia, are preſerved in Surius's Hiſtory of the Saints, and approved by Baronius, Bellarmin, and others of the Romiſh communion: but they are rejected by the beſt critics as ſpurious. The ancients, ſays Dupin (Hiſtory of the Canon, &c. vol. ii. p. 149.), knew no other acts of St Andrew beſides thoſe which had been corrupted by the Manichees, mentioned by Euſebius, (Eccl. Hiſt. lib. iii. c. 25.) Philaſtrius (Hæres. 87.) Epiphanius (Hæres. 47. n. 1. Id. 61. n. 1. Id. 63. n. 2.) and Auguſtin (de fide. cont. Manichæos) and which pope Gelaſius has placed among the apocryphal writings. This work was not cited till the ſeventh century; and neither its doctrine nor language agrees with thoſe of the early ages. Beſides, theſe Acts of St. Andrew are not found in any of the ancient catalogues of the ſacred books, nor are they appealed to by any Chriſtian writers, nor read in any of their aſſemblies, but on the contrary expreſsly condemned as an impious forgery by every one who has mentioned them. As they contained ſome doctrines which were favourable to the Manichees, Encratites, Apotacticks, or Apoſtolicks, and Origenians, it is no wonder that they ſhould have eſteemed this apocryphal piece above other ſcriptures. The "Goſpel of Andrew," and other books that have been ſanctioned by his name, belong to the ſame claſs of apocryphal writings. The relation of thoſe who ſay that he was crucified on a croſs in the form of the letter X, hence vulgarly called St. Andrew's croſs, or on an olive tree, which others have aſſerted, is entitled to no credit; nor indeed is it certain that he was crucified. According to Jerom (Adv. Vigil. p. 22.) his body was removed with St. Luke's to Conſtantinople in 357. The accounts of this apoſtle that are given by Gregory of Tours in the ſixth century, by Nicephorus of Conſtantinople in the 9th, and by Nicephorus Calliſtus in the fourteenth, contain many fabulous particulars. The legend of Gregory, therefore, will claim no regard; which informs us, that ſtreams of oil flowed from the tomb of this ſaint on the anniverſary of his martyrdom, and ſometimes ſwelled to the middle of the church. Dupin, ubi ſupra. Jones's Canon, vol. i. p. 145—187. Fabr. Cod. Apoc. Nov. Teſt. p. iii. p. 526.

ANDREW, biſhop of Cæſarea, in Cappadocia, lived, according to Cave, about the year 500. He wrote a commentary upon the book of Revelation, prefacing it with aſſerting the inſpiration of the book, for which he appeals to the authorities of Gregory the divine, Cyril of Alexandria, Papias, Irenæus, Methodius, and Hippolytus, and dividing it into 24 larger, and 72 ſmaller ſections. He appears to have received as authentic all the books of the New Teſtament which we receive; he mentions the ſymbols of the four evangeliſts, *viz.* the lion for John, the calf for Luke, the eagle for Mark, and the man for Matthew. After reciting ſome opinions with regard to the period of a "thouſand years," mentioned in this book, he conſiders it as denoting the time of the preaching of the goſpel, or the time of the goſpel diſpenſation. Cave. Hiſt. Lit. tom. i. p. 467. Fabr. Bib. Græc. tom. vii. p. 791. Lardner's Works, vol. v. p. 249—252.

ANDREW, biſhop of Samoſata, was an intimate friend of Theodoret, and flouriſhed in the fifth century. About the year 429 he was appointed by John, biſhop of Antioch, to refute, on behalf of the eaſtern biſhops, the "Anathematiſms" of Cyril. Under the pretence of illneſs he declined attending at the council of Epheſus; however, he vigorouſly oppoſed the Neſtorians, and for many years renewed his hoſtilities againſt Cyril. Some curious extracts from his firſt book againſt Cyril are found in Cyril's "Apologetics for

his

his Anathematiſms." Smaller fragments of his ſecond book againſt Cyril are preſerved by Anaſtaſius the Sinaite in his "Hodegos." Eight letters of Andrew, in an ancient Latin verſion, are publiſhed in the collection of "Epheſian Epiſtles," by Lupus. Cave, Hiſt. Lit. vol. i. p. 419. Fabr. Bib. Græc. vol. x. p. 124.

Andrew, biſhop of Crete, was a native of Damaſcus, and flouriſhed at the cloſe of the ſeventh and beginning of the eighth century. Cave places him about the year 635. The early part of his life was ſpent by him as a monk at Jeruſalem. Theodoret, patriarch of Jeruſalem, invited him to attend the ſixth general council of Conſtantinople; and he afterwards copied the acts of that aſſembly againſt the Monothelites. He was appointed biſhop of Crete, and probably remained in that ſee till his death, about the year 720. He wrote ſeveral homilies, which are extant; and which, according to Moſheim, (Eccl. Hiſt. vol. ii. p. 174.) are deſtitute of true piety and eloquence. They were collected, and publiſhed in folio by Francis Combeſius, at Paris, in 1644. Cave, Hiſt. Lit. vol. i. p. 582. Fabr. Bib. Græc. lib. v. c. xli. § 2. tom. x. p. 121.

Andrew, John, ſecretary of the Vatican library, was employed under the popes Paul and Sextus IV. when printing was firſt introduced into Rome, in reviſing MSS., writing prefaces and dedications, and correcting the preſs. Cardinal de Cuſa, who had been his ſchool-fellow, gave him the biſhopric of Accia in Corſica; and pope Paul II. afterwards appointed him to that of Aleria in the ſame iſland, where he died. He publiſhed an edition of Livy, and of Aulus Gellius, printed at Rome, in folio, in 1469; of Herodotus, in 1475; and of Strabo, printed at Venice, in folio, in 1472. He was alſo the editor of the Epiſtles of Cyprian, and of the works of S. Leo. Nouv. Dict. Hiſt.

Andrew, preſbyter of Ratiſbon, was an hiſtorian of the 15th century, and flouriſhed under the emperor Sigiſmund. He wrote in Latin "A Chronicle of the Dukes of Bavaria," publiſhed at Amberg; and "A Hiſtory of Bohemia," in ſeven books. His countrymen called him a ſecond Livy. Voſſ. de Hiſt. Lat. lib. iii. c. 5.

Andrew I. king of Hungary, was a prince of the blood-royal, and eldeſt ſon of Ladiſlaus the Bald. When king Peter was reſtored in the year 1044, he was obliged to take refuge in Ruſſia; but the idolatrous Hungarians promiſed to kill Peter, and to expel all foreigners, provided Andrew would aboliſh the Chriſtian churches. The compact was ſettled; and, after great ſlaughter and plunder, Andrew was placed on the throne in 1047, inſtead of Peter, who was impriſoned, loſt his eyes, and ſoon died. Andrew, however, in violation of his promiſe, obliged all his ſubjects to profeſs Chriſtianity. After having ſettled his diſputes with Albert of Auſtria, he invited his brother Bela, with his family, to ſettle in Hungary, and aſſigned him a third part of his dominions. When the emperor Henry III. invaded Hungary, he was reduced to ſuch ſtraits by Andrew and Bela, that, in order to avoid total deſtruction, he entered into a treaty, of which it was one condition, that the daughter of Henry ſhould be married to Solomon, the ſon of Andrew. This ſon was five years old, and he was then crowned; but, fearing that his brother Bela would diſturb the ſucceſſion, Andrew ſent for him, and inſtructed two of his confidential ſervants how to act. "I ſhall offer him," ſaid the king, "a crown, the ſymbol of the royal authority, and a ſword, that of the church. If he chooſes the former, inſtantly put him to death; if the latter, let him live." An officer, who overheard this order, whiſpered to Bela, "chuſe the ſword." Accordingly he took the ſword, and his brother Andrew was ſatisfied; but Bela ſoon after retreated to Poland, and came from thence at the head of an army to dethrone him. Andrew was protected by the emperor; but, meeting his brother on the banks of the Teiſs, he was defeated, abandoned by his own men, and killed in the purſuit, A. D. 1059. Mod. Un. Hiſt. vol. xxxii. p. 107.

Andrew II. king of Hungary, was the ſecond ſon of Bela III. Having occaſioned a rebellion againſt his elder brother Emerick, he was deſerted by his army, and, in endeavouring to make his eſcape, taken priſoner, and brought to Emerick, by whom he was freely pardoned. From this time his ſentiments were ſo changed, that he became a ſteady ſupporter of the throne. Upon the death of his nephew Ladiſlaus, Andrew ſucceeded, and was crowned by the univerſal conſent of the ſtates. During the firſt twelve years of his reign he enjoyed unmoleſted peace; but when pope Honorius III. ordered a new cruſade to be preached, Andrew reſolved to make an expedition into the Holy Land. He proceeded to Conſtantinople; but there he heard that during his abſence a tragical event had occurred in his kingdom. The government had been entruſted to Banchanus, one of the nobles, and it was adminiſtered to univerſal ſatisfaction. But the wife of the governor, who was very beautiful, was debauched by Queen Gertrude's brother, who viſited her during the king's abſence, and the queen was acceſſory to the diſhonour. The injured lady informed her huſband of this atrocious act; upon which he revenged himſelf by ſtabbing the queen; and, ruſhing out into the ſtreet with his bloody ſword, he publiſhed his wrongs, and the revenge he had taken; declaring, at the ſame time, that he would not decline a trial, but go immediately to Conſtantinople to receive the ſentence of the king. Andrew acquitted him, and ordered him back to his government. At the trial the accuſation againſt the queen was found to be juſt. Banchanus was acquitted, but his family was ruined by the reſentment of the king's ſons. Andrew tranſported his troops into Syria, and diſplayed his courage in ſome conflicts with the Saracens; but, being weary of the expedition, he determined to return home, though he was threatened with excommunication by the patriarch of Jeruſalem. He propoſed, however, to leave one-half of his troops in Paleſtine, under the command of the duke of Auſtria, and with the other half he was allowed to return into Hungary. Accordingly he ſet ſail on board the Venetian fleet, with a variety of precious relics, and with the title of the "Hieroſolymitan;" and, in his viſit to the prince of Eſte, by whom he was honourably entertained, he fell in love with his daughter, married her, and took her with him into Hungary. The remaining period of his reign was devoted to the buſineſs of healing the diſcontents of his ſubjects, and forming a ſyſtem of legiſlation. Beſides other meaſures which he adopted, he was the author of a famous decree, which confirmed and augmented the privileges of the nobility, and allowed them to take up arms in their defence, if he or his ſucceſſors attempted to abridge them: a ſtipulation nugatory againſt a powerful monarch, and which has anſwered no other purpoſe than that of rendering the ariſtocracy factious, and the body of the people ſlaves. Towards the end of his reign the Tartars made ſome ſucceſsful inroads into Hungary. Andrew, having reigned 31 years, died in 1235, and left the kingdom to his eldeſt ſon Bela, to whom he had ceded the ſovereignty before his death. Mod. Un. Hiſt. vol. xxxii. p. 120—123.

Andrew III. king of Hungary, was the grandſon of Andrew II. and being born and brought up in Venice, obtained the ſurname of "Venetian." On the death of Ladiſlaus in 1290, he ſucceeded to the throne, in oppoſition to a number of competitors, by the unanimous conſent of the Hungarians. In his way from Italy through Auſtria he was

detained by duke Albert; and obtained a releaſe by promiſing to eſpouſe Agnes, the duke's daughter. But in the year after his acceſſion he declared war againſt Albert, and laid waſte the country, till at length a peace was obtained by the interceſſion of the prelates. Upon his return to Hungary, Andrew found his kingdom in a diſtracted ſtate; the pope and many of the eccleſiaſtics and nobles having acknowledged the right of Charles Martel, who, in conſequence of their invitation, had ſet out for Hungary with his wife and ſon, Charles Robert, or Charobert, then an infant. The majority of the Hungarians were attached to Andrew; but as the party of Charles was very numerous, and Andrew having no children, Charles continued in poſſeſſion of part of Hungary for ſeveral years without oppoſition. The two rival kings are ſaid to have both died in the ſame year, 1301. Charles, having gone to the jubilee at Rome, died at Naples. Andrew died at Buda, and, leaving no male iſſue, the line of St. Stephen terminated in him. Mod. Un. Hiſt. vol. xxxii. p. 129.

Andrew, *Knights of St. Andrew, or the Thiſtle*, commonly called the *Order of St. Andrew*, in Scotland; according to John Leſley, biſhop of Roſs and others, was inſtituted by Achaius, king of Scots, in memory of an appearance in the heavens of a bright croſs in faſhion of that whereon St. Andrew ſuffered martyrdom, and ſeen by that king the night before the battle which he fought with Athelſtan, king of England, over whom prevailing, he went in ſolemn proceſſion to the kirk of St. Andrew, to thank God and his apoſtle for the victory; promiſing that they and their poſterity ſhould ever have the figure of that croſs in their enſigns and banners. Favin, in his Theatre of Honour, relates it to be inſtituted upon the famous league, offenſive and defenſive, made between Achaius and Charlemagne, king of France; to preſerve the memory of which alliance, Achaius added the treſſure of fleurs de lys to the lion, the then royal arms of Scotland, and took for device the thiſtle and rue, which he compoſed into a collar of his order; and for his motto, *Pour ma Defence*. Menenius makes theſe the ſymbols of two different orders; one of the Thiſtle, whence the Knights were ſo ſtyled, and the motto, *Nemo me impune lacceſſit*; the other called *Sortum Ruta*, or Garland of Rue: nevertheleſs, to both collars hung one and the ſame jewel, that is, the figure of St. Andrew bearing his croſs. Their ſolemn meeting was annually on St. Andrew's Day, in the church of the town dedicated to his name; at which the knights, thirteen in number, in alluſion to our bleſſed Saviour and the twelve apoſtles, were richly habited, and wore their parliament robes, having thereon embroidered on their left ſhoulder *an azure roundle charged with a ſaltier argent, St. Andrew's croſs enfilled in centre, with a crown compoſed of fleur de luces or*. The ſudden death of James V. of Scotland, the rebellion againſt Queen Mary, and the troubles which enſued in that kingdom nearly extinguiſhed the order, which continued to be neglected until it was revived by King James II. of England, who, on the 29th of May, 1687, iſſued his warrant for letters patent to be made out and paſſed *per ſaltum*, under the great ſeal of Scotland. In conſequence of this revival ſeveral new knights were made, and the order continued to flouriſh during the remainder of that king's reign; but on his abdication, and the advancement of King William to the throne, the order was again diſuſed.

Queen Anne, by her letters patent, bearing date at St. James's, 31ſt Dec. 1703, revived, continued, and re-eſtabliſhed the order; and ordained by the ſtatutes, "that the number of knights ſhould conſiſt of twelve beſides the ſovereign, making in the whole thirteen, as heretofore; that the ſovereign's habit ſhould be ſuch as the ſovereigns themſelves ſhould think fit to appoint; that the habit of the brethren ſhould be a doublet and trunk-hoſe of cloth of ſilver, ſtockings of pearl-coloured ſilk, with white leather ſhoes, garters and ſhoe-ſtrings of green and ſilver; the breeches and ſleeves of the doublet decently garniſhed with ſilver and green ribbons; a ſurcoat of purple velvet lined with white taffeta, girt about the middle, with a purple ſword-belt edged with gold, and a buckle of gold, at which a ſword with a gilded hilt, the ſhell thereof to be in the form of the badge of the order, and the pomel in the form of a thiſtle, in a ſcabbard of purple velvet; over all a mantle or robe of green velvet lined with white taffeta, with taſſels of gold and green; and upon the left ſhoulder thereof, *in a field of green, the image of St. Andrew the apoſtle, bearing before him the croſs of his martyrdom of ſilver embroidery, with a circle of gold round it, upon which the motto*, NEMO ME IMPUNE LACESSIT, *in letters of green*; and at the lower part of it a *thiſtle of gold and green, the flower reddiſh*. That about the ſhoulder of each knight ſhould be worn the collar of the order, conſiſting of *thiſtles and ſprigs of rue going betwixt*, and at the middle thereof before ſhould be hung the *image of St. Andrew, chaſed and enamelled on rays of gold, the croſs and feet reſting upon a ground of enamelled green*, or if of diamonds, to conſiſt of juſt thirteen in number; and that the collar ſhould be tied to the ſhoulders of the robe, and the knights have white ribbons upon their heads on days of ſolemn proceſſion or feaſting, where the ſovereign is preſent, or has a commiſſioner for that effect. That they ſhould wear, at the times of permiſſion, a cap of black velvet, a little divided before, wide and looſe in the crown, having a large plume of white feathers, with a black aigrette, or heron's top in the middle of it; the borders of the cap adorned with jewels. That the jewel of the ſaid order ſhould be worn at *a green ribbon over the left ſhoulder, croſs the body, and tied under the right arm*; ſuch jewel to have on the one ſide *the image of St. Andrew, with the croſs before, enamelled as is above ſaid, or cut on ſtone, enriched with precious ſtones round it*: and on the back, *enamelled on a green ground, a thiſtle gold and green, the flower proper with the before mentioned motto round it*. That the medal of the order ſhould be all of gold, the St. Andrew bearing before him the croſs of his martyrdom, with a circle round, and then the motto of the order; and at the lower part of the circle, between the joining of the words, a thiſtle; and to be worn in a green ribbon as the jewel, at times when the jewel is not worn. That upon the left breaſt of the coat and cloak ſhould be embroidered a badge of proportionable bigneſs, being a *St. Andrew's croſs of ſilver embroidery, with rays going out betwixt the points of the croſs; on the middle thereof a thiſtle of gold and green, upon a field of green, and round the thiſtle and field a circle of gold, having on it the motto of the order in letters of green*." This order is ſtyled The moſt Ancient Order, was inſtituted in 787, reſtored in 1540, revived in 1687, and re-eſtabliſhed in 1703, for the ſovereign, twelve knights, and four officers, *viz.* the Dean, Lord Lyon, King of Arms, Secretary, and Gentleman Uſher of the Green Rod. There being no inſtallation of this order, the ſtar and collar are worn immediately after the inveſtiture. See Plate 9.

Andrew, *St. Knights of*, in Ruſſia. This order was inſtituted by Peter the Great of Muſcovy, in 1698, ſoon after his return from his firſt expedition into foreign countries, and intended for animating the nobility in his war againſt the Turks. St. Andrew was choſen as patron of the order, from the Ruſſian tradition, that he introduced Chriſtianity among them. The Knights of this order, among whom were the kings of Sweden and Poland, wear the figure of the Saint on an enamelled croſs, formed by the imperial eagle; at the corners of the croſs are the four letters, S. A. P. R. "Sanctus Andreas Patronus

Patronus Ruſſiæ;" and in the middle an A. the initial of the empreſs Anne, who framed the ſtatutes, and aſſigned the habit of the order. The feaſt is held on the 30th of November. In 1790 it had 63 knights. The badge is faſtened to a blue ribband, and ſuſpended from the right ſhoulder; but at feſtivals is pendent to a collar of gold compoſed of ſquare chains and roſes.

ANDREW'S *Croſs*, is a badge worn in the hat by the people of Scotland, on the day of the feaſt of that Saint.

It conſiſts of blue and white ribbands, diſpoſed into a croſs, or *ſaltier*; and is intended as a commemoration of the crucifixion of St. Andrew, the tutelary Saint of Scotland.

ANDREW'S ST. in *Geography*, an ancient town of Scotland, in the ſhire of Fife, and formerly the metropolis of the kingdom of the Picts. It is ſeated on an eminence, and commands an extenſive proſpect. N. lat. 56° 18'. W. long. 2° 37'. The legendary account of the origin of this city is as follows: St. Regulus, a Greek of Achaia, being warned by a viſion to leave his native country, and to viſit Albion, an iſle ſituated in the remoteſt part of the world, was inſtructed to take with him the arm-bone, three fingers, and three toes of St. Andrew. After a tempeſtuous paſſage he was ſhipwrecked on the coaſts of Otholonia, in the territory of Herguſius, king of the Picts, in the year 370. The king, as ſoon as he heard of the diſaſter, ordered the ſtrangers to be reſpectfully received, and granted to the ſaint his own palace, near which he built a church, called St. Regulus. The place was then ſtyled Mucroſs, or the Land of Boars. St. Regulus changed the name to Kilrymont, and eſtabliſhed the firſt Chriſtian prieſts of the country, called Culdees. This church was ſupreme in the kingdom of the Picts; and Ungus the king ordained that the croſs of St. Andrew ſhould become the badge of the country. In 518, after the conqueſt of the Picts, the epiſcopal ſee was eſtabliſhed at St. Andrew's, and the biſhop was ſtyled, "Maximus Scotorum Epiſcopus." It is ſaid to have been erected into an archbiſhopric at the interceſſion of James III. This ſee contained the greateſt part of the ſhire of Fife, with a part of Perth, Forfar, and Kincardine ſhires, and a great number of pariſhes and churches in other dioceſes.

The town of St. Andrew's was erected into a royal borough by David I. in 1140, and its privileges were afterwards confirmed. The charter of Malcolm II. on a ſmall piece of parchment, is preſerved in the tolbooth; and here are alſo depoſited the ſilver keys of the city, which are delivered to the king if he ſhould viſit the place, or to a victorious enemy. The axe, which in 1646 took off the heads of Sir Rt. Spotſwood, and other diſtinguiſhed loyaliſts, is ſhewn in this place. St. Andrew's is now much reduced as to the number both of houſes and inhabitants, the latter being eſtimated at about 2000. It is ſtill decorated with magnificent relics of its ancient ſplendour. The principal of theſe is the cathedral, which was founded by biſhop Arnold in 1161, but it was not completed till the year 1318. Its demolition, however, was effected by John Knox and his followers, in 1559, in one day. The eaſtern end, with its two high pinnacles, is complete; and one turret of the weſt point yet remains, adorned with ſome curious carved work in a peculiar ſtyle; but the pillars and ſome of the arches of the ſide aile, exhibit a ſpecimen of the pure Gothic, when it admitted of very little ornament: the precinct of this church forms a common burial-place to the town. In the centre of the incloſure is a plain, ſquare tower, of a very extraordinary height, different in its ſtructure from the cathedral, and not unlike ſome of the relics of Norman architecture in England. This is the tower of the chapel of St. Regulus, the body of which remains, but the inſide chapels are demoliſhed. The arches of the windows and doors are round, and ſome exceed ſemicircles; whence we may infer the antiquity of the building. Some trace it to a very early period; but it is commonly thought to have been founded in the eighth century, and eſteemed the earlieſt Chriſtian church in Scotland. The priory was founded by Alexander I. in 1122; and the monks, who were canons regular of St. Auguſtine, were brought from Scone in 1140, by Robert, biſhop of this ſee. By an act of parliament in the reign of James I. the prior had precedence of all abbots and priors; and on the feſtival days wore a mitre and all epiſcopal ornaments. The revenues of this priory were very conſiderable, being in money 2237*l.* 2*s.* 10½*d.* beſides large quantities of different ſorts of grain, and 480 acres of land. The ruins adjoin to thoſe of the cathedral; and nothing now remains but the incloſing wall, which encompaſſes a large area, and one ſingle arch, very much defaced. The incloſure extends from the cathedral to the ſhore. Above the harbour ſtood the collegiate church of Kirk-heugh, originally founded by Conſtantine III. who is ſaid to have retired hither from the world, and to have become a Culdee. The remains of the caſtle occupy the ſummit of a high eminence, which overhangs the coaſt. Separated from the town by a deep chaſm, over which was a draw-bridge, and from the country by an impetuous ſea, foaming over a rocky bed, this caſtle was juſtly eſteemed one of the ſtrongeſt fortifications in the iſland. It was founded in 1401 by biſhop Trail; and it was the reſidence of cardinal Beaton in the zenith of his power and proſperity: but with all his attention to render it, as he conceived, impregnable, it was not of ſufficient ſtrength to defend an ambitious ruler againſt the rage of an exaſperated people. In this fortreſs the cardinal was ſurpriſed by Norman Leſlie, with 15 attendants, in 1546, and aſſaſſinated in the midſt of his numerous retinue. In 1547 the caſtle, poſſeſſed and guarded only by 150 men for five months, was at laſt reduced and demoliſhed. The death of Beaton led to the downfall of the Catholic religion in Scotland; and with that religion the fineſt edifices of St. Andrew's mouldered into ruins, its caſtle was neglected, and the city deſerted. The entrance into the caſtle is ſtill viſible; and ſtrangers are ſhewn the window out of which, it is ſaid, the cardinal leaned to enjoy the cruel martyrdom of George Wiſhart, who was burnt on an adjoining ſpot. Of the four great parallel ſtreets of this city only one now remains entire; one being totally loſt, and other two in a very decayed condition. The univerſity of this city was founded in 1411 by biſhop Wardlaw. It conſiſted once of three colleges. St. Salvator's was founded in 1458 by biſhop Kennedy. This is an irregular pile of building, of conſiderable extent, united with a large church, which contains a fine old monument of the founder, who died in 1466. The interior of the college, though ſpacious, is gloomy, and conſiſts of two large old halls, and a range of apartments in rather a more modern taſte, of which, however, only one ſide is finiſhed. The college of St. Leonard was founded by Prior Hepburn in 1522, but it is now converted into private houſes, and the collegiate part is united with the laſt. The third college is the New, or St. Mary's, which was eſtabliſhed by Archbiſhop Hamilton, in 1553; but the houſe was begun by James and David Beaton, who did not live to complete it. This has a far more cheerful aſpect than the old college, though it is much ſmaller. The library belonging to the whole univerſity is connected with this college. In this library are kept two curious maces, exquiſitely carved in braſs work, and a fourth is preſerved in the audit-room of the old college. Theſe maces were dug for under the great altar of the cathedral by the direction of an old man, who was ſaid to have in his poſſeſſion

poſſeſſion many papers relating to the church and its environs; ſix were found, one of which was preſented to each of the three univerſities of Edinburgh, Glaſgow, and Aberdeen; and the other three are kept at St. Andrew's. On the ſite of this college formerly ſtood, as it is ſaid, a "Schola illuſtris," long before its eſtabliſhment into an univerſity. It is called the "New College," becauſe of its late erection into a divinity college by the archbiſhop.

This univerſity is governed by a chancellor, who is elected by the two principals, and the profeſſors of both the colleges. The rector is the officer to whoſe ſuperintendance are committed the privileges, diſcipline, and ſtatutes of the univerſity. Each college has a principal; that of St. Salvator has nine profeſſors, and the New College has five profeſſors. The ſtudents in the former are generally about 100, and in the latter about 30. This univerſity has many advantages to recommend it in point of ſituation, inſtruction, and diſcipline.

The commerce of St. Andrew's is inconſiderable; and its manufactures, whatever they might formerly be, are reduced to that of golf-balls, which maintains a great number of people.

Andrew's, St. *Bay*, is ſituated between the Forth and the Tay. The haven is defended from the violence of the eaſterly ſea by a ſtone pier; the entry is very narrow, and it has only ſeven or eight feet at neap tides, and ten or eleven at ſpring tides. The city is at the bottom of the bay cloſe upon the ſhore.

Andrew's, St. a ſmall town of America, in the conteſted country between New Brunſwick and the United States, ſituated behind an iſland of the ſame name, on the eaſt ſide of the arm of the inner bay of Paſſamaquoddy, called Scoodick. The town is laid out in the form of an oblong ſquare, and the inhabitants are chiefly employed in the lumber trade.

Andrew's, St. is a townſhip in Caledonia county in Vermont, 100 miles north-eaſt from Bennington.

Andrew's, St. is alſo a pariſh in Charleſtown diſtrict, South Carolina, containing 2947 inhabitants, of whom 370 are whites, and 2546 ſlaves.

Andrew's, or Andres, St. *Bay*, a ſecure harbour in the gulf of Mexico, on the ſouth coaſt of Weſt Florida in North America. It is ſituated between Santa Roſa bay on the north-weſt, and St. Joſeph's bay on the ſouth; and being almoſt ſurrounded by land, it is well ſheltered from almoſt all winds. N. lat. 30° 15′. W. long. 85° 45′.

Andrew *Bay*, lies on the north ſhore of the Straits of Maghellan, between Port Holland on the eaſt, and Cordes bay on the weſt, at the entrance of which there is a good anchorage in 12 fathoms water.

Andrew's, St. or Andrea, *Cape*, lies on the weſt coaſt of Madagaſcar iſland, in the Indian or eaſtern ocean, and nearly eaſt from Mozambique, on the coaſt of Africa. S. lat. 15° 46′. E. long. 45° 22′.

Andrew's, St. *Cape*, lies alſo on the eaſtern coaſt of South America, between Rio de la Plata, on the north-north-eaſt, and Anegada bay on the ſouth-ſouth-weſt. S. lat. 37° 55′. W. long. 60° 45′.

Andrew's, St. *Cape*, is alſo on the north ſhore of Maghellan Straits, in the reach which trends from Cape Forward to the Weſt.

Andrew's *Cape*, or Andrea, lies on the eaſt point of Cyprus. N. lat. 35° 31′. E. long. 34° 55′.

Andrew's, St. *Iſland*, or Andrea, is a ſmall iſland in the gulf of Venice, on the weſt ſide of Liſſa iſland.

Andrew's, St. *River* and *Point*, lye on the coaſt of Africa, north-eaſt by eaſt from Cape Palmas, at the diſtance of 20 or 30 leagues. They are ſituated in that track of coaſt, extending ſeven leagues, which is called the Red Cliffs, or Red Land. Although no ſhips go up this river, a conſiderable traffick is carried on by means of the canoes of the Negroes, who bring down teeth for ſale. Wood and water may be procured here, but no proviſions.

Andrew's, St. *Sound*, lies ſouth of Jekyl's iſland, and is formed by this and a ſmall iſland at the mouth of the Great Sagilla River. The ſmall river oppoſite to this ſound ſeparates Camden from Glynn county, in Georgia.

Andrews, Lancelot, in *Biography*, an Engliſh divine, was born at London in 1565, and was biſhop of Wincheſter, in the reign of James I. and Charles I. From Merchant Taylors' ſchool he was ſent to Pembroke Hall in Cambridge; and by his aſſiduous application he became acquainted with the ſciences and moſt modern languages, and he excelled more eſpecially as a caſuiſt, and was often conſulted in caſes of conſcience. The following anecdote will illuſtrate this part of his character: a corpulent alderman of Cambridge, who had been often reproved for ſleeping at church, and whoſe conſcience troubled him on this account, applied to him for advice. Andrews told him it was an ill habit of body and not of mind, and adviſed him to eat little at dinner. The alderman tried this expedient, but found it ineffectual. He applied again with great concern to Andrews, who adviſed him to make a hearty meal as uſual, but to take his full ſleep before he went to church. The advice was followed, and the alderman came to St. Mary's church, where the preacher was prepared with a ſermon againſt ſleeping at church, which was thrown away, for the good alderman looked at the preacher during the whole ſermon time, and ſpoiled his deſign. Andrews's lectures, as a caſuiſt, were attended by a numerous auditory. His learning, popular talents as a preacher, and zeal for the Proteſtant cauſe, procured for him the patronage of Henry Earl of Huntingdon, and Sir Francis Walſingham, ſecretary of ſtate to Queen Elizabeth; and he paſſed through ſeveral ſtages of preferment to the deanery of Weſtminſter. Whilſt he reſided in London as prebendary and reſidentiary of St. Paul's, he read divinity lectures in that cathedral three times a week during term time; and he alſo maintained a connection with his college, of which he was choſen maſter, and to which he was a liberal benefactor. Andrews's ſtyle of preaching, which was pedantic and quaint, ſuited the taſte of king James I. ſo that he was a great favourite with this prince. The king ſelected him in order to vindicate his ſovereignty againſt the vehement attack of Bellarmine, who, in reply to "James's Defence of the Rights of Kings," had written a tract under the fictitious name of Matthew Tortus. The dean's anſwer was intitled "Tortura Torti;" or Tortus Tortured, and printed in 4to. in 1609. This ſervice was ſo acceptable, that in this year he was advanced from the ſee of Chicheſter, to which he had been promoted in 1605, to the biſhoprick of Ely; and he was alſo nominated a privy counſellor, firſt for England, and afterwards for Scotland, where he attended the king in his journey to that kingdom. In 1618 he was raiſed to the biſhoprick of Wincheſter, and the deanery of the king's chapel, which preferments he held till his death, which happened at Wincheſter-houſe, in Southwark, in 1626, in the 71ſt year of his age. He was buried in the pariſh church of St. Saviour's, Southwark, and a monument of marble and alabaſter was erected over his grave, on which is an epitaph written by one of his chaplains in the higheſt ſtyle of panegyric. Biſhop Andrews appears to have been a man of eminent talents, acquirements, and virtues. He is ſaid to have underſtood 15 languages: he employed a large portion of each day in devotion and ſtudy; and his learning and affability commanded the reſpect not only of his own countrymen,

men, but of foreigners, by whom he was viſited; ſuch as Voſſius, Grotius, Caſaubon, Cluverius, Erpinius, and Dumoulin. His firſt biographer, Iſaacſon, informs us, that in the diſtribution of preferment he was diſintereſted, impartial, and judicious; that he provided liberally for the deſcendants of his early inſtructors and benefactors; that, after he became biſhop, he never viſited either of the univerſities without leaving 50 or 100l. to be diſtributed among poor ſcholars; that his charity kept pace with his advancement, his private alms amounting in the laſt ſix years of his life to upwards of 1300l. and that, as he died a bachelor, he left large legacies to charitable uſes; and among the reſt, a great part of his eſtate to be diſtributed among his ſervants. Biſhop Andrews was a faithful ſon and zealous defender of the church; at the ſame time he was moderate in his political principles, independent in his ſpirit, and ſuperior to the mean adulation that diſgraced the court of James, as the following anecdote, related in the life of Waller the poet, will ſhew. Mr. Waller, going to the king at dinner, overheard a converſation between his majeſty and two prelates, the biſhop of Wincheſter and Dr. Neale, biſhop of Durham, who were ſtanding behind the king's chair. His majeſty aſked the biſhops, "My lords, cannot I take my ſubjects' money when I want it without all this formality in parliament?" The biſhop of Durham readily anſwered; "God forbid, Sir, but you ſhould; you are the breath of our noſtrils." Whereupon the king turned and ſaid to the biſhop of Wincheſter, "Well, my lord, what ſay you?" "Sir," replied the biſhop, "I have no ſkill to judge of parliamentary caſes." The king anſwered, "No put offs, my Lord, anſwer me preſently." "Then Sir," ſaid he, "I think it lawful for you to take my brother Neale's money, for he offers it." Milton thought biſhop Andrews worthy to be celebrated by his pen; and, at the age of 17, wrote an elegy on his death, abounding with that rich fancy which has rendered his works immortal. The works of biſhop Andrews, beſides that already mentioned, are, "A Manual of Private Devotions;" "A Manual of Directions for the Viſitation of the Sick;" a volume of tracts chiefly in Latin, conſiſting of ſermons, theological diſſertations on the eccleſiaſtical rights of princes, tythes, uſury, &c. publiſhed in 4to. in 1629; a poſthumous volume of "Sermons," publiſhed in folio by direction of the king, and under the inſpection of the biſhops of London and Ely; "The Moral Law explained; or Lectures on the Ten Commandments," with other ſermons, printed in folio in 1642; and "A Collection of Poſthumous and Orphan Lectures," delivered at St. Paul's and St. Giles's, Cripplegate, printed in folio in 1657. The ſermons of biſhop Andrews, though learned and pious, afford many ſpecimens of that pedantry and falſe wit which marked the period in which he lived, and cannot be read with pleaſure in an age of more correct taſte. Biog. Brit.

ANDRIA, in *Antiquity*, a name given by the Cretans to the public entertainments, at which whole cities, tribes, or other bodies of men, were preſent. They were firſt inſtituted by Minos of Crete, and, after his example, appointed by Lycurgus at Sparta. They were conducted with the greateſt frugality and decorum, and perſons of all ages were admitted to them.

The hall, or place of eating, where theſe entertainments were held, was denominated *andrion*, in the uppermoſt part of which was a conſtant table ſet apart for ſtrangers.

ANDRIA, is alſo uſed by ſome naturaliſts, to denote a ſpecies of hermaphrodite, wherein the female ſex has the predominancy.

ANDRIA, in *Ancient Geography*, now the *Indre*, a river of the interior of Gaul, which, uniting with the *Carœ*, diſcharges itſelf into the *Liger*.

ANDRIA, a town of Greece, in the diſtrict of Elis.

ANDRIA is alſo a town of Macedonia.

ANDRIA, or ANDRI, in *Geography*, a town of Italy, in the kingdom of Naples and province of Bari; the ſee of a biſhop ſuffragan of the archbiſhop of Trani. It is ſituated in a valley with hilly environs, about four miles from the coaſt of the Adriatic, five miles weſt-ſouth-weſt of Trani. This town is ſaid to have been built by Peter the Norman, and to have derived its name from the antra or caverns in which the firſt ſettlers took up their abode. N. lat. 41° 15'. E. long. 16° 17'.

ANDRIACA, in *Ancient Geography*, a town of Thrace, on the coaſt of the Euxine ſea, near Salmydeſſus, according to Strabo.

ANDRIACA is alſo a town of Aſia Minor, in Lycia. According to Appian this was the port of Mira; but M. d'Anville places it to the ſouth-weſt of Mira.

ANDRIACA is a town placed by Ptolemy in Media.

ANDRICLUS, a high mountain in Cilicia Trachea, placed between the promontory of Anemurium, and the river Selinus.

ANDRICUS, a river of Cilicia, according to Pliny.

ANDRIMACHIDES, a people of Africa whoſe country is not known; but Alexander ab Alexandro reports, that their king obtained the firſt favour of the young women before they were introduced to their huſbands.

ANDRINOPLE, in *Geography*. See ADRIANOPLE.

ANDRIPOURA, or INDRAPOOR, a country of the iſland of Sumatra, including a town of the ſame name, and ſeveral others; the chief article of commerce is pepper. The town is ſituated on a rapid river, 60 miles north-weſt of Bencoolen. S. lat. 2° 15'. E. long. 101°.

ANDRISCUS, called by the Romans *Pſeudo-philippus*, in *Biography*, is ſaid to have been a native of Adramyttium, and deſcended from mean parents. He aſſumed, however, the character of a natural ſon of Perſes, 16 years after the death of the king of Macedon, pretending, that his father had ſent him to Adramyttium in diſguiſe, and that he was not to diſcloſe the ſecret of his birth till he arrived at the age of 14 years. Reſembling Perſes in his perſon, the ſtory was more credible; and accordingly he went to the court of Demetrius Soter, who had married a daughter of that king. Demetrius, either ſuſpecting the impoſture, or dreading the Romans, delivered him up to the republic. From Rome he made his eſcape, and ſought refuge in Thrace. Here he aſſembled a number of perſons, who became attached to his intereſt, and, marching to Macedon, he aſſerted his rightful title to the crown. Having made himſelf maſter of the country, he extended his conqueſts to the adjacent parts of Greece. Scipio Naſica was deputed by the Romans to reſtrain his progreſs; and, by the aid of a body of auxiliaries, he drove him back to Macedon. When the prætor Juventius Thallus was commiſſioned to terminate the war, he advanced to Macedon, and was attacked, defeated, and ſlain by Andriſcus. In conſequence of this advantage Andriſcus was eſtabliſhed on the throne, and the Carthaginians ſent ambaſſadors to congratulate him, and to propoſe an alliance. Andriſcus, however, could not endure proſperity; but became cruel and oppreſſive, and loſt the affection of his ſubjects. At this time the Romans ſent Q. Cæcilius Metellus to Macedon, and Andriſcus was under a neceſſity of valiantly contending for his crown and life. After ſome trifling advantage which he gained at firſt, he was entirely defeated, and compelled to retire into Thrace. The Thracians enabled him to return with a numerous army, but he was again defeated by Metellus;

tellus; and ſeeking refuge with Byzas, a petty prince of Thrace, he was delivered by him to the Romans. Metellus led him in triumph, in the year before Chriſt 147; and he was afterwards put to death by the ſenate. The Roman general, who ſucceeded in the war againſt Andriſcus, obtained the appellation of *Macedonicus*; and it has been doubted whether Andriſcus was an impoſtor, or the ſon of a king. Mod. Un. Hiſt. vol. viii. p. 98—105.

ANDRUS, in *Ancient Geography*, a river of Aſia, which, according to Strabo, ran into the Scamander.

ANDRO, Port, in *Geography*, in the iſland of Belleiſle, on the coaſt of France, is round the eaſternmoſt point of the iſland, called Point de Locmaria on the ſouth ſide.

ANDROCALIS, in *Ancient Geography*, a town of Ethiopia, near Egypt, according to Pliny.

ANDRODAS, in *Ancient Writers*, denotes the ſixty-third year of a man's life, otherwiſe called *annus Ægypticus*, and *climacter magnus*.

ANDROGEUS, in *Entomology*, a ſpecies of PAPILIO (Eq. Tr.) that inhabits Surinam. The wings are black and bronzed; on the underſide lunated ſpots of blue, red, and yellow. Fabricius and Gmelin. This ſpecies is very ſimilar to papilio polydamas; and the PAPILIO ACANTHUS of Cramer is conſidered as a variety (β) of it.

ANDROGYNA, in *Botany*, plants bearing male and female flowers on the ſame root, or bearing ſome flowers with ſtamens only and ſome with piſtils only on the ſame root, without any mixture of ſuch as are hermaphrodite. Of this we have examples in the melon and cucumber.

ANDROGYNUM, in *Eccleſiaſtical Writers*, is uſed to denote *matrimony*, or even one of the parties married.

ANDROGYNUM, *balneum*, denotes a bath common to both ſexes.

ANDROGYNUS, or ANDROGYNOUS, ἀνδρόγυνος, a compound of ἀνηρ, *man*, and γυνη, *woman*, q. d. *man-woman*, an appellation diſtinguiſhing thoſe living creatures, which, by a monſtrous formation of their generative parts, ſeem to unite in themſelves the two ſexes, that of the male and female, and ſynonymous with hermaphrodite. See HERMAPHRODITE. The term is alſo applied in *ancient mythology* to fabulous creatures, each individual of which poſſeſſed the faculties and diſtinguiſhing characters of both ſexes, having two heads, four arms and feet. Some fanciful writers have reported, that the firſt man was created with two bodies, a male and a female, and that of theſe God made two perſons, by ſeparating one body from the other. See ADAM. It is generally ſaid, that this was a fiction of the Rabbins; but there is reaſon to believe that it was of more early original. Plato's fable of the *Androgynes* indicates the tradition to which he had recourſe; and it confirms the ſuppoſition, that a figment of this kind might have had its firſt riſe in thoſe early times, when the Egyptians and Phœnicians diſguiſed the plain narratives which they found of the origin of things with their fables and mythology. See Euſeb. Præp. Evang. lib. i. c. 10. According to Plato's account (in Conviv. Oper. vol. iii. p. 191. ed. Serrani) the Gods formed man with two bodies and two ſexes. This fantaſtic being, poſſeſſing in itſelf the whole human ſyſtem, was endowed with a gigantic force, and became inſolent, ſo as to make war againſt the gods. Jupiter, exaſperated at this inſolence, determined to deſtroy it; but relenting, and averſe from utterly annihilating the human race, he contented himſelf with debilitating this compound being by ſeparating the male from the female, and leaving each half to ſubſiſt with its own powers alone. The office of reforming the ſeparate bodies, and extending their ſkins ſo as to cover the whole ſurface, was aſſigned to Apollo, who faſtened it to the umbilicus. If this half rebelled, it was to be ſubdivided by another ſection, ſo that only one of the parts, which then compoſed it ſhould be left; and even this fourth part of a man was to be annihilated, if it ſhould perſiſt in its obſtinacy and miſchievous attempts. The idea of theſe Androgynes might poſſibly be borrowed from a paſſage in Moſes's account of the creation, in which he repreſents Adam as calling Eve "bone of his bone, and fleſh of his fleſh." A French poet has made an ingenious application of this fable of Plato. He attributes, as the philoſopher does, the propenſity by which the ſexes incline to one another to the natural ardour which each half of the androgynes feels for re-union, and their inconſtancy to the difficulty which each of the diſjoined parts encounters in its efforts to recover its proper and original half. If a woman appears to us amiable, we inſtantly imagine her to be that moiety with whom we ſhould only have conſtituted one whole, had it not been prevented by the inſolence of our original double-ſexed progenitor.

> "The heart, with fond credulity impreſs'd,
> Tell us the half is found, and hopes for reſt;
> But 'tis our curſe, that ſad experience ſhews,
> We neither find our half, nor gain repoſe."

The aſtrologers alſo give the appellation *androgynous* to ſuch of the planets as are ſometimes hot, and ſometimes cold: as Mercury, which is reputed hot and dry when near the ſun, and cold and moiſt when near the moon.

ANDROIDES, in *Mechanics*, compounded of ἀνηρ, ἀνδρος, *man*, and εἰδος, *form*, an AUTOMATON, in the figure of a man; which, by virtue of certain ſprings, &c. duly contrived, walks and performs other external functions of a man. Albertus Magnus is recorded as having made a famous *androides*, which is ſaid not only to have moved, but to have ſpoken. The conſtruction of this machine muſt have been very ingenious and complex, if it be true that he was employed upon it 30 years. Thomas Aquinas is ſaid to have been ſo frightened when he ſaw this head, that he broke it to pieces; upon which Albert exclaimed "Periit opus triginta annorum." Artificial puppets, which, by internal ſprings, run upon a table, and, as they advance, move their heads, eyes, or hands, were common among the Greeks, and from thence they were brought to the Romans. They were known by the name of "Neuroſpaſta," and were much uſed at their ſhows. Ariſtotle (De Mundo, c. vi.) ſpeaks of ſome which moved their heads, eyes, hands, and limbs in a very natural manner. They are alſo particularly mentioned by Galen, (De Uſu partium, lib. iii.) Xenophon, (Sympoſ.) Antoninus, (De Seipſo, ii. 2. iii. 5. vi. 16. vii. 3. xii. 9.) Horace, (Sat. ii. 7. 82.) Gellius, (lib. xiv. 1.) and others. That Dædalus made ſtatues which could not only walk, but which it was neceſſary to tie, that they might not move, is related by Plato, (Meno, Oper. tom. ii. p. 97. and Euthyphron, Oper. tom. i. p. 11.) Ariſtotle, and others. The latter ſpeaks of a wooden Venus, and informs us, that the ſecret of its motion conſiſted in pouring quickſilver into it. The Chineſe have uſed quick-ſilver for giving motion to puppets, and their method of doing it is deſcribed by Muſchenbroek, (Introd. ad Philoſ. Nat. vol. i. c. iii. iv. lviii. p. 143, &c.) Figures or puppets, which appear to move of themſelves, were formerly employed to work miracles; but this uſe is now ſuperſeded, and they ſerve only to diſplay ingenuity, and to anſwer the purpoſes of amuſement. One of the moſt celebrated figures of this kind was conſtructed by Vaucanſon, and exhibited by him at Paris, for the firſt time,

in 1738; and a particular account of it was published in the Memoirs of the Academy for that year. This figure represents a flute-player, which was capable of performing various pieces of music by wind issuing from its mouth into a German flute, the holes of which it opened and shut with its fingers. The figure was about $5\frac{1}{2}$ feet high, placed upon a square pedestal $4\frac{1}{2}$ feet high, and $3\frac{1}{2}$ broad. The air entered the body by three separate pipes, into which it was conveyed by nine pairs of bellows, which expanded and contracted, in regular succession, by means of an axis of steel turned by clock-work. These bellows performed their functions without any noise, which might have discovered the manner by which the air was conveyed to the machine. The three tubes, which received the air from the bellows, passed into three small reservoirs in the trunk of the figure. Here they united, and ascending towards the throat, formed the cavity of the mouth, which terminated in two small lips, adapted in some measure to perform their proper functions. Within this cavity was a small moveable tongue, which, by its motion at proper intervals, admitted the air, or intercepted it in its passage to the flute. The fingers, lips, and tongue derived their proper movements from a steel cylinder turned by clock-work. This was divided into 15 equal parts, which, by means of pegs pressing upon the ends of 15 different levers, caused the other extremities to ascend. Seven of these levers directed the fingers, having wires and chains fixed to their ascending extremities, which, being attached to the fingers, made them to ascend in proportion as the other extremity was pressed down by the motion of the cylinder, and, *vice versa*; then the ascent or descent of one end of a lever produced a similar ascent or descent in the corresponding fingers, by which one of the holes of the flute was occasionally opened or stopped, as it might have been by a living performer. Three of the levers served to regulate the ingress of the air, being so contrived as to open and shut, by means of valves, the three reservoirs above mentioned, so that more or less strength might be given, and a higher or lower note produced as occasion required. The lips were, by a similar mechanism, directed by four levers, one of which opened them to give the air a freer passage, the other contracted them, the third drew them backward, and the fourth pushed them forward. The lips were projected upon that part of the flute which receives the air, and, by the different motions already mentioned, modified the tune in a proper manner. The remaining lever was employed in the direction of the tongue, which it easily moves so as to shut or open the mouth of the flute. The just succession of the several motions, performed by the various parts of this machine, was regulated by the following simple contrivance. The extremity of the axis of the cylinder terminated on the right side by an endless screw, consisting of twelve threads, each placed at the distance of a line and a half from the other. Above this screw was fixed a piece of copper, and in it a steel pivot, which, falling in between the threads of the screw, obliged the cylinder to follow the threads, and, instead of turning directly round, it was continually pushed to one side. Hence, if a lever was moved, by a peg placed on the cylinder, in any one revolution, it could not be moved by the same peg in the succeeding revolution, because the peg would be moved a line and a half beyond it by the lateral motion of the cylinder. Thus, by an artificial disposition of these pegs in different parts of the cylinder, the statue was made by the successive elevation of the proper levers to exhibit all the different motions of a flute-player, to the admiration of every one who saw it. Another figure, constructed by Vaucanson, played on the Provençal shepherd's pipe, held in its left hand, and with the right beat upon a drum, or tambour de Basque. Another automaton, of the ingenious contrivance of Vaucanson, was a duck of the natural size, which moved its wings, exhibited all the gestures of that animal, quacked like a duck, drank water, ate corn, and voided something like excrement. We may here observe, that the flute-player of Vaucanson was not the first of its kind. In the beginning of the 16th century, the anonymous author of the poem, entitled, "Zodiacus Vitæ," saw at Rome a figure made in like manner by a potter, but no account is given of its construction. The performances of Vaucanson were imitated, and even exceeded, by M. de Kempelen of Presburg, in Hungary. The androides constructed by this gentleman in 1769 was capable of playing chess. It was brought over to England in 1783 by its inventor, and remained here for more than a year. The figure is as large as life, in a Turkish dress, seated behind a table, with doors $3\frac{1}{2}$ feet long, 2 deep, and $2\frac{1}{2}$ high. The chair on which it sits is fixed to the table, which is made to run on four wheels. It leans its right arm on the table, and in its left hand holds a pipe; with this hand it plays after the pipe is removed. A chess-board of 18 inches is fixed before it. The table, or rather chest, contains wheels, levers, cylinders, and other pieces of mechanism, all of which are publicly displayed. The vestments of the figure are then lifted over its head, and the body is seen full of similar wheels and levers. There is a little door in its thigh, which is likewise opened; and with this, and the table also open, and the figure uncovered, the whole is wheeled about the room. The doors are then shut, and the automaton is ready to play; and it always takes the first move. At every motion the wheels are heard; the image moves its head, and looks over every part of the chess-board. When it checks the queen it shakes its head twice, and thrice in giving check to the king. It likewise shakes its head when a false move is made, replaces the piece, and makes its own move, by which means the adversary loses one. M. de Kempelen has exhibited his automaton at Petersburg, Vienna, Paris, and London, before thousands, many of whom were mathematicians and chess-players, and yet the secret by which he governed the motion of its arm was never discovered. He valued himself upon the construction of a mechanism, by which the arm could perform ten or twelve moves. It then needed to be wound up like a watch, after which it was capable of continuing the same number of motions. This automaton could not play unless M. de Kempelen, or his assistant, was near it, to direct its movements. A small square box was frequently consulted by the exhibitor during the game, and in this consisted the secret, which the inventor declared he could communicate in a moment. Any person who could beat M. de Kempelen at chess, was sure of conquering the automaton.

There have been many speaking machines, which seem to answer various questions proposed, sometimes in different languages, sing, and even blow a huntsman's horn. The figure, or perhaps only a head, is often placed upon a box, the fore part of which, for the better deception, is filled with a pair of bellows, a sounding board, a cylinder and pipes, supposed to represent the organs of speech. At other times the machine is only like a perruke-maker's block, hung round with a Turkish dress, furnished with a pair of arms, and placed before a table; and sometimes the puppet stands upon the table, or against a wall. The sounds are heard through a speaking trumpet, which the figure holds in its mouth. Some have pretended, that the voice of machines of this kind does not proceed from a man, but that it is produced by mechanism, like the music of an organ. Some affirm, that the voice issues from the machine itself; others, that the juggler answers, by speaking in the manner of ventriloquists,

triloquiſts, from the lower part of his belly, or by having the power to alter his voice; and ſome believe that the anſwers are given by a man ſomewhere concealed. It is, however, well known, that a child or a woman is concealed in the juggler's box; or that ſome perſon, in a neighbouring apartment, ſpeaks into the end of a pipe, which proceeds through the wall to the puppet, and which conveys the anſwer to the ſpectators. The invention of cauſing ſtatues to ſpeak, by this method, ſeems ſo ſimple, that one can ſcarcely forbear conjecturing, that it was anciently employed to ſupport ſuperſtition; and many have imagined that the greater part of the oracles were delivered in this manner. See Van Dale de Oraculis, 4to. Amſt. 1700. p. 222. Whether the head of Orpheus ſpoke in the iſland of Leſbos, or, as is more probable, the anſwers were conveyed to it by the prieſts, as was the caſe with the tripod at Delphi, cannot be now aſcertained. That the impoſtor Alexander, however, cauſed his Æſculapius to ſpeak in this manner is expreſsly related by Lucian. He took, ſays this author, inſtead of a pipe, the gullet of a crane, and tranſmitted the voice through it to the mouth of the ſtatue. In the fourth century, when Biſhop Theophilus broke to pieces the ſtatues at Alexandria, he found ſome which were hollow, and placed in ſuch a manner againſt a wall, that a prieſt could ſlip unperceived behind them, and ſpeak to the ignorant populace through their mouths. Theodoret, Eccl. Hiſt. lib. v. c. 22. p. 228. Ed. Valeſii. Beckman's Hiſt. of Inventions, vol. iii. p. 317, &c. See AUTOMATON.

ANDROLEPSY, formed of ἀνηρ, *man*, and λαμβανω, *capio, I take*, in *Antiquity*, an action againſt thoſe who protected murderers, by which if an Athenian were killed by a citizen of ſome other place, and ſuch city refuſed to deliver up the criminal to puniſhment, it was held lawful to take three inhabitants of that city, and to detain them, till the murderer had either ſurrendered himſelf, or ſatisfied the law. This the Greeks called *androlepſia*, and the Romans CLARIGATIO. Some authors alſo uſe *androlepſia* for REPRISALS.

ANDROMACHA, in *Entomology*, a ſpecies of PAPILIO (Parnaſſius) that inhabits New Holland. Wing above and beneath alike, dotted with black; anterior pair naked, poſterior pair yelloviſh. Fabricius and Gmelin.

ANDROMACHA, a ſpecies of SPHINX, (zygaena of Fabricius) that inhabits America. It is black, wings tranſparent, margin and band black, tail red. Gmelin. The ſphinx caunus of Cramer is ſuppoſed to be a variety of this ſpecies.

ANDROMACHE, in *Biography*, the wife of Hector, was the daughter of Aëtion, king of Thebes, in Cilicia. She lived in the happieſt conjugal union with her huſband till his death. At the ſiege of Troy ſhe had the affliction of witneſſing the precipitation of her ſon Aſtyanax from a high tower, and of being herſelf a captive ſlave to Pyrrhus, the ſon of Achilles, who was the deadly foe of Hector. She afterwards became the concubine of Pyrrhus, and had children by him. After the death of Pyrrhus, or, as ſome ſay, during his life, ſhe married her fellow-captive Helenus, a ſon of Priam, and brother of Hector; and ſhe reigned with him over part of Epirus, and perpetuated a race from whom Pyrrhus, king of Epirus, the antagoniſt of the Romans, is fabled to have ſprung. Several tragedies, ancient and modern, have been compoſed on the ſubject of Andromache; but the intereſt of the moſt pathethic poem probably ariſes from ſentiments foreign to her period and character. Gen. Dict.

ANDROMACHUS of *Crete*, was phyſician to the emperor Nero. He invented the compoſition, called after him, Theriaca Andromachi, which he dedicated to the ſervice of Nero, in a copy of Greek verſes that have been preſerved to the preſent time. Galen wrote two books in commendation of the medicine. It was given as an antidote againſt the poiſon of the viper, and was ſoon ſuppoſed to have equal power againſt all other poiſons, and to prevent or cure malignant and infectious fevers. The emperor Antonine is ſaid to have made daily uſe of the compoſition, and it was kept conſtantly prepared in the palace by ſeveral ſucceeding emperors. The formula, or proceſs for making it, is deſcribed by Aretæus and by Galen, as well as by the inventor in his verſes to Nero. The Venetians became ſo famous for making this medicine, which they ſent for ſale to all parts of Europe, that it is now more commonly known by the name of Theriaca Venetæ, Venice treacle, than by that of the inventor. Andromachus is ſaid to have been the firſt phyſician who was dignified with the title of Archiater. Haller, Bib. Med. Pract.

ANDROMEDA, in *Aſtronomy*, a conſtellation of the northern hemiſphere, repreſenting the figure of a woman almoſt naked, with her feet at a diſtance from each other, and her arms extended and chained.

It is ſuppoſed to have been formed in memory of Andromeda, daughter of Cepheus and Caſſiopeia, and wife of Perſeus, by whom ſhe had been delivered from a ſea-monſter, to which her father had expoſed her to be devoured, in order to preſerve his kingdom from the plague. Minerva tranſlated her into the heavens.

Dr. Hook thinks he has diſcovered the hidden meaning of the ſtory of Andromeda. Vide Poſt. Works, p. 401. Andromeda is ſometimes called in Latin, "Perſea," "Mulier catenata," and "Virgo devota;" and the Arabians have changed the figure of this conſtellation from that of a woman to that of a ſea-calf. Schickard has changed the name for that of "Abigail;" and Schiller calls it the "holy ſepulchre," and exhibits it under that figure. The ſtars in the conſtellation Andromeda, in Ptolemy's catalogue, are 23, in Tycho's 23, in Hevelius's 47, in Mr. Flamſteed's no leſs than 66. About 27 of theſe ſtars are viſible to the naked eye, of which the principal are, α Andromeda's head, β in the girdle, called mirach, or mizar, and γ on the ſouth foot, named alamak, and ſometimes alhamec.

Some of the ſtars of Andromeda have been reckoned among the changeable ſtars, whoſe brightneſs varies. Mr. Pigott and Dr. Herſchel have made obſervations on their relative brightneſs, for which ſee Phil. Tranſ. vol. lxxvi. p. 203. 212. vol. lxxxvii. p. 307. 321.

ANDROMEDA, in *Botany*, ledum of Mich. chamædaphne and poliifolia of Buxb. and erica of Tournefort, a genus of the *decandria monogynia* claſs and order, of the natural order of *bicornes* and *ericæ* of Juſſieu. Its characters are, that the *calyx* is a perianthium, five-parted, acute, very ſmall, coloured, and permanent; the *corolla* is monopetalous, campanulate, and quinquefid, clefts reflex; the *ſtamina* have ſubulate filaments, ſhorter than the corolla, and ſcarcely fixed to it, anthers two-horned and nodding; the piſtillum is a roundiſh germ, ſtyle cylindric, longer than the ſtamens, and permanent, ſtigma obtuſe; the *pericarpium* is a capſule, roundiſh, five-cornered, five-celled, five-valved, opening at the corners, partitions contrary, and the *ſeeds* are very numerous, roundiſh, and ſhining. *Obſ.* It differs from *erica* in number. In ſome ſpecies the corolla is ovate, in others perfectly campanulate. The anthers in ſome are awned, in others awnleſs.

Martyn enumerates 25, and Gmelin 21 ſpecies. 1. A. *tetragona*, with peduncles ſolitary and lateral, corollas bell-ſhaped, and leaves oppoſite, imbricate, obtuſe, and revolute. This reſembles the *paſſerina filiformis*, but the flowers are very different, and

and ſimilar to thoſe of the lily of the valley; the leaves are generally four-fold, whence its ſquare appearance, and the name tetragona. Linnæus firſt obſerved it growing very ſparingly in Lapland, in 1732; and Gmelin found it on the mountains of Siberia. 2. A. *hypnoides*, with peduncles ſolitary and terminal, corollas bell-ſhaped, and leaves crowded and awl-ſhaped. It has the appearance of a moſs, ſpreads over large tracts of ground in the Lapland Alps, and adorns them with its beautiful red flowers, the anthers are awned; it is alſo found in Denmark and Siberia. 3. A. *cerea*, with peduncles axillary, two-leaved, and one-flowered, and leaves alternate, ovate, and ſerrate; the leaves are on ſhort petioles, the corolla is bell-ſhaped, and the anthers oblong, yellow, two-horned at the back. It is brought from the iſland of Otaheite. 4. A. *cærulea*, erica folio abietis, flore arbuti of Buxb. with peduncles aggregate, corollas ovate, and leaves ſcattered, linear obtuſe, and flat; the anthers are without awns. It grows wild on the mountains of Lapland, more plentifully on thoſe of Dalecarlia and Jemtia, and is alſo found in Denmark and Siberia. 5. A. *Mariana*, Maryland A. with peduncles aggregate and branched, corollas ovate-cylindrical, and leaves oblong ovate, quite entire, and deciduous; the anthers are without awns; a native of North America; introduced here in 1736 by Peter Collinſon, Eſq. There are two varieties, α with oval leaves, and β with oblong leaves; the corollas are ſhaped like thoſe of arbutus, are of an herbaceous colour, appear in June and July, and are ſometimes ſurrounded by fruit, which ſeldom ripens in England. 6. A. *ferruginea*, ruſty A. with peduncles aggregate, axillary, corolla ſubgloboſe, and leaves elliptic, quite entire, and beneath ſcaly-ſcarioſe. This is a native of North America, was cultivated here by Mr. J. Gordon in 1776, and flowers in July and Auguſt. 7. A. *polifolia*, polifolia of Buxb. erica humilis, &c. of Pluken, rhododendron polifolium of Scop. ledum paluſtre noſtras arbuti flore of Ray, with peduncles aggregate and terminal, and leaves alternate, lanceolate, revolute, beneath glaucous. Martyn enumerates three varieties, *viz.* α A. pol. latifolia, broad-leaved marſh A. with leaves oblong, corollas ovate and fleſh coloured, ſegments of the calyx ſpreading, ovate, and white, ſometimes red at the tip. β A. pol. media, common marſh A. or wild roſemary; with leaves lanceolate, corollas oblong-ovate red, and ſegments of the calyx more erect. γ A. pol. anguſtifolia, narrow-leaved marſh A. with leaves lanceolate linear, and ſegments of the calyx oblong and red. This is an elegant little ſhrub, which riſes from ſix or eight inches to a foot in height, erect and branched; the flowers are fleſhy and nodding, the calyx is red, the corolla of a pink colour, the anthers awned, the capſule erect and five-furrowed, the ſtyle white, with a purple ſtigma, and the ſeeds very many and ſmall. It is a native of America and the northern countries of Europe on turf bogs; in Ruſſia, Sweden, Denmark, Germany, Swiſſerland, and in Britain, on the moſſes of Cheſhire, Lancaſhire, Weſtmoreland, Cumberland, Yorkſhire, and Scotland, as on Brigſten moſs, near Kendal, Middleton moſs, by Lancaſter, on Blackſtone-edge, between Halifax and Rochdale, upon Solway moſs in great quantities, and not unfrequent in peat-bogs in the lowlands of Scotland. It flowers in June, and is called mars chiſtus, wild roſemary, Poley mountain, moor-wort, and marſh holy roſe. There is ſome difference in the varieties as found in North America (α), in Europe (β), and in Newfoundland and Labrador (γ), as above ſpecified. 8. A. *bryantha*, bryanthus of Gmelin, with flowers corymbed, leaves elliptic, and proſtrate ſtem. This comes up in thick clumps, like wild thyme, on the rocks of Kamtſchatka. 9. A. *daboecia*, erica daboecii, erica Hibernica, &c. of Ray, Iriſh whorts, Cantabrian heath, or trailing Andromeda, with racemes pointing one way; flowers quadrifid, ovate, and leaves alternate, lanceolate, and revolute. This was formerly an erica, and wants one-fifth in the parts of fructification, and ought, perhaps, with droſeroides and cærulea, to be removed to that genus. This ſpecies has the habit or air of an andromeda, but the character of an erica. The ſeed-veſſel is a four-celled, four-valved capſule; it has been obſerved to grow only in the Iriſh bogs, and flowers in June and July. 10. A. *droſeroides*, erica glutinoſa of Berg. chamæcillus roris folis foliis of Pet. clammy A. with racemes pointing one way, and leaves linear, hairy and viſcid. The number of parts of fructification varies from 4 or 8 to 5 or 10; it is ſiſter to N° 9, and has all the habits of Andromeda; a native of the Cape of Good Hope. 11. A. *paniculata*, panicled A. with racemes terminal, panicled, corollas roundiſh, and leaves ovate, rather entire: the ſtem is about four feet high; the flowers grow in looſe ſpikes from the ends of the branches, being ſhaped like thoſe of arbutus, only a little longer, and appearing in July, but not producing ſeeds in this country; the anthers are awned: a native of Virginia, and cultivated here in 1748 by Archibald, duke of Argyle. 12. A. *japonica*, with racemes panicled, cylindric and bracted, and leaves elliptic, reflex, and ſerrate at the tip. This is a tree, a native of Japan, near Nagaſaki, and flowers in December. 13. A. *arborea*, tree—Andromeda, or ſorrel-tree, with panicles terminal, corollas rather downy, and leaves elliptic, pointed, and tooth-letted. This is in Virginia a ſhrub, growing 10 or 12 feet high, but in Carolina it riſes 20 feet; the branches are ſlender, and bend downwards; the flowers grow in long, naked ſpikes from the ſides of the branches, they are of an herbaceous colour, and ranged on one ſide of the ſtalk. Cultivated here in 1752 by Mr. Miller. 14. A. *racemoſa*, branching or Pennſylvania Andromeda, with racemes terminal, ſimple, and bracted, corollas cylindric, and leaves oblong-lanceolate, and ſerrate. This was found in Pennſylvania by Kalm, introduced here in 1736 by P. Collinſon; flowers in July. 15. A. *axillaris*, notch-leaved A. with racemes axillary and ſimple, corollas oblong, leaves ovate, acute, and ſerrulate. A native of Carolina, introduced in 1765, and flowering from May to Auguſt. 16. A. *coriacea*, thick-leaved A. with racemes axillary and ſimple, leaves ovate, very entire, very ſhining, and branchlets three-cornered; found in North America, introduced in 1765, and flowering in July and Auguſt. 17. A. *acuminata*, A. lucida of Jacq. acute-leaved A. with racemes axillary and ſimple, leaves ovate-lanceolate, acuminate and ſerrate. This is a ſhrub about four feet high, upright and ſmooth, with round branches, leafy to a conſiderable extent; the flowers ſmell like honey, the perianthium is green, the corolla ſnow-white. It is a native of North America, was introduced in 1765, and flowers in July and Auguſt. 18. A. *calyculata*, calycled A. with peduncles ſolitary, axillary, and pointing one way, two bractes, and leaves oval, ſcaly-dotted, and obſoletely ſerrulate. There are three varieties: α A. cal. ventricoſa, chamædaphne of Buxb. globe-flowered calycled A. with globoſe corollas, and oblong-lanceolate leaves; β. A. cal. latifolia, broad leaved calycled A. with corollas oblong-cylindric, and leaves oblong-oval, and obtuſe; γ. A. cal. anguſtifolia, narrow-leaved calycled A. with corollas oblong-oval, and leaves oblong-lanceolate. This is a low ſhrub, with leaves of ſimilar ſhape and conſiſtence to thoſe of the box tree, with ſmall punctures on them; the flowers grow in ſhort ſpikes at the extremes of the branches, ſingle, between two leaves, and white; the leaflets are oval on the racemes, and from the axil of each proceeds a ſolitary, pedicelled flower; the calyx is covered at the baſe, with two ovate leaflets; the anthers are oblong, bifid, and awnleſs; growing in Sweden, Ingria, Siberia, and North America, on moſſy land;

land; cultivated in 1748 by Archibald, duke of Argyle. There is ſome difference in the varieties from Ruſſia (α), Newfoundland (β), and North America and Siberia (γ). 19. A. *anaſtomozans*, with racemes crowded and leafy; leaves ovate, ſlighty ſerrate, anaſtomizing underneath; and dotted. This is a ſhrub with hairy branches, ovate corollas, two-awned anthers, and obtuſe capſules, gaping at the angles; found by Mutis in New Granada. 20. A. *rupeſtris*, with leaves oblong, alternate and ferrulate. A native of New Zealand. 21. A. *ſalicifolia*, willow-leaved A. with racemes pointing one way, and naked, corollas ſubcylindrical, and leaves lanceolate, acute, and quite entire; found by Commerſon in the iſland of Mauritius. 22. A. *buxifolia*, box-leaved A. with racemes pointing one way, and naked, corollas ſubcylindrical, and leaves cordate-ovate, quite entire, with a little dagger point. This and the former ſpecies differ ſcarcely at all in their fructification, or in the ſtructure of their leaves, and are diſtinguiſhable only by their form; this, however, has none of thoſe lines parallel to the midrib that are ſo conſpicuous in the other ſpecies. It is a native of the iſle of Bourbon where it was found by Commerſon. 23. A. *faſciculata*, with peduncles aggregate, leaves alternate, ovate-lanceolate, obtuſe, ſlightly crenulate and coriaceous. 24. A. *Jamaicenſis*, with peduncles aggregate, corollas ovate tranſparent, leaves alternate, broad-lanceolate, obtuſe, entire, beneath aſh-coloured and membranaceous. 25. A. *octandra*, with peduncles aggregate, corollas cylindric quadrifid, and leaves alternate, ovate-lanceolate, entire, and membranaceous. The three laſt ſpecies are natives of Jamaica. Gmelin enumerates the following ſpecies beſides ſeveral of thoſe above deſcribed, *viz.* A. *ferruginoſa*, with flowers aggregate, axillary, and terminal, leaves rounded at the margin, revolute, and beneath ferruginous; ſuggeſted not to be diſtinct from the A. *ferruginea*; A. *nitida*, with peduncles aggregate and axillary, leaves alternate, lanceolate-ovate, entire and permanent; A. *cateſkai*, with racemes ovate and axillary, leaves alternate, petiolate, ovate-lanceolate, ferrulate and permanent; A. *reticulata*, with racemes ovate and axillary, leaves ovate, acuminate, crenulate, alternate, petiolate, beneath reticulate and permanent.

Culture. Moſt of the ſpecies are hardy, deciduous ſhrubs, which delight in moiſt ground; they may be increaſed by their creeping roots, which put up ſuckers at a diſtance, that may be taken off with roots, and tranſplanted where they are to remain. Thoſe that are imported from America may be propagated by ſeed ſown in the ſpring in a bed of moiſt earth; they may be increaſed by layers in autumn. The 13th ſort muſt be ſheltered from froſt in winter, and in ſummer frequently watered. It grows naturally in boggy places, and requires greater heat than that of this climate. Martyn's Miller.

ANDROMEDA, in *Entomology*, a ſpecies of PAPILIO (Parnaſſius) found in India. The wings are roundiſh, tranſparent, white: poſterior pair red at the tip, with a ſingle eye-ſhaped ſpot on each ſide. Fabricius and Gmelin.

ANDROMEDA, in *Natural Hiſtory*, is likewiſe a ſpecies of MEDUSA amongſt the VERMES MOLLUSCA. It is hemiſphærical, without marginal arms; eight round, ramoſe, foliaceous arms on the under part. Forſk. Fn. Arab. Gmelin. This kind is extremely abundant on the coaſts of the Red Sea. The body is tranſparent, and of a pale browniſh colour with white rays; the margin is entire; in the middle is a black croſs: the arms are white, and rather thicker than a gooſe quill at their baſe. Gmelin, &c.

ANDROMEDA, in *Middle Age Writers*, denotes a kind of garment made of ram-ſkins.

ANDRON, or ANDRUM, in *Antiquity*, an apartment in houſes aſſigned for the uſe of the men. This was otherwiſe denominated *androna*, and *andronitis*. The andron ſtood oppoſed to the GYNECÆUM, or apartment of the women. The Greeks alſo gave their dining-rooms the title andron becauſe the women had no admittance to feaſts with the men.

ANDRONA, in *Ancient Writers*, denotes a ſtreet, or public place, where people met and converſed together. In ſome writers androna is more expreſsly uſed for the ſpace between two houſes. In which ſenſe the Greeks alſo uſed the term ἀνδρὼν, as for the way or paſſage between two apartments. The word is ſometimes alſo written *andra*, *andrion*, and *andronium*.

ANDRONA is alſo uſed, in *Eccleſiaſtical Writers*, for that part in churches deſtined for the men. Anciently it was the cuſtom for the men and women to have ſeparate apartments in places of worſhip, where they performed their devotions aſunder; which method is ſtill religiouſly obſerved in the Greek church. The ἀνδρὼν, or androna, was on the ſouthern ſide of the church, and the women's apartment on the northern.

ANDRONICUS I. COMNENUS, in *Biography* and *Hiſtory*, was the ſon of Iſaac and grandſon of Alexius Comnenus, and one of the moſt conſpicuous characters of the age, ſo that his genuine adventures might form the ſubject of a very ſingular romance. He was ſtrong and beautiful; the want of the ſofter graces was ſupplied by a manly countenance, a lofty ſtature, athletic muſcles, and the air and deportment of a ſoldier; and the preſervation of his health and vigour in old age, was the reward of temperance and exerciſe. Dextrous in arms, he was ignorant of fear; his perſuaſive eloquence could accommodate itſelf to every ſituation and character of life; and in every deed of miſchief, he had a heart to reſolve, a head to conceive, and a hand to execute. In his youth he followed the retreat of the Roman army, and in the march through Aſia Minor he wandered into the mountains, was taken by Turkiſh huntſmen, and became a captive to the ſultan. Both his virtues and his vices recommended him to the favour of his couſin, the emperor Manuel; and whilſt he lived in public inceſt with his niece Theodora, Andronicus openly maintained a licentious intercourſe with her ſiſter Eudocia, who gloried in the name of his concubine. She accompanied him in his military command in Cilicia, where he preſſed, with active ardour, the ſiege of Mopſueſtia; but he was ſurpriſed and thrown into diſorder by a ſally of the enemy. On his return to the Imperial camp in Macedonia, Eudocia attended his motions; and their tent was ſuddenly attacked at midnight by her brothers, who were impatient to expiate her infamy in his blood. Refuſing to aſſume a female habit, in compliance with her advice, he ſtarted from his couch, and cut his way through the aſſaſſins with his ſword. At this time he engaged in a treaſonable correſpondence with the king of Hungary and the German emperor; in conſequence of which he was arreſted, and ſtrictly confined in a tower of the palace of Conſtantinople. In this priſon he remained for more than 12 years; and after repeated and ineffectual attempts to eſcape, in which he manifeſted ſingular reſolution and dexterity, he at laſt ſucceeded, and retired to the court of the great duke of Ruſſia. Having gained this aſylum, he ſolicited the Ruſſian prince to join his arms to thoſe of Manuel in the invaſion of Hungary, and thus obtained forgiveneſs from the emperor; and, after a campaign on the Danube, he returned with Manuel to Conſtantinople. By refuſing the oath of allegiance, which he was required to take to the prince of Hungary, who became the preſumptive heir by marrying the emperor's daughter, he again incurred

curred his diſpleaſure; and he was puniſhed by an honourable exile to a ſecond command of the Cilician frontier, with the abſolute diſpoſal of the revenues of Cyprus. Here he engaged the affections of Philippa, ſiſter of the empreſs Maria, and daughter of Raymond of Poitou, the Latin prince of Antioch. In connection with her he purſued a courſe of diſſipation for ſome time, till Manuel's reſentment interrupted his pleaſures. His intercourſe with Philippa being obſtructed, he collected a band of deſperate adventurers, and undertook the pilgrimage of Jeruſalem. In this military undertaking he ſo far ſucceeded as to captivate the eſteem of the clergy and of the king, and to obtain the lordſhip of Berytus, on the coaſt of Phœnicia. In this neighbourhood reſided Theodora, great grand-daughter of the emperor Alexis, and widow of Baldwin the Third, king of Jeruſalem, who was young and beautiful, and a princeſs of his own family. Theodora became the third victim of his amorous ſeduction; and her ſhame was more public and ſcandalous than that of her predeceſſors. The emperor's reſentment ſtill purſued him; in Paleſtine he was no longer ſafe; and Theodora diſcloſed his danger, and accompanied his flight. Damaſcus was his firſt place of refuge; and having viſited ſeveral other parts of the eaſt, probably Bagdad and the courts of Perſia, he made a long circuit round the Caſpian Sea and the mountains of Georgia, and finally ſettled among the Turks of Aſia Minor, the hereditary enemies of his country. He made frequent inroads in the Roman province of Trebizond, and ſeldom returned without an ample harveſt of ſpoil and of Chriſtian captives. Theodora was at length ſurpriſed by the governor of Trebizond, and, together with her two children, was ſent to Conſtantinople; upon which Andronicus implored and obtained a final pardon; with leave to throw himſelf at the feet of his ſovereign, who was thus ſatisfied. He acted the part of a humble and conſtant penitent with ſuch ſucceſs, that his ſins were forgiven both by the church and ſtate; and he was ſent by the emperor to reſide at a diſtance from the court, namely, at Oenóe, a town of Pontus, ſurrounded with rich vineyards, and ſituate on the coaſt of the Euxine.

Soon after this event the death of Manuel in 1177, who was ſucceeded by his ſon Alexius Comnenus, at the age of 12 or 14 years, without vigour, wiſdom, or experience, opened a new career to his ambition. A civil war having been excited in Conſtantinople by the miſconduct of the empreſs dowager, the views of the people were directed to Andronicus. Urged to interpoſe for quelling the diſturbance that prevailed, and for reſtoring the public tranquillity, both by the patriarch and the patricians, he began his march from Oenóe towards Conſtantinople; his ſlender train inſenſibly ſwelled to a crowd and an army; and he ſoon reached the city, took poſſeſſion of the palace, ſaluted the emperor, confined his mother, puniſhed her miniſter, and re-eſtabliſhed the public order and peace. His wicked deſigns were for ſome time diſguiſed by his hypocriſy; but he haſtened to manifeſt the cruelty of his diſpoſition by putting to death many perſons whom he thought ill-affected towards him, and by cauſing the empreſs herſelf to be tried and executed on a charge of treaſon, in correſponding with Bela, king of Hungary. After the coronation of the young emperor, at which Andronicus ſolemnly attended and vowed fidelity, with the ſacrament in his hands, he found means to repreſent the neceſſity of committing the empire to the care of ſome perſon of experience, and to engage the people, as well as the emperor himſelf, to ſolicit the aſſociation of a colleague. Having ſucceſsfully conducted this part of the farce, his adherents unanimouſly exclaimed, "Long live Alexius and Andronicus, Roman emperors!" And the artful hypocrite was elevated, by acclamation, apparently againſt his own conſent, and merely to protect the young emperor and to ſupport his authority, to a partnerſhip in the empire. This partnerſhip, which was merely a preparatory ſtep to the ſole ſovereignty, he ſoon terminated by the death of Alexius, whom he cauſed to be ſtrangled with a bow-ſtring; and the tyrant, inſenſible to pity or remorſe, after ſurveying the body of the innocent youth, ſtruck it rudely with his foot: "Thy father," he cried, "was a knave, thy mother a whore, and thyſelf a fool!" Having thus attained to the dignity of ſole emperor, A. D. 1183, he ſwayed the ſceptre about three years and a half, as the guardian or ſovereign of the empire. His government exhibited a ſingular contraſt of vice and virtue: when he liſtened to his paſſions he was the ſcourge, and when he conſulted his reaſon he was the father of his people. In the exerciſe of private juſtice he was equitable and rigorous; the provinces, which had been neglected and oppreſſed, revived in proſperity and plenty; and millions applauded the diſtant bleſſings of his reign, while he was curſed by the witneſſes of his daily cruelties. The nobleſt families, eſpecially thoſe who claimed any alliance to the Comneni, were either maſſacred or exiled. At length his throne was ſubverted by a rival without merit, and a people without arms. Iſaac Angelus, a deſcendant, in the female line, from the great Alexius, being marked as a victim, defended his life and liberty, ſlew the executioner, and fled for refuge to the church of St. Sophia. The populace were rouſed, and Iſaac was inſtantly raiſed from the ſanctuary to the throne. Andronicus, who was indulging himſelf in the delicious iſlands of the Propontis, in the ſociety of a young wife and a favourite concubine, returned with all ſpeed to Conſtantinople; but he found, upon his arrival, that he was univerſally deſerted, and that no condition which he propoſed, however ſelf-denying and humiliating, would be accepted. Accordingly he attempted to make his eſcape; but he was purſued and taken in his flight, and brought back, loaded with fetters, and with a long chain round his neck, to the preſence of Iſaac Angelus. "His eloquence, and the tears of his female companions, pleaded in vain for his life; but inſtead of the decencies of a legal execution, the new monarch abandoned the criminal to the numerous ſufferers, whom he had deprived of a father, an huſband, or a friend. His teeth and hair, an eye and a hand were torn from him; and a ſhort reſpite was allowed, that he might feel the bitterneſs of death. Aſtride on a camel, without any danger of a reſcue, he was carried through the city, and the baſeſt of the populace rejoiced to trample on the fallen majeſty of their prince. After a thouſand blows and outrages, Andronicus was hung by the feet, between two pillars that ſupported the ſtatue of a wolf and a ſow; and every hand that could reach the public enemy, inflicted on his body ſome mark of ingenious or bloody cruelty, till two friendly or furious Italians, plunging their ſwords into his body, releaſed him from all human puniſhment. In this long and painful agony, 'Lord, have mercy upon me!' and 'Why will you bruiſe a broken reed?' were the only words that eſcaped from his mouth. His death, in the 73d year of his age, cloſed a reign of two years, and with him terminated the dynaſty of the Comneni. Anc. Un. Hiſt. vol. xv. p. 158, &c. Gibbon's Hiſt. vol. ix. p. 93—108.

Andronicus, Cyrrestes, or of Cyrrhus, was an Athenian aſtronomer, and celebrated as the inventor of weathercocks. He erected an octagon tower of marble, on each ſide of which he engraved figures repreſenting the eight winds mentioned by Vitruvius, under the names of

Solanus, Lunus, Auster, Aquilo, Favonius, Corus, Septentrio, and Apulo. A copper Triton, holding in its hand a flick, turned upon a pivot, and fhewed the direction of the wind. Salmafius gives the form of this tower in his commentary on Solinus. Aul. Gell. lib. vi. c. 22.

Andronicus, Livius, the oldeft of the Latin poets, is faid to have been a Greek flave, and to have been emancipated by Livius Salinator, whofe children he inftructed, and whofe name he aflumed. His performances were chiefly dramatic and comic, and he acted in his own pieces; and, it is faid, that when he became hoarfe, he caufed the words to be recited by a fervant, while he himfelf exhibited the gefticulation. He alfo wrote hymns to the gods, one of which, in honour of Juno, is faid, by Livy and Valerius Maximus, to have been fung through the city by girls. An odyffey is alfo attributed to him. Some lines, which are quoted by grammarians and critics, are the only relics of him, and they have been printed in the fragments of the other ancient Latin poets, in the "Comici Latini," and the "Corpus Poetarum." Andronicus repreſented his firſt piece on the ſtage, A. U. C. 514. B. C. 240, a year before the birth of Ennius. Voſſius.

Andronicus of *Rhodes*, a peripatetic philoſopher, came to Rome in the time of Cicero, and ſerved to revive and eſtabliſh the philoſophy of Ariſtotle. Andronicus collected the writings of Ariſtotle, by means of the library of Apellicon, ſent to Rome by Sylla, and Tyrannio's uſe of it, arranged, corrected, tranſcribed, and publiſhed them; and, according to Plutarch, he annexed indexes to them; ſo that he may be conſidered as a reſtorer of theſe writings. Andronicus wrote a paraphraſe of Ariſtotle's Categories and Phyſics, and probably of ſome other pieces, but none are extant, unleſs the paraphraſe of Ariſtotle's Ethics, publiſhed under his name by Heinſius, 8vo. at Leyden, in 1617, and at Cambridge in 1679, be his, which Salmaſius, Voſſius, &c. diſpute. It is doubted whether a ſmall treatiſe "On the Paſſions," publiſhed by David Hoeſchelius, in 1593, was written by this Andronicus. Plut. Vit. Sylla apud Oper. tom. i. p. 468. Gen. Dict.

Andronicus of *Theſſalonica*, flouriſhed in the 15th century, and among other learned men, who left Conſtantinople when it was taken by the Turks, contributed to the revival of letters. He taught Greek at Rome, and was entertained in the houſe of Beſſarion; but his ſalary was ſo inconſiderable that he was obliged to leave Rome and repair to Florence; whence he removed to Paris, where he died at an advanced age. His knowledge of the Greek language and of Greek authors exceeded that of any of his contemporaries; but he was diſqualified for public ſpeaking by a bad pronunciation. Gen. Dict.

ANDRONION, in *Phyſic*, the name of a paſtil, invented by an ancient phyſician named Andro, ſaid to have been of great efficacy againſt the carbuncle and herpes. Its ingredients, according to Ægineta's preſcription, are the *ſquamæ* of copper, *æs uſtum*, *ſal ammoniac*, *alumen rotundum*, ſhavings of verdegriſe, and frankincenſe, all wrought up with wine. Celſus gives another recipe, and Aetius a third.

ANDROPHAGI, from *ανηρ*, *man*, and *φαγω*, *I eat*, among *Ancient Geographers*, denoted man-eaters. Theſe were more uſually called *anthropophagi*. Herodotus and Pomp. Mela ſpeak of a nation of androphagi, in Scythia, who obſerved neither laws nor juſtice, and had nothing in common with the other inhabitants but their dreſs and occupation of feeding cattle.

ANDROPOGON, q. d. *man's beard*, in *Botany*, a genus of the *polygamia monoecia* claſs and order, and of the natural order of *gramina*, or graſſes. Its characters are, that the hermaphrodite flowers are ſeſſile, that their *calyx* is a glume, one-flowered, two valved, oblong, obtuſe, cartilaginous and awnleſs, the outer valve concave, flattiſh at the back, embracing the inner, which is narrower, with its edges; the *corolla* is a two-valved glume, leſs and more ſlender than the calyx; outer valve ſmaller, often very ſmall, within the inner valve of the calyx, ſharp or bifid at the end, in moſt of the ſpecies awned; awn terminating, or from the cleft of the glume, long, with a bent joint, and twiſted at bottom; the inner valve lanceolate, doubled at the edges; nectary two-leaved; leaflets thickiſh and diaphanous; the *ſtamens* have three filaments, capillary, very tender; anthers oblong, forked at both ends, and incumbent; the *piſtillum* is an oblong germ, ſtyles two, and capillary, ſtigmas oblong, and feathered; no *pericarpium*; glumes of the corolla and calyx involving, and incloſing the ſeed; the *ſeed* ſolitary, oblong, and covered, armed with the awn of the corolla, which eaſily falls off. The male flowers are peduncled, ſingle, or in pairs to each hermaphrodite; the *calyx*, *corolla*, and *ſtamens* as in the others, except that the corolla has no awn. Martyn enumerates 35, and Gmelin 38 ſpecies. 1. A. *caricoſum*, gramen caricotum of Rumph. with ſpikes ſolitary and imbricate, ſeeds ſhaggy, awns naked and contorted. A. native of Amboina and Japan. 2. A. *contortum*, Ægilops Maderas-patana, &c. of Scheuch. gramen fecalinum indicum, &c. of Pluk. and Mor. with ſpike ſolitary, male flowers awnleſs on the back of the ſpike, female flowers on the belly of it twice as long as the males, with twiſted approximating awns, longer than the whole ſpike. A native of the Eaſt Indies; introduced into Kew Garden in 1779 by Anthony Chamier, Eſq. 3. A. *crinitum*, with ſpikes ſolitary and ſhaggy; awns naked, jointed, and very long. A native of Japan; found by Thunberg. 4. A. *divaricatum*, lagurus humilior, &c. of Gron. Virg. &c. with ſpike oblong, flowers woolly, remote and divaricate; awn flexuoſe and naked. A native of Virginia. 5. A. *gryllus*, Ægilops bromoides ſpica purpuraſcente of Scheuch. gram. ſparteum feſtuceum, &c. of Barr. gram. avenaceum, &c. of Monti, with peduncles of the panicle entirely ſimple and three-flowered: the hermaphrodite floſcule ſeſſile, awned, ciliate, and bearded at the baſe. A native of Piedmont, Verona, Montpelier, Carniole, the Griſons, and Switzerland. 6. A. *ſaccharoides*, with branches of the panicle ſimple, florets in pairs, hermaphrodite awned ſeſſile, the other awnleſs, pedicelled, withering, pedicel and rachis woolly. A native of Jamaica. 7. A. *nutans*, with panicle nodding, awns twiſted and poliſhed, glumes of the calyx ſhaggy. A native of Virginia and Jamaica. 8. A. *ciliatum*, with panicle nodding, outer calyx many-flowered and ciliate, awns contorted and hairy. Found by Thunberg on the mountains of Nagaſaki in Japan; flowering in September. 9. A. *ſerratum*, with panicle looſe, one floſcule ſeſſile, villoſe at the baſe; the other pedicelled, with the pedicel villoſe, and ſhorter than the calyx. A native of Japan. 10. A. *cotuliferum*, with panicle ſpreading, villoſe, awn-twiſted, naked, pedicels clubbed or ſwelling at top, and hollowed like a ſaucer or diſh. A native of Japan. 11. A. *cymbarium*, with panicle ſcattered, bractes boat-form, flowers tranſverſe, awned, and threefold. A native of the Eaſt Indies. 12. A. *ſquarroſum*, A. *muricatum* of Retz, with panicle crowded, glumes awl-ſhaped and rugged. Koenig obſerved it in Ceylon, ſwimming on deep pools; it is uſed by the natives for its pleaſant ſmell; they alſo make fans of it. 13. A. *proſtratum*, with peduncles in five-flowered umbels, without calycles, the hermaphrodite floſcule awned. A native of the Eaſt Indies. 14. A. *faſtigiatum*, with ſpikes of the panicle ſolitary, pe-

duncles elongate ſubfaſtigate, rachis woolly, floſcules awned, and male fertile. A native of Jamaica. 15. A. *alopecuroides*, gram. dactylon, &c. of Sloane, with panicle looſe; rachis woolly, and a twiſted awn to each floſcule. A native of Jamaica and Virginia. 16. A. *diſtachyum*, with ſpikes two, terminal, and culm undivided. Linnæus ſays that it grows wild in Switzerland. Scheucher had it from Smyrna. 17. A. *ſchænanthus*, lagurus of Fl. Zeyl. gram. ad junceum accedens aromaticum majus ſyriacum of Mor. gram. dactylon aromaticum, &c. of Pluken. ſchænanthus of Bauhin and Ray, ſweet ruſh, or camel's hay, with ſpike of the panicle conjugate, ovate-oblong, rachis pubeſcent, floſcules ſeſſile, with a twiſted awn. It is brought over from Turkey and Arabia in bundles about a foot long, conſiſting of ſmooth ſtalks, in ſhape and colour reſembling barley ſtraws, full of a fungous pith like that of ruſhes. It has an agreeable ſmell, and a warm, bitteriſh, not unpleaſant taſte. Diſtilled with water it yields a ſmall quantity of a yelloviſh, fragrant, and pungent eſſential oil, and the remaining decoction is bitteriſh, and ſomewhat acrid. The ſpirituous extract is pleaſantly aromatic and bitteriſh. This plant was formerly employed as a warm ſtomachic, and deobſtruent; but in our country its uſe is ſuperſeded by more common aromatic vegetables. It is kept in the ſhops merely as an ingredient in the mithridate and theriaca; but theſe compoſitions being excluded from the pharmacopœias, the ſchænanthus, or juncus odoratus is left out of our materia medica. Lewis and Murray. 18. A. *Virginicum*, gram. dactylon bicorne tomentoſum minus of Sloane, with ſpikes of the panicle conjugate, peduncles ſimple, rachis woolly, floſcules awnleſs, the male one wanting. A native of America. 19. A. *bicorne*, lagurus of Linn. hort. cliff. and Gron. Virg. gram. dactylon bicorne tomentoſum maximum, ſpicis numeroſis of Sloane, with ſpikes of the panicle conjugate, peduncles branching very much, rachis woolly, awn caducous, male floſcule wanting. A native of the Eaſt Indies, on dry hills, and there called by the Engliſh fox-tail graſs. 20. A. *hirtum*, gram. dactylon ſpica gemina of Scheuch. gram. dactylon ſiculum, &c. of Pluk. with ſpikes of the panicle conjugate, and calyces ſhaggy. A native of Portugal, Italy, Sicily, and Smyrna. 21. A. *inſulare*, gram. avenaceum, &c. of Sloane, with panicle looſe and ſmooth, floſcules double and awnleſs, one pedicel ſhorter, calyces woolly. A native of Jamaica. See PANICUM *lanatum*. 22. A. *barbatum*, with ſpikes digitate, calyces permanent, and corollas ciliate. A native of the Eaſt Indies; introduced into Kew gardens, in 1777, by Dr. Solander. 23. A. *pubeſcens*, chloris ciliata of Swartz, with ſpikes digitate, calyces ſubtriflorous, outer petals awned, keel and edge of the hermaphrodite flower ciliate. A native of Jamaica; introduced at Kew in 1779, perennial, and flowering from July to September. 24. A. *nardus*, lagurus of Fl. Zeyl. with branches of the panicle ſuperdecompound and proliferous. See SPIKENARD. 25. A. *muticum*, with ſpikes digitate, moſtly three, and floſcules alternate, ſeſſile, and awnleſs. A native of the Cape of Good Hope. 26. A. *iſchæmum*, gram. dactylon, &c. of Scheucher, with many digitate ſpikes, ſeſſile floſcules, awned and awnleſs, and woolly pedicels. A native of the ſouthern parts of Europe, growing on mountains, hills, and other dry ſituations; introduced to Kew, in 1778, by Mr. Thomas Blackie. 27. A. *faſciculatum*, chloris radiata of Swartz, gram. dactylon, &c. of Mor. many-ſpiked andropogon, with ſpikes faſcicled, very many and ſmooth, calyces two-flowered, valves acute, ſmooth and even, the outer like petals, and awned, the inner floſcule barren. A native of Jamaica; introduced in 1779, and flowering from July to September. 28. A. *polydactylon*, cholris polydactyla of Swartz, gram. dactylon elatrus of Sloane, with ſpikes faſcicled, outer petals awned, thoſe of the lower floſcule ciliate-bearded. A native of Jamaica. 29. A. *glaucum*, with panicle leafy, involucles and calyces two-flowered, calyces of the ſeſſile flowers three-valved, of the peduncled ones two-valved. A native of the Eaſt Indies, whence it was ſent by Koenig. 30. A. *ſerratum*, with ſpike ſimple, imbricate, with two rows of awned ſeſſile flowers, and two of awnleſs pedicelled ones, calyces one-valved. A native of Bengal, where it was found by Koenig. 31. A. *incurvatum*, with ſpikes filiform, ſubdigitate, flowers twin, the female pedicelled and awned, the male ſeſſile and awnleſs, the calyces one-valved. Found by Koenig in Tranquebar near rivers. 32. A. *binatum*, with ſpikes twin, woolly, one valve of the calyces acuminate, the other truncate, three toothed, the larger petal-awned. Obſerved in the Eaſt Indies by Koenig. 33. A. *aciculatum*, with panicle contracted upright, peduncles three-flowered, male-flowers two, pedicelled, and acuminate, female ſeſſile and awned. A native of the Eaſt Indies in barren places. 34. A. *Bladhii*, with ſpikes about eight, hermaphrodite floſcule, ſeſſile, awned, neuter peduncled, ciliate, and awnleſs. A native of China, and ſent from thence by Bladh. 35. A. *provinciale*, with ſpikes faſcicled, ſmooth, floſcules alternate ſubſeſſile, directed one way, and awned. A native of the ſouth of France, where the ſeeds were ſent by Dahl. Gmelin has omitted the 23d, 27th, and 28th ſpecies above enumerated, and introduced the following, *viz.* A. *brevifolium*, with ſpikes lateral and ſolitary, floſcules alternate and remote, and ſtalk geniculated and compreſſed. A. *ramoſum*, with ſpikes terminal conjugate, with double ſpiculæ, the male awnleſs and pedicelled, with ramous ſtalk. A. *annulatum*, with ſpikes at the top of the ſtalk crowded and alternate, flowers adpreſſed and germinate, the male awnleſs and pedicelled, and an erect, ramous ſtalk. A. *undatum*, with an erect, ramous panicle, ſpikes alternate, floſcules by threes; the males inferior and later. A. *afer*, with ſpikes three and terminal, and floſcules all awned. Gmelin ſuggeſts that this is the Gir Gir, or Geſhe el Aube of Abyſſinia, deſcribed by Bruce in his Travels, vol. v. Appendix, p. 47. Gmelin makes a diſtinct ſpecies of the A. *muricatum* of Koenig, which is above referred to the A. *ſquarroſum*, and deſcribes it as having a contracted panicle, verticillated ſpikes, and calyces awnleſs and muricated.

Culture. Few of theſe graſſes have been cultivated in European gardens; as they are for the moſt part natives of the Eaſt or Weſt Indies, they would require the protection of a ſtove. Martyn's Miller.

ANDROPOGON. See SACCHARUM and STIPA.

ANDROS, in *Ancient Geography*, now ANDROS, one of the moſt fertile and delightful iſlands in the Archipelago Sea, lies near the ſouth end of Negropont. According to Pliny it was 93 miles in circumference, and had various names, *viz.* Cueros, Laſia, Nonagria, Epagris, Antandros, and Hydruſia. It is ſaid to have borrowed the name of Andros from one Andrius, who, according to Diodorus Siculus (lib. v.), was one of the generals whom Rhadamanthus appointed to govern the Cyclades, after their voluntary ſubmiſſion to him. Conon will have this Andrius to be the ſon of Anius, and grandſon of Apollo and Creuſa, and to have been the firſt who ſettled in this iſland. It received the name of Antandros, ſignifying "for one man," from its having been given as his ranſom by Aſcanius, the ſon of Æneas, when taken priſoner by the Pelaſgians. The territory of Andros is ſtill one of the moſt fertile and pleaſant countries in the Archipelago, producing all kinds of delicious fruit, and watered with numerous ſprings, whence it had

had the name of Hydruſia, from ὕδωρ, *water*. The Andrians were the firſt of all the iſlanders who joined the Perſians; and, therefore, Themiſtocles, after the victory at Salamis, reſolved to attack the city of Andros, and put it under large contributions for the maintenance of his fleet. Having landed his men in the iſland, he acquainted the magiſtrates, that the Athenians were come with two powerful divinities on their ſide, "Perſuaſion and Force;" and therefore they muſt part with their money, by either fair or foul means. The Andrians replied, that they likewiſe had two mighty deities, who were very fond of their iſland, "Poverty and Impoſſibility," and therefore could give no money. Herodotus, lib. viii. c. 1. Themiſtocles, diſſatisfied with the anſwer, laid ſiege to the town. The event is not known; but it is probable that the Athenian general made himſelf maſter of the place, ſince Pericles, as Plutarch (in Pericl. Oper. tom. i. p. 157.) informs us, a few days after, ſent thither a colony of 250 Athenians. It was not long after retaken by the Perſians, and in vain beſieged by Alcibiades, who, after having taken and fortified the caſtle of Gaurium, left Thraſybulus in it with a ſtrong garriſon, and retired, firſt to Rhodes, and thence to the iſland of Cos. (Diod. Sic. lib. xiii.) This, as well as the other Greek iſlands, ſubmitted to Alexander; after whoſe death it took part with Antigonus, who was driven out by Ptolemy; and his ſucceſſors held it to the Roman times, when Attalus, king of Pergamus, beſieged the metropolis at the head of a Roman army; and having taken it, the Romans granted him the poſſeſſion of the whole iſland; but upon his death Rome claimed this iſland, as well as his other dominions, in virtue of his laſt will. Livy, lib. xxxi. c. 43.

Andros is ſeparated from Tino by a channel of a mile in breadth, into which veſſels of burden are afraid to enter on account of the rocks and ſhoals which are there ſituated. Although it is lofty and mountainous like Tino, it has in proportion more lands fit for cultivation; its plains are ſomewhat more extenſive, equally fertile, and as well watered. Here are to be ſeen 50 villages, and yet its population does not exceed 12,000 ſouls. Andros is the appanage of a ſultana: a Turkiſh waiwode adminiſters the police, and watches over the peace of the iſland. It pays about 30,000 piaſtres, as well for the duties of the ſultana as for thoſe of the captain-pacha. The principal produce of its territory is ſilk, of which the quantity annually exported is eſtimated at 6000 okes. A conſiderable quantity of oranges and lemons is alſo exported for Salonica, Athens, and the Morea. The wheat, barley, wine, and oil, are generally ſufficient for the conſumption of the inhabitants. The iſland alſo produces legumes, herbage, various fruits, honey, wax, and cotton. It wants only a good harbour, and a better government. N. lat. 37° 50′. E. long. 25° 25′. Olivier's Travels in the Ottoman Empire, vol. ii. p. 105.

Andros, or Edros, a ſmall iſland in the Iriſh ſea, now called "Bardſey," about a mile from the coaſt of North Wales.

Andros, a town of Aſia Minor, in Galatia.

Andros was alſo a ſmall iſland ſituate upon the coaſt of Gallia Aquitania. It is now a heap of rocks, upon which is built the tower of Cordouan, at the mouth of the Garonne.

Andros *Iſlands*, in *Geography*, lie on the ſouth-weſt of Providence, in the Bahama iſlands, called by the Spaniards "Yllas del Eſpiritu ſanto." They extend from N. lat. 23° 30′ to 25° 0′, and from W. long. 77° to 77° 58′, and take up a ſpace of 30 leagues in length, and 4 or 5 broad, interſected by many very narrow paſſages.

ANDROSACE, Ἀνδρόσακες, the ſhield of a man, ſo called from the form of the calyx, which, in the common ſpecies, is large, in *Botany*, a genus of the *pentandria monogynia* claſs and order, of the natural order of *preciæ*, and *lyſimachiæ* of Juſſieu: its characters are, that the *calyx* is an involucre many-leaved, many-flowered, and very ſmall; the perianthium is one-leafed, five-cornered, ſemiquinquefid, acute, erect, and permanent; the *corolla* is monopetalous, and ſalver-ſhaped; tube ovate and involved in the calyx; border flat and five-parted; diviſions ovate-oblong, obtuſe, entire; throat beſet with glands; the *ſtamina* have very ſhort filaments within the tube; anthers oblong, erect, and included; the *piſtillum* is a globoſe germ, ſtyle ſubulate and very ſhort; ſtigma globoſe and included; the *pericarpium* is a globoſe capſule, ſitting on a flat calyx, one-celled, opening into five parts at the top; the *ſeeds* are very many, roundiſh, gibbous on one ſide, and flat on the other; the *receptacle* is erect and free. Martyn enumerates 7, Willdenow 10, and Gmelin 11 ſpecies. 1. A. *maxima*, oval-leaved A. with the perianths of the fruit very large. The flowers of this ſpecies appear in April or the beginning of May; the ſeeds ripen in June, and the plants ſoon after periſh. It grows naturally among corn, in Auſtria, Bohemia, and other parts of Germany, in the Valais, Piedmont, Carniola and Hungary; and was cultivated here, in 1596, by Gerard. 2. A. *elongata*, cluſter flowered A. with leaves lanceolate, toothed, fruiting umbel elongate, and corollas ſhorter than the angular calyx; a native of Auſtria, near Vienna, even in the ſuburbs; flowers in April, and perfects its ſeed in June; introduced, in 1776, by M. Thouin. 3. A. *ſeptentrionalis*, aretia of Haller, tooth-leaved A. with leaves lanceolate, toothed, and ſmooth, and perianths angular, and ſhorter than the corollas: a native of Lapland, Sweden, Denmark, Swiſſerland, Germany, Ruſſia, in mountainous ſituations; cultivated, by Mr. Miller, in 1755. 4. A. *villoſa*, aretia of Hall, ſedum of Cluſ. Chamæjaſme alpina of Bauhin, hairy A. with leaves hairy and perianths ſhaggy; common in the Swiſs Alps, Jura, &c. in the mountains of Auſtria and Carniola, in the Pyrenées, &c. introduced, in 1768, by profeſſor de Sauſſure. 5. A. *lactea*, A. obtuſifolia of Allion. aretia of Hall. ſedum alpinum, &c. of Bauhin and Ray, graſs-leaved A. with leaves lanceolate and ſmooth, and umbel many times larger than the involucres; a native of the mountains of Swiſſerland, Auſtria, and Carniola, flowering, like the foregoing, in July and Auguſt. 6. A. *carnea*, aretia of Hall. ſedum alpinum of Col. awl-leaved A. with leaves awl-ſhaped and ſmooth, and umbel equalling the involucres: a native of the Alps and Pyrenées, and introduced in 1768, by profeſſor de Sauſſure. 7. A. *filiformis*, with leaves ovate-toothed, petioled, rays of the umbel capillary, and corollas exceeding the bell-ſhaped calyx; a native of Siberia. 8. A. *brevifolia* of Gmelin, with leaves lanceolate, petioled, and hiſpid, and peduncles four times longer than the involucre. This Willdenow ranks as a variety of the next ſpecies. 9. A. *obtuſifolia*, with leaves ſmooth and lanceolate, calyxes angular, pubeſcent, and leſs than the corolla, and the folioles of the involucre very ſhort (G.) or with leaves lanceolate, narrow at the baſe and ſmooth, and the perianths angular and pubeſcent. It is found on the high mountains of Swiſſerland, Italy, and Styria. 10. A. *odoratiſſima*, with leaves triquetrous and ciliated, and perianths ſhaggy (G.) or with leaves triquetrous, lanceolate, and ciliated, the rays of the umbel ſhort, and the perianths angular, and ſhorter than the corolla; found in the high mountains of Cappadocia. 11. A. *pauciflora*, with leaves ſetaceous-linear, and ſmooth, two peduncles of the length of the ſtalk, and ſegments of the corolla emarginated.

Gmel.

Gmel. 12. A. *chamæjaſme*, A. villoſa of Jacy, chameejaſme of Bauhin, ſedum alpinum, &c. of Cluſ. with leaves lanceolate and narrow at the baſe, ciliate at the margin, and with ſhaggy perianths. It is found in the high mountains of Auſtria. Willd.

Culture. Theſe plants being low, and having ſmall flowers, without any great appearance, are preſerved only in botanic gardens. All, except the firſt, require a ſhady ſituation. The ſeeds ſhould be ſown ſoon after they are ripe; if permitted to ſcatter they will grow of themſelves; the annual ſorts periſh as ſoon as the ſeeds are ripe, but the others, by being merely kept clear from weeds, will live in an open border for ſeveral years. Martyn's Miller.

ANDROSACE. See ARETIA.

ANDROSACE, in *Natural Hiſtory*, a name given by ſome naturaliſts to the TUBULARIA ACETABULUM of Linnæus; this ſpecies is variouſly deſcribed by authors; it is corallina (androſace) tubuloſa ſimplex pelta terminali radiata of Pallas, androſaces cotyledon foliofum marinum of Lobel, androſaces petræ innaſcens of C. Bauh. pin. herba marina androſaces of Beſl. muſ. acetabulum marinum of Tournefort, plantula lapidea ſcutulata, and callopilophorum Matthioli of Donat. adr. Beſides this Brown deſcribes a variety, in which the target is not radiated. Vide Jamaica, p. 74. The Linnæan ſpecific character is, the ſtems filiform and terminating in a calcareous target or cup, which is ſtriated and radiated. Gmelin. This kind inhabits the Mediterranean and American ſeas, growing upon ſhells, ſtones, &c. it is white, ſoft, and fragile when dry: the tubes are ſimple, about the thickneſs of a ſtraw, and two inches in length. Gmelin. This ſubſtance, reduced into powder, has been uſed in France for deſtroying worms and for dropſies. Dr. Lewis obſerves, that it does not promiſe to be of uſe in either of theſe intentions, or to differ from the coralline, which has been uſed as a vermifuge with little ſucceſs. The dried androſace, when held in the flame of a candle, yields repeatedly for ſeveral times a dazzling brightneſs, which is a phenomenon exhibited alſo by the coralline.

ANDROSÆMUM, in *Botany*. See HYPERICUM.

ANDROSCOGGIN, or AMARISCOGGIN *River*, in *Geography*, a river of America, in the diſtrict of Maine, may be called the chief weſtern branch of the Kennebeck. Its ſources are north of Lake Umbagog, and it purſues a ſoutherly courſe till it approaches near the White Mountains, from which it receives Mooſe and Peabody rivers; afterward turning to the eaſt and ſouth-eaſt it paſſes within two miles of the ſea coaſt, and again turning north, and running over Pejapſkaeg falls into Merry-Meeting Bay, where it joins the Kennebeck, 20 miles from the ſea. The lands near this river are good.

ANDROSIA, in *Ancient Geography*, a town of Aſia Minor, aſſigned by Ptolemy to the Trocni.

ANDROTOMY, or ANDRATOMY, from ἀνηρ, *man*, and τεμνω, *I cut*, the anatomy or diſſection of human bodies. It is thus called in oppoſition to *zootomy*, which is uſed to denote that of brutes.

Anatomy is the genus, and comprehends all diſſections in general, whether of men, beaſts, or plants; and androtomy and zootomy are the ſpecies.

ANDROUET DU CERCEAU, JAMES, in *Biography*, a celebrated French architect, was born at Orleans, or, as ſome ſay, at Paris. He was ſent for acquiring perfection in his art to Italy, where he was chiefly ſtruck by the triumphal arch at Pola in Iſtria, to which there is a viſible reference in the ſtyle of his works. Upon his return, though he was a ſteady Calviniſt, he was made architect to Henry III. who employed him, in 1578, in the conſtruction of the pont neuf at Paris. Henry IV. employed him in enlarging the Tuilleries, and continuing the great gallery that connects it with the Louvre. But perſecution obliged him to quit his country in 1585; and the place of his retreat, and the time of his death are not known. He left two ſons, one of whom was eminent in his father's profeſſion. He was one of the principal improvers of architecture in France, and he publiſhed ſeveral books on the art; as his "Architecture," in 1560, comprehending deſigns of all the parts and ornaments of buildings; "Leſſons in Perſpective," in 1576; "The moſt excellent Edifices in France," in 1576 and 1607, 2 vols. folio, being a deſcription of 30 royal palaces and other buildings, with figures; "Architecture of Country-houſes and Manſions," 1582; and "Roman Edifices, or a Collection of Remains of Antiquity, drawn on the ſpot."

ANDRUM, in *Phyſiology*, a local diſeaſe, epidemical among the people of Malabar, being a peculiar ſpecies of *hydrocele*, or watery tumour of the *ſcrotum*. The andrum, in the language of the country, is alſo called *perical*; ſometimes paraphraſtically *andu wajaku*, q. d. a popular water rupture. Its origin is derived from the vicious quality of the country waters, impregnated with corroſive muriatic ſalts, the ſource of moſt other diſeaſes that affect the Malabarians. Its ſigns, or ſymptoms, are an eryſipelas of the ſcrotum, returning every new moon, by which the lymphatics being eroded, pour a ſerous ſaline humour into the cavity of the ſcrotum. The andrum is incurable; thoſe once ſeized with it have it for life; but it is not dangerous, nor very troubleſome, to thoſe uſed to it; though ſometimes it degenerates into a hydroſarcocele. The means of prevention is by a heap of ſand fetched from a river of the province Mangatti, and ſtrewed in the wells. This is practiſed by the rich. As to the cure, they have only a palliative one, which is by inciſion, or tapping and drawing off the water from the ſcrotum, once in a month or two.

ANDRUSA, in *Geography*, a town of European Turkey in the Morea, 20 miles north-eaſt of Navarin.

ANDRY, NICHOLAS, in *Biography*, born at Lyons in 1658, was made doctor in medicine at Rheims in 1693, having quitted the ſtudy of theology, in which he had been engaged ſeveral years. In 1697 he was admitted into the faculty of phyſic at Paris. In 1701 he was made profeſſor of medicine there, and the following year cenſor or examiner of intended publications in that ſcience. He died in 1742, aged 84 years. He was a conſiderable contributor to moſt of the medical and philoſophical journals of the time, and in 1702, one of the editors of the "Journal des Savans." He wrote alſo a variety of other works, of which the principal are, "Cleon and Eudoxe," 2 vols. 12mo. Paris; in which he ſtrenuouſly inſiſts on the ſubordination of the ſurgeon to the phyſician. "Acrum et ingenioſum ſcriptum," Haller ſays. "De la Generation des vers dans le Corps Humain," 12mo. Paris. This was afterwards augmented to two volumes. At the end is an engraving of a tape-worm, of an enormous length, that had been voided entire by one of his patients. "Orthopedie, ou l'Art de prevenir et de corriger, dans les enfans, les difformites du Corps," two vols. 12mo. Paris, 1741; that is, the art of preventing or redreſſing any defects or deformities in the bodies of children. This is directed to be effected by regimen, exerciſe, and by various mechanical contrivances, and contains the germ, at the leaſt, of every thing known on the ſubject at this time. The author compoſed this work, he ſays, as a ſupplement to the Callipædia, the art of getting handſome children, by Quillet; and the Pædotrophia, the art of rearing and nurſing children, by

Scævola da St. Martha, two beautiful and well known poems, of which he gives an analyſis in the preface to this work. The Orthopædia was ſoon tranſlated into our language, as well as into thoſe of moſt of the countries in Europe, and ſtill retains its popularity. For the titles of numerous other productions by this writer, ſee Eloy's Dict. Hiſtor. de la Medicine.

ANDRYALA, eriophorus of Vaillant, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs and order, of the natural order of *compoſitæ ſemiflоſculæ*, and *cichoraceæ* of Juſſieu. Its characters are, that the common *calyx* is many-parted, ſhort, rounded, and villoſe; the ſcales are very many, ſubequal, and ſubulate (in a double row, G.); the compound *corolla* is imbricate and uniform; the corollules are hermaphrodite, numerous, and equal, each ligulate, linear, truncate, and five-toothed; the *ſtamina* have five filaments, capillary, and very ſhort, anther cylindrical, and tubuloſe; the *piſtillum* is an ovate germ, ſtyle filiform, of the length of the ſtamina, ſtigmas two, and reflex; no *pericarpium*, calyx converging and globoſe; the *ſeeds* are ſolitary and ovate, the down capillary, of the length of the calyx, (ſeſſile, G.); the *receptacle* is villoſe and flattiſh, (alveolate and hairy, G.) Martyn enumerates ſix, and Gmelin eight ſpecies. 1. A. *integrifolia*, ſonchus lanatus of Dalech. and Bauh. S. villoſus luteus major of Bauh. and Parkinſ. hieracium villoſum of Ray, hoary A. with lower leaves runcinate or notched, and upper ovate-oblong and tomentoſe. It is about a foot and a half in height; the flowers are in ſmall cluſters at the top of the ſtalk, yellow, and reſembling thoſe of ſow-thiſtle; flowers in July, and its ſeeds ripen in September. There is a variety *β*. A. *ſinuata*, which has the lower leaves indented and woolly, but thoſe on the ſtem are entire; it ſeldom riſes more than a foot high, and ſupports a few yellow flowers at top. Theſe are annual plants, growing naturally in the South of France, Spain, Italy, and Sicily; and cultivated in the Chelſea garden in 1711. 2. A. *cheiranthifolia*, A. glanduloſa of La Marck, A. tomentoſa of Scop. various-leaved A. with leaves runcinate, upper ones lanceolate and entire, down glanduliferous. It is perennial, three feet high, and full of milk. A native of the iſland of Madeira, and introduced by Mr. F. Maſſon, who obſerved it there in 1777. 3. A. *pinnatifida*, with leaves tomentoſe and pinnatifid, and calyces tomentoſe and hairy, hairs rather ſtiff. There are two varieties: *α*. tooth-leaved A. with leaves pinnatifid, and pinnas diſtant and toothed; a native of Madeira: and *β*. wing-leaved A. with leaves deeply pinnatifid, and pinnas ſhort and entire. A native of the Canary iſlands; found by Mr. F. Maſſon; flowering in July and Auguſt, and introduced in 1778. 4. A. *crithmifolia*, ſamphire-leaved A. with leaves pinnate, linear, and tomentoſe. A native of Madeira, found by Mr. F. Maſſon; flowering from June to Auguſt, and introduced in 1778. This and the laſt ſpecies are biennials. 5. A. *raguſina*, downy A. with leaves lanceolate, undivided, denticulate, acute, and tomentoſe, and ſolitary flowers. As it is very hoary it makes a pretty appearance intermixed with others, whoſe leaves are green; but it will not live abroad except in a dry ſoil and warm ſituation. It has been received from Spain, from the Cape, and from Algiers. Linnæus ſays, that it is a native of the iſlands of the Archipelago. This ſpecies has leaves ſtiffer, more acute, and more acutely toothed than the other ſpecies. 6. A. *lanata*, hieracium montanum tomentoſum of Dill. Hall. and Mill. woolly A. with leaves oblong-ovate, ſlightly toothed and woolly, and peduncles branching; biennial according to Miller, but according to others perennial; flowering in June, and ripening its ſeeds in Auguſt; the whole plant is white. A native of the ſouth of Europe; cultivated in 1732 by Dr. Sherard. 7. A. *nigricans*, with lower leaves lyre-ſhaped pinnated, peduncles ramoſe, and down blackiſh above. Poir. voy. en Barb. 8. A. *uniflora*, with leaves ſmooth, entire, dentated, oblong-acute, with a ſingle-flowered ſtalk. Schranch flor. bav.

Culture. All theſe plants may be propagated from ſeeds, ſowing thoſe of the hardy ſort in Spring, where they are to remain. They require no other attention but to be thinned and kept free from weeds; the 2d, 3d, 4th, and 5th require the protection of a green-houſe, in which they will flower all the Summer, often perfecting their ſeeds, by which they may be propagated. The perennial ſorts may be propagated by their creeping roots.

ANDRYALA. See LEONTODON.

ANDUC *Iſland*, in *Geography*, one of the group called the Maldives, on the eaſt ſide, in N. lat. 6° 25′. E. long. 73° 40′.

ANDUJAR, or ANDUXAR, a town of Spain, with a caſtle, ſituate on the Guadalquivir, in the confines of Jaen and Cordova, and built near the ſpot on which ſtood Illurgis, or Illiturgis, called by the Romans Forum Julium, and now Andujar el Viejo. Its principal commodity is ſilk. The adjacent country abounds with wine, oil, honey, and various ſorts of fruit and alſo game. It is 10 leagues eaſt of Cordova, and 9 weſt of Jaen.

ANDUINNA, in *Entomology*, a ſpecies of PAPILIO (Nymph. Phal.) found in Ruſſia. The wings are dentated, fulvous, with black ſpots; under ſide of the poſterior wings white, with two brown bands, and dotted behind with black. Fabricius and Gmelin.

ANDUZE, in *Geography*, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Alais, carries on a conſiderable trade in ſerges and other woollen ſtuffs; eight leagues north-weſt of Niſmes, and two ſouth-weſt of Alais.

ANECDOTES, ANECDOTA, a term uſed by ſome authors for the title of *Secret Hiſtories*; but it more properly denotes a relation of detached and intereſting particulars. It is now often uſed for a biographical incident or minute paſſage of private life.

The word is Greek, ἀνέκδοτα, q. d. *things not yet known*, or *hitherto kept ſecret*.

Procopius gives this title to a book which he publiſhed againſt Juſtinian and his wife Theodora; and he ſeems to be the only perſon among the ancients, who has repreſented princes ſuch they are in their domeſtic relation. Varillas has publiſhed anecdotes of the houſe of Medicis. We have had repeated attempts for arranging anecdotes under different heads; a "Dictionaire d'Anecdotes," in two volumes, was publiſhed at Paris in 1767; and a ſimilar work was publiſhed by Mr. D'Iſraeli in 1793, entitled, "Diſſertation on Anecdotes."

ANECDOTES is alſo an appellation given to ſuch works of the ancients as have not yet been publiſhed.

In which ſenſe M. Muratori gives the name *Anecdota Græca* to ſeveral writings of the Greek fathers, found in the libraries, and firſt publiſhed by him. F. Martene has given a *Theſaurus Anecdotarum Novus*, in folio. five vols.

ANE'E, otherwiſe called *aſnée*, in *Commerce*, denotes a corn-meaſure, uſed in ſome provinces of France, particularly in Languedoc and Maconnois.

The anee is not ſo properly a meaſure as the denomination or aſſemblage of a certain number of other meaſures. The *anee* at Lyons conſiſts of ſix *bichets*, equal to one *ſeptier* and three buſhels Paris meaſure. At Macon the *anee* is ſomewhat more.

ANÉE is alſo uſed for a quantity of wine ſuppoſed to be

an

an aſs's load, and is fixed to eighty Engliſh quarts wine meaſure.

ANEGADA, in *Geography*, one of the Virgin Iſles, in the Weſt Indies, and dependent upon Virgin Gorda. It is about ſix leagues long, and ſo low as to be almoſt covered with water at high tides. On the ſouth ſide is Treaſure Point. N. lat. 18° 35′. W. long. 63°

ANEGADA *Bay* lies on the eaſtern coaſt of South America, and is formed by the mouth of the river Sauces, which falls into the South Atlantic ocean on the eaſt, in S. lat. 39° 45′, and W. long. 62° 30′.

ANEIO, a town of Italy, in the kingdom of Naples and province of Otranto, eight miles ſouth-weſt of Brindiſi.

ANEL, Dominic, in *Biography*, phyſician to the court of Savoy, publiſhed, in 1707, in 8vo. "L'art de ſucer les plaies ſans ſe ſervir de la bouche de l'Homme, &c." Among the inſtruments by which this was performed was a kind of ſyphon, "metuendæ magnitudinis," of a fearful ſize, Haller ſays. But his principal work, and which is ſtill reſpected, is his "Nouvelle Methode de guerir les fiſtules lachrymales," publiſhed at Turin, in 4to. 1713. He here deſcribes a ſound and a fine flexible tube, by which he was enabled to open the lachrymal duct, and by means of a ſyringe to waſh away the ſores, and finally heal the paſſage. This work gave riſe to numerous controverſial pieces, in ſome of which his method is cenſured, or the honour of the invention of it denied him. But the academy of ſurgery, at Paris, declared his method to be equally new and ingenious; and it has certainly led the way to all the improvements that have been ſince made in the method of treating this very troubleſome complaint. Haller Bib. Chirurg. Eloy. Dict. Hiſt.

ANELE, or Anil, in *Commerce*, the ſame with indigo. 23 Eliz. c. 9.

ANELLA, in *Entomology*, a ſpecies of phalæna, of the tinea tribe. The anterior wings are grey, with an obſolete brown ſtripe, and two central, ſub-ocellated ſpots. Fabricius. This ſpecies inhabits Auſtria, is large, and has a ferruginous abdomen.

ANEMIUS *furnus*, among *Chemiſts*, a wind-furnace, uſed to make fierce fires for melting, &c. The word is formed of ανεμος, *wind*.

ANEMO-CHORD, a name given to the Æolian harp. An inſtrument of this kind was conſtructed by John James Schnell, who was born at Wehingen, in the duchy of Wittemberg, in 1740, and having paſſed through ſeveral ſtages of mechanical employment, became at length muſical inſtrument-maker to the Counteſs of Artois at Paris. The ſounding of a harp, hung by accident in a paſſage admitting a breeze, ſuggeſted to him the idea of that inſtrument, which, in 1789, he firſt expoſed to ſale by the name of anemochorde.

ANEMOMACHIA, from ανεμος, *wind*, and μαχια, *fight*, in ſome *Ancient Writers*, denotes a whirlwind, or hurricane. In which ſenſe, we ſometimes alſo meet with *anemozale*, *anemotaraxis*, &c.

ANEMOMETER, compounded of ανεμος, *wind*, and μετρον, *meaſure*, in *Mechanics*, a machine wherewith to meaſure the force and velocity of the wind. The anemometer is variouſly contrived. The firſt of the kind ſeems to have been invented by Wolfius in 1708, and firſt publiſhed in his "Aerometry" in 1709, and alſo in the "Acta Eruditorum" of the ſame year; afterwards in his "Mathematical Dictionary," and alſo in his Elementa Matheſeos," vol. ii p. 319. In the Philoſophical Tranſactions we have one deſcribed, in which the wind being ſuppoſed to blow directly againſt a flat ſide or board, which moves along the graduated limb of a quadrant, the number of degrees it advances ſhews the comparative force of the wind.

This machine is moved by means of ſails, A, B, C, K, (*Plate* IX. *Pneumatics*, *fig.* 69.) like thoſe of a wind mill, which raiſe a weight L, that, ſtill the higher it goes, receding farther from the centre of motion, by ſliding along a hollow arm K M, fitted on to the axis of the ſails, becomes heavier and heavier, and preſſes more and more on the arm, till being a counterpoiſe to the force of the wind on the ſails, it ſtops the motion thereof. An index then, M N, fitted upon the ſame axis at right angles with the arm, by its riſing or falling, points out the ſtrength of the wind, on a plane divided like a dial-plate into degrees.

It is objected to this machine, however, that it requires a conſiderable wind to make it work. Leutmannus has contrived another, the ſails of which are horizontal, and are more eaſily driven about, and will turn what way ſoever the wind blows.

In the Philoſophical Tranſactions for the year 1766, Mr. A. Brice deſcribes a method which has been ſucceſsfully practiſed by himſelf, of meaſuring the velocity of the wind by means of that of the ſhadow of clouds paſſing over the ſurface of the earth.

Mr. d'Ons en Bray invented a new anemometer, which of itſelf expreſſes on paper not only the ſeveral winds that have blown during the ſpace of twenty-four hours, and at what hour each began and ended, but alſo the different ſtrength and velocities of each. Vide Mem. Acad. Scienc. an. 1734, p. 169. For other inſtruments of this kind, and their uſe, ſee Wind-*Gage*.

ANEMONE, formed from ανεμος, *the wind*, becauſe the flower is not ſuppoſed to open, except the wind blows, or becauſe it grows in ſituations much expoſed to the wind, anemone and pulſatilla of Tourn. anemonoides, anemone-ranunculus, hepatica of Dill. anemonoides of Vaill. *wind-flower*, in *Botany*, a genus of the *polyandria polyginia* claſs and order, of the natural order of *multiſiliquæ*, and *ranunculaceæ* of Juſſieu; its characters are, that it has no *calyx*; that the *corolla* has petals in two or three rows, three in a row ſomewhat oblong; the ſtamina have numerous filaments, capillary, half the length of the corrolla; anthers twin and erect; the *piſtillum* has numerous germs in a head, ſtyles acuminate, and ſtigmas obtuſe; no *pericarpium*; receptacle globular or oblong, hollowed, and dotted; the *ſeeds* very many, acuminate, retaining the ſtyle. Obſ. Hepatica of Dill. has a three-leaved perianthium, remote from the flower; an involucre. Pulſatilla of Tourn. has a leafy, multifid involucre, with the ſeeds tailed and hairy. Anemonoides and hepatica of Dill. have naked ſeeds, without a feathered tail. Martyn enumerates 28, Gmelin and Willdenow 29 ſpecies.

* *Hepatica*, with a ſubcalyculate flower. 1. A. *hepatica*, hepatica, with leaves three-lobed, quite entire. The flower lies a year complete in all its parts within the bud; the ſeeds are oblong-ovate, involved in a ſilky ſubſtance, and many of them abortive; the plant is a mild aſtringent and corroborant; and formerly uſed with theſe intentions, in an infuſion like tea, or in powder given to the quantity of half a ſpoonful at a time; but it is now expunged from the diſpenſaries, and its uſe does not extend beyond that of gargariſms; it is found wild in Sweden abundantly, in Denmark, Swiſſerland, France, Spain, Italy, and other parts of Europe, in woods and among buſhes, with blue, red, and white flowers, ſingle: cultivated here, in 1596, by Gerard. There are many varieties of hepatica, which are common in gardens, as ſingle and double blue, ſingle and double red or peach-coloured, ſingle and double white, ſingle and double variegated red and white, ſingle and double violet-coloured, and with ſtriped leaves. Parkinſon mentions a white, with red ſtamens. Theſe are ſome of the chief ornaments of the Spring; the

flowers are plentifully produced in February and March, before the green leaves appear, and make a very beautiful figure in the borders of the pleasure-garden, especially the double sorts, which commonly continue a fortnight longer in flower than the single ones, and the flowers are much fairer.

** *Pulsatillas*, with the peduncle involucred, and the seeds tailed. 2. A. *patens*, pulsatilla patens of Mill. pulsatilla polyanthes violacea, anemones folio of Breyn. and Helw. woolly-leaved A. with peduncles involucred, and leaves digitate and multifid. The corolla is white, villose underneath, and the stamens yellow; a native of Siberia, about Toboski, and also of lower Lusatia; cultivated here in 1759 by Mr. Miller. 3. A. *sulphurea*, with peduncle involucred, leaves triply-pinnate, hairy, flat, acutely gashed, and seeds tailed. 4. A. *halleri*, with biternate shaggy leaves, or with biternate leaves, tripartite folioles, trifid laciniæ, foliose involucre, and woolly seeds, with a very short permanent style, Willd. It is distinguished from the A. alpina, which it resembles, by its leaves and seeds; and grows wild about Aigle, &c. in Switzerland, Mont Baldo, M. Cenis, &c. 5. A. *vernalis*, pulsatilla vernalis of Miller, with peduncle involucred, leaves pinnate, folioles tripartite, obtuse and smooth, and erect flowers, Willd. The flower is red without, and white within, and blows earlier than our pasque-flowers. It grows in the woods, bordering on the mountains, in barren lands, in Sweden, Germany, and the high Alps of Switzerland. 6. A. *cernua*, with peduncle involucred, leaves pinnate, and flowers nodding. It differs from the last species in the nodding of the flowers, and in the leaves having more pinnæ finely cut. Thunberg found it near Jedo, in Japan, flowering early in Spring. 7. A. *pulsatilla*, pulsatilla folio crassiore et majore flore of Bauhin. Park. Mor. Ger. Helw. Camer. and Ray, pulsatilla vulgaris of Miller, A. pratensis of Sibth. and Wither. pasque-flower, with peduncle involucred, petals straight, and leaves bipinnate. It grows wild on open hills in dry soils, in Sweden, Denmark, Switzerland, France, Italy, Germany, Carniola, Siberia, &c. and in England on chalky downs, as Gogmagog hills, near Cambridge; Barnack heath, near Stamford, in the neighbourhood of Pontefract, near Cherlbury in Oxfordshire, Lexham, Bury, Newmarket, &c. It is perennial, and flowers in April and May. It has the Italian name *pulsatilla*, from the downy seed being beaten about by the wind. The plant is acrid, and will raise blisters; the distilled water will vomit; and it cannot be given with safety in disorders of the lungs. The juice of the petals stains paper green. Goats and sheep eat it; but horses, cows, and swine refuse it. There is a variety with double, and another with white flowers. 8. A. *pratensis*, pulsatilla pratensis of Miller, flore minore nigricante of Bauh. and Helw. p. vulgaris, saturatiore flore of Clusi. p. flore minore of Ger. p. flore clauso obsoleto, petalis reflexis of Helw. p. foliis decompositis pinnatis, flore pendulo, limbo reflexo of Hort. Cliff. &c. Meadow A. with peduncle involucred, petals reflex at the tip, and leaves bipinnate. It is very common in the barren stony fields of Oeland and Scania, also in Denmark, Piedmont, and in Germany, where it grows in the open fields and flowers in May. It was first cultivated in England by Mr. Miller in 1731, and in our gardens it very much resembles the A. pulsatilla, which would prove a good substitute to it; the principal distinctions between these species, as they grow naturally, are taken from the flower, which in this species is more pendulous, of a darker colour, and has the apices of the petals reflexed: the stem is also said to be less hairy and shorter than that of the pulsatilla; to which may be added, that the leaves of the pratensis are somewhat tomentose, while those of the pulsatilla are of a bright green. All the anemones have a considerable degree of acrimony; but this (says Dr. Lewis) seems to possess the greatest share. In its recent state the plant has scarcely any smell; but its taste is extremely acrid, and when chewed, corrodes the tongue and fauces; and the dried plant likewise retains a considerable share of acrimony. The root is milder than the other parts. The liquor, obtained by distilling the plant with water, is strongly impregnated with its virtues; and the remaining extract is considerably active. It also appears from some experiments to contain a camphoraceous matter, which was obtained in the form of crystals, of an unctuous taste, and very inflammable. This plant, as well as others of great activity, has been received into the Materia Medica of the Edinburgh pharmacopeia, upon the authority of Baron Stoerck, who recommends it as an effectual remedy for most of the chronic diseases affecting the eye, particularly amaurosis, cataract, and opacity of the cornea, proceeding from various causes. He likewise found it of great use in venereal nodes, nocturnal pains, ulcers, caries, indurated glands, suppressed menses, serpiginous eruptions, melancholy and palsy. Six cases of amaurosis, three of cataract, and seven of affections of the cornea, we are told, were either entirely cured, or greatly relieved, by this remedy. The sensible operation of the medicine was nausea and vomiting, particularly when the distilled water was used; and increased flow of urine; and sometimes gripes and looseness with increased pain at first in the affected part. The dose of the distilled water to adults is about half an ounce, twice or thrice a day; of the extract, reduced to powder with the addition of sugar, five or six grains. Many German physicians have tried the effects of this medicine in diseases of the eyes, with success; but several others, among whom is Bergius, bear testimony to its inefficacy in these diseases, though they increased the dose beyond that directed by Stoerck. Notwithstanding this, says Dr. Cullen, (Mat. Med. vol. ii. p. 216.) "I would still recommend it to the attention of my countrymen, and particularly to a repetition of trials in that disease, so frequently otherwise incurable, the amaurosis. The negative exception of Bergius, and others, is not sufficient to discourage all trials, considering that the disease may depend upon different causes; some of which may yield to remedies, though others do not." Every part of the plant, except its root, is ordered for medicinal use, and was prepared by Baron Stoerck for that purpose into an extract, or distilled water, and an infusion; but the first form seems to have been preferred, and was given from seven grains to three or four times that quantity, twice or thrice a day. The fluid preparations of the plant are likewise recommended for external use in ulcers and disorders of the skin. The manner of preparing the extract is given in the Edinburgh pharmacopeia. Murray's Mat. Med. vol. iii. p. 93.—101. Lewis's Mat. Med. p. 525. Woodville's Med. Bot. vol. iii. p. 400—403.

9. A. *alpina*, pulsatilla flore albo of Bauh. and Lob. alpina A. with stem-leaves ternate, connate, superdecompound, multifid, and seeds shaggy tailed. Willdenow mentions as a variety, A. alpina alba major of Bauh. and Burs. This species grows wild on the Alps, Jura, and in Austria, and was cultivated here by Mr. Miller in 1731. 10. A. *apiifolia*, pulsatilla lutea of Camer. and Gesn. p. tertia alpina of Dalech. sylvestris tertia of Clus. with stem-leaves ternate, connate, superdecompound, multifid, very slender, extremely hairy underneath. It has no smell, and is a native of the Leonese Alps. It is doubted whether it be a distinct species from the last.

*** *Anemones* with a leafy stem, and tailed seeds. 11. A. *coronaria*, pulsatilla foliis decompositis ternatis of Hort. Cliff.

Cliff. A. tenuifolia, ſimplici flore of Bauh. narrow-leaved garden A. with radical leaves ternate-decompound and involucre leafy, or with radical leaves ternate-decompound, mucronated teeth, leafy involucre and woolly ſeeds; according to Willdenow, who reckons as varieties A. tenuifolia multiplex rubra of Bauh. and A. anguſtifolia multiplex, mutata florum facie quotannis nova of Miller. This ſpecies grows naturally in the Levant, particularly in the iſlands of the Archipelago, where the borders of the fields are covered with it of all colours; but the flowers are ſingle and have been rendered double by culture. It was cultivated in France long before it was known in Holland or England: in our gardens, however, it was found in 1596. Parkinſon, in 1629, ſays, that ſome reckoned 30 ſorts with ſingle flowers; and of thoſe with double flowers he gives 12 varieties. Ray enumerates near 300 varieties of this and the broad-leaved ſort. The catalogues of our modern ſeedſmen have uſually about 150 or 200. The principal colours in anemones, according to Mr. Miller, are white, red, blue, and purple; and in ſome theſe are curiouſly intermixed; but the moſt prevailing colours amongſt our Engliſh raiſed anemones are white and red; though we have received from France a great variety of blues and purples, which are very fine flowers. The plain colours in the modern catalogues are red, crimſon, roſe-coloured, purple, lilac, clear and pale blue, aſh-coloured and white. The principal variegated ones are red and white ſtriped, roſe and white, blue and white, red, white, and purple; but there are innumerable ſhades of theſe and the other colours. A double anemone, in order to be fine, ſhould have a ſtrong upright ſtem, about nine inches high; the flower from two to near three inches in diameter, the outer petals firm, horizontal, except turning up a little at the end; and the ſmaller petals within theſe ſhould lie over each other gracefully, ſo as to form an elegant whole. The plain colours ſhould be brilliant and ſtriking; the variegated ones ſhould be clear and diſtinct. 12. A. *hortenſis*, pulſatilla foliis digitatis of Hort. Cliff. broad-leaved garden A. or hard-leaved A. or ſtar A. with leaves digitate and ſeeds woolly; or, according to Willd. with radical leaves digitate, laciniæ trifid, ſtem leaves ternate, lanceolate, connate, and ſubdivided, and woolly ſeeds. It is found wild, with ſingle flowers, in Italy, Provence, and Germany. There are ſeveral varieties of this with ſingle and double flowers; it was cultivated here by Gerard in 1597. 13. A. *palmata*, pulſatilla foliis palmatis of Hort. Cliff. A. latifolia flava of Bauh. or A. hortenſis latifolia of Cluſ. with leaves heart-ſhaped and ſublobate, and calyx ſix leaved and coloured. This ſpecies connects the hepaticas with the anemones by its ſix-parted calyx. It was found by Cluſius in Portugal, near the Tagus.

**** *Anemonoides*, with a naked flower, and tailleſs ſeeds. 14. A. *ſibirica*, with ſtem one-flowered, involucre leafy, and obtuſe; found by Gmelin in Siberia. 15. A. *ſylveſtris*, large white-flowered wood A. with naked peduncle and ſeeds roundiſh, ſhaggy and awnleſs; or with a ſtem two-flowered and leafy, leaves tripartite, laciniæ trifid and dentated, ſeeds roundiſh and woolly, and permanent ſtigma, according to Willdenow, who mentions as a variety, A. ſylveſtris alba minor of Bauhin, &c.; a native of many parts of Germany, found alſo in Sweden, Alſace, and Siberia; flowering in May, and ripening its ſeeds in June. 16. A. *fragifera*, with peduncle naked, ſeeds roundiſh, woolly, awnleſs, gaſhes of the leaves acute, and lanceolate; a native of Carinthia. 17. A. *virginiana*, virginian A. with peduncles alternate, very long, fruit cylindric, and ſeeds ſhaggy and awnleſs; or according to Willd. with many flowered leafy ſtem, tripartite leaves, laciniæ trifid acuminate and dentated, acute petals, ſhaggy ſeeds, and very ſhort permanent ſtyle; a native of North America, cultivated here in 1722, and flowering in May and June. 18. A. *decapetala*, ten-petalled A., with ſtem one-flowered, flower ten-petalled, leaves ternate, lobate and radical; a native of Brazil. 19. A. *penſylvanica*, penſylvanian A. with ſtem dichotomous, leaves ſeſſile, ſtem-claſping, the loweſt ternate, trifid, and gaſhed; reſembling the dichotoma, a native of Canada and Pennſylvania, and cultivated here in 1766 by Mr. J. Gordon. 20 A. *dichotoma*, with ſtem dichotomous, leaves ſeſſile, all oppoſite, ſtem-claſping, trifid and gaſhed. It flowers about Midſummer, and ripens its ſeeds; a native of Canada and Siberia, and ſent growing into Sweden by David de Gorter, phyſician to the empreſs of Ruſſia, in 1760. 21. A. *trifolia*, with leaves ternate, ovate, entire, ſerrate; and ſtem one-flowered; a native of France, Carniola, and Siberia, growing in woods and flowering at the end of April. 22. A. *quinqueſolia*, ranunculus nemorum, &c. of Pluk. with leaves quinate, oval and ſerrate, and ſtem one-flowered; a native of Virginia and Canada. 23. A. *nemoroſa*, wood A. ranunculus ſylvarum of Cluſ. A. nemorum alba of Ray and Ger. with ſeeds acute, leaflets gaſhed, and ſtem one-flowered. This grows in woods, among buſhes and in hedges, in moſt parts of Europe, and ſometimes in paſtures. In many of our woods the ground is almoſt covered with the flowers in March, April, and May. In fine clear weather, the bloſſoms are expanded and face the ſun; but in the evening and wet weather, they are cloſed and hang down. It is perennial, and flowers in April. This plant is acrid, and in ſome degree poiſonous. Linnæus ſays, that cattle brought from open to woody paſtures, and eating this plant, have been affected with the bloody flux, and have made bloody urine. Goats and ſheep eat it; but horſes, cows, and ſwine refuſe it. It is now diſuſed in medicine; but Chomel ſays, that the leaves bruiſed with the flowers, and applied twice a day to the head, have in a little while healed the tinea; and it is alſo ſaid that a bliſter prepared of theſe when recent ſerves to remove intermittent fevers, but it ſhould be cautiouſly uſed. This plant may be employed as a dye, becauſe Dr. Stokes ſays that the paper in which dried ſpecimens are preſerved is ſtained brown. This plant is ſometimes found with yellow dots on the under ſurface of the leaves, and has been miſtaken for a polypodium. Some have ſuppoſed theſe dots the work of an inſect, but without ſufficient proof. Mr. Relhan aſcribes this appearance to the Æcidium fuſcum; but Dr. Pulteney (in Linn. Tranſ. vol. ii. p. 305.) has rendered it probable, that they are formed by a minute ſpecies of lycoperdon, allied to the lycoperdon epiphyllum of Linnæus; though as they may be diſcovered in their younger ſtate under the outer cuticle of the leaf, it is not evident how the ſeeds could be introduced. The plants thus affected are in a feeble or morbid ſtate, of a yellow green, and do not bear flowers. When the flowers become double, the wood anemone is cultivated by the gardeners; if pains were taken with it, it might be much improved. 24. A. *apennina*, ranunculus nemoroſus, flore purpureo cæruleo of Park. Ray, Mentz, and Cluſ. blue mountain A. with ſcape involucred and one-flowered, involucre three-leaved petiolate and foliaceous, ſeeds tailleſs, and petals lanceolate and numerous. Smith. It bears ſome affinity in its foliage to the preceding, but the root is thicker, the petals much narrower; more than twice as many, and of a light pleaſant purpliſh blue; it is perennial and flowers in April; it grows in woods and ſhady places; a native of the Apennines, near Rome, and of ſome few places in England, as Lord Spencer's park at Wimbledon, near Harrow on the Hill, a wood near Luton Hoe in Bedfordſhire, and near Berkhampſtead in Herts.

It

It is a very ornamental plant, ſuitable to the flower-garden or plantation, and loves a light loamy ſoil. 25. A. *ranunculoides*, A. nemorum lutea of Ger. ranunculus nemoroſus luteus of Bauhin, yellow wood A. with ſcape involucred ſubbiflorous, involucre three-leaved ſubſeſſile and foliaceous, taillefs ſeeds, and petals elliptic and by fives, Smith; or with acute ſeeds, leaflets gaſhed, petals roundiſh, and ſtem moſtly one-flowered. It differs from the A. nemoroſa or wood A. in having a yellow corolla, two petals alternately outer, and two inner, and one having one ſide within and the other ſide without the next petal, whereas that has three outer and three inner petals; it differs alſo in the peduncles being accompanied with two leaflets, the latter of which is furniſhed with three at the baſe. This is perennial and flowers in April; grows wild in Sweden, Denmark, Swiſſerland, France, Germany, Auſtria, Carniola, Italy, and Siberia; and with us in ſhady places and hedges, near King's Langley, Herts, and near Wrotham, in Kent. 26. A. *narciſſiflora*, ranunculus montanus, &c. of Bauh. narciſſus-flowered A. with flowers umbelled (involucred Willd.), and ſeeds oval-depreſſed and naked (radical leaves palmated and gaſhed dentated, Willd.) This grows wild on the mountains of France, Swiſſerland, Auſtria, Sileſia, Siberia, and Cappadocia: introduced here in 1773 by John, earl of Bute. 27. A. *faſciculata*, ranunculus orientalis, &c. of Tourn. with flowers umbelled, collected, and leaves multifid. This was firſt obſerved by Tournefort, in the Levant, and is found on the mountains about the lake Baikal. Linnæus doubts whether it be a diſtinct ſpecies; Haller thinks it is only a variety of the laſt ſpecies, and Willdenow ſays, that it differs only in having ſhorter peduncles. 28. A. *thalictroides*, ranunculus nemoroſus, aquilegiæ foliis, &c. of Pluk. meadow rue-leaved A. with flowers umbelled, ſtem-leaves ſimple, and verticillate; and radical leaves biternate. It grows wild in Virginia and Canada, and was cultivated here in 1768 by Mr. Miller. 29. A. *Halleri*, with leaves ſhaggy and pinnate, the pinnæ acutely lobated, and the involucres multifid, Gmelin from Allion. flor. pedem., or with involucred peduncle, pinnated leaves, leaflets tripartite, acuminate, and villoſe, and flower ſomewhat erect, Willd.; a native of the Alps of Piedmont, &c. Willdenow has omitted the fragifera, faſciculata and ſulphurea, and inſerted the following ſpecies, *viz.* A. *triternata*, with leaves ternated, leaflets cuneated and ſlightly cut, and multifid involucres; a native of Braſil, and deſcribed by Vahl. A. *reflexa*, with ſtem ſubbiflorous, ſtem-leaves by threes and ternated, leaflets ſubtrifid, at the tip dentated, and petals lanceolate, obtuſe, and reflex; a native of Siberia, and very much reſembling A. ranunculoides. A. *umbellata*, ranunculus orientalis napelli folio lanuginoſo flore albo of Tourn. with flowers umbellate and involucred, radical leaves tripartite, and laciniæ trifid and entire; a native of Cappadocia.

Culture. The plants of this genus are moſtly hardy perennials, and may be increaſed both by ſeeds and by the roots. The *Hepaticas* are ſome of the chief beauties of the Spring; they produce flowers in February and March, before the green leaves appear; and the double ſorts eſpecially make a very handſome figure, continue a fortnight longer in flower than the ſingle ones, and afford much fairer flowers. The ſingle ſorts are eaſily propagated by ſeeds, which they produce every year. The beſt ſeaſon for ſowing them is the beginning of Auguſt, and they ſhould be ſown in boxes or pots of light earth, expoſed only to the morning ſun till October, and then removed to the full ſun during the whole Winter. In March, when the plants begin to appear, they ſhould be removed to a ſhady ſituation, and frequently watered in dry weather. In Auguſt they will be fit to be tranſplanted; for this purpoſe a border ſhould be prepared facing the eaſt, of good freſh loamy earth, in which the plants ſhould be ſet at about ſix inches diſtance every way, and the earth ſhould be cloſed firmly to the roots, to prevent their being injured by the worms; in the following Spring they will ſhew their flowers, but it will be an interval of three years before the flowers are ſtrong, and you are able to judge of their goodneſs. If at this time any double flowers, or any of a different colour from the reſt ſhould appear, they ſhould be tranſplanted into the borders of the flower-garden, where they ſhould continue at leaſt two years before they are taken up or parted. The double flowers, which never produce ſeeds, are propagated by parting their roots in March when they are in flower. The ſoil in which they delight is ſtrong and loamy, in an eaſtern ſituation expoſed to the morning ſun.

The *pulſatillas* (2—10.) may be propagated by ſeeds, in boxes or pots filled with light ſandy earth, and expoſed to the morning ſun till ten, and ſecured from it in the heat of the day, and in dry weather often refreſhed with water. The ſeeds are beſt ſown in July and Auguſt ſoon after they are ripe. The pots ſhould remain in a ſhady ſituation till October, and then expoſed to the full ſun during the Winter. About the beginning of March, when the plants appear, they ſhould only have the forenoon ſun, be refreſhed with water in dry weather, and kept free from weeds. When the leaves are decayed, which occurs uſually in July, all the roots ſhould be carefully taken up, and immediately planted in beds of light, freſh, ſandy earth, about three or four inches aſunder, and covered to the depth of about three inches with the ſame light earth. In the following Spring moſt of theſe plants will produce flowers, but they will be larger and fairer in the ſucceeding years, when the roots are larger.

The *garden anemones* (11, 12.) are natives of the eaſt, from whence their roots were originally brought; but culture has ſo improved them, that they are become the chief ornaments to our gardens in the Spring. To prepare the ſoil for theſe plants, take a quantity of freſh, light, ſandy loam, or hazel-earth, from a common or dry paſture, not dug above ten inches deep; mix this with a third part its quantity of rotten cow-dung, and lay it up in a heap; turn this over at leaſt once a month, for eight or ten months, and every time pick out the ſtones and break the clods. After this mixture has been twelve months made, it will be fit for uſe.

The beds of this earth muſt be prepared in September, and ſhould be made ſix or eight inches deep, in a wet ſoil; but in a dry one three inches will be ſufficient; lay this compoſt at leaſt $2\frac{1}{2}$ feet thick, with about four or five inches of rotten neat's dung, or the rotten dung of an old melon or cucumber bed at the bottom; in a wet ſoil let the beds be rounded, ſo that the water may run off; but in a dry ſoil let them be nearer to a level: three weeks after the compoſt has been laid in, ſtir it about ſix inches deep with a ſpade, and then with a ſtick draw lines each way of the bed, at ſix inches diſtance, ſo that the whole may be in ſquares; then make a hole three inches deep in the centre of each ſquare, and plant a root in each; and when all are planted, rake the earth of the whole bed ſmooth, ſo as to cover the roots two inches thick. The ſeaſon of planting theſe roots for forward flowers is the latter end of September, and for thoſe of a middle ſeaſon is October: this is beſt done at a time when there are gentle rains. Some roots ſhould alſo be ſaved to be planted after Chriſtmas, for fear of accidents to the former from very hard weather. Theſe uſually flower three weeks after thoſe planted in Autumn.

In the beginning of April the early planted roots will begin to flower, and they will keep in flower near a month, if the weather prove favourable, and they are properly ſhaded with mats, laid over hoops in the greateſt heat of the day: the ſecond, and laſt planted ones, will follow theſe; and, in the whole, there will be at leaſt two months fine flowering.

Toward the beginning of June the firſt planted roots will loſe all their leaves, and they muſt be then taken up and waſhed clean, and laid to dry on mats in the ſhade; after which they are to be put up in paper bags, and hung up till the time of planting them comes on again. The later planted ones are to be taken up alſo as ſoon as their leaves decay, and not ſuffered to remain to make new ſhoots, for then it is too late to remove them.

They are propagated two ways, either by dividing the roots or by ſowing. The roots are to be divided as ſoon as they are taken up out of the ground: they will ſucceed if broken into as many parts as there are eyes or buds in them; but they flower moſt ſtrongly, if not parted too ſmall.

The way, by ſowing, is this: chooſe firſt ſome good kinds of ſingle anemones, called by the gardeners *poppy anemones;* plant theſe early, and they will produce ripe ſeeds three weeks after the flower firſt blows. This muſt be carefully gathered, and in Auguſt it ſhould be ſowed in pots or tubs, or a very well prepared bed of light earth, rubbing it between the hands with a little dry ſand, to prevent ſeveral of the ſeeds from clinging together, and ſpreading them as even as poſſible all over the bed; after this a light hair-bruſh ſhould be drawn many times over the ſurface of the bed, to pull aſunder any lumps of ſeed that may yet have fallen together; obſerving not to bruſh off the ſeed, and as much as poſſible not to bruſh it into heaps. When this is done, ſome light earth, about a quarter of an inch deep, ſhould be ſifted over the bed. If the weather be hot, the bed muſt be at times covered with mats laid hollow, and gently watered.

In about ten weeks after ſowing, the plants will appear, if the ſeaſon has been favourable, and they are to be carefully defended from the hard froſts by proper covering, and from the heat of the ſun afterwards by a moveable reed-fence. As the Spring advances, if the weather be dry, they muſt be gently watered, and when their green leaves decay, there muſt be a quarter of an inch more earth ſifted over them, and the like again at Michaelmas; and the bed muſt be kept clear from weeds, and the following Spring they will flower.

The ſingle or poppy anemones will flower moſt part of the Winter and Spring, when the ſeaſons are favourable, and in a warm ſituation; and they require little culture, for it will be ſufficient to take up the roots every other year, and when they are taken up, they ſhould be planted again very early in the Autumn, or elſe they will not flower till the Spring. There are ſome fine blue colours among theſe ſingle anemones, which, with the ſcarlets and reds, form a beautiful mixture of colours; and as theſe begin to flower in January or February, when the weather is cold, they will continue for a long time in beauty, provided that the froſt is not too ſevere. The ſeeds of theſe are ripe by the middle or end of May, and muſt be gathered daily as they ripen, otherwiſe they will ſoon be blown away by the winds.

The roots of *wood anemone* (23, 24, &c.) may be taken up when the leaves decay, and tranſplanted into wilderneſſes, where they will thrive, and in the Spring have a good effect in covering the ground with their leaves and flowers. The *blue anemone* (24.) flowers at the ſame time with the foregoing, and intermixed with it, makes a fine variety. Double flowers of both theſe ſorts have been obtained from ſeeds. This, and moſt of the other wild anemones, may be propagated by offſets from the root, which they put out plentifully, and they will grow in moſt ſoils and ſituations. *Virginian anemone* (17.) and ſome others, produce plenty of ſeeds, and may be readily increaſed alſo that way. Martyn's Miller.

ANEMONE *pulſilla*. See DRYAS.

ANEMONE, in *Natural Hiſtory*, a ſpecies of HYDRA in Gmelin's arrangement, but which ſhould with more propriety be referred to the ACTINIÆ of Linnæus, as Ellis had placed it with other analogous ſpecies before. The body is fleſhy and flat, the diſk ſub-hexagonal, and ſurrounded with numerous tentacula. It is found in the Weſt Indian ſeas.

ANEMONE is likewiſe the trivial name given by ſome to the ACTINIÆ of Linnæus in general; hence the French author Dicquemarre calls the *actinia rufa* of Linn. Anemone de la prémiere eſpece, actinia craſſicornis, anemone de la ſeconde eſpece, &c. &c.

The ſingular reproductive properties of this kind of vermes is now ſufficiently aſcertained, yet it appears that we were in a conſiderable degree indebted to the accurate obſervations and experiments of M. Dicquemarre, in the firſt inſtance, for the intereſting diſcovery. This author conjectures that it is owing to the gelatinous texture of thoſe creatures that they poſſeſs the wonderful faculty of reproduction. He obſerves, that their limbs budded out ſucceſſively after ſeveral amputations; nay, ſome of them were diſſected through the body; and the baſis, together with that part of the ſtump which was left, ſurvived, projected new limbs, and the animal moved and eat bits of muſcles, which are its uſual nouriſhment. They appeared to bear a conſiderable degree of heat, and to live in a vacuum, at leaſt in a very rare air; and they require for a very conſiderable time no other food than what they find diſſeminated in ſea water.

Dicquemarre endeavours to prove that ſea anemones may be made uſe of for indicating the different changes of temperature in the atmoſphere; but certainly without ſucceſs, as the obſervations of later naturaliſts fully demonſtrate. His account of this new kind of barometers is thus related. The ſea-water, in which the anemones are placed, muſt be renewed every day, and this muſt be their only nouriſhment; and the obſervations ſhould be made at intervals equally diſtant from the renewals of the water. If the anemones be ſhut and contracted, there is reaſon to apprehend an approaching ſtorm; that is, high winds, and a rough agitated ſea. When they are all ſhut, but not remarkably contracted, they forebode a weather ſomewhat leſs boiſterous, but ſtill attended with gales and a rough ſea. If they appear in the leaſt open, or alternately and frequently opening and cloſing, they indicate a mean ſtate both of winds and waves. When they are quite open, tolerably fine weather and a ſmooth ſea may be expected. And, laſtly, when their bodies are conſiderably extended, and their limbs divergent, they ſurely prognoſticate fixed, fair weather, and a very calm ſea. The glaſs in which they are depoſited may be ſwung at ſea, in the ſame manner as the compaſs, ſo that the rolling of the ſhip, may agitate the water as little as poſſible. Theſe animals are viviparous; for ſeveral of them brought forth eight, ten, or twelve young ones in the hand.

The account of the ſpecies *ſociata*, as related by Mr. Ellis, in the Philoſophical Tranſactions, affords ſtill more accurate information concerning this tribe of creatures, their internal organization, economy, &c. than the reports of Dicquemarre. "This compound animal, which is of a tender fleſhy ſubſtance, conſiſts of many tubular bodies, ſwelling gently towards the upper part, and ending like a bulb,

bulb or very ſmall onion; on the top of each is its mouth, ſurrounded by one or two rows of tenticles, or claws, which when contracted look like circles of beads.

"The lower part of all theſe bodies has a communication with a firm fleſhy wrinkled tube, which ſticks faſt to the rocks, and ſends forth other fleſhy tubes, which creep along them in various directions. Theſe are full of different ſizes of theſe remarkable animals which riſe up irregularly in groups near one another.

"This adhering tube, that ſecures them faſt to the rock or ſhelly bottom, is worthy of notice. The knobs that we obſerve are formed into ſeveral parts of it by its inſinuating itſelf into the inequalities of the coral rock, or by graſping other pieces of ſhells, part of which ſtill remain in it, with the fleſhy ſubſtance grown over them.

"This ſhews us the inſtinct of nature, that directs theſe animals to preſerve themſelves from the violence of the waves, not unlike the anchoring of muſcles, by their fine ſilken filaments that end in ſuckers, or rather like the ſhelly baſis of the ſerpula, or worm-ſhell, the tree oyſter, and the ſhipper barnacle, &c whoſe baſes conform to the ſhape of whatever ſubſtance they fix themſelves to, graſping it faſt with their teſtaceous claws to withſtand the fury of a ſtorm.

"When we view the inſide of this animal diſſected lengthwiſe, we find a little tube leading from the mouth to the ſtomach, from whence there riſe eight wrinkled ſmall guts, in a circular order, with a yellowiſh ſoft ſubſtance in them; theſe bend over in the form of arches towards the lower part of the bulb, from whence they may be traced downwards to the narrow part of the upright tube, till they come to the fleſhy adhering tube, where ſome of them may be perceived entering into the papilla, or the beginning of an animal of the like kind, moſt probably to convey it nouriſhment till it is provided with claws; the remaining part of theſe ſlender guts are continued on in the fleſhy tube, without doubt for the ſame purpoſe of producing and ſupporting more young ones from the ſame common parent.

"The many longitudinal fibres that we diſcover lying parallel to each other, on the inſide of the ſemi-tranſparent ſkin, are all inſerted in the ſeveral claws round the animal's mouth, and are plainly the tendons of the muſcles for moving and directing the claws at the will of the animal: theſe may likewiſe be traced down to the adhering tube."

Another remarkable creature of this kind is deſcribed in Hughes's Natural Hiſtory of Barbadoes, and which, it is ſaid, was only found in a baſon in one particular cave.

"In the middle of the baſon," ſays that author, "there is a fixed ſtone, or rock, which is always under water. Round its ſides, at different depths, ſeldom exceeding 18 inches, are ſeen, at all times in the year, iſſuing out of little holes, certain ſubſtances that have the appearance of fine radiated flowers, of a pale yellow, or a bright ſtraw colour, ſlightly tinged with green, having a circular border of thick-ſet petals, about the ſize of, and much reſembling thoſe of a ſingle garden-marigold, except that the whole of this ſeeming flower is narrower at the diſcus, or ſetting on of the leaves, than any flower of that kind.

"I have attempted to pluck one of theſe from the rock, to which they are always fixed, but never could effect it; for as ſoon as my fingers came within two or three inches of it, it would immediately contract cloſe together its yellow border, and ſhrink back into the hole of the rock; but if left undiſturbed for about four minutes, it would come gradually in ſight, expanding, though at firſt very cautiouſly, its ſeeming leaves, till at laſt it appeared in its former bloom. However, it would again recoil with a ſurpriſing quickneſs when my hand came within a ſmall diſtance of it. Having tried the ſame experiment by attempting to touch it with my cane, and a ſmall ſlender rod, the effect was the ſame.

"Though I could not by any means contrive to take or pluck from the rock one of theſe animals entire, yet I once cut off (with a knife which I had held for a long time out of ſight, near the mouth of an hole out of which one of theſe animals appeared) two of theſe ſeeming leaves. Theſe, when out of water, retaining their ſhape and colour; but being compoſed of a membrane-like ſubſtance, ſurpriſingly thin, it ſoon ſhrivelled up and decayed."

The ſame author further adds, that many people coming to ſee theſe creatures, and occaſioning ſome inconvenience to a perſon through whoſe grounds they were obliged to paſs, he reſolved to deſtroy the objects of their curioſity, and that he might do ſo effectually, cauſed all the holes out of which they appeared to be carefully bored and drilled with an iron inſtrument, ſo as to cruſh their bodies to a pulp, and yet they again appeared in a few weeks from the very ſame places. It has been ſuſpected that this Barbadoes *anemone* may be a ſpecies of tubularia rather than actinia.

ANEMONOIDES, in *Botany*. See ANEMONE.

ANEMONOSPERMOS. See ARCTOTIS and GORTERIA.

ANEMOSCOPE, derived from *ανεμος*, *wind*, and *σκεπτομαι*, *I conſider*, is ſometimes uſed for a machine invented to foretel the changes of the wind. For this purpoſe it ſhould conſiſt of an index moving about a circular plate, like the dial of a clock, on which the 32 points of the compaſs are drawn inſtead of the hours. The index, pointing to the diviſions in the dial, is turned by an horizontal axis, having a handle-head at its outward extremity. This handle-head is moved by a cog-wheel on a perpendicular axis; on the top of which is fixed a vane, that moves with the courſe of the wind, and gives motion to the whole machine. The whole contrivance is very ſimple, and nothing is required in the conſtruction, but that the number of cogs in the wheel and rounds in the trundle-head be equal; becauſe it is neceſſary, that when the vane moves entirely round, the index of the dial ſhould alſo make a complete revolution. An anemoſcope of this kind is placed in one of the turrets of the Queen's palace. An account of an anemoſcope contrived by Mr. Pickering, may be ſeen in the Phil. Tranſ. vol. xliii. pl. II. p. 9; and another deſcribed by Mr. Martin, in his Philoſ. Britan., vol. ii. p. 211. See ANEMOMETER and WIND GAGE.

It has been obſerved, that hygroſcopes made of cat's-gut, &c. prove very good anemoſcopes; ſeldom failing, by the turning of the index about, to foretel the ſhifting of the wind.

The anemoſcope uſed by the ancients ſeems, by Vitruvius's deſcription of it, to have been intended rather to ſhew which way the wind actually blew, than to foretel into which quarter it would change.

Otto de Gueric alſo gave the title anemoſcope to a machine invented by him, to foretel the change of the weather, as to fair and rain. It conſiſted of a wooden little man, who roſe and fell in a glaſs tube, as the atmoſphere was more or leſs heavy.—Accordingly, M. Comiers has ſhewn, that this anemoſcope was only an application of the common BAROMETER. See WIND.

The anemoſcope of Væroe is famous. It is made of the bird *lunde*, whoſe feathers are picked, the ſkin ſtripped off, *viſcera* taken out, and the ſkin in this ſtate drawn a-new over the bones; this being hung up in the chimney, is ſaid always to direct its bill to the point from whence the wind

is

is like to blow. Ephem. Acad. N. C. Dec. 3. An. 9. App. 245.

AN-END, in *Sea-language*, denotes the poſition of any maſt, &c. when erected perpendicularly on the deck. The top-maſts are ſaid to be *an-end*, when they are hoiſted up to their uſual ſtation.

ANET, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Dreux, near the Eure; eight miles north-north-eaſt of Dreux.

ANETHIFOLIUS, in *Botany*. See PROTEUS.

ANETHUM, derived from ἀνα θεω, becauſe it runs up quick or ſtraight, a genus of the *pentandria digynia* claſs and order, and of the natural order of *umbellatæ* or *umbelliferæ*: its characters are, that the *calyx* has an umbel univerſal and partial manifold, the involucre neither univerſal nor partial, the perianth proper obſolete; the *corolla* univerſal, uniform, floſcules all fertile; proper; five-petals, involute, entire and very ſhort; the ſtamina have capillary filaments and roundiſh anthers: the *piſtillum* is a germ inferior, ſtyles approximating, obſolete; ſtigmas obtuſe; no *pericarpium*, fruit ſubovate, compreſſed, ſtriated and bipartile; the ſeeds are two, ſubovate, margined, convex, and ſtriated on one ſide, flat on the other. There are three ſpecies, 1. A. *graveolens*, A. hortenſe of Bauh. Common dill, "with fruit compreſſed." Dill differs from fennel, which it moſt reſembles, in having an annual root, a ſmaller and lower ſtem, the leaves more glaucous, and of a leſs pleaſant ſmell, the ſeeds broader and flatter, ſurrounded with a membranaceous rim, and of a leſs pleaſant flavour than fennel ſeeds. This plant grows wild among the corn in Spain and Portugal, and alſo in Italy on the coaſt, and near Conſtantinople; it is annual, and was cultivated here in 1597; the ſeeds of dill are directed for uſe by the London and Edinburgh pharmacopeias; they have a moderately warm pungent taſte, and an aromatic ſmell, but not of the moſt agreeable kind. Water extracts very little of their virtues, either by infuſion or digeſtion for many hours. In boiling, their whole flavour exhales with the watery vapour, and may be collected by diſtillation. The diſtilled water, drawn off to the quantity of a gallon from a pound, is occaſionally made the baſis of carminative draughts or juleps. The ſimple water ariſes better than any in the ſhops. Along with the water ariſes a conſiderable portion of eſſential oil, in taſte moderately pungent, and ſmelling ſtrongly of the dill. Rectified ſpirit, digeſted in dill ſeeds, readily extracts both their ſmell and taſte; but, by diſtillation, it brings over very little of the flavour, the active part of the ſeeds remaining in the extract. The ſeeds and the plant itſelf were formerly much uſed in medicine, and, from the time of Dioſcorides, have been eſteemed for their carminative and hypnotic powers; and they have, therefore, been recommended in flatulent colics, and certain dyſpeptic ſymptoms proceeding from a laxity of the ſtomach. Foreſtus ſpeaks highly of their uſe in allaying vomiting and hickups. They are alſo ſaid to be more effectual than the other ſeeds of this claſs in promoting the ſecretion of milk. At this time, however, the ſeeds of dill are ſeldom employed, though a ſimple diſtilled water from them is directed both by the London and Edinburgh pharmacopeias. Allaine ſays, that the eſſential oil, rubbed on the abdomen, is uſeful in allaying flatulence and colic; and in a clyſter, as a carminative. Lewis. Murray. Woodville. 2. A. *ſegetum*, A. ſylveſtre minus of Bauhin, fœniculum luſitanicum minus annuum anethi odore of Tourn. "with three ſtem leaves, and oval fruits." It is annual, and a native of Portugal. 3. A. *fœniculum*, common fennel, or ſinckle, "with gibbous fruits, and ſtem leaves numerous and deflexed." It is a native of Germany, Spain, Italy, Madeira, China, &c.; it is biennial, and flowers in July and Auguſt, and the ſeeds ripen in Autumn. Linnæus diſtinguiſhes four varieties of fennel, viz. ſweet fennel; common fennel, F. vulgare germanicum of Bauh. Italian fennel, F. vulgare italicum of Bauh. and wild fennel, F. ſylveſtre of Bauh.; Miller enumerates three varieties, viz. F. vulgare, or common fennel, F. dulce, or ſweet fennel, and F. azoricum, or azorian fennel, or finochio. The common fennel runs from three to five feet high, blue green, with yellow flowers. It has a ſtrong fleſhy root, which penetrates deep into the ground, and will continue for ſeveral years; it has ſown itſelf in many places, and appears like a native in England; accordingly it is enumerated among our native plants by Hudſon, Withering, Smith, &c.; and is now common on chalk cliffs, as about Marazion in Cornwall, in Suſſex, about Graveſend and in other parts of Kent, Nottingham Caſtle, near Spetchly in Worceſterſhire, Burwell, and other places in Cambridgeſhire, and commonly on the weſtern coaſts. The ſweet fennel has been ſuppoſed to be a variety of the common ſort, but it has been cultivated in the ſame ground with the other and retained its differences; though botaniſts affirm, that it will return to its priſtine form and qualities. The ſeeds, which are longer, narrower, and of a lighter colour, are generally imported from Germany and Italy, and are reckoned ſuperior to thoſe of our own growth.

Dietetic and medical qualities of fennel. The tender buds of fennel are eaten in ſalads: the leaves boiled are uſed as ſauce for fiſh, particularly mackerel, and they are eaten raw with pickled fiſh. In Spain they put them up with olives and pickled pork. The ſeeds of ſweet fennel are admitted into the materia medica of the London and Edinburgh pharmacopeias, and the root of the common fennel in that of Edinburgh. Sweet fennel ſeeds are an uſeful ſtomachic and carminative, and are ſometimes given in powder, from a ſcruple to a dram; and ſometimes candied. Water extracts the virtue of theſe ſeeds very imperfectly by infuſion, but carries it off totally in evaporation. By diſtillation, they impregnate water with their flavour; a gallon of water receiving a ſtrong impregnation from a pound of the ſeeds. A large proportion of eſſential oil ſeparates in the diſtillation, and floats on the ſurface of the aqueous fluid; in colour yelloviſh, in ſmell moderately ſtrong and diffuſive, and exactly reſembling the fennel, in taſte mild and ſweetiſh, like the oil of aniſeeds, and like it alſo congealing, by a ſlight cold, into a white butyraceous maſs. Theſe ſeeds contain likewiſe a conſiderable quantity in groſs oil of the expreſſed kind, which, when freed from the eſſential oil, manifeſts no particular ſmell or taſte. This oil is extracted, with the aromatic matter of the fennel, by digeſtion in rectified ſpirit, but ſeparates and riſes to the ſurface upon inſpiſſating the filtered tincture. The ſpirit, gently diſtilled off, has very little of the flavour of the ſeeds; the oily matter retains a part both of their taſte and ſmell; but much the greateſt part remains concentrated in the extract. The ſeeds of the common fennel are warmer and more pungent, but leſs ſweet, and of a leſs grateful flavour than that of the preceding; and there is the ſame difference in the preparations from them; the ſpirituous tincture of the ſweet fennel is yelloviſh, but that of the common greeniſh. The leaves impregnate water by diſtillation with a grateful flavour, and yield a conſiderable portion of eſſential oil. An extract made from them by rectified ſpirit is no inelegant aromatic. The roots, taken up early in the ſpring, have a pleaſant ſweetiſh taſte, with a ſlight aromatic warmth. They are ranked among the aperient roots, and ſuppoſed by ſome to be equivalent in virtue to the celebrated ginſeng of the Chineſe, from which, however, they

differ in their ſenſible qualities. They are ſaid to be pectoral and diuretic, but now wholly diſregarded. The fœniculum of the Latins is ſuppoſed to be the *μαραθρον* of the Greeks, by whom it was highly eſteemed for promoting the ſecretion of milk; and this opinion has been confirmed by the experience of ſome modern authors. The ſtomachic, carminative, and other effects aſcribed to fennel, depending upon their ſtimulant and aromatic qualities, muſt be leſs conſiderable than thoſe of dill, aniſe, and caraway, though termed one of the ſame greater hot ſeeds. Lewis. Murray. Woodville. The finochio, ſuppoſed to have been originally brought from the Azores, has been long cultivated in Italy as a ſalad herb; and it is alſo cultivated in ſome few gardens in England.

Culture. Dill is propagated by ſowing the ſeeds in autumn ſoon after they are ripe, in a light ſoil, where they are to remain, at the diſtance of eight or ten inches aſunder. When the plants are come up, they ſhould be hoed, and left at the above diſtance, and kept clear from weeds. When the ſeeds begin to be formed, thoſe that are intended to be put into the pickle for cucumbers ſhould be cut up, and thoſe intended for ſeeds left till they are ripe; and then they ſhould be cut, ſpread upon a cloth to dry, and beat out for uſe. The beſt time to ſow the ſeeds of fennel is ſoon after they are ripe; the plants will come up in the autumn or following ſpring, and require no other care beſides being thinned and cleared from weeds; they will grow in any ſoil or ſituation. For the finochio, good ſeeds muſt be procured; and a good ſpot of light rich earth, neither dry nor very wet, ſelected, the firſt crop may be ſown about a fortnight in March, which, if it ſucceeds, will be fit for uſe in July; and, by ſowing it ſeveral times, a ſupply may be had for the table till the froſt puts a ſtop to it. When the ground has been well dug and levelled, a hollow drill muſt be formed by a line and the ſeeds thinly ſcattered in it, about two inches apart; the drills ſhould be 18 inches aſunder, that there may be room to clean the ground and earth the plants. The plants will uſually come up about three weeks or a month after ſowing; and then with a ſmall hoe the weeds ſhould be cut between them, and the plants thinned; and thus ſucceſſively till they are at the diſtance of ſeven or eight inches. The ſtems of the plants, which riſe above the ſurface of the ground, ſhould be earthed for blanching, about a fortnight or three weeks before they are uſed, and they will thus be rendered very tender and criſp. The ſecond crop ſhould be ſown about three weeks after the firſt; and theſe crops ſhould be continued in ſucceſſion at ſuch intervals till the end of July. In April, May, and June, the ſoil ſhould be moiſter than the firſt; and in July it ſhould be drier and in a warm ſituation, and the beds at this ſeaſon ſhould be watered and ſhaded. In autumn, if ſharp froſts ſhould occur, the plants ſhould be covered with peas-haum, or ſome light covering; and thus they may be preſerved for uſe till the middle of winter. Martyn's Miller.

ANEURIN, *in Biography*, one of the moſt eminent of the ancient bards of Britain, who was a chieftain of the Otodini, and bore a conſpicuous part in the battle of Cattraeth, about A. D. 530, the ſubject of a noble heroic poem compoſed by him; and which is printed in the Archaiology of Wales, with another compoſition by the ſame perſon, entitled Odes to the Months. About the year 540, Aneurin is ſuppoſed to have loſt his territories in the north, in conſequence of the growing power of the Saxons; and eventually, ſome old documents and traditions ſay, that he took refuge in the famous monaſtery of Iltutus, in the country of the Silures, where he died, about A. D. 570.

ANEURISM, or ANEURYSM (from *ανευρυνω*, *dilato*), in *Surgery*, a preternatural dilatation of an artery, or a collection of blood in the cellular membrane, occaſioned by the rupture or puncture of an artery. The firſt caſe has been called the *true*, or *genuine* aneuriſm; the ſecond, the *falſe* or *ſpurious* aneuriſm. The true aneuriſm is again diſtinguiſhed into the *true circumſcribed aneuriſm*, in which the artery is only dilated in one ſmall part, and the tumour is circumſcribed; and *the true diffuſed aneuriſm*, when the tumour produced by the dilatation of the artery is of conſiderable extent, and, as it gradually loſes itſelf in the ſurrounding parts, its boundaries cannot be accurately defined.

The ſpurious aneuriſm is again divided into the *circumſcribed ſpurious aneuriſm*, in which the blood is collected in a ſac in ſome part of the cellular membrane, forming a diſtinctly circumſcribed tumour; and the *diffuſed ſpurious aneuriſm*, where the blood is effuſed into the adjacent cavities of the cellular membrane, forming an unequally elongated tumour.

Beſides theſe two principal ſpecies of aneuriſm, a third, the *mixed aneuriſm* is reckoned; which conſiſts in a combination of the true and falſe aneuriſms with each other. The *firſt* ſubdiviſion of this ſpecies occurs when the external membrane of an artery has been injured by puncture, cutting, laceration with the ſplinter of a bone, or any other accidental cauſe, whilſt the internal membrane remains untouched. The internal membrane, which is unable of itſelf to reſiſt the impetus of the blood, is protruded through the orifice in the external membrane, ſo as to form a tumour, partly by laceration, partly by dilatation of the artery, and conſequently by a combination of both cauſes. The *ſecond* ſubdiviſion occurs, when the ſac of the true aneuriſm burſts, and the blood, penetrating into the adjacent cellular membrane, ſurrounds the ſac. As the true circumſcribed aneuriſm may be produced wherever arteries exiſt, and conſequently as well in the internal as the external parts of the body; it is divided into the *internal* and *external* true circumſcribed aneuriſm. Of the internal, that of the aorta, and of the external, that in the ham or hollow of the knee, is the moſt frequent.

The true circumſcribed external aneuriſm may be known when the patient remarks an unuſual pulſation in any part of his body; when, upon cloſe examination, he diſcovers a ſmall pulſating tumour on the part, which diſappears on being preſſed with the finger, and, as ſoon as the preſſure is removed, returns. It alſo will often diſappear when the artery is ſtrongly compreſſed at ſome part above it, and returns again as ſoon as the preſſure is removed.

This tumour is not painful, neither is the external ſkin diſcoloured. When it has once been produced, it generally goes on increaſing with an uninterrupted progreſs. The larger it grows, the leſs the pulſation is perceived, which may at length entirely ceaſe when the tumour has become very large. When the ſac is of conſiderable ſize, and the pulſe under the tumour weak and ſmall, the limb frequently becomes cold, collapſed, pale, weak, or oedematous. The danger is the greateſt when the ſac burſts, which it does either in ſuch a manner as to leave the external ſkin, that covers it, entire, in which caſe the *true* aneuriſm is changed into the *mixed*; or, the ſac burſts, together with the external ſkin, in which caſe a violent hæmorrhage enſues, that proves fatal, unleſs ſpeedy aſſiſtance can be procured. The rupture of the ſac is ſometimes produced by concuſſion, or any other external cauſe, and ſometimes ſpontaneouſly; in which caſe it may generally be foreſeen for ſome time before it happens, by the place, which before was particularly dilated and elevated, becoming thin, ſoft, red, or bluiſh.

The internal true aneuriſm is only to be diſcovered by an unuſual, conſtant, and violent pulſation in one part, which cannot be diſtinctly perceived till the tumour has attained a conſiderable

conſiderable magnitude; for whilſt it is ſtill ſmall, this pulſation is very indiſtinct. When theſe tumours have attained to a conſiderable ſize, they ſometimes at length appear externally, in which caſe they may eaſily be aſcertained.

It now and then happens, however, that pulſation combined with dilatation does not certainly characterize this diſeaſe. (See Deſſault's Obſ. Chir. and Medical Communicat.) We have known the moſt careful obſervers deceived both in tumours of the extremities as well as internally, by forming their diagnoſis from the pulſation alone. It is therefore neceſſary in theſe caſes to take all the circumſtances into conſideration, from the earlieſt period of the diſorder to its complete formation. When a ſoft tumour lies immediately upon an artery, the pulſation of the veſſel may be felt through the tumour; and when the coagula of a real aneuriſm have become firm, the pulſation may be obſcure or imperceptible.

The proximate cauſe of the true aneuriſm is indiſputably a preternatural debility of the artery in ſome part, whereby it is rendered unable to reſiſt the impetus of the blood, in conſequence of which it yields, and is dilated into a ſac. This may happen from a local injury; for example, a bruiſe; which may particularly be the caſe in thoſe parts of the body where the artery has but few muſcular parts to cover it, and is ſituated near a bone. Probably a ſudden and violent elongation or ſtretching of the artery may occaſion this topical weakneſs; at leaſt we ſometimes ſee true aneuriſms ariſe after violent ſtretching of a limb, in fractures, diſlocations, violent bodily exertions, convulſions, &c. Sometimes, probably, the cauſe may conſiſt in a violent and inordinate motion of the blood: the artery may alſo be deprived of its ſupport, by an abſceſs in any part of the body, and weakened in ſuch a manner as to be unable to reſiſt the impetus of the blood. In all theſe, and other ſimilar caſes, the aneuriſm deſerves the name of a topical diſeaſe. Frequently, however, and perhaps in the majority of caſes, the aneuriſm is the conſequence of a general diſeaſe of the whole arterial ſyſtem. According to the experience of Morgagni and others, aneuriſms are ſaid to be ſometimes produced by the venereal, rheumatic, ſcorbutic, and other conſtitutional taints in the ſyſtem. Sometimes theſe tumours ariſe ſpontaneouſly, without any occaſional cauſe; frequently ſeveral of them are produced at the ſame time in different external and internal parts: we alſo find in diſſecting the bodies of perſons who have been affected with aneuriſm, that the arterial ſyſtem is in many parts, nay, even univerſally, extremely feeble, and eaſily lacerated. This ſpecies of the diſeaſe, DIATHESIS ANEURYSMATICA, is, in the preſent ſtate of our knowledge, to be conſidered as altogether incurable, as we cannot determine its cauſe with certainty.

The falſe or ſpurious aneuriſm conſiſts in a rupture of the artery, the blood being effuſed through the orifice into the ſurrounding cellular membrane. As this ſpecies, like the true aneuriſm, may be produced both in internal and external parts, it is likewiſe ſubdivided into the *internal* and *external*. The cauſes by which a preternatural orifice may be made in an artery, are numerous: *e. g.* ſudden violent exertion of a limb or of the whole body, the lifting of heavy burdens, violent ſpaſms, vomiting, &c. The moſt frequent cauſe, however, is a leſion of the artery by ſome foreign ſubſtance, as by the ſplinter of a bone; and particularly by the lancet, when blood-letting is performed in an unſkilful manner, at the bend of the fore-arm, of which we therefore ſhall treat more minutely than of the other kinds.

In letting blood at the arm, the artery may be diſcovered to have been wounded, by the blood being thrown out with unuſual force, in an uninterrupted but unequal ſtream, as it were by jerks; alſo by its florid red colour; and, which is the moſt certain ſign, by the blood flowing out in an even ſtream, with leſs force, when preſſure is applied to the artery above the wound. In theſe caſes the diffuſion of the blood forming a ſpurious aneuriſm is generally owing to the fault of the ſurgeon, in attempting to ſtop the hæmorrhage too ſuddenly, either by preſſing his fingers upon the wound, or by applying a bandage. The aneuriſm is produced either in conſequence of the orifice in the external ſkin being diſplaced in ſuch a manner that the blood can no longer be diſcharged through it, and muſt conſequently diffuſe itſelf in the cellular membrane; or by the preſſure, which is haſtily applied, being too weak, ſo as merely to cloſe the orifice in the ſkin and vein, but not that in the artery, which conſequently diſcharges the blood into the ſurrounding cellular membrane. The tumour produced in this manner is commonly of a red, bluiſh, and, finally, of a black colour.

The falſe diffuſed aneuriſm, ariſing from this cauſe, increaſes in ſize as long as the internal hæmorrhage continues; and if this be not ſpeedily ſtopped, it produces violent pain and immobility of the limb, nay, at length, inflammation, ſuppuration, and gangrene. The moſt recent caſe of this kind, with which we are acquainted, is related in the ſixth volume of the Medical and Phyſical Journal, by Dr. Adams, of Madeira; and in this caſe a perfect cure was effected, by long continued preſſure on the artery, at the ſuperior part of the arm.

The circumſcribed ſpurious aneuriſm is produced, when the hæmorrhage has at firſt been ſtopped by the application of a proper preſſure, but the bandages have been removed too early, and before the orifice of the artery has been cloſed, ſo that the blood is effuſed through the wound, ſtill left, or newly torn open, into the ſurrounding cellular texture; but, on account of the adheſion of the cellular membrane, produced by the preſſure previouſly applied, cannot penetrate into its cavities, and conſequently collects itſelf into a maſs, near to the orifice in the artery, dilating the cellular membrane into a ſac. Sometimes, however, though rarely, this kind of aneuriſm is produced immediately after the artery has been wounded; namely, when on account of the ſmallneſs of the puncture in the artery, the hæmorrhage takes place ſo ſlowly, that the blood firſt diſcharged becomes coagulated, ſo as to ſtop the apertures through which the ſucceeding diſcharge might paſs into the cavities of the cellular membrane, and prevent its diffuſing itſelf. Sometimes alſo the artery is covered with a membrane, aponeuroſis, &c. which prevents the diffuſion of the blood, and compels it to collect into a maſs.

The circumſcribed falſe aneuriſm conſiſts therefore of a ſac, formed out of the cellular texture, and filled with blood, which is ſituated cloſe to the artery, and communicates with the artery itſelf by means of the wound in it. In the falſe aneuriſm a pulſation can almoſt always be perceived, and that the more diſtinctly, the ſmaller the tumour is. The larger this ſac becomes, the more it loſes its elaſticity, the greater becomes the accumulation of coagulated blood within it, and the weaker conſequently becomes the perceptible pulſation, which in very large aneuriſms of this kind entirely diſappears. At firſt the tumour is ſmall, and vaniſhes entirely under the preſſure of the finger; but as ſoon as the preſſure is removed it appears again. It vaniſhes in the ſame manner, when preſſure is applied to the artery above the tumour, and re-appears when that preſſure is removed. As ſoon as coagulated blood has accumulated in the ſac, the tumour can no longer be made entirely to diſappear by preſſure, but it becomes hard. It is without pain, and the integuments that cover it, preſent the natural appearance. When

once produced, it increaſes with a conſtant and regular progreſs, and at laſt becomes enormouſly large. The flow of the blood into the limb below the tumour is always impeded, the pulſation of the arteries in it becomes feeble and ſmall, and the limb itſelf is cold, collapſed, torpid, pale, or oedematous. A caries of the neighbouring bones frequently takes place. This aneuriſm may alſo at length burſt, and produce a fatal hæmorrhage, unleſs ſpeedy aſſiſtance can be procured. The part where it burſts previouſly grows thin, ſoft, and bluiſh, or of a gangrenous aſpect.

Notwithſtanding the great reſemblance which exiſts between the phænomena of the true and thoſe of the falſe aneuriſm, they may however in general be eaſily diſtinguiſhed from each other, eſpecially after the firſt period of their exiſtence. The true aneuriſm yields to the preſſure of the finger very quickly, and reappears as quickly, when the preſſure is removed; the falſe aneuriſm, on the contrary, yields only in a gradual manner, and appears again in the ſame manner, as the blood contained in the ſac cannot be wholly preſſed through the orifice of the artery, nor again be effuſed, except by ſlow degrees. Sometimes a whizzing ſort of noiſe may be diſtinctly heard, when the blood is preſſed into the orifice, and again poured through it. The pulſation in the falſe aneuriſm is always weaker; and, as the tumour increaſes in ſize, diminiſhes much more rapidly than in the true aneuriſm, in which, even though it have attained a very conſiderable ſize, a ſtrong pulſation can always be felt. The falſe aneuriſm becomes ſooner hard than the true one, and cannot then be made entirely to diſappear by preſſure, as coagulated blood is very readily accumulated within it. Moreover, any miſtake that may be occaſioned by the difficulty of the diagnoſis between the two ſpecies, cannot often be attended by any bad conſequences, as they both require pretty much the ſame method of treatment. The internal falſe aneuriſms are, on account of the pulſation being much weaker and imperceptible, and vaniſhing much ſooner, than in the true aneuriſms, as difficult, nay more difficult to be diſtinguiſhed than theſe, though in other reſpects they excite ſimilar ſymptoms.

When, in letting blood at the arm, the ſurgeon diſcovers, by the ſigns which we have already mentioned, that an artery has been wounded, he muſt immediately apply a TOURNIQUET to the upper part of the arm, in order firſt to ſtop the hæmorrhage, and obtain time for applying his bandages with the requiſite care and accuracy. The hæmorrhage from the vein is to be ſtopped with the common bandage. But, in order permanently to arreſt the hæmorrhage and cloſe the wound of the artery, he muſt apply a compreſs with great exactneſs, which muſt be ſufficiently tight entirely to prevent the hæmorrhage, and not eaſily to be removed from its ſituation; it ought alſo to cloſe merely the artery itſelf, without affecting the lateral branches and the veins, leſt a ſwelling and mortification might enſue from want of circulation. A pledget, or firm compreſs, is to be applied, the inner ſurface of which muſt be ſomewhat broader than the opening in the veſſel, immediately upon the external wound, otherwiſe the pledget might eaſily miſs the orifice of the artery. All now depends upon this compreſs being ſufficient to ſtop the wound, its being applied with an uniform preſſure, and in ſuch a manner as not to prevent the motion of the blood through the lateral branches and veins. The common bandage uſed in blood-letting does not anſwer theſe purpoſes ſo conveniently as by means of Plenks' apparatus, which, however, muſt be applied with great exactneſs. (Joſ. Jac. Plenks Sammlung von Beobachtungen ueber einige Gegenſtænde der Wundarzneiwiſſenchaft. Vienna, 1775. 8. p. 195. Alſo: Richters Anfangſgruende der Wundarzneyk. B. i. § 531. tab. iv. f. 7.) Should a ſmall tumour ariſe cloſe to the point of the pledgit, the apparatus ſhould firſt be ſcrewed ſomewhat tighter, as the preſſure was poſſibly not ſufficiently ſtrong. If nevertheleſs the tumour ſhould grow ſtill larger, we may be certain that the compreſs does not lie upon the wound of the artery; the tourniquet muſt therefore be immediately applied, and the dreſſings removed; after which they muſt be again applied with as great exactneſs as poſſible; but firſt the extravaſated blood muſt be preſſed back into the artery, by gently rubbing and ſqueezing the tumour. If at any ſubſequent time it ſhould become neceſſary to remove the apparatus from the limb, the tourniquet muſt be employed in the ſame manner.

The apparatus being properly applied, the arm ſhould be ſuſpended, moderately bent, in a ſling, and kept as much as poſſible at reſt during the whole courſe of the cure. Should any ſwelling appear in the fore-arm, we ought to endeavour to diſcuſs it by diligent friction with ſpirituous and aromatic remedies. Moreover, the ſurgeon ſhould daily examine whether the bandages remain firm and unmoved in their ſituations, and as ſoon as he diſcovers any tumour, he ſhould proceed as above recommended. The length of time during which the compreſs ought to remain in its ſituation, in order to preclude the poſſibility of a future hæmorrhage, cannot be accurately determined: if, therefore, we wiſh to examine whether it may be ſafely removed, we ought firſt to apply the tourniquet, and then take off the apparatus: this being done, we ſhould gradually looſen the tourniquet, and carefully obſerve whether any tumour is produced at the place of the wound. Should no ſuch tumour appear, we need not uſe theſe bandages any longer; it will, however, be proper, for ſecurity's ſake, (as in ſome inſtances the wound of the artery has been known to burſt open afreſh) to apply gentle preſſure, by means of a compreſs, to the artery, immediately after the bandages have been entirely removed, in order to diminiſh the flow of blood through it, and prevent its burſting. Every other motion of the limb ſhould be avoided for ſome time after.

When a circumſcribed falſe aneuriſm has already been produced, we may alſo in that caſe employ compreſſion, provided the tumour be ſtill ſoft, and can be made entirely to diſappear by preſſure. For, as experience has proved, that the efforts of nature alone may, in ſuch circumſtances, ſometimes effect a perfect cure of the aneuriſm, (Repertorium Medicin. u. Chirurg. Abhand. &c. b. i. Leipzig. 1792. 8vo. p. 107.) we have the greater reaſon to expect a favourable event from the employment of compreſſion. The ſurgeon ought, therefore, after having applied a tourniquet to the arm, as in the former caſe, to return the blood into the artery, by means of repeated preſſing and ſtroking of the part, and then apply the compreſs. But when there is already coagulated blood in the ſac, and the tumour can no longer be made to diſappear under preſſure, compreſſion can be of no uſe. Should there, however, be but a ſmall quantity of coagulated blood, we may ſtill attempt compreſſion; for it may ſometimes ſucceed: and when it does not, it produces the advantage of compelling the blood to flow with greater force into the lateral branches, by the diſtention of which a favourable iſſue of the operation is ſecured.

Mr. Theden (in Neue Bemerkungen u. Erfahrungen zur Berinherung der Wundarzneik. u. Arzneygelehrſaml. th. i. Berlin. 1792. p. 20. & th. ii. p. 52.) recommends another method for curing aneuriſms, which is applicable even where there is already a very conſiderable quantity of extravaſated and coagulated blood. When, in performing the

the operation of blood-letting, we have wounded an artery, we are to ſuffer more than the proper quantity of blood, nay even ſo much as to induce ſyncope, to be diſcharged, and in the mean time prepare whatever is requiſite for bandaging the limb. Three or four compreſſes, into the lowermoſt of which we may introduce a ſmall piece of money, are then to be applied in ſuch a manner as to fill up the cavities in the angle of the elbow, which, till the reſt of the bandages are ready, is to be preſſed by an aſſiſtant ſo tight upon the orifice of the artery, that no blood can be diſcharged from it. The bandaging muſt then be performed ſpirally, a longuette of the thickneſs of a finger's breadth muſt be laid upon the trunk of the artery, and incloſed in the bandage. When the hæmorrhage has been ſtopped in this manner, a quantity of Theden's *aqua traumatica* is to be poured upon the whole of the bandages, ſo as to wet them through and through. The bandages ſhould not be applied too tight at firſt, if we intend to ſoak them with the liquid, as it is well known that moiſture cauſes them to contract and compreſs the limb with greater force, by which means obſtruction, tumour, and pain might be produced. Should we, however, have applied them tight, on account of the hæmorrhage, we muſt not wet them till after they have become ſomewhat looſe. As our ſucceſs depends upon the bandage lying equally cloſe in every part, each turn of the bandage ought to cover half of the former, ſo that no part of the limb remain uncovered, or not incloſed within the bandage; neither ought any one turn of the bandage to be drawn tighter than the reſt.

The firſt bandages may be ſuffered to remain on the limb for the ſpace of three or four days, unleſs they ſhould grow looſe at an earlier period, as generally happens when there is a large quantity of extravaſated blood, and this ſoon begins to be ſeparated and re-abſorbed. In applying the bandages the ſecond time, we proceed in the following manner. The roller is taken off from the fingers, hand, and fore-arm, and theſe parts are bandaged anew before the bandages and compreſſes are removed from the joint and humerus. The roller is then applied over the elbow, and upwards to the axilla. The end of the fillet is carried round the neck, in order to prevent the bandages from ſliding downwards, and, as an additional ſecurity againſt this accident, the turns of the roller are ſewed to each other from the elbow to the arm-pit; the whole is ſoaked with Theden's vulnerary, and kept continually wet. Theſe dreſſings may remain in this condition for three or more days, provided the bandage becomes neither too tight nor too looſe, and applies to the limb in an uniform manner. If, ſays Mr. Theden, all theſe meaſures are adopted immediately after the accident, the cure may certainly be effected in the ſpace of eight days, only we muſt examine very attentively whether, at the place where the artery has been wounded, a new tumour or effuſion takes place. Should this happen, we muſt ſtill continue to apply the bandages for ſome time; but if the blood has been effuſed from the beginning into the cellular ſubſtance, as ſometimes happens, the bandages muſt be worn till the whole has been re-abſorbed, and the wound properly cicatriſed. The utility of this method of Theden's has been confirmed by ſeveral practitioners, eſpecially by the ſucceſsful cure of a remarkable caſe, related by Mr. Schmalz. (Seltene Chirurg. u. Mediciniſche Vorfælle. Leipzig. 1784. 8vo. p. 59.)

But when there is a great deal of extravaſated blood in the ſac, when the tumour is very large, ſo as not to admit of compreſſion or bandaging, and there is reaſon to apprehend that the tumour may burſt open, an operation muſt be performed without delay. The tourniquet being applied to the humerus, the ſkin which covers the tumour is laid open by an inciſion, made according to the direction of the artery, and carried acroſs the middle of the tumour, ſo as to extend from one of its extremities to the other. The ſac, which is generally ſituated immediately under the ſkin, is opened in the ſame manner. The whole of the extravaſated blood contained in the ſac is then taken out, upon which the wounded artery becomes diſtinctly viſible at the bottom, and ſhould be tied. But in order completely to ſtop the hæmorrhage and prevent its recurrence, the artery muſt be tied not only above, but alſo below the orifice. Sometimes the ſurgeon is obliged to apply even three or more ligatures; for when, in the vicinity of the wound of the artery, between the two principal ligatures, any lateral branches proceed from the trunk of the artery, theſe muſt be tied cloſe to the trunk.

Since, after the operation has been performed, every thing depends upon the reſtoration of the circulation in the limb, by means of the diſtenſion of the lateral branches in conſequence of the increaſed impetus of the blood in them; the ſurgeon muſt be particularly attentive in performing the operation, not to injure theſe branches. For this purpoſe the two ligatures muſt be applied as near the wound of the artery as can be done with ſafety, leſt any lateral branch ſhould happen to be included between them, whereby it would neceſſarily be rendered uſeleſs. On this account alſo we muſt not uſe a very broad two-edged needle for applying the ligatures. Mr. Deſſault uſed an elaſtic needle of his own invention. It is needleſs, after having tied the veſſels, to apply another tourniquet or other bandage to the humerus, with a view to prevent the recurrence of the hæmorrhage; for if the ligatures have been ſkilfully applied this precaution will be ſuperfluous. In caſes where the ligatures become looſe, and ſucceſſive hæmorrhages are produced, the method of Mr. Deſſault has been recommended. At the third hæmorrhage, which took place on the eleventh day after the operation had been performed on the femoral artery, he firſt applied new ligatures above and below, ſecured them properly, and renewed the bandages. But in order to prevent a recurrence of the hæmorrhages, which might have ſupervened in conſequence of the collapſe of the artery and the ligatures growing looſe, he applied, four days afterwards, over the ligatures, and at the ſides of the artery, ſmall flat pieces of ſoft wood, fifteen lines long and three broad, which were ſecured by winding them round with ſeveral turns of waxed thread, and were made to compreſs the artery at the ſides with more or leſs force, by introducing under their upper extremity ſmall wedges of the ſame wood. By this means the impetus of the blood was reſtrained, and a new effuſion prevented. Suppuration took place in the wound, and on the 38th day after the operation, the ſmall pieces of wood fell off, the ligatures having come away ſome days earlier.

If it can be avoided the ſurgeon muſt take care not to include the nerve in the ligature. Sometimes the extravaſated blood, which frequently penetrates behind the artery, ſeparates the nerve from the artery; and in this caſe we may, in order to avoid incloſing it in the ligature, bend the patient's arm, before applying it, and by means of a ſomewhat crooked probe, introduced into the open ſpace, raiſe up the artery, and remove it from the bone, and then introduce the needle, to which the thread is attached, cloſe under the artery. We muſt, however, not raiſe up the artery with too much force, leſt we ſhould tear ſome of the lateral branches. Moreover, it is always adviſeable not to draw the ligature tighter than is neceſſary for ſtopping the hæmorrhage, leſt we ſhould cut through the coats of the veſſel,

or

or compreſs the nerve too forcibly, in caſe it ſhould happen to be incloſed. Frequently the artery is ſo much detached from all the neighbouring parts, that the thread may eaſily be drawn through below it, by means of a common needle with the eye foremoſt. But when the artery is not detached from the ſubjacent parts, we muſt make uſe of a pointed needle having an eye near its point, taking care always not to puncture the nerve, or any tendinous parts, or to incloſe them in the ligature. The ligature ſhould be ſecured with a double knot, and the ends of the threads ſuffered to hang out about two inches long. The tourniquet may then be immediately looſened, in order that we may ſee whether the ligature be ſufficiently tight; after which the wound is to be dreſſed lightly with lint, and the proper bandages applied; and the patient ſhould be directed to carry his arm in a ſling.

The wound is treated after the uſual manner till the ligatures have come away. In order to reſtore the natural heat to the fore-arm, and to diſcuſs the tumour in it, it may frequently be rubbed with ſpirituous, ſtimulant, and aromatic applications. M. Pouteau aſſures us, that no remedy has ſucceeded ſo well with him, in reſtoring the natural warmth and ſenſibility of the fore-arm, as dry heat applied by means of hot aſhes or ſand. The remaining debility may, in general, be ſpeedily removed by uſing the ſhower-bath, and external tonic applications.

When in conſequence of an aneuriſm in a limb, the neighbouring parts are deſtroyed, when ſuppuration or caries have taken place in a high degree, or when the limb remains lifeleſs after the operation, ſo as to threaten the production of gangrene, amputation becomes neceſſary. We ought, however, not to be too haſty in proceeding to this operation, ſince even in caſes where gangrene has ſeemed to be unavoidable, the limb has ſtill ſometimes been preſerved; frequently after the lapſe of ſeveral weeks the pulſe has again become perceptible. We ſhall here ſubjoin an account of the method employed with ſucceſs by Dr. Adams. (Med. and Phyſ. Jour. vol. vi. p. 535.)

On the 4th of February, 1797, a young baronet was blooded in the vena mediana baſilica, and from his having worn a tight flannel ſleeve, it was not immediately obſerved that the blood came alſo from an artery. The orifice having been cloſed in the uſual manner, bled again in the evening, but was ſtopped before Dr. Adams could ſee the patient. On the following morning a conſiderable extravaſation of blood took place. In a few days, however, the gentleman was not thought in need of further attendance, although the arm did not recover its ordinary ſize. Six weeks afterwards a ſmall circumſcribed tumour had ariſen in the arm, below the original cicatrix; and, on preſſure, a very obſcure pulſation might be felt; it was firmly bound by the faſcia, and not at all diſcoloured or painful. The tumour increaſed ſuddenly towards the end of March, with the ſame circumſcribed appearance and an evident ſurrounding extravaſation. Strong preſſure was now applied by means of a roller to the upper part of the fore-arm, exactly upon the trunk of the artery, ſo as to leſſen its pulſation; but the bandage was kept hollow, except over the artery, by ſeveral pieces of cane applied along different parts of the limb. Although this degree of preſſure was had recourſe to with the view of obliterating the large trunk of the artery, an increaſe of the ſwelling took place in about ten days, accompanied with ſlight pain.

The mechanical preſſure on the veſſel itſelf was then augmented, until but little pulſation could be felt in the radial artery. Painful ſenſations near the wriſt, along the lower arm, and under the aneuriſm, were now complained of as intolerable. The fingers were without ſenſation, the whole arm was enlarged, the veins became turgid, and the pulſe remained very feeble. This proceſs being perſevered in, Dr. Adams had at length the ſatisfaction to obliterate the main trunk of the brachial artery, and to effect a complete cure. The maſs of coagulated blood, however, was diſcharged by a gangrenous ſore at the bend of the arm, about two inches in diameter, which was cicatrized before the end of July, 1797; and in January, 1798, every unpleaſant ſymptom had diſappeared. This plan of treatment, by *compreſſion*, was adopted by the author without his having known that it had been ſeveral times practiſed with ſucceſs, in different parts of the continent, for other caſes of aneuriſm.

The treatment of the true external aneuriſm is in moſt reſpects the ſame as that of the falſe. If it be ſmall in ſize, and not of long ſtanding, external aſtringent applications, as alſo ice, have been uſed with very good effect. In trying ſuch an experiment we may, at the ſame time, apply a tourniquet to the artery, above the ſwelling, in order to diminiſh the quantity and momentum of blood flowing into the ſac. Compreſſion has likewiſe been recommended in this ſpecies of aneuriſm, but only at the commencement. Mr. Bruckner, however, (D. Juſt. Chr. Loder Journal fuer die Chirurgie, &c. b. i. ſt. 2. Jena 1797. p. 248.) has uſed it in a caſe of a very large and old aneuriſm in the hollow of the knee, in combination with the remedies before mentioned, together with Theden's bandage applied from the toes upwards, and the concurrence of other favourable circumſtances, with complete ſucceſs. When compreſſion is applied, it ought to be to every part of the ſurface of the tumour, as well as in the courſe of the artery; and it will act with greater ſafety and efficacy, if we combine it with Theden's manner of bandaging, as was done by Mr. Bruckner.

When none of theſe remedies are applicable, we muſt proceed to the operation, which (if we follow the old mode) is in no eſſential circumſtance different from that performed in caſes of falſe aneuriſm. It is, however, to be obſerved, that it is not adviſable to cut through the poſterior part of the ſac, as in that caſe the ends of the artery eaſily contract themſelves under the fleſh; and if the firſt ligature ſhould grow looſe, they cannot eaſily be tied again. It appears from experience, that the operation has been far more rarely attended with a ſucceſsful event in the true than in the falſe aneuriſm; it being frequently followed by violent pain, fever, ſwelling, gangrene, and death. Only in thoſe true aneuriſms which are ſmall, and originate from external cauſes, the ſurgeon is able to operate with expectations of a ſucceſsful event. Sometimes, however, theſe aneuriſms require amputation to be performed, and that, under the ſame circumſtances by which the operation is indicated in the falſe aneuriſm. But as this operation, as well as the application of the ligatures, very frequently miſcarries, all the precautions with reſpect to the application of the ligatures, that have juſt been mentioned, are here alſo to be recommended.

Internal aneuriſms, both true and falſe, are incurable: all that we can do is to retard the progreſs of the diſeaſe, by frequent blood-letting, ſpare diet, and the careful avoiding of every thing by which the blood may be heated, or its motion accelerated. Moreover, it is very adviſable to cover the tumour well, as ſoon as it appears externally, and to defend it againſt all external violence, by friction, blows, &c. whereby its burſting might be haſtened.

To the cure of the diffuſed falſe aneuriſm two things are requiſite; namely, to cloſe the wound of the artery, in order to ſtop the hæmorrhage, and to diſcuſs the extravaſated blood. The firſt is performed by compreſſion with a pledgit, and the ſecond by applying bandages to the whole limb, according to Theden's method, and keeping them conſtantly

ſtantly wet, either with Theden's vulnerary, or a ſolution of ſal ammoniac in vinegar and water. But if the extravaſation ſpreads farther, and the hæmorrhage continues, the operation muſt be performed without delay.
